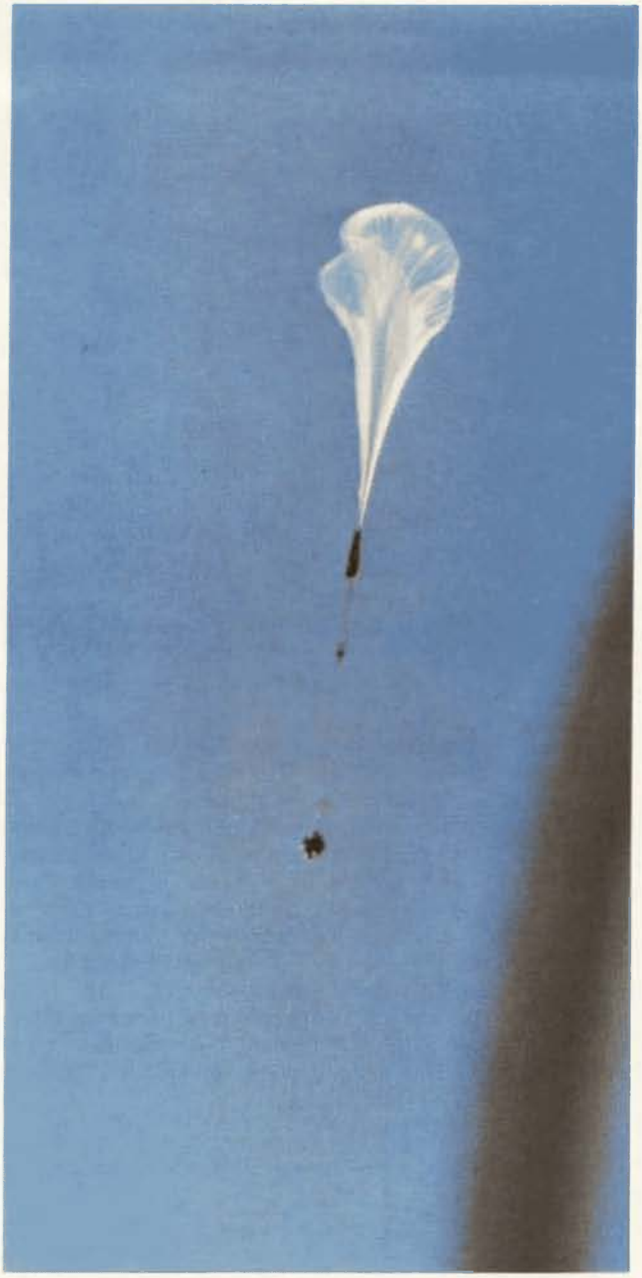
scratching followed, during which time the matter was chatted up on the air with anyone who would listen. Ron Nurnberg VE4KA became interested and, after some discussion, it was decided that a "simplex" repeater would be flown. Although the title "simplex repeater" seemed incredible to some amateurs who heard last-minute publicity announcements some time later, the concept was fairly straightforward. Two repeaters would be constructed back-to-back. One would accept input on 144.33 MHz from the ground control station and retransmit on 147.33 MHz. The other would accept input from amateur stations on 147.33 MHz and retransmit on 144.33 MHz. This would be our "simplex" mode using a common simplex channel. A solid-state relay system would ensure that when either transmitter was operating, the receiver of the opposite pair would be muted. Normal duplex repeater operations on 144.33/147.33 or 147.33/144.33 were also possible upon command. The 3-MHz spacing was selected to give protection against desensing of the unmuted receiver. This was necessary as it would not be possible, due to restricted space, to include a duplexer for a normal 2-meter repeater split.

The word started to get around about the crazy things being planned out at Gimli! Barry Malowanchuk VE4MA came forward with a plan to include a low-power 432-MHz beacon in the package. As an L-band radar reflector was mounted on the balloon, it was suggested by members of the group that "balloon-bounce" communications might be attempted. The ideas were coming forward, but still the problems of components and hardware remained. The slowly growing team of helpers began to chip in equipment and bucks where they could. A massive scrounging spree for expensive or hard-to-get items was directed towards local electronics stores and other businesses. Larry and Max reworked two Marconi DT-85 transceivers for use as the repeaters, and Ron VE4KA set to work on the control circuitry.

Because of the anticipated current drain, power was a problem! Numerous suggestions were made ranging from dry cells to gel batteries, but due to the high costs, these ideas were discarded in favor of a bank of silver cells which had been formerly used for rocket experiments. Hugh McKay VE4HC was given the somewhat tedious task of charging and discharging the battery pack to a very strict program to ensure that the maximum battery life would be available "come the day."

Because the design operating altitude was to be about 100,000 feet, the package would have to be insulated against the extremely low temperatures and sealed against the rarified atmosphere as none of the equipment had been originally designed to operate in a partial vacuum. One local amateur worked for a company which used explosion-proof electrical junction boxes. These were made of 3/4"-thick aluminum alloy, with inside di-



"Skyhook" balloon at about 1000 feet, just after lift-off.

Ron VE4KA working on the repeater package.

mensions approximately 19" × 12" × 12" and weighing an incredible 95 pounds each! Two such boxes were diverted to the project and became the air-tight equipment enclosures we needed.

Thus, most of the equipment was acquired and assembly of the flight package began during the first week of July. The radio equipment was installed in a compartmented aluminum box 12" × 17" × 3" with two receivers in one compartment and the transmitters in separate compartments. Connections between the compartments was via feedthrough capacitors. Control of the package was of paramount concern. No control equipment, either digital or tone, was readily available. However, on each high-altitude experimental balloon, several command functions are required, such as to open a helium valve to cause the balloon to descend or to dump ballast to cause it to ascend. Command functions for on-board experiments also are provided. A Command Instrument Package (CIP) is flown for this purpose. A system had to be devised which would convert the CIP output, consisting of a +24-volt pulse of 80-ms duration to a logic level which would actuate the specific functions of our experiment. Ron VE4KA, being responsible for the control circuitry, with assistance from Keith Jonas VE4YA, constructed a system of optical isolators and digital latches which effected the required command sequences. In addition, op amps and digitally-actuated relays were used in the repeater when operating in the duplex mode. Failing to manufacture a suitable bipolar supply to operate from the battery pack, we were forced to rely on Radio Shack D-cells hastily wired together to provide the ±15 volts required for these op amps. This proved to be the Achilles heel of the whole operation! Fig. 1 shows a block diagram of the repeaters and command system.

During the later part of the assembly period, Bill Bowman VE4AFO had been busy assisting with assembly of the equipment, helping to prepare the deactivated airport control tower for use as the ground station, building antennas for HF communications, and running errands for the constructors. He also managed to spend some time on the local 2-meter repeaters advertising the Gimli activity, arranging for the loan of equipment, and recruiting help where he could find it.

I was recruited at this time and did some publicity work on 20 meters and on the various 75-meter nets in the adjoining states and provinces. This I found a little frustrating. After accepting the information I had to offer, sometimes a little skeptically, most people would ask for a launch date and time. This I was not able to give! The problem

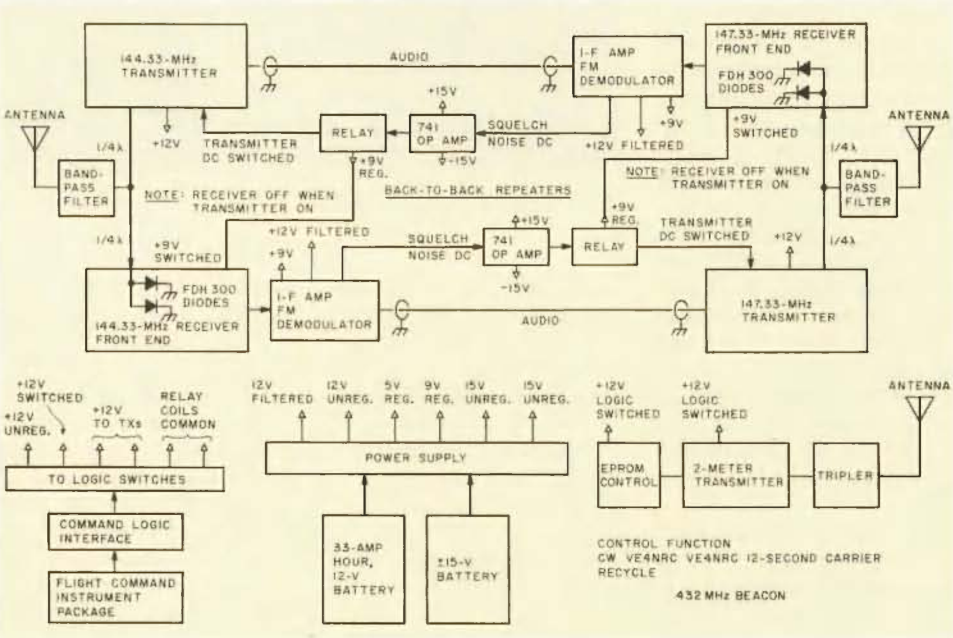


Fig. 1. Flight package.

The repeater package with two receivers in the left-hand compartment and the transmitters in two separate compartments on the right.

was that this balloon would be a real monster! It would have an inflated volume of 1.5 million cubic feet, and the combined length of the balloon, payload, and flight train, consisting of the ladder structure and collapsed parachute, would be 600 feet. It was therefore necessary that, at launch time, there be no more than a 5-mph wind velocity difference between ground level and 400 feet, or else the balloon could be damaged. Thus the launch date and time were highly dependent on local weather conditions. Regarding the size of the balloon/package combination, one of the group described it as "like flying a large condominium to a height of 22 miles."

During the later stages of the airborne package construction, the ground station was being prepared. Most of this equipment was obtained on loan from various amateur and business sources, while some specialized equipment was obtained from NRC. Dick McGuire VE4HK ran a courier service between Winnipeg and Gimli! He delivered purchased and scrounged equipment to the construction team. The ground 2-meter transceiver was an Icom 280 driving a KLM 70-Watt linear amplifier. The main tracking antenna, a 4- × 6-element yagi array, was jointly constructed by Vic Grant VE4VG and Joe DeLaronde. It was mounted on an Andrew pedestal for manual control of azimuth and elevation. Also mounted on the pedestal was a remote receiver agc meter to assist the antenna operator in tracking the balloon. Fig. 2 is a block diagram of the ground station equipment used.

The Federal Department of Communications had been kept informed of our plans at all times and had approved the call VE4NRC for use during the flight, the sponsor being Kathy Toms VE4YI. Sponsorship was later transferred to VE4KA in order that Advanced class privileges would be available.

At last the day came, after many days of payload checks, weather briefings, false alarms, and final preparation of the ground station. At 0012Z on July 27, 1979, the balloon was launched, not looking like a conventional hot-air balloon, round and graceful, as I for one expected, but more like a sad sausage skin which someone had forgotten to fill! At first, as I watched from the balcony of the control tower along with dozens of local amateurs who had heard that the launch was imminent, the balloon went straight up, then it drifted off to the southeast over Lake Winnipeg. It appeared to hang motionless over the southern end of the lake for several hours. Later, under the influence of upper winds and the Earth's rotation, it would travel westward across Manitoba and into Saskatchewan.

Amateur operations commenced at 0025Z, thirteen minutes after lift-off when the balloon was at about 15,000 feet, the first contact

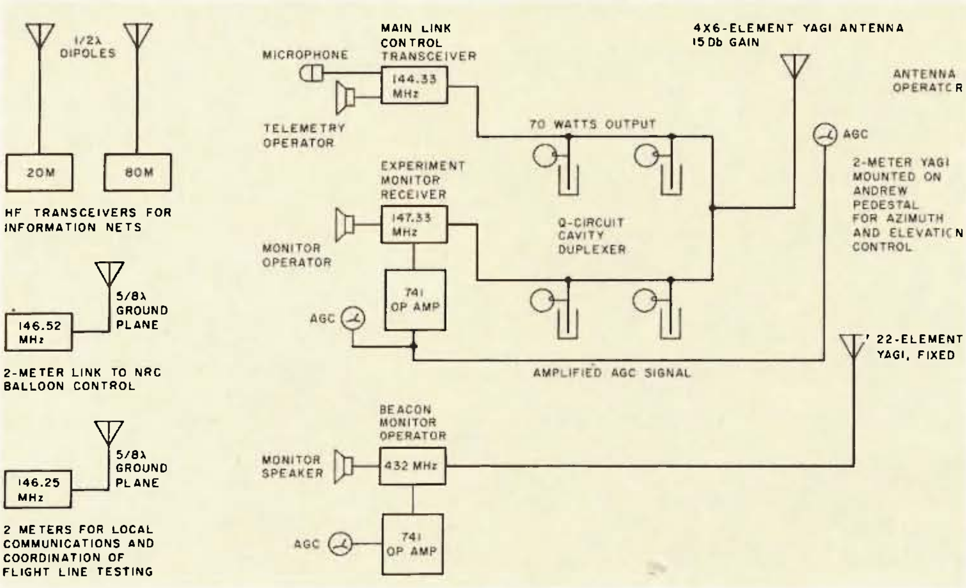

Fig. 2. Ground station.

Balloon package prepared for flight.

being VE4BE at 0027Z. Bill VE4AFO was in his element, feeling like a DX operator in a pileup! Alas, it did not take long for the amateur community to find the ground control input frequency, but this was being monitored and no station attempting contact on the control frequency was acknowledged. We had little to fear! With 2000 Watts ERP from the base station through its antenna system, we could certainly "capture" the flight uplink receiver! Although some interference continued, a great many contacts were made until the experiment was temporarily shut down at 0830Z.

There were a few amusing contacts. While I was putting out the word on 75 meters, I ran into two amateurs in Minnesota and I broke into their QSO to tell them what was taking place. A few minutes later I heard them make contact with the control station, and a short time later, again on 75 meters, I heard the following:

Hugh VE4HC and the 432-MHz monitors.

"How high did that guy say the balloon was?"

"102,000 feet, but no one in his right mind would put a repeater on a free balloon. It must be tethered."

Short pause.

"Where the devil would they get a rope 20 miles long?"

Long pause!

My favorite story is the one about the amateur in northern Nebraska who was called by nature in the early hours of the morning. Noticing that the scanner on his handie-talkie by his bedside was stuck on one frequency, he took it with him. Perhaps to this day he doesn't believe that he spoke to an operator 500 miles away on 147.33 simplex, with a 1-Watt handie-talkie with a rubber ducky antenna while sitting on his own john!

Many similar tales made our 30-hour day more bearable!

The experiment was turned on again at 1010Z, but insufficient power remained in the ±15-volt power supply to operate the repeater in the simplex mode. The 147.33-MHz transmitter was commanded on continuously and successful operation continued in the 144.33/147.33 duplex mode until termination at 1529Z. During the 15-hour, 17-minute flight, over 500 contacts were made in 5 states and 3 provinces. From calculations and a Fresnel plot, the theoretical radio range from 102,000 feet was 451.6 miles. Information provided by the NRC weather service indicated that there were no significant inversions during the period of the flight. Analysis of the actual contacts made indicates that the actual radio range was indeed very close to the theoretical.

It was also noted that differences in polarization at ground stations, e.g., verti-

cal, horizontal, or circular, had no apparent effect on the received signal strength.

A drop in signal strength of about 30 dB occurred approximately every 74 minutes. The regularity of this phenomenon leads us to suspect that balloon rotation resulted in eclipsing of the flight antenna system. Rotation was confirmed by telescopic sightings.

The 432-MHz beacon experiment was not successful as the unit was inadvertently turned off by the balloon command officer and it was only just before termination that, when supposedly switching it off, it was in fact switched on, and we could hear the signal clearly from almost 400 miles away. No reception reports were received.

The flight was terminated near Broadview, Saskatchewan, and a search team quickly located and recovered the amateur package which was safely returned, undamaged, to Gimli the next day.

As a result of this flight and the professional attitude of the amateur fraternity, amateurs in general, and the recently formed Canadian Amateur Radio Research Club (CARRC) in particular, have gained a measure of credibility and recognition from the scientific and industrial communities.

At present, members from the Greater Winnipeg area, together with an Ottawa chapter, are working on a flight experiment expected to be included as a passenger on a balloon flight during the summer of 1981. The design of the package calls for:

1. A microprocessor which will act as the control center for other experiments on board. This will demonstrate that programming and execution can be controlled from the ground. Commands will be transmitted from the ground to activate various functions of the experiment, e.g., to turn equipment on or off, etc. Command verification and analog data from the experiment (temperatures, supply voltages, etc.) will be transmitted back to the ground via Pulse Code Modulation (PCM).

The data transmissions will be decommutated at the ground station and the data will be analyzed in real time. Magnetic tape recordings will preserve data for further analysis at a later time.

PCM format: 1.5 kilobits per second, bi-phase level; mainframe length—20 words; word length—9 bits (8 data bits + 1 bit); sync word length—18 bits. The PCM will be transmitted on an FM subcarrier, frequency modulated on the main telemetry down-link.

2. The radio experiments will consist of:

(a) a 2-meter duplex repeater with input on 144.33 MHz and output on 147.33 MHz.
(b) a 10-meter-to-2-meter transponder. This will consist of a 10-meter SSB input with a 2-meter FM output.
(c) a UHF beacon, tone modulated.

We have been informed that, as we would be passengers on the flight, we must keep the package weight down to 50 pounds and the size down to 1 cubic foot. Ah, well, the impossible just takes a little longer!

It is hoped that we will be able to publicize the next flight rather better than the last. Our publicity man will probably send information to local net managers in Canadian provinces and the northern United States, so perhaps you should monitor your local net frequencies for up-to-date news on the progress of our next venture. The results of the proposed experiment may be published in a future article. Meanwhile, any further information is available from CARRC, Box 473, Pinawa, Manitoba, Canada R0E 1L0. ■

Digital Control for the Ham III Rotor

—good-bye manual switching!

Don Inbody WA0PBQ
8413 Riggs
Overland Park KS 66212

Shortly after I installed my new CDE Ham III™ rotator, I decided that there just had to be a more convenient method of operation. Being basically lazy, I am fundamentally opposed to the manual manipulation of switches required. (Press brake lever and hold, press rotation switch and hold until antenna is at desired heading, release rotation switch, and release brake switch a few seconds later.) With the state-of-the-art of electronics, I knew that there should be a better way.

I contemplated the matter for several weeks and even sketched out a few designs on paper. Nothing really jelled until I read a *73* article by Randy Kaeding K8TMK (September, 1979). The article described how he developed a digital readout for the CDE AR-44™ rotator. With his modification, manual manipulation of switches is still required, but he showed me how to produce digital information which can be used to control rotator operation.

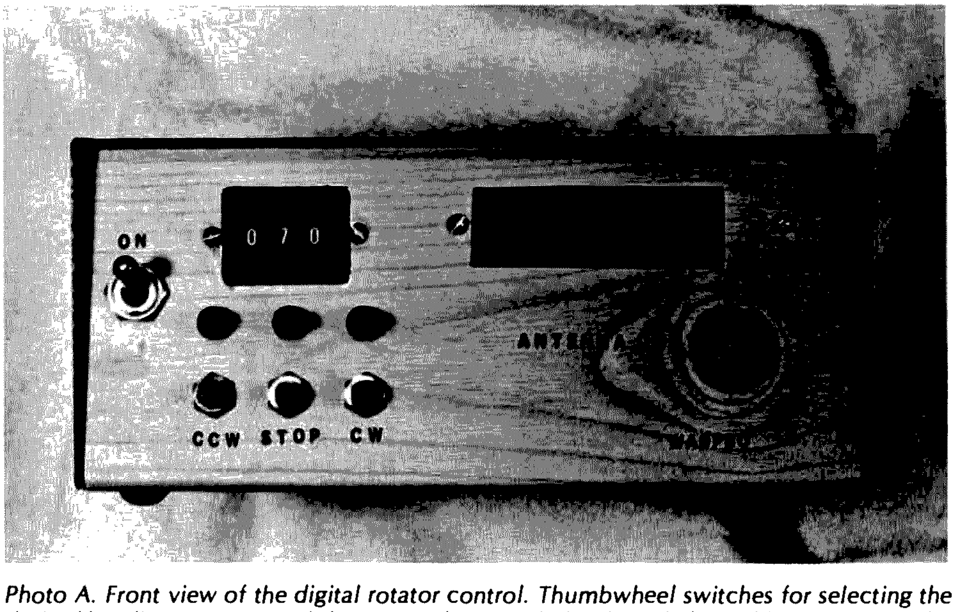

Photo A. Front view of the digital rotator control. Thumbwheel switches for selecting the desired heading are at upper left. LED readouts are behind a red plastic filter at upper right. At lower left are three push-buttons for ccw and cw rotation manually. Discrete LEDs above each push-button indicate the status of the control.

I can operate my rotator by selecting the desired heading with thumbwheel switches and momentarily pressing one of two push-buttons, depending on whether clockwise or counterclockwise rotation is desired. I can go back to operating while the antenna rotates to the new heading and stops. A few seconds later the brake solenoid engages. The heading is shown by a three-digit LED readout.

The block diagram (Fig. 1) shows the general operation of the control. A voltage which varies according to the antenna heading is produced across the potentiometer in the rotator assembly. That voltage is

translated into digital information by an analog-to-digital converter. The A/D converter output is fed to decoder/drivers and LED displays. The A/D output is also compared with the settings of thumbwheel switches. When the values agree, rotation stops. A delay timer keeps the brake released for a few seconds to allow the antenna to coast to a full stop.

Fig. 2 shows the logic circuit. U9 is a 3½-digit analog-to-digital converter designed for voltmeter applications and provides a full-scale reading of 2.0 volts. A voltage divider (R34 and R35) furnishes 0.36 volts across the 500-Ohm pot in the rotator assembly; thus, at complete rotation, a readout of 360 is provided. Pins 20-23 provide binary-coded-decimal (BCD) outputs for all digits. Pins 16-19 are digit-enable lines. To obtain information needed by the 7485 comparators (U3 and U4), the output must be de-multiplexed. I used a 74175 (U7) and a 7474 (U6). As explained later, only two digits are used, so the outputs of pins 16 and 19 are disregarded.

The largest number to be shown in the hundreds position is 3, so the binary 4 and 8 outputs are ignored for that digit. The BCD outputs go to the memory chips (U6 and U7) which are clocked by the digit-enable lines. U6 and U7 require positive-going pulses for clocking, so the outputs of pins 17 and 18 must be inverted. I tried various types of inverters, but I could get dependable clocking only by using a 7414, a hex Schmitt trigger. The Schmitt trigger has a very quick snap action, responds with less variation between high and low values, and is fairly tolerant of noisy signals.

U6 and U7 remember the BCD information for each digit until a new clock pulse is provided by the digit-enable lines. This allows the 7485s to compare the values being shown on the readout with those set on the thumbwheel switches. When the values agree, pin 6 of U3 goes high, resets the control flip-flops, and starts the brake-delay timer.

Antenna rotation is accomplished by three set-reset flip-flops and three relays. There is one each for clockwise and counterclockwise rotation and one for operating the brake solenoid. For example, when counterclockwise rotation is desired, momentarily pressing S5 drives pin 1 of U11 high, which closes K1, an SPST relay, and provides 25.2 V ac to the brake solenoid.

At the same time, pin 10 of U10 goes high, which closes K2 and provides 25.2 V to the ccw winding in the rotator motor.

When the desired heading is reached, pin 6 of U3 goes high and resets the ccw flip-flop, which releases K2 and stops rotation. Also, the delay timer is triggered. About three seconds later, the stop flip-flop is reset and K1 is released, allowing the brake to engage. Operation for clockwise rotation is the same, using S4.

S3 provides a manual method of stopping rotation before the desired setting is reached. (This is also useful if you press ccw when you mean to press cw!) LEDs (D4 and D5) light when the antenna is turning. Another LED (D6) lights when the brake solenoid is energized (brake released). These are not really necessary, but they give a visual indication of action and impress the tourists.

To get more dependable triggering, I routed the output of U3 through two inverters of U8. This may not be necessary, but the inverters were available and they do provide a very clean, fast trigger pulse. D7 blocks the +5-V dc supply from the output of the inverter when the stop button is pressed.

Brake delay is accom-

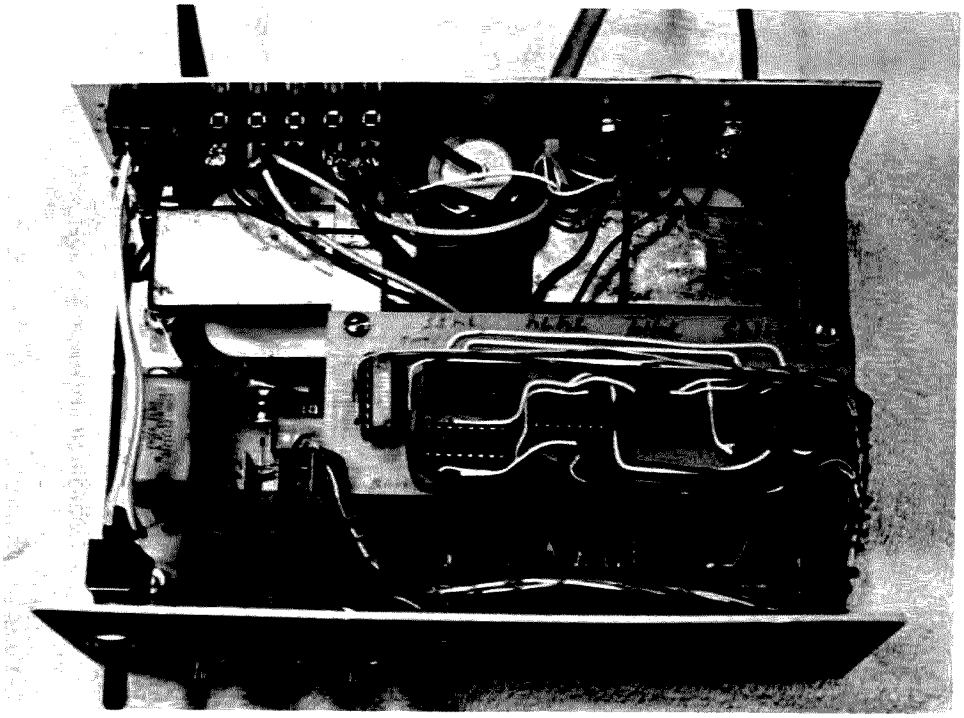

Photo B. Interior view. A 25.2-V transformer at upper left provides ac for rotator operation. At upper right is a 12.6-V transformer for control operation. Connections to the rotator assembly are made on the terminal strip at upper left. After the photo was taken, I installed a molex connector and eliminated the terminal strip. The ac power switch and thumbwheel switches are at lower left. The six ICs mounted on a separate circuit board which is double-decked over the main board are the de-multiplexers, comparators, and inverters.

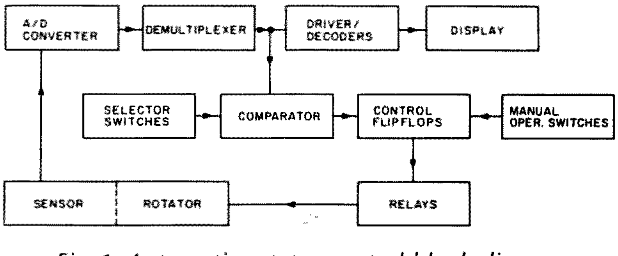

Fig. 1. Automatic rotator control block diagram.

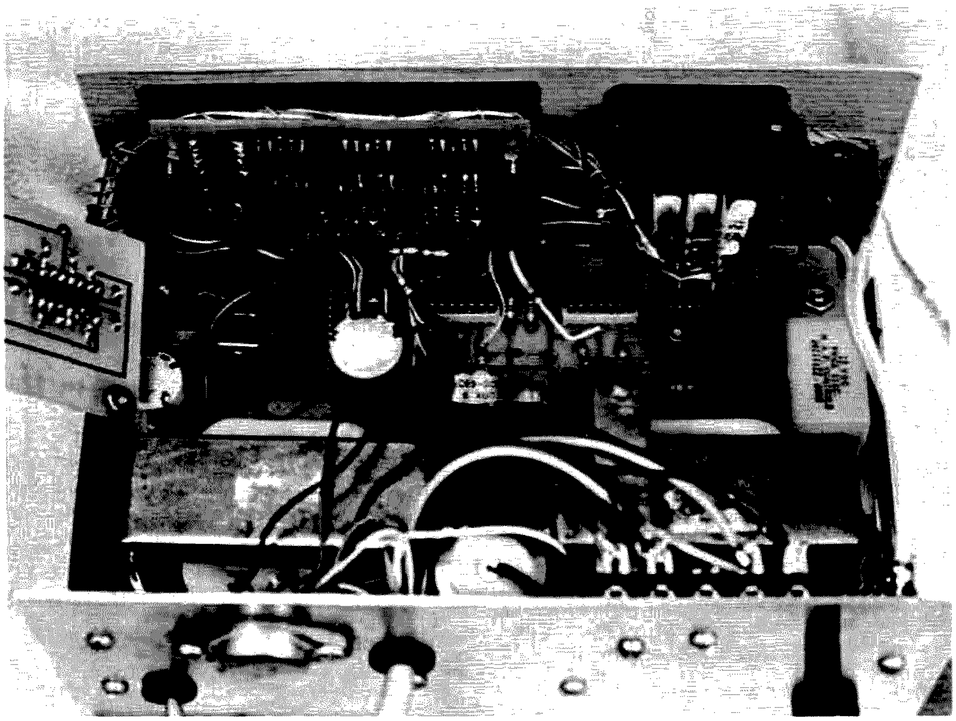

Photo C. The double-decked board has been rotated away to show layout of the main board. The displays and drivers are mounted on the board at upper left. Thumbwheel switches are at upper right. The A/D converter is the large chip at left center. Motor control and brake relays are at right center. The tops of the transformers can be seen near the bottom. At the left is a separate two-conductor shielded cable for the sensor circuit. At left center is the main rotator cable. These have been replaced by a nine-conductor molex connector.

plished by U12, a 555 timer. The values of C5 and R32 shown in Fig. 3 hold the brake released for about three seconds after the motor is turned off. The time can be altered by changing the values of C5 and/or R32 to provide the amount of delay needed for any particular installation. The delay can be any amount from a small fraction of a second to several minutes.

The trigger input of a 555 must be a negative pulse and must be held high between triggerings. The high output from U3 is inverted by a gate on U11. (One of the inverters on U8 could have been used.) The timer is held high by R30 and R31 and is isolated from U11 by C4. When pin 13 of U11 goes low, a pulse crosses C4 and starts the delay timer. C6 in the U12 output line (pin 3) also improves triggering.

The external components around the A/D converter (U9) were chosen according to the manufacturer's application sheet. R16 and R17 are used to set the reference voltage at +2.0 V dc. Other components establish internal operation of the chip.

As shown on the schematic, the rotator control reads out only the hundreds and tens digits. I tried several ways to get more precise readings, but I finally gave up. Because of the method of picking up the sensing voltage, a long rotator cable, and the clocking times of U6 and U7, reliable action in the units digit just wasn't possible. I finally hard-wired the units LED to show 0. Unless your antenna is much sharper than mine, I doubt that 10 degrees difference between actual and indicated heading will be noticeable. If you know of a way to get a more precise readout, please let me hear from you.

I got the control working well on the breadboard using a 500-Ohm trimpot to simulate the pot in the rotator assembly. When I connected it to the rotator, the readout was totally erratic. After a great deal of checking, consultation, head scratching (and maybe just a little cussing), I found the problem. Instead of 0.36 V dc across terminals 3 and 7 of the rotator, I had about 12 V ac. Apparently, an ac voltage was being induced within the approximately 100 feet of rotator cable. I tried several types of filters and chokes, but nothing worked. A separate two-conductor shielded cable from the shack to the rotator assembly solved that problem.

Another source of difficulty was the nature of the wiring of the rotator assembly. The wiper of the indicator pot in the rotator is connected to earth ground. As that is the source of voltage for U9, all control circuitry must be insulated from earth ground. Also, as I learned the hard way, grounded test instruments cause erratic and meaningless readouts.

I used PC board construction. Perfboard or wire-wrap should work just as well. There are three boards. On one are the power supply, the flip-flops, the relays, and the A/D converter with its associated components. A second board holds the readouts and drivers. The de-multiplexers, Schmitt trigger, and comparators are on a third board, which is double-decked over the main board.

The whole works is mounted in a Radio Shack (#270-269) cabinet, including the transformers. The fit is pretty tight, but it does work, and it looks nice. Wood-grained self-adhesive paper was used to cover the bare aluminum.

The thumbwheel switches provide BCD output. The 7485 comparators require BCD complement, so the switch outputs must be inverted. As only the 1 and 2 outputs are used by the hundreds digit, one 7405 (U5) provides the needed 6 inverters.

The power supply as shown in Fig. 4 is conventional. U13, an LM309K regulator, is mounted on the rear of the cabinet to dissipate the heat. No heat sink is needed for U14, a 7905 regulator, which provides −5 V dc for U9. C10 and C11 are needed to prevent oscillation. They should be installed very near the output terminals of the regulators.

I used 6-volt relays for motor operation and a 12-volt relay for brake oper-

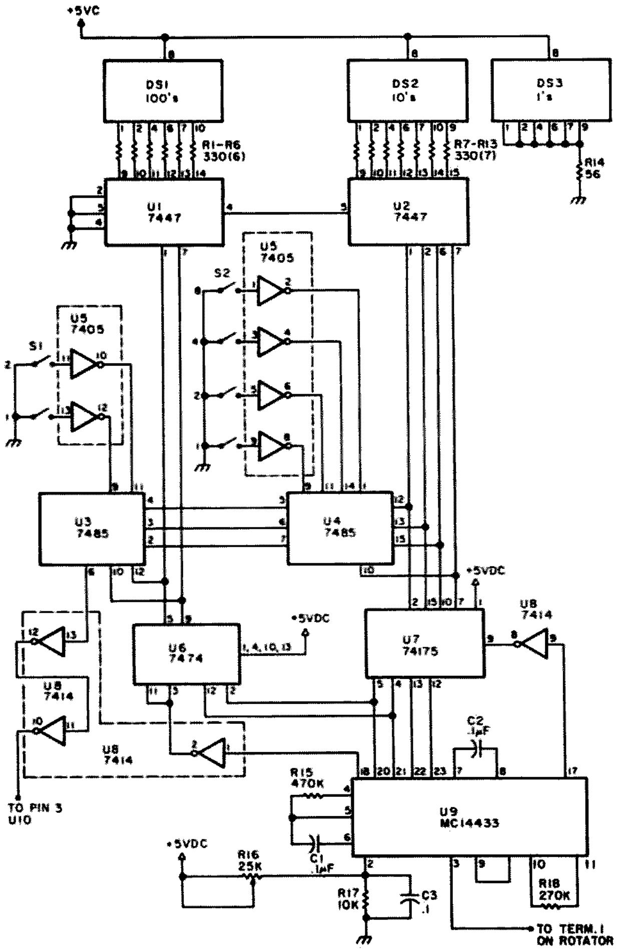

Fig. 2. Readout and logic schematic. All circuitry must be insulated from earth ground.

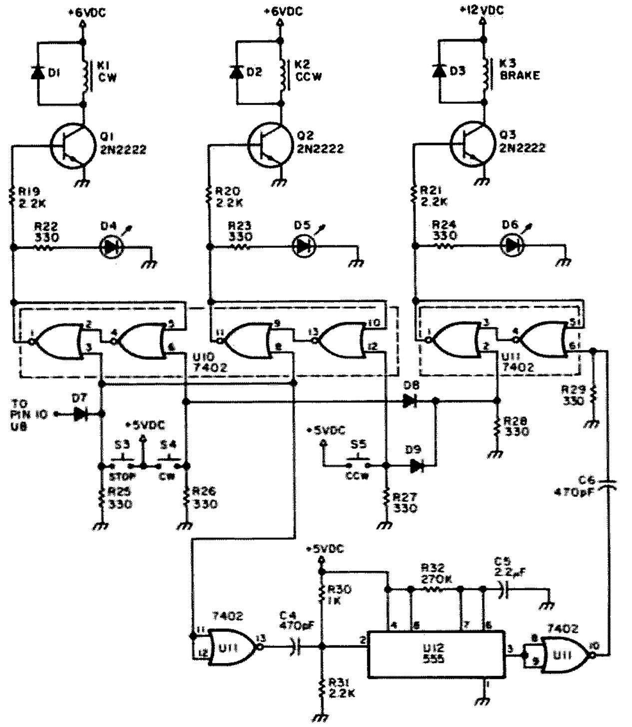

Fig. 3. Control schematic. All circuitry must be insulated from earth ground.

ation because they were on hand. The motor relays are not especially critical as the current is relatively small. The brake relay must handle about 2 Amps plus the amount required by the motor. Note that the motor relay contacts are in series with the brake relay contacts. This ensures that the motor will not run unless the brake is released.

My 6-volt relays would not operate from the 5-volt power supply, so I included D12, a 6-volt zener, ahead of the positive regulator with R35 in series. The power supply voltage ahead of the positive regulator was near enough to 12 volts to operate the brake relay. Different relays will, of course, have different power requirements.

Almost any general-purpose NPN switching transistors should work for Q1-Q3. D1-D3 across the relay coils help prevent voltage spikes which occur when the coils are switched out.

If you build this project, don't forget C7, a 120-140-uF unpolarized electrolytic capacitor. It is necessary for rotator operation. I got mine from CDE.

There are only two adjustments to make. R16 must be set to provide 2.0 V dc at pin 2 of U9. R34 is adjusted to provide a 360 reading at full rotation of the antenna and will need to be readjusted if the control cable length is changed.

All parts used in the control are readily available. Except for the motor capacitor, I got all my parts from

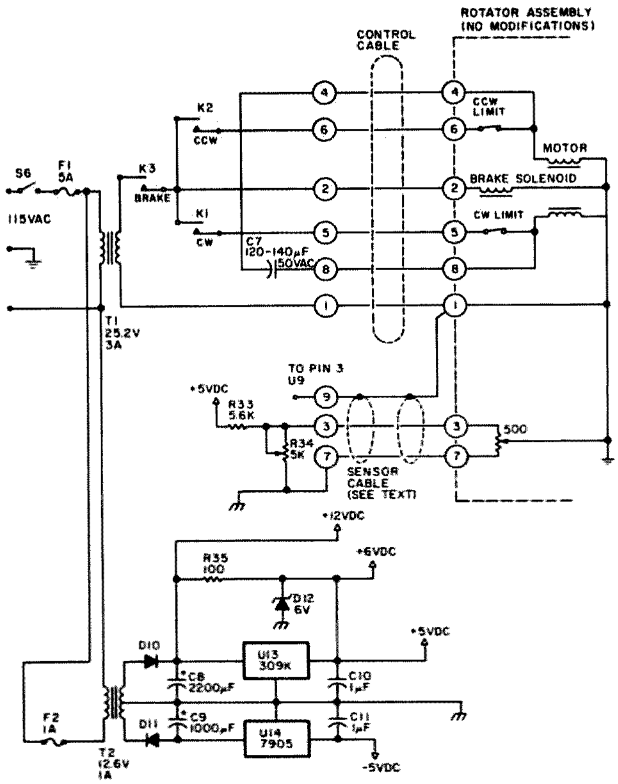

Fig. 4. Power supply and connections to rotator assembly. All circuitry must be insulated from earth ground except potentiometer wiper and motor in the rotator assembly and the cabinet ground on the 115-V ac line.

Parts List

C1	0.1-uF mylar®
C2,3	0.1-uF ceramic disc
C4,6	470-pF ceramic disc
C5	2.2-uF tantalum
C7	120-140-uF ac electrolytic
C8	2200-uF electrolytic
C9	1000-uF electrolytic
C10,11	1-uF tantalum
D1-3,7-9	1N914/1N4148, etc.
D4-6	LED
D10,11	1N4001
D12	6-volt zener
DS1-3	FND-510
K1,2	SPST 1-A relay
K3	SPST 3-A relay
Q1-3	2N2222 or equivalent
R1-13,22-29	330 Ohms (all fixed resistors are 1/4 Watt)
R14	56 Ohms
R15	470k
R16	25k trimpot
R17	10k
R18,32	270k
R19-21,31	2.2k
R30	1k
R33	5.6k
R34	5k,10-turn trimpot
R35	100 Ohms
S1,2	BCD thumbwheel switch*
S3-5	NO push-button
S6	SPST toggle
T1	25.2 V, 3 A
T2	12.6 V, 1 A
U1,2	7447
U3,4	7485
U5	7405
U6	7474
U7	74175
U8	7414
U9	MC14433
U10,11	7402
U12	555
U13	LM309K
U14	7905

Other:

Cabinet
Power cord
5-A fuse and holder
1-A fuse and holder
IC sockets
2-conductor shielded cable
9-pin molex connectors
(2 male, 1 female)
Despiking capacitors
(0.01-0.1-uF ceramic)

*Thumbwheel switches are available from Jameco Electronics, 1355 Shoreway Road, Belmont CA 94002. This project uses 2 SR21 BCD switches and 1 pair SREP end plates.

Radio Shack, *73* advertisers, and my junk box. Prices vary, so it pays to do some comparison shopping. Except for the timing of the brake release delay and the external components around the A/D converter, nothing in the circuit is especially critical. The 330-Ohm resistors are typical for TTL circuits, but any value from 100 Ohms to 560 Ohms will work, although lower values will increase the power supply demand. Diodes D1-D3 and D7-D9 can be just about any general-purpose diodes you have available.

Good TTL design requires liberal use of despiking capacitors. They are not shown on the schematics, but several 0.01-uF ceramic discs were installed at various locations where +5-V dc lines were near ground buses. There should be one for every three ICs and one at each place a supply line enters a circuit board. Any value from 0.01 uF to 0.1 uF will work in a circuit such as this one. Supply connections for most ICs have been omitted from the schematics. See Fig. 5 for connections required.

The readouts are FND-510s. They are large (0.5″) and can be bought for $1.00 or less. Almost any 7-segment LEDs could be used. The 510 is a common-anode device. If common-cathode displays are used, substitute 7448 drivers for the 7447s and connect the common pins to ground instead of to +5 V dc.

As mentioned before, this project was developed to adapt my Ham III. Other CDE rotators have basically the same circuit, so adaptation to other models should be possible. Fig. 6 shows the sensing circuit of the Ham III. If you have a different model, you can check the circuit shown in your owner's manual to learn if any changes are needed.

With this control, the antenna will have to be shifted 180 degrees. The standard dial on CDE rotators has 0 and 360 degrees at the center of the meter scale. With the digital control described here, mid-rotation provides a 180-degree reading. As I wanted to be able to continue using my CDE control box as a backup, I changed the marking on the meter plate. A south-centered meter plate is available from CDE.

I also provided both control boxes and the rotator cable with molex™ connectors. This allows me to switch controls easily. Incidentally, this quick-disconnect feature provides a safety factor. When lightning threatens and I disconnect my antennas, I also can disconnect the rotator cable and remove one more possible source of lightning in the shack.

The digital rotator control has been in operation in my shack for several months without any problems. It certainly is more convenient to use than the standard control. During net or contest operation, I can change the antenna heading quickly by dialing the new heading and pressing a button. I can immediately go on operating without waiting for the antenna to complete its rotation.

There are probably better and simpler ways to accomplish the same results. I will be interested in hearing about your efforts. If you have questions, write to me and include an SASE. I will try to answer. ■

The Doppler Systems DDF-3003

—a review of the latest in direction-finding equipment from Doppler Systems

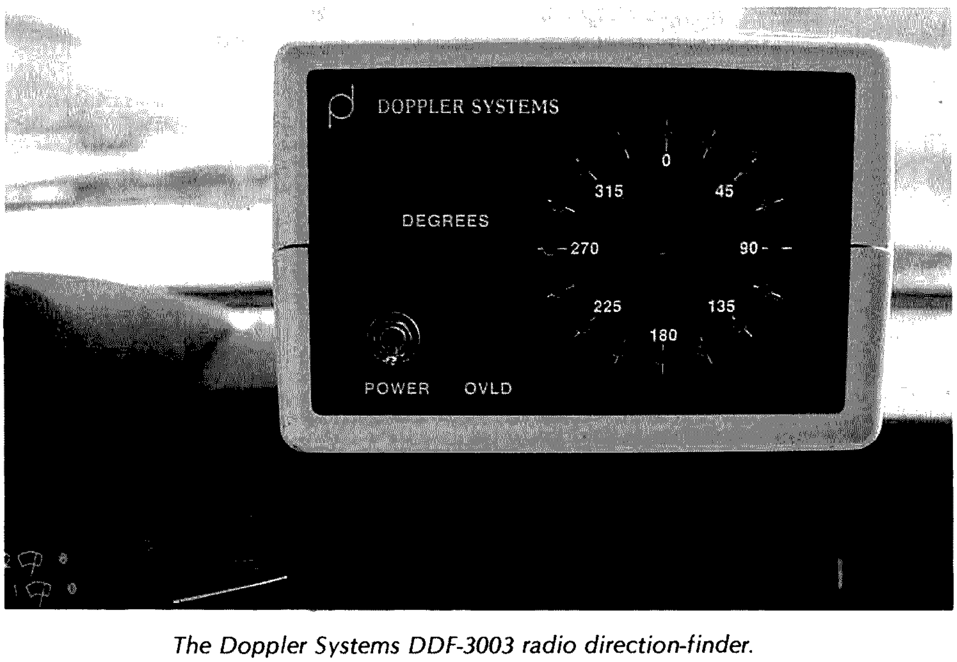
Paul Grupp KA1LR
73 Magazine Staff

One rather unfortunate by-product of the boom in repeater activity is the large flock of wild turkeys that has accompanied it. For the uninitiated, a wild turkey is an uncivilized lout who manifests various and sundry antisocial behaviors while firmly clutching the PTT switch on the microphone of an FM transceiver. As an avid FM operator, I have developed a fairly well-tested hypothesis which I call the wild-turkeys-per-square-mile factor.

In any given population center, there will be a certain number of wild turkeys per square mile. The greater the population density of a specific geographical area, the greater the number of wild turkeys in that area. By the same token, the wider the coverage of a particular repeater, the larger the number of wild turkeys that will be operating within its coverage area.

Now, whatever the coverage of a particular repeater, it can only carry so much traffic. A repeater with a very small coverage area in a location with a low population density will probably be able to laugh off the feeble efforts of the .325 wild turkeys within its coverage area. The matter gets a bit more serious as the coverage of the repeater increases. A wide-area-coverage repeater in a metropolitan area will have no more hours in its operating day than the rural repeater, yet the flock of wild turkeys using its time will be much larger, causing a level of interference that often cannot be tolerated.

It is on this fertile ground that sophisticated direction-finding equipment has begun to get a foothold in the amateur market. At some point, the operators of a repeater grow tired of the activities of the wild-turkey contingent, and they



The Doppler Systems DDF-3003 radio direction-finder.

begin to cast about for methods of silencing the cretins. The FCC does what it can, but a problem has to get awfully serious before the Commission can get its ponderous machine into motion. Enter the direction-finding committee.

For the DF committee to do its job, it needs good direction-finding equipment, and really good DFing equipment has been neither plentiful nor cheap. Some of the best DFing units are those that operate on the Doppler principle, but the complexity and expense of these devices has kept them out of the reach of most repeater groups.

Doppler Systems of Phoenix, Arizona, is trying to change this situation. The Doppler Systems DDF-3003 is a radio direction-finder that works on the Doppler principle using a relatively compact antenna array. It is designed to work with almost any VHF FM receiver and is suitable for either mobile of fixed operation. Doppler Systems has been kind enough to present complete engineering data and construction information for their direction-finder in another article in this issue. That article gives you enough information to build a DFer on your own, or Doppler Systems will sell you a complete unit, in kit form or assembled. This review will not repeat the material presented in the article, but instead will attempt to give you an idea of what the completed unit is capable of and how well it works.

Description

Doppler Systems offers their DFing unit in three different configurations. The DDF-3001 is the basic unit and reads out the bearing of a transmitter with an array of sixteen LEDs spaced 22½ degrees apart. Model DDF-3002 adds a digital display that gives a numeric readout with one degree resolution. The DDF-3003 includes all the features of the other two models and adds a serial AFSK interface which can be used for remote readout, telemetry, tape recording, etc. As this is written, the price of the 3001 is $235 in kit form, $335 assembled. The 3002 is $295 kit, $470 assembled, and the 3003 is $325 kit, $470 assembled. For the truly cautious ham who doesn't rush into anything, the assembly and operation manual is available for $12.50.

For this review I obtained a DDF-3003 and an antenna built to the specifications detailed in the manual. The antenna can either be mast-mounted or mounted atop a car—I opted for the mobile installation. New Hampshire's mountains are beautiful for everything but direction-finding. Reflections being so plentiful and unpredictable, I thought I would have better luck with mobile DFing than with operation from a fixed location.

The Manual

The DDF-3003 I tested was supplied assembled, so I really can't comment on the assembly instructions other than to say that they appear to be well thought out and complete. The theory of operation, installation, and troubleshooting sections are some of the best I've seen anywhere, but the operation and use section isn't too hot—in fact, it is almost nonexistent! According to the manufacturer, the DDF-3003 has seen a lot of action in competitive transmitter hunts. It would be nice if the experience gained in this activity could be passed along to the customer. I'd like to see Doppler Systems add a section on how to interpret readings or at least suggest another publication that offers general information on DFing.

Installation and Use

Installation was fairly simple, involving audio and antenna connections to a VHF receiver and a source of 12 V dc. Four RG-174 cables from the antenna atop the car also plug into the back of the DDF-3003. Audio and power connect through an Amphenol "D" connector; antennas use phone jacks and plugs.

Once everything is installed and connected, the real fun begins. You flatlanders have it easy! The object of the game is to aim the front of the DFer-equipped car directly at a transmitter and have the DFer read 0 degrees at the same time. A multi-turn pot inside the case gives a 90-degree range of adjustment. If proper calibration is out of this range of adjustment, you simply plug the antennas into the DFer in a different order. Calibration isn't complicated, but it can be annoying. It took me several hours to get the thing aligned correctly, because of reflections from surrounding mountains. I would zero the display, move the car backwards or forwards a few feet, and the display would go totally berserk. This unit can teach you some good lessons about multipath!

I finally found a location that was relatively free of reflections, and thereafter things went smoothly. After careful calibration, I drove the car in a circle and the display tracked perfectly, always showing the location of the transmitter in relation to the nose of my car. Things were looking up! I took a nice long drive around the transmitter and was soon reassured that the DFer was indeed calibrated correctly. Over the next few days I spent a lot of time taking bearings on several different transmitters, and it was quite an education. The DDF-3003 is at best only a smart machine, and it will occasionally display the bearing of a reflection of a signal rather than the signal itself. However, once you get to know the little beast, it will rarely fool you. I found that when it was tracking reflections, the display would "box the compass," with the LEDs flicking around erratically. When it was on to the real thing, it would lock onto a single heading, occasionally flicking back and forth between two 22½-degree increments. Only when I attempted to track a very distant transmitter while I was deep in a valley did I get incorrect readings that appeared to be correct.

Conclusions

The DDF-3003 will tell you where a transmitter is, but you sometimes have to use a little common sense when interpreting readings. I didn't have another type of unit to compare it with, but it didn't seem to have any serious shortcomings. The accuracy was such that a single unit installed in a vehicle could be used to track down a reasonably long-winded wild turkey. More units, handled properly, will pinpoint the gobbler far more quickly. A repeater group could install a set of DDF-3003s to monitor their repeater's coverage area and use the serial AFSK outputs to feed the information into a microcomputer. Such a network could accurately locate a wild turkey in a very short period of time. What you do with him after you find him is another story, but this DFer will find him for you!

DF Breakthrough!

—the "turkey" tracker we've all been waiting for

A U.S. Patent is pending on the direction-finding system described in this article. For further information, contact the author.

Radio direction-finding (RDF) systems tend to fall into two general categories depending on whether or not they use the Doppler shift principle. Most non-Doppler RDFs employ directional antennas which produce peaks or nulls in the received signal amplitude as they are rotated. Doppler-type systems, on the other hand, detect the phase modulation imparted to the received signal by translational motion of the receiving antenna. As a consequence of the "capture effect" of the FM receiver which detects the phase modulation, Doppler-type systems generally are less sensitive to site errors than amplitude measurement systems. The first known RDF based on detecting the Doppler shift was patented by H.T. Budenbom and used a motor driven antenna. Doppler RDFs today do not mechanically rotate an antenna, but instead rely on sequential switching between a series of antennas placed in a circular array to approximate the continuously rotating single element.

In 1969, W7KWB and I built one of the earliest adaptations of this system for amateur use. That system employed 16 switched antennas housed in a 4-foot-diameter wooden "hat box" and was used successfully in local transmitter hunts during 1970-1972. The antenna itself was heavy (115 pounds) and the system required an external oscilloscope for display. DTL logic was used. Other systems were subsequently built in the Phoenix area which operated on essentially the same basis but incorporated improved mechanical construction and utilized the more sophisticated TTL and CMOS integrated circuits then becoming available.

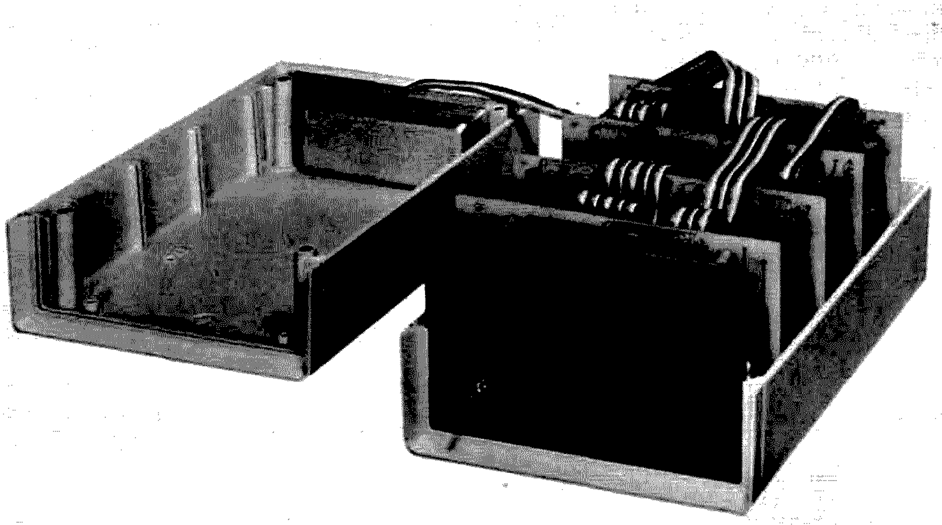

Photo A. Fully expanded version of the electronics available in kit form from Doppler Systems.

A serious drawback to these systems was the drastic loss in sensitivity which occurred during operation. A second problem which was equally vexing was the appearance of mysterious false bearing vectors apparently due to off-channel frequencies being shifted onto the received frequency by something in the commutation (electrical rotation) process. Both of the above problems would disappear whenever the antenna commutation was halted, i.e., on-channel stations would immediately regain their signal strength into the receiver and off-channel carriers would disappear.

Several techniques were tried unsuccessfully to eliminate these problems. Theorizing that the switching transients related to turning on and off the various antennas were causing receiver desensitization and, in addition, were modulating off-channel signals into the receiver passband, several methods were investigated to smooth out the switching transients. These included:

(1) overlapping the antenna selection so that at least

one antenna was always connected to the receiver;

(2) rounding the antenna switching waveforms and using PIN diodes to create a more gradual on/off transition; and

(3) generating a complex analog control waveform matched to the gain characteristics of the PIN diodes to further reduce switching transients.

None of these solutions produced especially noteworthy results. In addition, it was felt that an antenna array of the size being used was impractical, especially for mobile use. Reducing the number of elements would help this problem, but with discrete commutation, the linearity of the system deteriorates as the number of antennas decreases.

Photo B. Antenna mounted to a 1974 Blazer. The ground plane formed by the radials is particularly useful with non-metallic roofs.

The solution which ultimately was discovered uses only four antennas which are located in a square pattern, the sides of which are typically 1/4 wavelength long. The received signal induced into all four antennas is continuously mixed in a precision summing circuit in such a manner that the resultant rf voltage produced is very nearly identical to that which would be induced in a single antenna rotating at a uniform rate around the circle which inscribes the square formed by the four actual antennas. Tests have demonstrated that this system does not possess the loss of gain or off-channel susceptibility problems of previous designs. Antenna size for VHF applications is very compact. Electronic processing is relatively involved, but considering the performance which is obtained, it is justified for serious direction-finding applications. The system to be described works with any FM receiver to detect the Doppler-induced phase modulation and does not require any modification of the receiver. It is relatively broadband and has been tested over the frequency range of 135 to 165 MHz.

Depending on the application, three different outputs are available. For mobile application, a circular array of 16 light-emitting diodes (LEDs) provides an immediate analog bearing relative to the vehicle's direction. For more demanding mobile or fixed station applications, a 3-digit panel display provides the bearing directly in degrees. Finally, a serial interface is available in a format suitable for remote-display (utilizing the same or similar electronics for readout), recording the bearing data on an ordinary audio tape recorder, or connection to a microprocessor. The linking of several remotely-located direction finders into a common microprocessor for automatic station triangulation and logging should be straightforward.

A simplified functional block diagram of the complete system is shown in Fig. 1. The rf summer combines the output of the four antennas in a manner which phase-modulates the rf signal to the receiver. As explained on the next section, the phase modulation contains the bearing information. A conventional FM receiver provides the audio input to the Doppler signal processor via connection to the external speaker output. Synchronous filtering removes the normal voice content leaving a sine wave having the same frequency as was used to modulate the antenna signals and a phase angle equal to the bearing angle. This sine wave acts as a trigger to latch the outputs of counters for display of the bearing in either a circular LED array and/or a 3-digit decimal display. An optional serial interface transmits the bearing data displayed by the unit or receives external bearing data as input for the display.

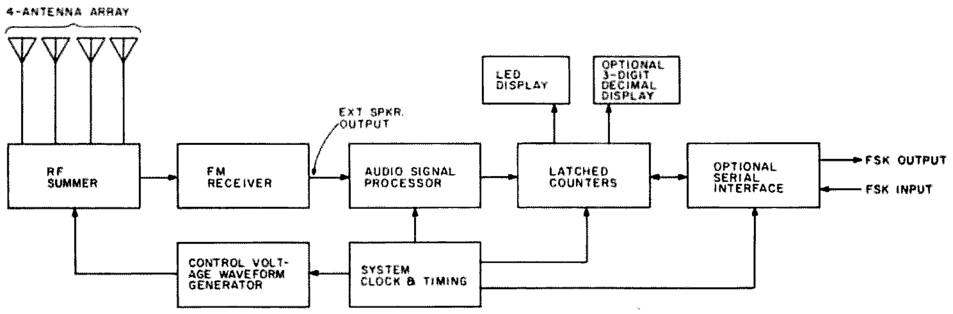

Fig. 1. Block diagram of the complete direction-finding system.

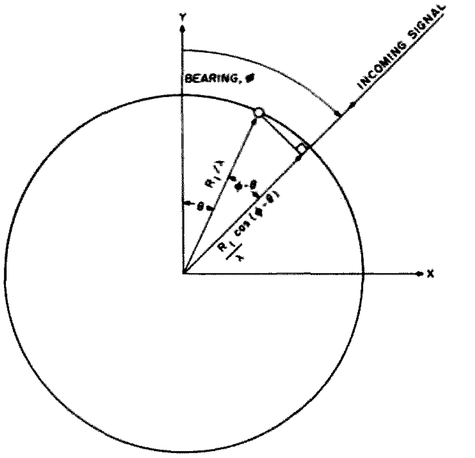

Fig. 2. Geometry used to derive the signal received by a rotating antenna.

Theory

Fig. 2 illustrates a simple antenna located at distance R_1/λ and angle θ from the reference position. Assume the incoming signal is located far (relative to the wavelength, λ) from the receiving antenna at the bearing ϕ shown. Then the voltage induced in the antenna can be written as shown in Equation (1), where A is the received amplitude in volts, ω_c is the carrier frequency in radians per second, t is the time in seconds and is selected to start with a zero crossing of E_R at the origin, and ψ is the phase shift in radians due to the antenna being closer to or further from the transmitter. If the antenna is closer to the source, ψ would be positive, indicating a phase lead, etc. For the geometry shown, see Equation (2).

Now suppose the receiving antenna is permitted to rotate with velocity ω_d in a circular path of radius R_1/λ. Then $\theta = \omega_d t$ and the phase of the received signal is as shown in Equation (3).

Equation (3) indicates that the rotating antenna has caused the incoming carrier to become phase (and frequency) modulated. The modulation frequency is the same as the rotation frequency, ω_d, so the frequency deviation which is equal to the rate of change of the phase is as shown in Equation (4) or Equation (5).

A standard FM receiver with de-emphasis will produce an audio output equal to the phase which is modulating the received signal (assuming the deviation is small compared to the discriminator full-scale range). See Equation (6).

Thus the receiver's audio output is a sinusoid having a frequency equal to the antenna commutation frequency, ω_d, and a phase angle equal to the bearing angle, ϕ. The commutation frequency should be selected to be at the low end of the receiver's audio passband to facilitate filtering out the normal voice modulation of the received signal.

Another way of looking at the problem is to consider the situation when the rotating antenna is at the angle where it is directly approaching the incoming signal. The maximum relative velocity causes an apparent increase in the carrier frequency at this point. Similarly, when the antenna has moved 180 degrees to the point where it is traveling away from the transmitter, the relative velocity is a minimum and the carrier frequency appears to be lower. This is the familiar Doppler shift phenomenon, but here the rotation of the antenna produces a periodic up/down shift, the phase of which is set by the bearing angle between receiver and transmitter.

Fig. 3(a) shows Equation (3) plotted against time for an assumed bearing angle of 45 degrees. Instead of physically rotating a single antenna, present-day Doppler systems discretely switch between adjacent antennas located in a circular array. To indicate graphically what sort of waveforms are generated by discretely commutated antenna arrays, the theoretical audio output for a system of 16 and 8 antennas is plotted in Figs. 3(b) and 3(c), respectively. The antenna, of course, receives many different signals in addition to the channel of interest. The phase modulation of all of these signals by a complex waveform such as shown in Fig. 3(b) or 3(c) may generate a variety of frequency components within the receiver passband. It is believed that these spurious frequencies are responsible for the false bearing problems noted earlier.

The technique for electronically producing the phase modulation of Fig. 3(a) with four antennas will now be described. Consider the system of antennas A, B, C, and D shown in Fig. 4 and assume for the moment

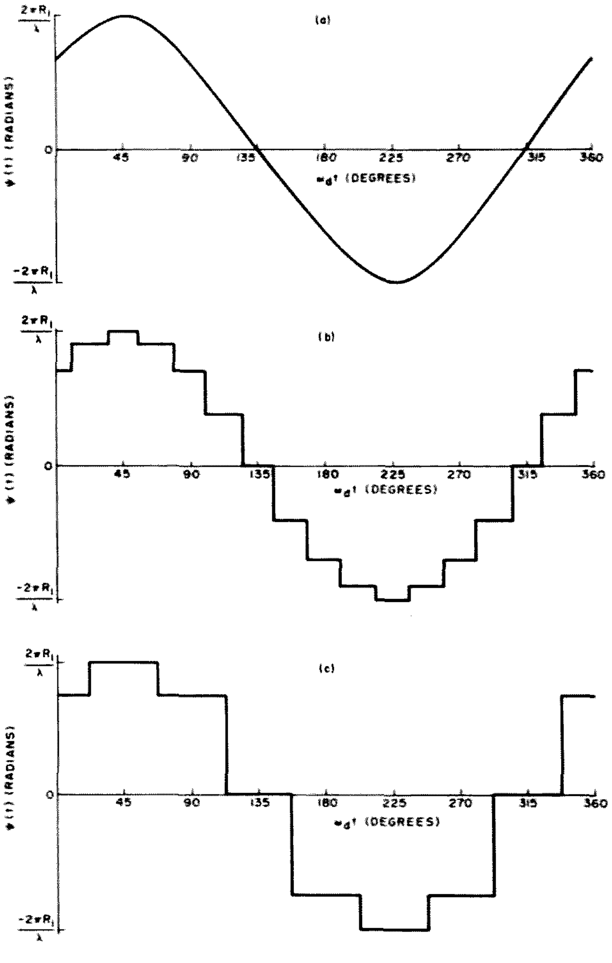

Fig. 3. Waveforms illustrating the phase modulation imparted to the received signal when the bearing angle is 45 degrees.

that the antennas are not coupled, i.e., there is no mutual impedance between them. The signals received by the four antennas can be summed electronically as shown in Equation (7), where K_A, K_B, K_C, K_D are gains and E_A, E_B, E_C, E_D are the rf voltages induced in the four antennas. We wish to find the value of the four gains which will create a voltage E_S equal to that induced in an antenna S located on the inscribed circle of radius R_1/λ at the angle θ shown in Fig. 4.

If an incoming signal were arriving from the left or right in Fig. 4, the phase at A and B would be equal, and the phase at C and D would also be equal. As long as the array is less than 1/2 wavelength on a side, the phase at point S may be computed by interpolating linearly between the phases to the left and right as indicated in the plot directly below the sketch of the antenna array in Fig. 4. See Equation (8).

For example, if S is midway between A and D, $\theta = 0°$, $K_X = 1/2$, $(1-K_X) = 1/2$, and the phase is the simple average of the phases measured at A and D. If we now consider a signal originating from the top in Fig. 4, the phase at S can be computed from that at A or D and that at B or C by interpolating along the Y direction. Referring to the graph to the left of the antenna in Fig. 4 see Equation (9).

Equations (8) and (9) may be combined to give a two dimensional interpolation of phase. From similarity, Equation (7) can then be written as in Equation (10).

The mixing is not perfect since rf voltages rather than phase angles are being mixed; the errors, however, are small, as discussed below. The gain for antenna A is given in Equation (11), which is shown plotted in Fig. 5 over one cycle of rotation in θ. Note that the gain peaks, as would be expected, at 45 degrees where the imaginary antenna is closest to antenna A. A second small gain increase also occurs 180 degrees from this location. The other antenna gains, K_B, K_C, and K_D, have identical shapes to K_A, but are displaced 90 degrees in phase (K_B lags K_A by 90°, etc.).

To evaluate the accuracy of the mixing given by (10), the instantaneous amplitude and phase of E_S was computed for antennas of different size with various bearing angles, ϕ. A typical result is shown in Fig. 6 for an antenna of dimension $2R_1/\lambda = 1/4$ on each side. In

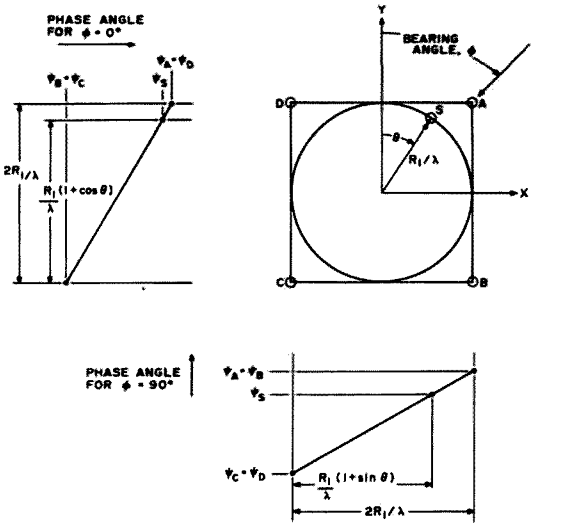

Fig. 4. Top view of a four-antenna array showing the interpolation of phase angle between opposite sides of the array.

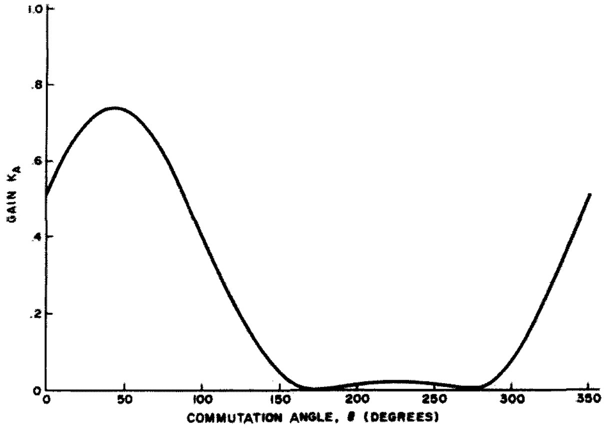

Fig. 5. Theoretical gain variation for antenna "A" required to produce an equivalent continuously rotating antenna signal.

EQUATIONS

Equation (1): $E_R = A \sin(\omega_c t + \Psi)$

Equation (2): $\Psi = \frac{2\pi R_1}{\lambda} \cos(\phi - \theta)$

Equation (3): $\Psi(t) = \frac{2\pi R_1}{\lambda} \cos(\phi - \omega_d t)$

Equation (4): $\omega_{deviation} = \frac{2\pi R_1 \omega_d}{\lambda}$ radians/second

Equation (5): $f_{deviation} = \frac{R_1 \omega_d}{\lambda}$ Hz

Equation (6): $E_{audio} = K_A \frac{2\pi R_1}{\lambda} \cos(\phi - \omega_d t)$

Equation (7): $E_S = K_A E_A + K_B E_B + K_C E_C + K_D E_D$

Equation (8): Phase at S $= \Psi_S = \Psi_{C \text{ or } D} + \left[\frac{(1 + \sin\theta) R_1/\lambda}{2 R_1/\lambda}\right] (\Psi_{A \text{ or } B} - \Psi_{C \text{ or } D})$

$= K_X \Psi_{A \text{ or } B} + (1 - K_X)\Psi_{C \text{ or } D}$

where $K_X = (1 + \sin\theta)/2$

Equation (9): $\Psi_S = \Psi_{B \text{ or } C} + \left[\frac{(1 + \cos\theta) R_1/\lambda}{2R_1/\lambda}\right] (\Psi_{A \text{ or } D} - \Psi_{B \text{ or } C})$

$= K_Y \Psi_{A \text{ or } D} + (1 - K_Y)\Psi_{B \text{ or } C}$

where $K_Y = (1 + \cos\theta)/2$

Equation (10): $E_S = K_X K_Y E_A + K_X(1 - K_Y) E_B + (1 - K_X)(1 - K_Y) E_C + (1 - K_X) K_Y E_D$

Equation (11): $K_A = K_X K_Y = 1/4 (1 + \sin\theta)(1 + \cos\theta)$

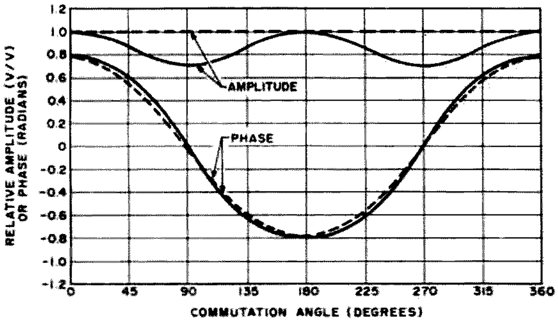

Fig. 6. Amplitude and phase modulation for an uncoupled antenna array of size 1/4 wavelength and a bearing angle of 0 degrees. The dashed lines represent the ideal (continuously rotating antenna) case.

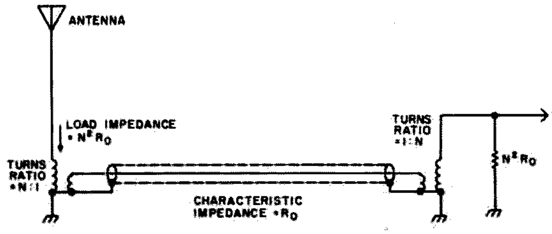

Fig. 7. Use of impedance transformers to minimize the effect of mutual impedance coupling between array antennas.

Fig. 6, the bearing angle ϕ is 0 (signal coming from top in Fig. 4). The composite rf signal contains some amplitude modulation (about 18% at twice the commutation frequency) in addition to the desired phase modulation. Note that the phase modulation error relative to an ideal (physically rotating) antenna is very small (less than 8%).

At bearing angles of 22.5 and 45.0 degrees, the amplitude modulation is lower and the phase modulation error is about the same—better than 8%. Antenna symmetry causes the amplitude and phase error characteristic to repeat every 45 degrees of bearing. Decreasing the antenna size improves the error characteristic over that shown in Fig. 6, but antenna tolerances become more critical and the magnitude of the phase modulation (deviation) which must be detected decreases as given by Equation (5).

The above results were based on an antenna array in which the elements do not interact with each other—that is, a current flowing in one antenna element does not induce a voltage in one of the other elements. This is generally not the case for antennas spaced at these distances.

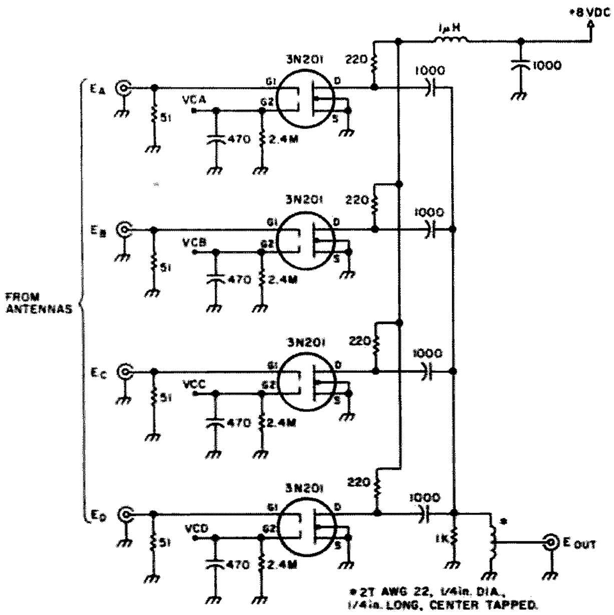

Fig. 8. Rf summer circuit schematic.

A detailed analysis has been made which takes into account the actual coupling between elements (mutual impedance). If each antenna element is terminated into a 50-Ohm load, the antenna currents and hence the coupling between elements are significant and the rf output voltage to the receiver is affected. For the 1/4-wavelength array, amplitude modulation increases to about 65% and the phase modulation waveform becomes noticeably distorted. The situation is considerably better with smaller antennas. For example, if the array size is 1/8 wavelength on a side, the amplitude modulation is only 19% and the phase modulation is very nearly sinusoidal.

An alternate to reducing the array size is to increase the effective load impedance across each antenna element. This may be accomplished using an impedance step-down transformer at the antenna and an impedance step-up transformer at the receiving end of the transmission line. See Fig. 7. It should be kept in mind that in a receiving application, the antenna is acting as the source and the receiver (or rf summer here) is the load. We wish to minimize standing waves on the transmission line to prevent rf pickup other than from the antenna. Therefore, the line must be matched to the rf summer. At the antenna, we are interested in having the maximum voltage developed across the antenna terminals. This is obviously obtained by presenting a high impedance load to the antenna. An impedance match between line and antenna is generally regarded as essential to proper system operation, but that is the case only for transmitting where the antenna acting as the load determines the line swr and maximum power transfer occurs when line and load are matched.

At this point, it might be asked just how significant amplitude modulation and phase modulation distortion are in this system. The receiver provides limiting which will remove most of the AM, and the phase detector provides synchronous filtering which will remove most of the harmonic distortion in the phase modulation. Initially, it was feared that any amplitude modulation would cause modulation products from adjacent channel signals to be formed which might appear on the selected channel and cause interference. Also, distortion of the phase modulation could lead to bearing errors at specific bearing angles. Neither of these problems has been observed in either the testing or the field use of this system. Therefore, while a solution is at hand, the need to employ it has not been evidenced and the design to be discussed in the remainder of this article does not include impedance transformers. The subject

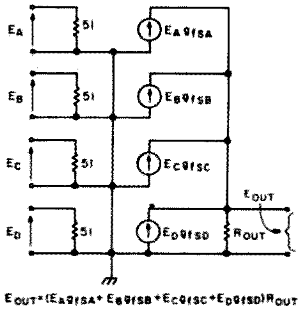

Fig. 9. Equivalent circuit of the rf summer.

of antenna array optimization and coupling for this system is an area for much additional experimentation and development.

Rf Summer

The circuit to be used for antenna summing should provide a low insertion loss, provide a stable and electronically-controlled gain characteristic, have negligible phase-shift variation with the control voltage, be compatible with a 50-Ohm unbalanced input, and lend itself to operating into a 50-Ohm unbalanced output.

PIN diodes and voltage-controlled FET resistor devices were tried and eventually rejected for one or more incompatibilities with the above requirements. The dual-gate MOSFET operating in a common-source configuration was found to provide an excellent choice. Fig. 8 shows the circuit configuration.

The rf equivalent circuit is given in Fig. 9. Each MOSFET acts as a current source into a common output impedance. The single, tapped inductor is used to cancel the combined output susceptance of the four MOSFETs. Device input impedance is extremely high, and the circuit is broadbanded by the use of relatively low value resistors for line impedance termination at all inputs and the output. Some gain is lost, but it is quite acceptable (less than 6 dB) and could easily be made up with a preamplifier stage at the output if desired. The output voltage is the weighted sum of the four antenna voltages with the weighting determined by the transconductance of the FETs. Since the transconductance can be varied by the second gate control voltage, this provides the means for electronically combining the rf voltages.

Fig. 10 plots the measured circuit gain (E_{out}/E_{in}) of four randomly selected devices together with a 7th order polynomial fit to the data. By combining the MOSFET rf gain characteristic of Fig. 10 with the desired antenna gain variation given in Fig. 5, the control voltage waveform for antenna A can be found. This is plotted in Fig. 11. The control waveforms for channels B, C, and D are identical in shape, but delayed by 90, 180, and 270 degrees respectively.

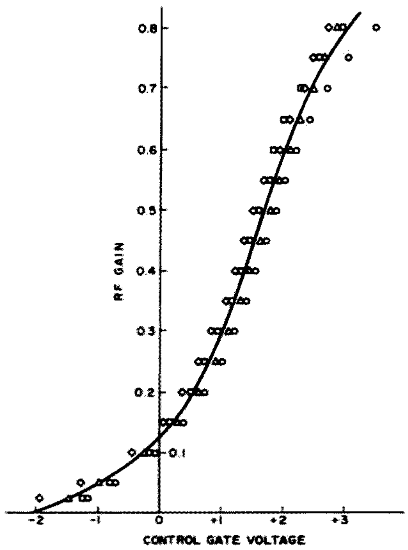

Fig. 10. Rf gain variation with control gate voltage for four typical field-effect transistors. The curve is a seventh-order polynomial fit to the measured data.

Control Voltage Waveform Generator

Two inexpensive PROMs are used to store the waveform plotted in Fig. 11. The PROM address is multiplexed in multiples of 90 degrees commutation angle, and the PROM output, after conversion to an analog voltage, is demultiplexed at the same time so that the entire PROM memory is utilized to generate each of the four control voltages. Fig. 12 shows the schematic of the control voltage waveform generator.

The CD4040 is a 12-stage ripple-carry binary counter that produces an 8-bit incrementing address to the PROMs. When driven at a frequency of 1,228,800 Hz, the PROM address will cycle at a rate of 300 Hz, which is the commutation frequency of the system. To multiplex the PROM, the two most significant bits are modified by adding a 0, 1, 2, and 3 sequentially to each of the PROM addresses using a CD4008 full adder. The resulting address is held temporarily in the 8-bit 74LS273 latch which synchronizes the otherwise skewed output of the ripple counter.

Together, the two 74S287 PROMs provide an 8-bit address by 8-bit output memory for the control waveform. Each address corresponds to 360/256 or 1.40625 degress of commutation, while the output is scaled to cover the range −2.5 to +3.5 volts dc which provides a resolution of 6.0/256 = 0.0234 volts/step. The MC1408 digital-to-analog converter is used with a CA3240 BIMOS operational amplifier to minimize offset and noise. The CD4051 is an 8-channel analog demultiplexer which directs the converter output into one of the four dual-gate MOSFETs. A small RC filter formed by the 10-kilohm resistors and 470-pF capacitors in the rf summer is sufficient to hold the demultiplexed control voltage between updates. NAND gates A and B are used to inhibit the demultiplexer except during that portion of the cycle when the D/A output is stable. They also provide the synchronizing pulse to the 74LS273 octal latch.

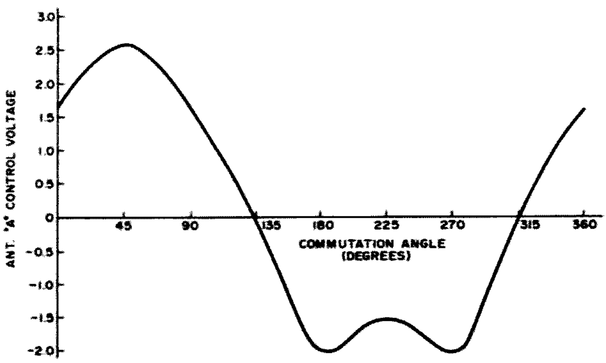

Fig. 11. FET control voltage required to produce the amplitude variation shown in Fig. 5.

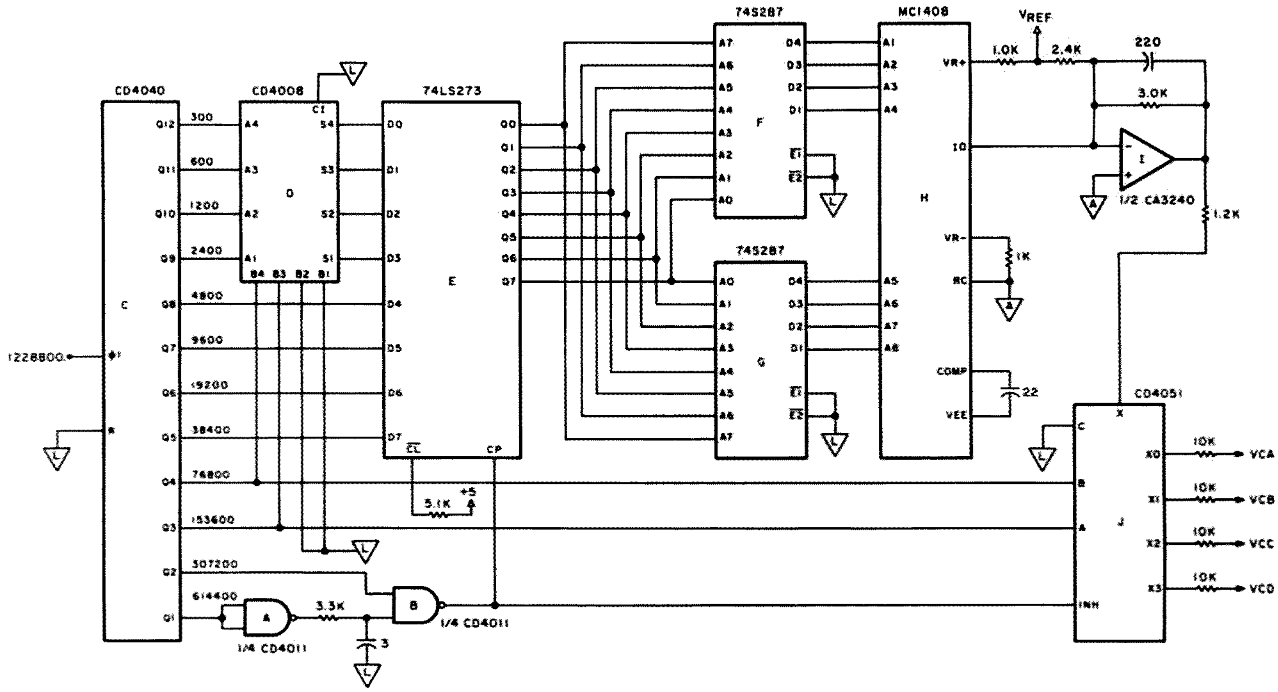

Fig. 12. Circuit schematic of the control voltage waveform generator. Notes: Logic power is Vcc = Vdd = +5, Vee = −6, Vss = GND = [L] Op amp power is +5 and −6 V dc.

Audio Signal Processor

Fig. 13 shows the circuitry used to extract the 300-Hz Doppler modulation frequency from the receiver's audio output and generate a logic signal synchronized to the phase of this signal for the display generator. Threshold detectors are also provided to give an overload indication to assist in setting up the audio gain of the circuit and to blank the display when no signal is present.

Preamplifier A is ac coupled to the receiver and contains a gain adjustment variable over the range 0.2 to 10. Frequencies below 142 Hz are attenuated by the input filter and frequencies above 664 Hz are reduced by the feedback compensation. Amplifier B provides an additional gain

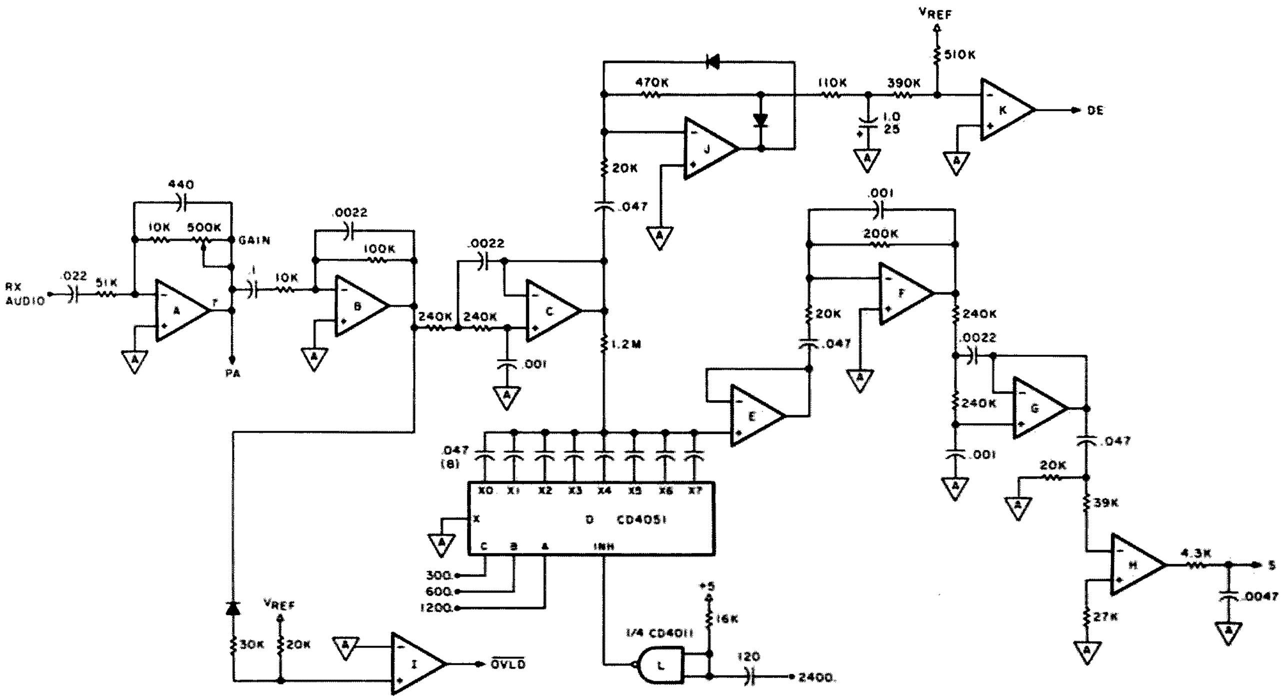

Fig. 13. Audio signal processor circuit schematic. Notes: All op amps are 1/2 LM1458 except H, which is 1/2 CA3240. All diodes are 1N4148. Logic power is Vdd = +5, Vee = −6, Vss = [A] Op amp power is +5 and −6 V dc.

of 10 and further filtering above 724 Hz.

Amplifiers C and G are identical second-order low-pass filters tuned to a frequency of 469 Hz with critical damping. These filters and the commutative filter described below were designed using the methods given in "Get Notch Qs in the Hundreds," by Mike Kaufman, *Electronic Design* 16, August 2, 1974, pp. 96-101.

The 8-section commutative filter, composed of multiplexer D and follower amplifier E, provides a 300-Hz bandpass synchronized to the antenna waveform frequency with a Q of 7540 RC where R is the series input resistor and C is the value of each of the switched capacitors. In Fig. 13, R = 1.2 megohms and C = .047 uF, providing a Q of 425. Since the Q of this circuit determines the speed of response of the system as well as the selectivity, a trade-off can be made in the selection of resistor R. The value shown provides a good compromise, but individual users may prefer a somewhat faster or slower responding display. The one-shot formed with NAND gate L is used to inhibit switching of the multiplexer during transition of its logic-select inputs.

Amplifier F provides an additional gain of 10 and helps to attenuate harmonics produced in the commutative filter above 796 Hz. Ac coupling is used to attenuate frequencies below 169 Hz because the commutative filter does pass dc. Amplifier H is used as a comparator to produce a square wave sync signal for the display generator. A CA3240 operational amplifier is used here instead of the LM1458s used elsewhere for its very high slew rate. Ac coupling is employed to remove any dc offsets from the previous two stages, and a small RC filter at the output prevents extremely short sync pulses from being generated with zero input.

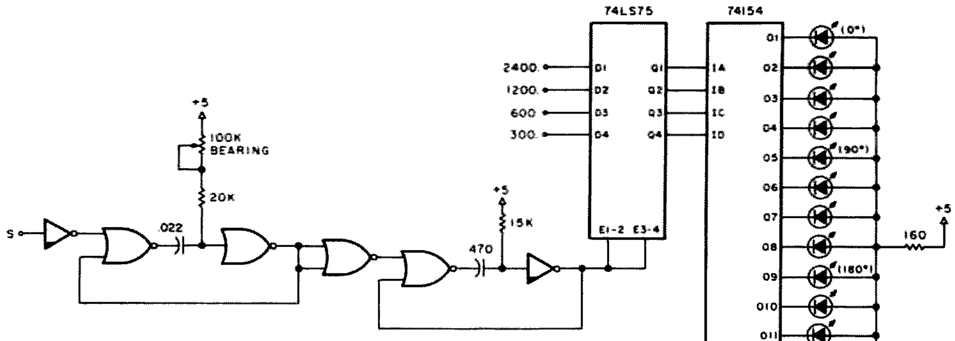
Amplifier I generates an overload signal which is helpful in setting the audio gain of the system. Blanking of the display in the absence of audio input (when the receiver is squelched) is accomplished by the half-wave rectification of amplifier J and the comparator operation of amplifier K. A blanking delay of approximately 100 milliseconds is provided by the electrolytic capacitor.

Display

The circuitry required for a simple LED display is shown in Fig. 14. Two one-shot circuits are used to convert square wave sync signal S to a short positive clock pulse which is used to latch the binary clock count into the 74LS75 quad latch. The first one-shot has an adjustable delay time to permit calibration of the display over a 90-degree bearing angle. (Rotation of the four antenna inputs is used for greater correction.) The second one-shot generates the 10-microsecond latching pulse.

A 74154 decoder drives the 16-LED circular display directly. Two additional LEDs are used to indicate audio overload in the signal processing circuit and the power-on status.

When both LED and three-digit decimal bearing readouts are required, the circuit of Fig. 15 is used in place of Fig. 14. This circuit is designed for compatibility with the optional serial interface to be described below and uses a 4-bit data bus to transfer data between temporary holding registers and the display latches. If the serial interface is omitted, the two signals $\overline{\text{SEND}}$ and MS must be tied to logic ground.



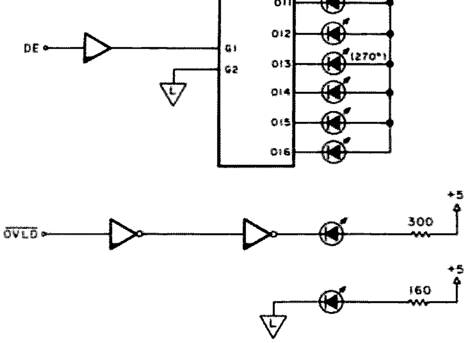


Fig. 14. Simple LED display circuit schematic. Notes: All LEDs are MIL32 R. Logic power is Vcc = Vdd = +5, Vss = GND = ⏚ NOR gates are 1/4 CD4001. Inverters are 1/6 74C903.

BCD counter latches H, I, and J are driven by a 108,026-Hz clock signal and their contents are latched into tri-state latches O, P, and Q by the delayed sync pulse. The binary clock count is simultaneously strobed into latch R by the same sync pulse. Since the maximum count is (decimal) 359, the maximum BCD count required for the hundreds digit is 3 (binary 0011). Since the two most significant bits of this digit are always zero, these bits are used to transfer the overload (MSB) and the display enable (MSB-1) information. A one-shot is used to stabilize the overload flag for sampling.

Selection of the system clock frequency and dividers was made so as to produce compatible binary and BCD counter frequencies. Over a complete commutation interval of 1/300 second, the 4-bit binary input to register R will increment through 2400/300 × 2 = 16 counts. Each of these counts then corresponds to 1/16th of a revolution on the LED circular display. Over the same time interval, the clock input to the BCD counters generates 108026.3736/300 = 360. 0879 counts, or approximately one count per degree. Although the error is very small (less than 0.1 degree), it will accumulate rapidly unless the BCD counter is periodically synchronized back to the binary counter. The circuit consisting of flip-flop A and the surrounding gates is used to reset the three BCD counters every complete cycle (as defined by the binary counter) so that the BCD and binary counts remain synchronized.

At a rate of 2.34375 times per second (each 426.66 . . . millisecond), data is transferred from tri-state registers O-R to latching registers S-V. Timing for the data transfer is obtained from the 12-bit counter, F, and the sequence is as follows for the case where a serial interface is not used. At the beginning of each transfer cycle (output of F all zeros), the input to registers O-R is disabled using the DID2 control inputs. These inputs remain disabled during the first quarter of the transfer cycle (106.66 . . . milliseconds). During this same quarter cycle, the 1-of-4 decoder, Y, places the tri-state output of registers O-R sequentially onto the bus using their DOD2 control inputs. The order of selection is Q (overload/blanking/hundreds), P (tens), O (units), and R (binary). Each register is connected to the bus for 26.66 . . . milliseconds. While a tri-state register is connected to the bus, a corresponding display register (S-V) is strobed by a short pulse generated by one-shot K-L and steered to the correct display register via a second 1-of-4 selector (Z). The data transferred to the display registers is held until the next update (426.66 . . . milliseconds later). Consequently, the display appears stable, but is still reasonably responsive to changes in the bearing data. Also, the data displayed is consistent (i.e., the binary and BCD data displayed are sampled simultaneously even though they

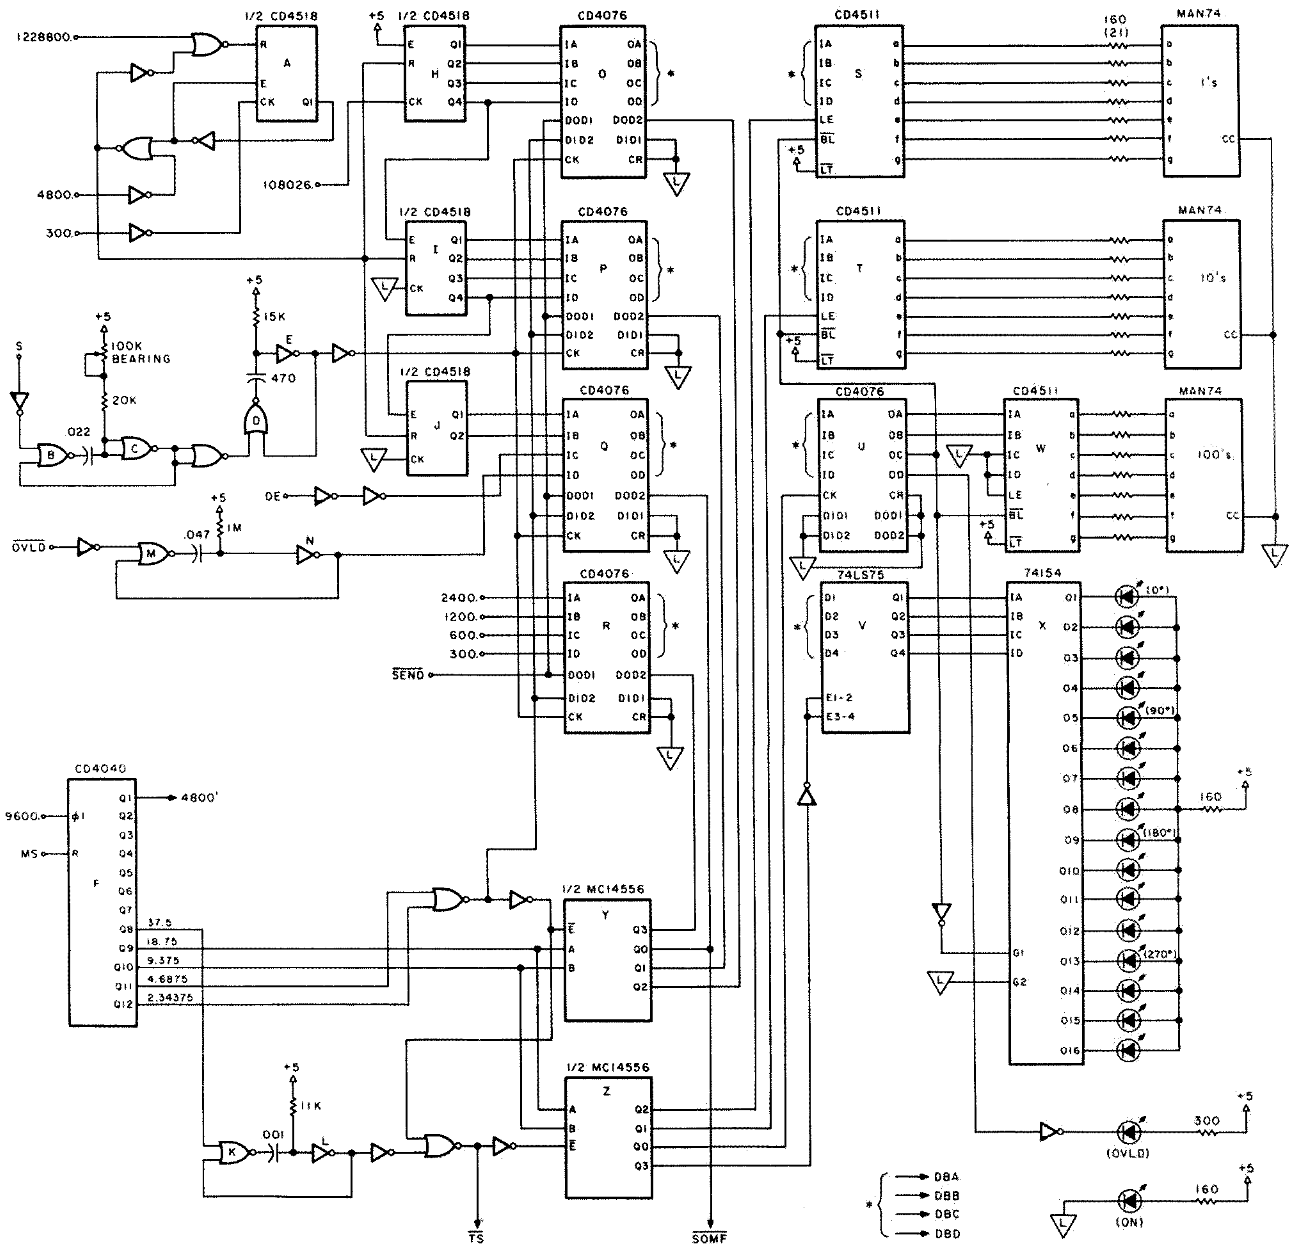

*Fig. 15. Schematic of the circuit used to provide circular LED display and a three-digit decimal display. A data bus technique is employed which is compatible with the optional serial interface. Notes: Connect 4-bit data bus *. All LEDs are MIL32 R. Digital logic power is Vdd = Vcc = +5, Vss = GND = L. All NOR gates are 1/4 CD4001. All inverters are 1/6 CD4069 except are 1/6 74C903. Schematic is drawn for operation with serial interface. For no serial interface, add jumpers $\overline{\text{SEND}}$ to L, MS to L.*

are transferred sequentially).

Registers S and T are CD4511 BCD-to-7-segment latching drivers which drive the units and tens displays directly. Latch U is a holding register which provides the 2 bits of hundreds data to the third CD4511 driver (W). The blanking information and overload data are also available from outputs C and D of latch U. Quad latch V provides the binary LED data to the 1-of-16 selector X.

Serial Interface

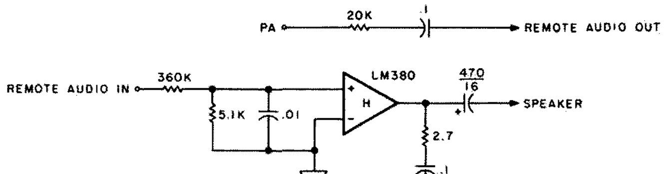
An optional serial interface is shown in Fig. 16 which permits remote transmission or reception of the displayed data using standard 300 baud audio frequency shift tones. This data rate and the FSK tones used are compatible with data recording and playback using an inexpensive tape recorder so that this interface may also be used whenever unattended operation is desired.

The universal asynchronous receiver transmitter (UART), A, is shown programmed for five data bits, no parity, and 1-1/2 stop bits per character. The first four data bits of each character are simply the four data bus bits transferred to the display registers S-V in Fig. 15. The fifth bit is used to signal the first character of the four-character message; a zero represents the first character (overload/blanking/hundreds).

When locally received data is to be displayed, the UART operates in its transmit mode. The data transfer across the data bus operates exactly as explained above, and the data bus is strobed into the UART transmit buffer whenever any of the display registers is clocked. Thus, a four-character word of data is sent every 426.66... milliseconds. At 300 baud, it requires (5 + 1-1/2)/300 seconds or 21.66... milliseconds to send each character. Since data is taken from the bus each 26.66... milliseconds, this creates a gap of 5 milliseconds between consecutive characters.

When display of remote data is selected, the timing changes somewhat. All of the tri-state registers are removed from the data bus using their DOD1 control inputs, and the UART tri-state received data output is connected to the bus ($\overline{RDE}$ = 0). When a first character has been received (bit 5 = 0 and UART data available), a pulse is generated at MS which resets 12-bit counter F in Fig. 15. Data transfer into the display registers then proceeds as usual except that the UART supplies the data. The first data character is clocked into display register U at 13.333... milliseconds following data reception. Therefore, a large skew can be tolerated between local and remote clocks without affecting system operation.

In the local data display mode, digital data at 300 baud from the UART serial output is used to select which of two clock frequencies, 9600 or 19200, is applied to the 4-bit Johnson counter, E. The counter outputs are applied through summing resistors to inverter F configured to work as an operational amplifier. The weighting of the three summing resistors is chosen such that the filtered output of F approximates a sine wave of frequency



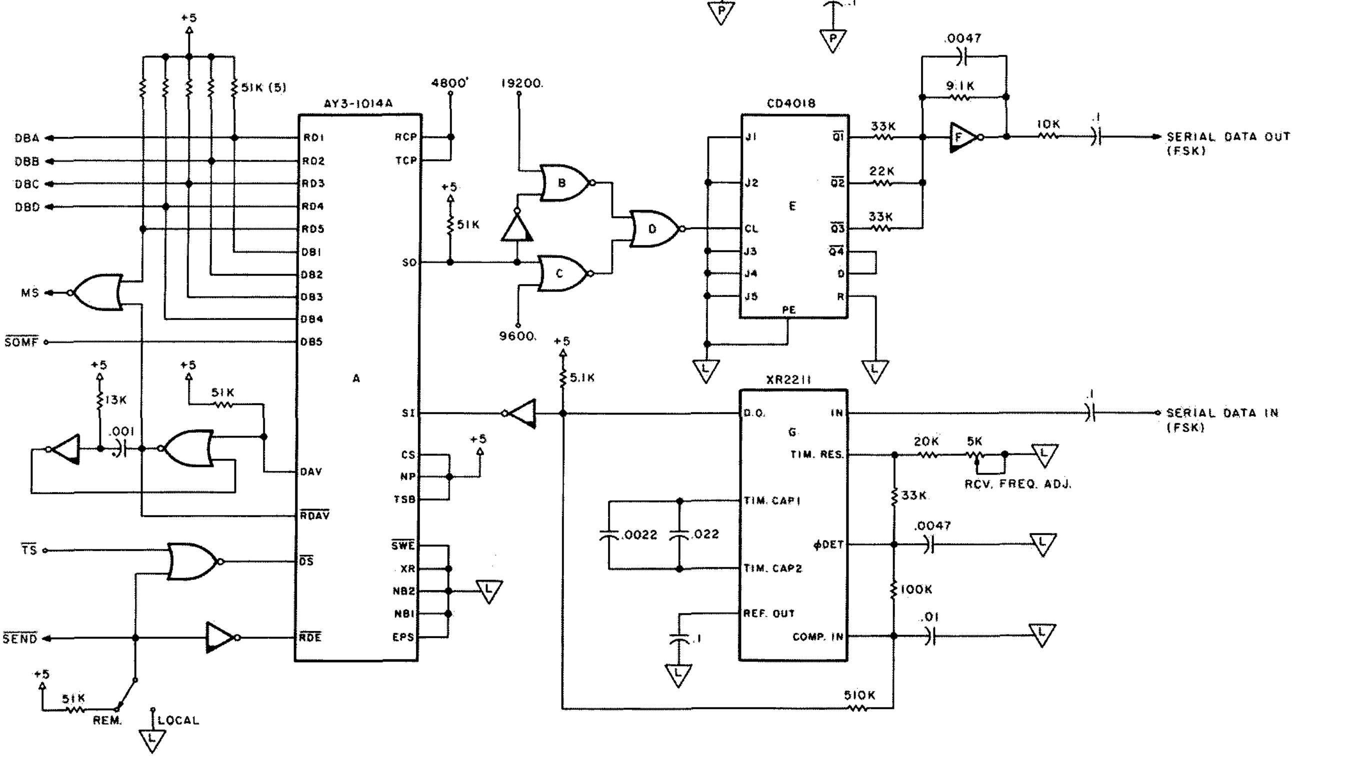


Fig. 16. Optional serial interface circuit schematic. Notes: NOR gates are 1/4 CD4001. Inverters are 1/6 74C903. Digital logic power is Vcc = Vdd = +5, Vss = GND = (L). Amplifier H power is +13 switched (sw); ground is (P).

1200 Hz when the UART output is "0" or 2400 Hz when the UART output is a "1". Sine-wave distortion is below 5% with this arrangement, and the FSK frequencies are as accurate as the system clock (which is crystal controlled).

When the system is in the remote data display mode, FSK input is demodulated in the XR2211 decoder, G. The component values shown are optimized for 300-baud, 1200/2400-Hz operation using the procedure given in EXAR's specification sheet for the XR2211.

The audio circuitry shown at the top of Fig. 16 is included as a convenience when using the system with a two-channel tape recorder. FSK data can be placed on one channel, and the received audio out of preamplifier A in Fig. 13 can be coupled through the RC circuit shown to the second channel for simultaneous recording. On playback, this audio is amplified by the LM380 (amplifier H) to drive a loudspeaker so that bearing data can be easily correlated with the received signal.

Power Supply and Clock

The entire system is designed to operate from a single unregulated supply voltage between 11.5 and 14.5 V dc negative ground for mobile operation. Total input current is approximately one Ampere with the display enabled. Fig. 17 shows the power supply and clock circuits.

Gates A and B are connected for linear operation and form a crystal-controlled oscillator. The 74LS197 is used to divide the 9.8304-MHz clock frequency by 8 to generate 1.2288 MHz for the antenna control waveform generator and binary display. Two 74LS193 counters are connected to divide the clock frequency by 91 to generate 108026 Hz for the BCD display. Gates F and G and the 74LS74 flip-flop are used to load a count of 256 − 91 = 165 into the two 4-bit counters. If the BCD display is not used, ICs D, E, and H may be omitted.

A 7805K regulator provides +5 V dc for the digital logic, operational amplifiers, and the displays. The 7808 regulator provides +8 V dc for the MOSFETs used in the rf summer.

Negative voltage is generated by a switching inverter/voltage doubler circuit that produces approximately −8 V dc at the input to a 7906 regulator. The −6 V dc is used as the negative analog supply voltage.

Operational amplifier K generates the +2.0 V dc reference used for D/A conversion and threshold comparison.

Electronics Construction

If you wish to build the electronics from scratch, your best bet is to use wire-wrap sockets for all of the DIP integrated circuits and the discrete components (resistors, diodes, and small capacitors). Individual wire-wrap pins may be used for the larger components such as the electrolytic capacitors. All circuitry except the rf summer may be constructed on open perforated board with 0.1" spacing to accept the wire-wrap sockets. Be sure to bypass the +5 V dc using .047- or .1-uF disc ceramic capacitors near each of the TTL ICs and the CD4511s. Mount the 7805K regulator on a good heat sink. Be sure to use 5% resistors and either mylar or dipped mica capacitors for all of the audio filtering and digital one-shot circuits.

The rf summer circuit must be mounted in a shielded enclosure using construction practices consistent with the frequencies involved. Phono jacks work well for the antenna and

receiver connectors. Keep all leads short and arrange the parts symmetrically.

A professionally designed unit utilizing double-sided printed wiring boards with plated-through holes and an attractive enclosure is available from Doppler Systems in either kit form or fully assembled and tested. Photo A shows the interior construction of the fully expanded version of the system (digital readout and serial interface).

Antenna Construction

The antenna array must contain four identical elements located in the corners of a square array having sides less than one-half wavelength. Analysis shows, however, that the best performance can be expected with an array size between 1/16 and 5/16 wavelength. Each element must be vertically polarized and nondirectional in the horizontal plane. Antenna impedance and matching to the transmission lines is not especially important; however, each of the four lines must be of the same electrical length. For this reason, and to prevent excessive signal loss, the antenna should not be located too far from the electronics.

Element length may be increased to provide greater capture area and may be either balanced or unbalanced using a ground plane composed of radials. Mechanical stability is important, however, especially in a mobile application.

A good basic design suitable for either fixed or mobile use is given below. Elements are approximately 1/4 wavelength long and are spaced 1/4 wavelength apart at 2 meters. Radials extend an additional 1/4 wavelength beyond the elements, giving the antenna compact and sturdy characteristics. All material should be available from local suppliers. Alternatively, specific items may be ordered from Doppler Systems.

Electrical

RG-174/U coax cable (length depends on installation)

(4)—phono plugs (shielded type)

*Required for mobile mounting.

**Required for mast mounting.

Cut two pieces 20-1/2″ long and one piece 18-5/8″ long from the aluminum angle. Save the remaining short length for use as a drill template with the teflon. Be sure to file all ends smooth after cutting.

From each of the 12-foot pieces of tubing, cut one piece 57″ long, two pieces 20-1/4″ long, and two pieces 19″ long. If you are making the antenna for mobile mounting, cut four additional pieces 11/16″ long from the remaining short length of tubing. File all ends smooth after cutting.

Mark and drill all of the holes shown in Figs. 18 through 24. Use a countersink to deburr all of the holes after drilling.

Cut the teflon into four pieces 1-1/2″ long as shown in Fig. 25. Clamp the four teflon pieces together between a piece of wood and the end of the drill guide. Drill the six 5/32″-diameter holes through all four pieces.

Prepare four lengths of coax cable by soldering No. 6 solder lugs to both the inner conductor and the shield at one end, and a phono plug at the other. Be sure that the four pieces are cut to the same length.

Assemble the two arms to the support bracket using the 8-32 hardware as shown in Fig. 26. Use a square to align the arms perpendicular to the support before tightening the screws.

At each end of the two arms, assemble a vertical element using the 6-32 hardware and teflon insulator as shown in Fig. 27. Check that the element is perpendicular to the arm and that the element mounting hardware does not touch the aluminum arm. Tighten the screws sufficiently to compress the lockwashers, but do not overtighten so as to crush the tubing or the teflon insulator. Connect the coax cable and tie it as shown as a strain relief.

Attach the short and long radials to the ends of each arm using the 6-32 hardware shown in Fig.28. If the antenna will be used on a car, also mount the suction cups and eye bolts as shown. Align the "eyes" so that they face outward from the suction cups. Photo B shows a typical installation.

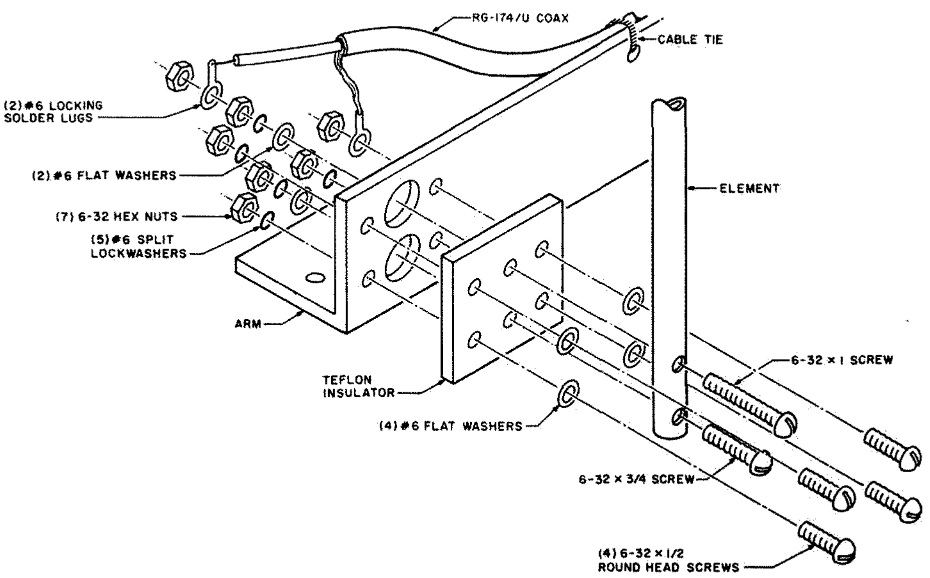

Fig. 27. Vertical element installation on the antenna side arms.

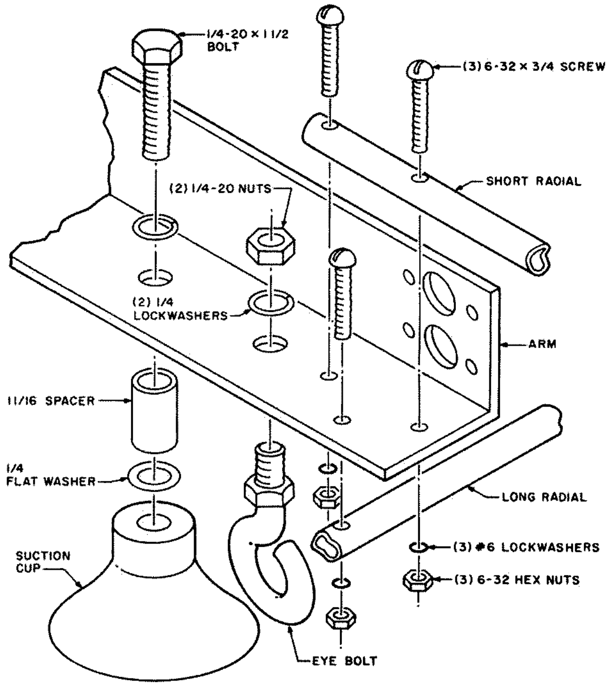

Fig. 28. Radial element assembly. The eye bolt and suction cups are required only for car mounting.

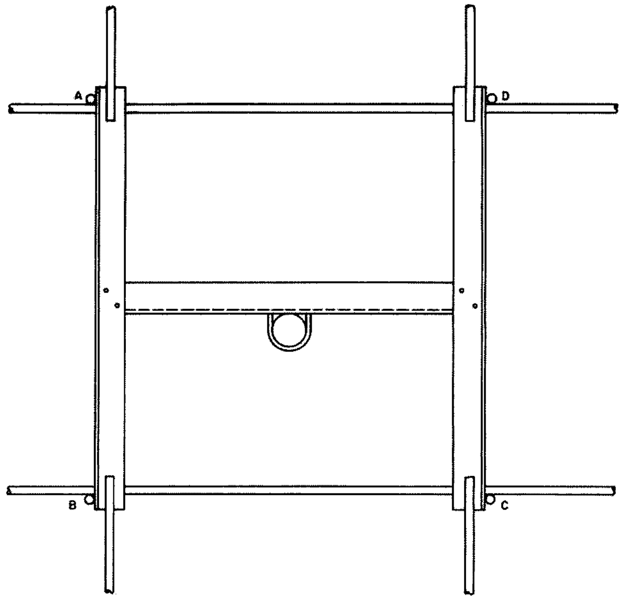

Fig. 29. Antenna top view showing marking of phono plugs required for proper calibration.

Mark the phono jack ends of the coax cable "A", "B", "C", and "D" according to Fig. 29. Mark antenna "A" also for ease in aligning the system later.

Installation and Adjustment

Primary power requirements for the electronics is 11.5 to 13.5 V dc negative ground at 1 Ampere maximum. Ordinary 12-V dc automobile battery power may be used, or, for fixed operation, an inexpensive 12.6-V dc power supply may be used, such as Radio Shack Model 22-127.

System interconnection without the serial interface is particularly simple as indicated in Fig. 30. While the external speaker connection can be used, you will probably find a more convenient connection to be the high and low ends of the receiver's volume control. This will enable the listening level of the receiver to be adjusted without affecting the audio input level to the direction finder.

The serial interface can be used in several ways as indicated in Figs. 31 and 32. Bearing data and receiver audio may be recorded simultaneously as shown in Fig. 31. Virtually any audio tape recorder is adequate for this application because of the low baud rate and wide FSK shift used for serial data transmission. A stereo system is recommended so that the normal receiver audio (voice) information may be recorded with the bearing data.

Two systems may be connected as shown in Fig. 32 for remote data display. A switch could be installed at the central site to enable a single monitor point to display the bearing data received at two or more remote sites for triangulation. The possibilities for more complex system interconnects using digital processing for automatic triangulation and logging are exciting.

Calibration adjustments are very simple and should not be required after initial setup unless the antenna orientation is changed or a different receiver is used. Allow the receiver and direction finder to warm up before making final calibration adjustments, however.

After setting the receiver's volume control, the direction-finder gain adjustment is made. Increase the gain until the overload LED flashes on voice peaks. (If this adjustment is very low, the display will remain blanked.) Setting is not critical, but the overload LED should blink with a duty cycle between about 10 and 50 percent during normal speech.

The direction-finder bearing control should then be adjusted so that the correct bearing is displayed for a known transmitted signal. Do not use a nearby handie-talkie for this calibration as local reflections are sure to result in an error. A repeater station which is within the line of sight of the antenna makes the best calibration source. Changing channels will have very little effect on system calibration, so any convenient station within the band may be used. The display should be

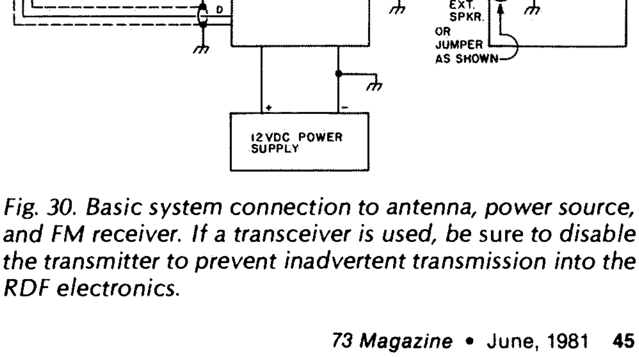

Fig. 30. Basic system connection to antenna, power source, and FM receiver. If a transceiver is used, be sure to disable the transmitter to prevent inadvertent transmission into the RDF electronics.

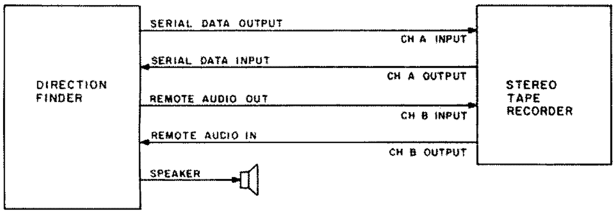

Fig. 31. Serial interface connection for tape recording and playback.

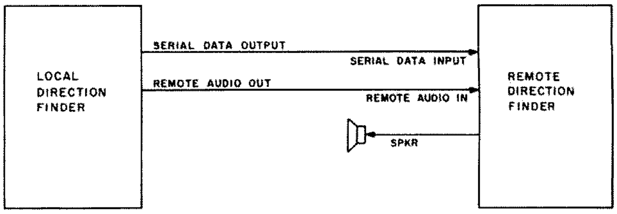

Fig. 32. Use of serial interface for remote display of bearing data.

calibrated to display bearing relative to magnetic North in a fixed station setup and should correspond to straight ahead in a mobile application. The calibration range of the bearing control is approximately 90 degrees. If the system needs further correction, either rotate the antenna physically or switch the antenna inputs to the electronics. Be sure not to reverse the order of antenna rotation, however. The acceptable combinations for inputs A, B, C, and D are: Ant. A, Ant. B, Ant. C, Ant. D; or Ant. D, Ant. A, Ant. B, Ant. C; or Ant. C, Ant. D, Ant. A, Ant. B; or Ant. B, Ant. C, Ant. D, Ant. A. See Fig. 8 for definition of antenna inputs to rf summer and Fig. 29 for the definition of antenna elements.

If the serial interface option is to be used, the receive frequency adjustment can be made by recording a few minutes of data, then playing it back in the Remote Display Mode while making this adjustment. Note the control settings where invalid data occur, then set the control midway between these settings. If valid data is received up to one of the ends of the control adjustment, use the end point as the invalid data point. The setting of this control is not very critical.

Accuracy tests have been performed using fixed-signal sources and a fixed-receiving site to eliminate changing reflection paths. The antenna was rotated on a calibrated turnstile and errors measured between the true bearing and the displayed bearing. These were generally well within 5 degrees except when the transmitted audio was unusually loud or deep-voiced. Even in those cases, better bearing data could be obtained by mentally averaging the displayed data.

Field testing has occured over the past year using the system competitively in local transmitter hunting. The success record achieved to date has been very impressive considering the high expertise in transmitter hunting which exists in the Phoenix area. ■

The History of Ham Radio
—part XV

Reprinted from QCC *News*, a publication of the Chicago Area Chapter of the QCWA.

There had been no changes in radio legislation in fourteen years, and by 1926 there were over 700 applications on file with the Department of Commerce for radio broadcast station licenses and about 16,000 licensed radio amateurs operating in the United States. Of special interest to all was the allocation of frequencies above 2000 kc decided upon by the Fourth National Radio Conference. (See Table 1.)

Broadcasters had 95 available frequencies with ten-kc separation, with six reserved exclusively for Canada.

Mounting Listener Resentment

The listening audiences generally agreed that there were too many high-powered broadcast stations operating in the lower wavebands with too little information and entertainment of high-class value. In addition, the problem of regenerative whistles from neighboring radio sets was a bugaboo. The receivers on the market in 1926 lacked good design and circuitry development, so they oscillated and produced spurious signals. By 8 pm every night, when the squealers and howlers started, the time for receiver shutoffs had arrived. Enjoyment of radio listening began to wane.

Kilocycles	Meters	Service

400,000-401,000	.7477-.7496	Amateur

Table 1. 1926 frequency allocations.

Licenses and frequency assignments for radio broadcasting, as well as all other associated regulation, still rested with the Department of Commerce, with Secretary Hoover in charge. As more conflicts arose, the Department's authority was seriously questioned. Several broadcasters, notably WJAZ in Chicago, challenged the legality of the regulations pertaining to "time on the air" assignments. They asserted that The Freedom of the Air gave everyone the right to choose. . . where and when he operated. . . that the people of the country were the ones who had The Freedom of the Air. In consequence, the division of time among

the powerful stations, known as Class B stations, was challenged and legal action resulted.

The New Radio Bills

The radio legislative situation in Congress brought about important stipulations through the enactment of two long-overdue bills. The House's White Bill, H.R. 9971, one of many previously considered by committee, was finally voted on favorably March 15, 1926, placing the control of radio in the Department of Commerce. In the Senate, the Dill Bill, S.4027 (Fig. 1), introduced April 19, 1926, provided for an independent regulatory commission. These two bills went to a joint compromise conference committee, but were not acted upon until the 70th Session. The new law emerged in final form February 23, 1927, after being signed by President Calvin Coolidge and designated *The Radio Act of 1927*.

Henceforth, available licenses were granted to license-seekers on request on the basis of priority of demand. The new Radio Act provided for dividing the United States into five radio zones to facilitate parceling out available radio channels as applications for licenses and renewals were received. It was implied that the Secretary of Commerce should make an equitable distribution of frequencies and power among the zones and issue licenses accordingly. Also provided for in the Act was the appointment of a five-member commission, one member for each zone, to constitute an advisory body to aid the Secretary in the designation of channels, etc. President Coolidge made the committee appointments on March 1, 1927.

With radio and other associated regulations still in the hands of the Department of Commerce, Senator Dill had the following remarks to contribute:

The question has arisen during consideration of the bill as to whether the regulation of radio should be entrusted to the Secretary of Commerce, or to any other one man. It is my belief that at the present stage of development the details of administration should remain with the Department of Commerce, but that a nonpartisan commission should be established with authority to pass finally upon questions which may be referred to it by the Secretary of Commerce or anyone else. The decision of this commission should, of course, be subject to review by the courts.

In all the fourteen years of radio control under Secretary Hoover, no serious criticism was aimed at his method of administration . . . referred to in a passing remark by Dill. During the debate in Congress, there emerged criticism concerning one-man control with the observation that "such arrangement would give the President the final say while political opposition would be deprived the use of the ether! Control must be non-partisan!!"

The several committees, in their long debates before reaching compromises, recognized the need for extension of broadcast into the higher frequencies, but did not want to encroach upon the major bands used by the amateurs. The extensive progress continuously made by amateur and experimental "wireless" was clearly exemplified in the assignments made to the frequency bands for amateur use. ■

69TH CONGRESS
1ST SESSION

S. 4057

FROM THE LIBRARY OF
E[illegible]IC G. SHALKHAUSER

IN THE SENATE OF THE UNITED STATES

APRIL 19 (calendar day, APRIL 22), 1926

Mr. DILL introduced the following bill; which was read twice and referred to the Committee on Interstate Commerce

A BILL

For the regulation of radio communications, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, (A) That it is hereby declared and reaffirmed that the ether within the limits of the United States, its Territories and possessions, is the inalienable possession of the people thereof, and that the authority to regulate its use in interstate and foreign commerce is conferred upon the Congress of the United States by the Federal Constitution.

No person, firm, company, or corporation shall use or operate any apparatus for the transmission of energy or communications or signals by radio (a) from one place in

Fig. 1.

The VoCom Two-Meter Monkey

—30 Watts out from a mighty small package

Alyson Grupp N1BEJ
73 Magazine Staff

VoCom's 2CO25-2 2m amp.

Through the wonder of integrated circuits, you can now buy a hand-held two-meter transceiver that will do almost everything a larger rig will do. Today, many hams are using the new synthesized handhelds in their cars. The only drawback to this arrangement is the limited power output of the hand-held—sometimes you *need* those extra Watts! VoCom has come up with an ideal solution. The 2CO25-2 two-meter power amplifier will provide you with thirty Watts out for a mere two Watts in and is small enough to fit almost anywhere.

The amp is housed in a classy gold-colored metal case, measuring 3.37" × 3" × 1.56" high (2" high including the bracket). The bracket is a typical U-shaped strip of metal which can be positioned either over or under the amplifier. Finding a place for this little gem is not too difficult, even in a small car. Excellent installation instructions are given in the manual. Any questions that arise concerning what to use to hook the amp up are easily answered by consulting the complete charts provided which list properties of various sizes of stranded hookup wire and coax. Also covered in the well-written manual are the selection of a proper location and the vital importance of adequate heat dissipation.

The front panel has an on/off toggle switch for power and a power-status LED. The switch is on the horizontal axis rather than the usual vertical axis, which takes some getting used to. The back panel sports two SO-239 coax connectors, one for the antenna and the other to hook the amplifier up to the transceiver. Exiting the back panel via a grommeted hole is a short, heavy power cable, a reminder of the relatively high current requirements of such an amplifier.

Being insatiably curious, I had to know what was inside the box, and getting inside proved a bit difficult. The screws are apparently secured with some sort of shellac and require a lot of torque to remove. Operation of the amplifier does not require opening the

case, but two of the six screws that hold the case together also hold the bracket on. These, naturally, must be removed for installation.

Once you do get a peek inside, it is obvious that the amplifier is carefully planned and well laid out. Its kick is supplied by an MPSA13 which is bolted to the thick aluminum plate that serves both as a heat sink and as the bottom of the cabinet.

I tested the amplifier on a 12.25-volt power supply, which is some 1.55 volts less than the recommended 13.8 volts. Even at this low voltage, the amplifier performs above the manufacturer's rating. Specifically, with an input power of ½ a Watt, the output is 7 Watts; at 1 Watt, output jumps to 25 Watts. Either 1½ or 2 Watts will give you about 27 Watts out, while at 5 Watts in (the maximum recommended by the manufacturer), the output was 31 Watts.

Gripes? Only one. The cabinet is not rf-tight, which may or may not be a problem in your installation. Otherwise, I found the amplifier to be a superb performer. T/R switching is fast and silent, and use of the amplifier had no effect on the audio quality of my transceiver. The model I tested was designed for a rated drive of two Watts; there is also a model available that achieves full output with a battery-saving 200 mW. If you'd like to give your hand-held a little more punch, at home or in your car, take a good look at the VoCom amps!

The Solid-Copy RTTY TU

—state-of-the-art performance you can afford

RTTY can be one of the most enjoyable aspects of amateur radio. Though outwardly it may seem complex to the uninitiated, the concepts involved are easily mastered by anyone acquainted with CW. The September, 1977, issue of *73* is probably the best introduction, and it was after reading it that I became interested. RTTY had always seemed rather mysterious and untouchable, but a clear explanation was all that was needed to remedy that situation.

I will describe here the top-quality terminal unit

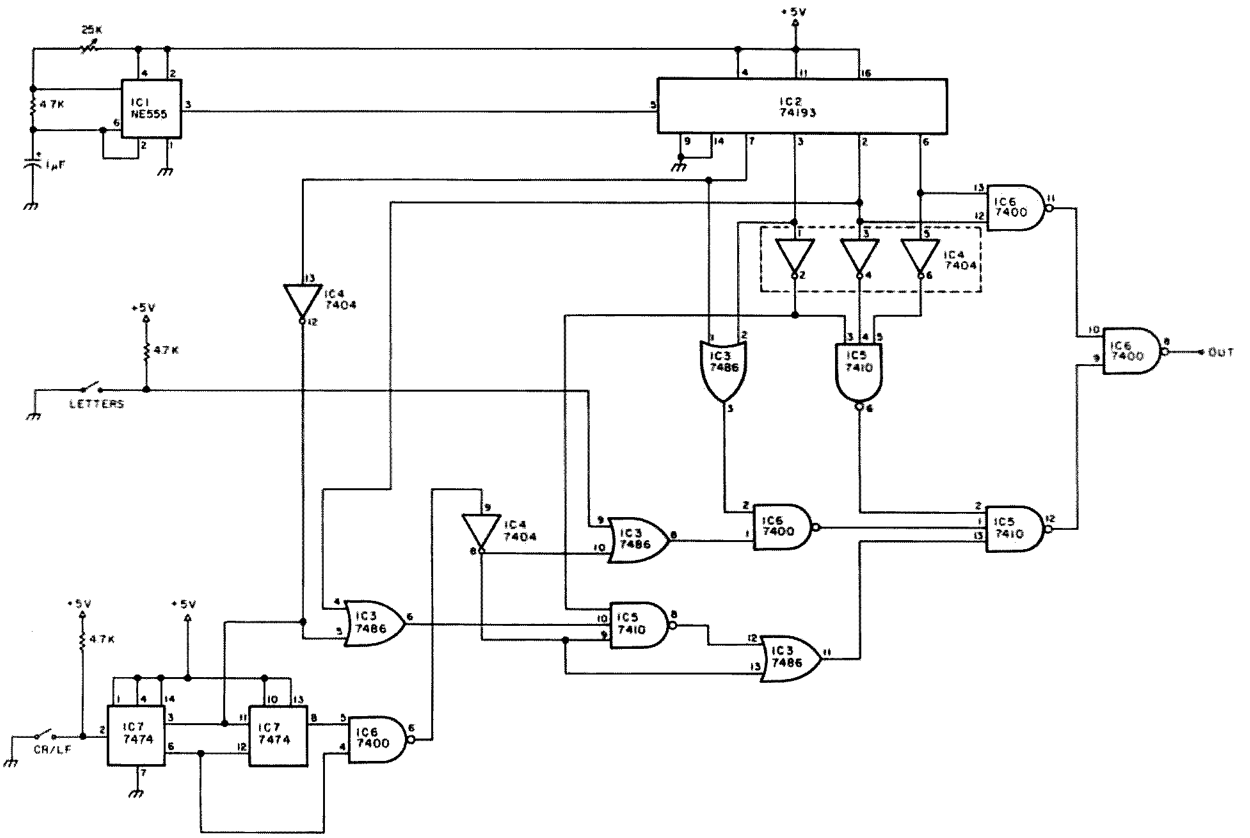

Fig. 1. The W2FJT RY generator.

that I have been using with excellent results for over a year now. It is simple to assemble and provides real state-of-the-art performance.

The heart of my TU is the Flesher DM-170. The price of $39.95 and excellent reviews[1] made this the logical choice for the best low-cost demodulator. The DM-170 has easily-tuned active filters (for 170-Hz shift), autostart, a tuning meter, and an oscilloscope output.

After using it for a while, I decided to try the Flesher PS-170 bandpass filter. The whole filter is contained on a 2" × 2-3/8" PC board and consists of four stagger-tuned active filters. I was skeptical about any increase in performance, but in situations of heavy QRM, the filter really helps. Watching the signals on a scope with and without the PS-170 switched in is convincing evidence that the unit really performs. The output of the filter can be taken before or after a stage of hard limiting, providing even more flexibility.

Having the Flesher demodulator and filter up and running, I added an autostart relay board to the setup. Actually, since I do little VHF RTTY work here, I haven't used this feature, but since the Flesher has an autostart output, it seemed easy enough to include it. The relay will turn on the ac power to the TTY in the presence of a RTTY signal and turn it off in its absence. The delay time for turning on the power is about 3 seconds and the delay for turning it off is adjustable by an external pot. Flesher also sells a relay board kit, incidentally, but it is simple enough to homebrew one.

In use, it is sometimes nice to be able to test the demodulator and teleprinter without the necessity of using signals from the receiver. For this purpose, I included in my terminal unit an RY generator. The characters RYRY . . . are sent continuously until the Return/Line Feed switch is depressed. This allows any adjustments to be made off the air. The RY generator I used is extremely simple; it was described in *73 Magazine*.[2] I have included a schematic in Fig. 1.

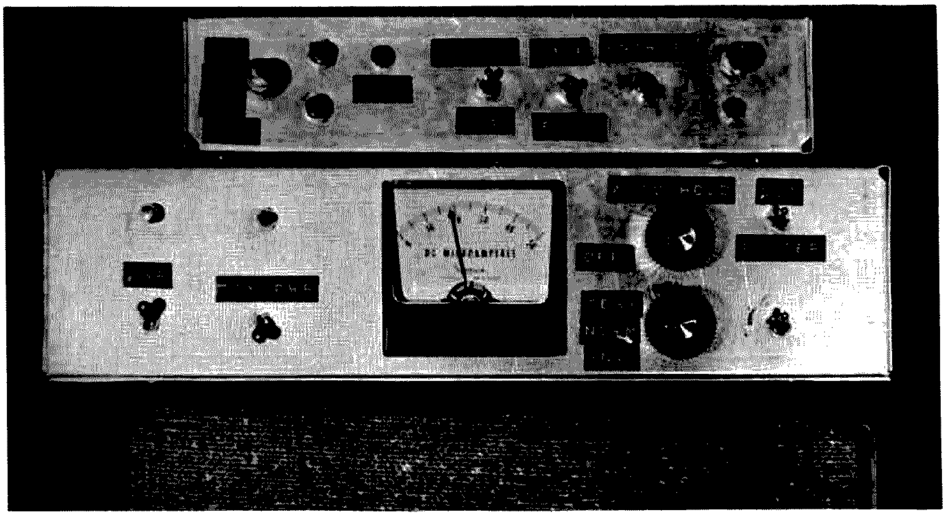

Photo A. TU with Baudot/ASCII converter on top.

My teleprinter is a Model 33 ASR and uses the ASCII code. A code converter is used with the 33 to convert to Baudot code. The code converter also was described in *73*.[3] One very nice feature of this setup is that the code converter utilizes two UARTs to convert the serial code to parallel code which can be processed by the converter. The UARTs provide signal regeneration and possible speed conversion as a side benefit. The TTY is much more reliable when operating on a regenerated signal. In addition, the converter includes the unshift-on-space feature which inserts a letters character after a space if you are in the figures mode. This helps the copy very much when conditions are bad.

A block diagram of the TU is shown in Fig. 2. A bottom view is shown in Photo B. On the right are the DM-170 and PS-170. In the center near the front panel is the RY generator, and behind it is the relay board. The left-hand side is filled with the ±12-volt supplies for the demodulator and filter and the +5-volt supply for the RY generator and code converter. The tuning meter on the front is useful, but not nearly so much as an external scope. Originally, I had planned on including a small scope in the same chassis, but things got a little too cramped. The scope outputs can be seen in the rear view, Photo C. They are the BNC connectors. Also shown in that photo are the plugs for the code converter and the TTY outlet.

The receiver here is an NC-303 which I use in the 500-Hz bandwidth position. The bfo is offset so that the passband is centered about

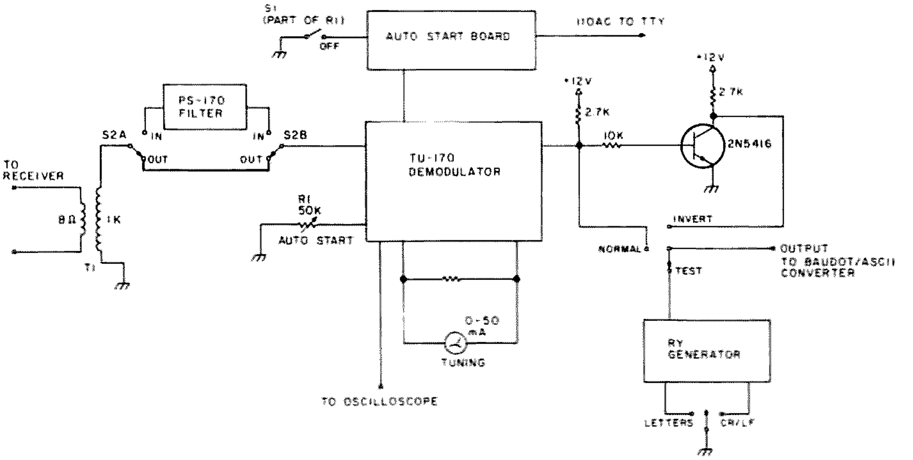

Fig. 2. Block diagram of the TU.

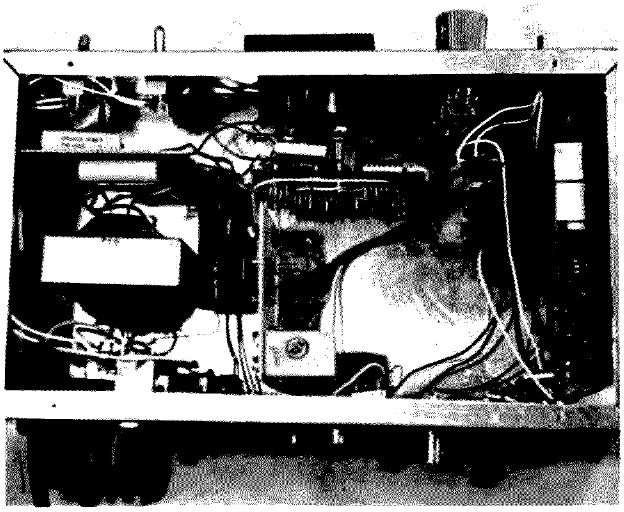

Photo B. Bottom view of the TU. DM-170 is on the far right, with PS-170 on its left. The RY generator is behind the meter.

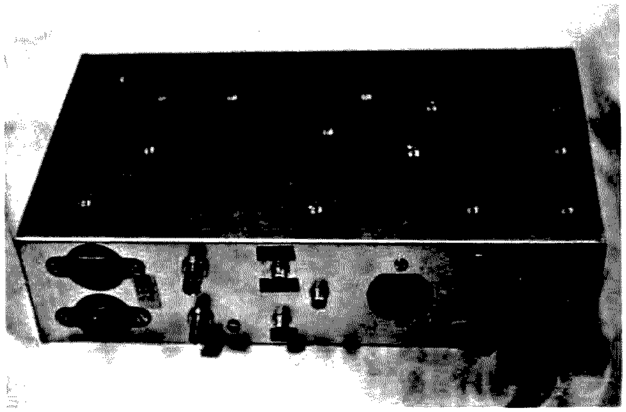

Photo C. Rear view. BNC jacks are for the tuning scope.

2200 Hz from zero beat of the incoming signal. This allows full advantage to be taken of the selectivity offered by the receiver. Audio is coupled into the TU through a small transistor output transformer which matches the 8-Ohm audio to the 1000-Ohm input impedance of the DM-170.

This compact TU has shown itself to be very sensitive, easy to use, and reliable under real operating conditions. Sometimes a totally unrecognizable signal (to the human ear) will provide perfect copy. Under marginal conditions, copy becomes garbled, occasionally, but only at the point where the signal is either buried under the noise or an interfering station is too close in frequency. Considering that the total cost was under $100 (excluding the code converter), the performance is outstanding.

Build one and see! ■

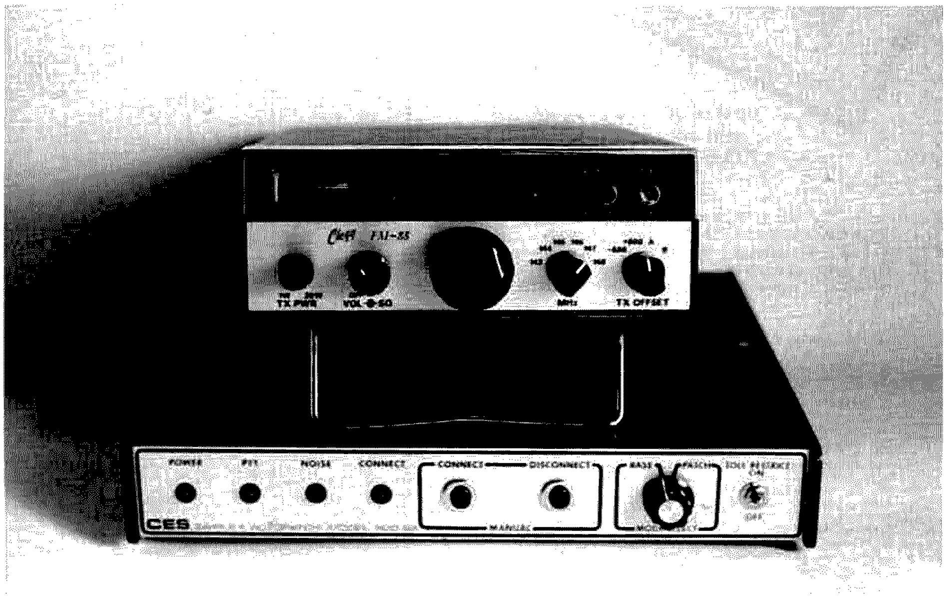
The CES Simplex Autopatch

—some hot new hardware for two

One of the most controversial devices in a well-equipped repeater is its autopatch. Some hams use autopatch facilities frequently, as part of their daily life, while others are very uncomfortable with autopatch usage for routine communications. Many repeater groups permit their autopatch to be used only for emergency calls or set strict time limits for routine calls. Whatever your views on autopatching are, you have to admit that in congested areas where repeaters receive heavy use, autopatching can create problems. Users trying to carry on a conversation grow tired of being interrupted by people needing the patch, and many a stranded motorist has increased his blood pressure to dangerous levels while trying to break into a long-winded monologue to call for help.



CES Model *500SA simplex autopatch.*

Communications Electronics Specialties, Inc., best known in amateur circles for their microphone-mounted tone pads and autodialers, has come up with a fascinating solution to the autopatch problem, the CES 500SA. The 500SA is a simplex autopatch unit which interfaces an amateur transceiver to a standard phone line. No cavities or other hardware are required. You access the patch just as you would access the patch on a repeater: "*" brings the patch up and "#" disconnects it from the phone line. Now if you think about this for a moment, you might get a little confused. How in the world can you operate an autopatch on a single frequency? It's not as difficult as it first seems.

How It Works

When the autopatch is not in use, it sits there waiting, patiently listening in the receive mode. When it receives a "*", it connects the patch to the phone line and switches the transceiv-

er over to transmit. You hear a dial tone just as you would with a normal autopatch, with one important difference. Once per second, the patch samples its receiver for a "window" of anything from 5 to 100 milliseconds, depending on the squelch characteristics of the receiver. If there is a carrier present during this sampling window, the logic locks the system in the receive mode and doesn't switch back to transmit until the carrier drops. This ensures that the party on the other end of the phone line can't capture the transmitter.

It doesn't take much of an imagination to conclude that the constant switching between receive and transmit will be audible, and indeed it is. *How* audible it is depends on how long it takes the autopatch's transceiver to switch from transmit to receive and back again, and how good the squelch is on the transceiver you use to access the patch. CES provides information on how to modify your own transceiver to work with the patch, or they will sell you a Clegg FM-88 synthesized two-meter transceiver that is already modified. The most important change required for a transceiver to work with the 500SA is a simple mod that allows the receiver to stay on all the time. Using the modified Clegg FM-88 on the patch end and a standard Kenwood TR-7600 in the car, we found that the sampling window is audible, but never interferes with intelligibility. The sampling window makes the 500SA sound different than repeater autopatches, but in practice it works just as well.

In the past, some hams have put together systems that used a VOX circuit and stayed in the transmit mode whenever the person on the telephone was talking. When they stopped talking, the system switched back to receive, allowing the ham to talk. These systems were *not* legal. The person on the other end of the phone line was clearly in control of the transmitter, and if that person chose to talk about things that made you uncomfortable, you and every other ham on frequency had no choice but to listen. With the CES system, the ham is in control of the autopatch transmitter, because he can cause the patch's transmitter to shut down whenever he chooses, in one second or less.

Advantages of Simplex Autopatch

The advantages of a simplex autopatch are pretty obvious, but they are worth mentioning anyway. First of all, the patch only occupies one frequency, rather than a pair. In our increasingly congested amateur allocations, this becomes an important consideration. The ability to use a normal synthesized transceiver with the patch is positively enticing. Since the costs involved are negligible compared to a complete repeater, an individual or small group could easily put such a system on the air, or a repeater group could move autopatching activities off the repeater and onto a simplex frequency, freeing the repeater for normal QSOs.

A simplex autopatch could be extremely useful in an emergency situation when telephone communications fail. Just plug the 500SA into the phone system outside of the affected area, and police, fire, and medical teams can be given access to the phone system.

As it is presently configured, the 500SA cannot be accessed through a repeater, but the manufacturer is developing some modifications to allow that use. Many repeaters are located in remote areas where it is impossible to bring in a phone line, and the 500SA could provide autopatch facilities for these systems.

While the concept of a simplex autopatch is revolutionary, it is only fair to mention that a similar system is presented in Bill Pasternak's and Mike Morris's epic tome, *The Practical Handbook of FM and Repeaters*, and has probably been discussed elsewhere as well. Simplex autopatches have been in use for several years, but the introduction of this commercially-built unit by CES will certainly increase the popularity of the simplex autopatch. With no further ado, let's take a good look at the 500SA.

Description

Physically speaking, there isn't much to the 500SA. It is a well-finished metal box that measures 1-1/2 inches high by 9 inches deep by 10-1/2 inches wide. The front panel is a model of simplicity. On the far right-hand side is a toggle switch marked "Toll Restrict," and it does just that. Inside the patch is a circuit board with 10 spaces available for the insertion of diodes. Our unit had diodes in the "0" and "1" slots. Numbers starting with a 0 or 1 are consequently ignored by the decoder when the Toll Restrict switch is on.

Next to the Toll Restrict switch is a two-position rotary switch marked "Base" and "Patch". This allows you to completely bypass the patch electronics and use the transceiver as a normal base station. Next to this switch are two momentary-contact push-buttons marked "Disconnect" and "Connect" for manual testing of the patch. The last item sharing the front panel is a row of LEDs, to keep you informed of the status of the system's various functions.

Inside, construction is uniformly excellent. The glass-epoxy circuit board, high-quality components, and careful layout all serve as reminders that CES produces a wide range of equipment for the commercial radio services.

Moving to the back of the patch, we find a neatly grommeted hole with telephone wire exiting it. The wire is equipped with a standard modular phone plug, so interfacing the patch to the phone line is not traumatic. Also on the rear panel are two multi-pin connectors for interfacing the unit with transceiver and IDer.

Installation and Use

We used a modified Clegg FM-88 as the transceiver for the patch, and setting up the system couldn't be simpler. CES thoughtfully wired up all the necessary functions to the accessory socket of the Clegg and provided an interface cable as well. Installation consequently took less than five minutes and consisted of hooking up the transceiver to a 12 V dc power supply, an antenna, and the autopatch, and plugging the autopatch into a phone jack. Power is supplied to the patch through the interface cable from the transceiver. The patch can be configured to work with either pulse or touchtone™ phone systems; touchtone is a far-off dream in our area, so we had the optional pulse dialer installed.

Operation of the simplex autopatch is even less challenging than its installation. As with any phone interconnect system that is not full duplex, you have to remind people that if they talk at the same time you're talking, you won't hear them. Because of the once-per-

second sampling of the patch's receiver, you also have to be careful not to cut off the first part of a transmission, particularly when dialing. If you have a fancy tone pad or autodialer with automatic push-to-talk, you'll have to forego the pleasures of that particular feature. Good operating practice with a simplex autopatch requires the transmitter to be keyed a couple of seconds before the first tone is sent, to allow the patch's logic to lock into the receive mode.

The 500SA is equipped with a time-out timer that gives warning beeps after 80% of timeout. The timer can be programmed to reset with a carrier, a "*", or no reset at all. Our unit was programmed to reset with a "*", which seems a good compromise.

One feature of the 500SA that you may not wish to use is its reverse autopatch capability. When someone calls the autopatch, it transmits a beep to let you know that a call is waiting. If you wish to talk to the caller, you simply press the "*" on your tone pad to connect the phone line to the patch. Since this system does not allow a control operator to screen the call before the caller goes on the air, it is doubtful that the reverse autopatch function is legal under present FCC rules and regulations. If you choose not to use this feature, it is easily disabled.

Legal Considerations

Many people I have talked with about the simplex autopatch have questioned the system's legality. After several phone calls to the FCC, I came to the conclusion that within the following limitations, the 500SA is legal. For any autopatch to be legal, simplex or otherwise, a control operator has to be present at a control point for the transmitter. This rather dashes any hopes of simply plugging the thing in at home and having your own private autopatch. A ham will either have to be present in the room with the patch, or you'll have to arrange a control link to turn the patch on and off that is independent of the input frequency of the patch. If you monitor the patch whenever it is up and can shut the thing down if a wild turkey brings up the system, you'll be well on your way to being legal.

The other thing you'll need if you want to be legal is an IDer. CES offers one as an option for the 500SA, and at about 50 dollars, it's well worth the investment. The reverse autopatch feature? As mentioned above, the legality of reverse autopatch is doubtful at best, so you might as well disable that feature right away.

Applications

So how is the average ham going to use the 500SA? Well, the possibilities are almost endless! You could just plug the thing in at a good site and hope that the FCC never catches you operating it without a control operator. That's just asking for trouble, and besides, there are some far more intriguing possibilities that are still within the capabilities of an individual ham.

Install the 500SA at a good site, hook up a 220- or 430-MHz control receiver, and bring in a phone line. Designate anybody you wish as a control operator, and leave the patch normally disabled. Whenever one of the control operators wants to use the patch, he or she can activate it via the control link and then use it normally. This has the advantage of giving instant accessibility, yet it stays well within the letter and intent of the law.

The only disadvantage is that you need to have a transmitter for 220 or 430 as well as two meters to use the patch, since control functions cannot be performed on two meters. The obvious solution is to put both the patch and its control receiver on the same band, say 220 MHz. Install a 220-MHz transceiver in your car or use a handheld, and the one rig can handle both control and operating functions. Dial in the control frequency, bring up the patch, and then flip to the patch's operating frequency to place your call.

This approach seems ideal for the individual or small group with a closed system in mind. If the group grows or decides to make its facility available on an open basis, the patch could be left on all the time, as long as a control operator is monitoring the frequency.

Conclusions

However you use it, the CES 500SA is a versatile and innovative new product. The concept is a logical one, and CES has produced an autopatch system that should give dependable, trouble-free operation at a fraction of the cost of a repeater and its associated autopatch equipment.

If you or your group has ever wanted to have an autopatch system, as a convenience or for emergency use, you owe it to yourself to check out the CES 500SA!

About the Beverage

—When you say longwire, mean it. Use the remarkable beverage!

No, a beverage is not a drink! This beverage is a super longwire receiving antenna that is absolutely worth all the time and effort that it takes to put it up.

The advantages of a beverage antenna are that it is highly directional, has extremely low noise pickup, and produces excellent signal-to-noise ratios. Its disadvantage is that it requires a lot of ground to put it up in the direction that you want to listen.

The beverage antenna was invented in the early 1920s by Harold H. Beverage. It was first discussed in a paper titled "The Wave Antenna—A New Type of Highly Directive Antenna," written by Beverage, Chester W. Rice, and Edward W. Kellogg for the journal of the American Institute of Electrical Engineers (Volume 42, 1923, page 215 ff). Other writings on the subject are found only periodically thereafter as an editor or writer "rediscovers" the antenna. The several *Radio Engineering Handbooks* edited by Keith Henney and published by McGraw-Hill also have discussions of the antenna.

Results

As a medium-wave DXer in the late 1950s and through the 1960s, I had heard of beverages. Several National Radio Club DXers used them to good advantage. Probably the most spectacular example was Jerry Conrad's 1500' beverage in an orange grove in southern Florida. I heard one tape of 1550 kHz on which 50-kW CBE, Windsor, Ontario, normally is the dominant North American clear-channel station, but, changing from a random wire to the beverage, 50-kW 4QD in Queensland, Australia, completely took over the frequency! As it was later explained, normal daytime reception included regional-frequency stations from Texas and Oklahoma, and twilight reception normally included California and Hawaii stations.

It was not until my wife and I moved to a new location in 1980 that I had the room to put up a beverage. Despite summertime static, St. Pierre et Miquelon on 1375 kHz was readable most evenings on the beverage, yet there was no trace of a carrier on a random length 120' wire. Europeans on the standard medium-wave band were present most evenings throughout the fall, and Saudi Arabia on 1521 kHz often put a strong heterodyne on WKBW, 1520, Buffalo, New York. Daytime reception of central and northern New England stations on the regional and local frequencies is commonplace.

The results on 75 meters have been equally satisfying. In the fall and winter of 1980, more than 20 new countries have been added to the log just because I can hear them! The best ones include Faroe Islands, Maldive Islands, Reunion, and Djibouti.

Under normal conditions, the beverage scrubs at least 25 dB and sometimes as much as 40 dB off signals to the sides and to the rear of the antenna. In no-signal conditions, the typical atmospheric noise drops from an S6 or S7 on the dipole to an S2 on the beverage.

What is a Beverage?

The beverage is a very long longwire run in the direction in which you intend to listen. To be effective, a beverage should normally be at least two wavelengths long on the lowest frequency on which it will be used. For example, two wavelengths at 1.8 MHz is 1100 feet; at 3.5 MHz, 600 feet.

At less than two wavelengths, the property of high directionality will be lessened. At less than a wavelength, signals to the sides and rear will not significantly be reduced. The

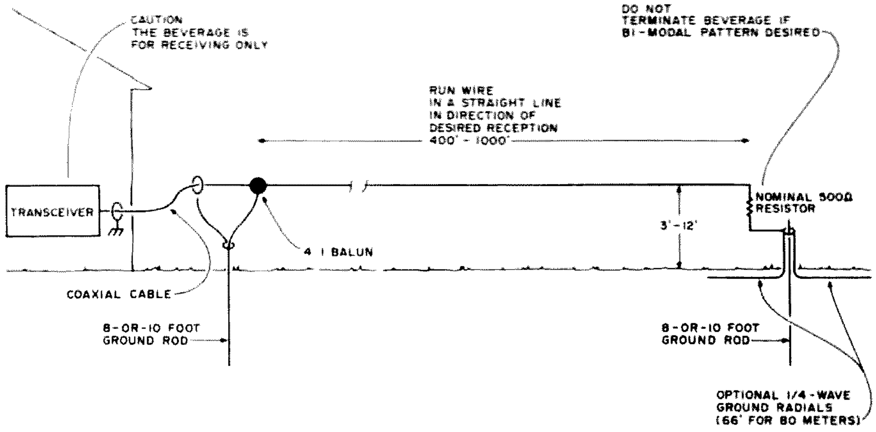

Fig. 1. Installation of the beverage antenna.

advantage of improved signal-to-noise ratio will be retained, however.

Increasing the number of wavelengths on the wire is not normally effective when the number exceeds eight to ten. The front acceptance angle also becomes smaller. That was exemplified here by back-to-back QSOs on October 5, 1980, with XT2AW, Upper Volta, on 40 and 75 meters. Whereas my beverage, running northeast, offered no advantage over the dipole on 40, on 75 it was significantly better and provided solid copy. XT2AW was just barely audible on the dipole.

At certain times, particularly in the twilight hours, the beverage will not appear to be functioning. The changing, tilting ionospheric layers in transition tend to produce high-angle signals without any worthwhile low-angle components.

How It Works

The long antenna wire pointed in the direction of a passing radio wave has a high degree of exposure to the horizontal component of the wave. This induces a continuously building series of voltages that are propagated along the antenna from one end toward the receiver. The effects are cumulative over the long length. Energy collected from a radio wave traveling in the opposite direction is dissipated in a terminating resistor and so does not enter the receiver. Radio waves arriving from the sides have relatively little effect on the receiver.

Installation

Installing a beverage is relatively simple. As a minimum, you will need antenna wire, a 4:1 balun, a ground rod, a 500-Ohm 1- or 2-Watt carbon resistor, and coaxial cable to feed the receiver.

I used a surplus 1000′ roll of insulated #18 hook-up wire. Others use copperweld; almost anything will suffice. The wire should be installed at a more-or-less uniform height 3′ to 12′ off the ground. Mine averages about 8′ so that deer walking through the area won't snag the wire and pull it down.

Run the wire—at least 400′ and preferably 600′-1000′—in a straight line. A few degrees of bending over the course is acceptable but anything more than a 10- or 20-degree bend should be avoided. Run the antenna wire in the direction of primary interest.

At the far end, install an 8′ or 10′ ground rod. Connect the end of the beverage to the ground rod with a nominal 500-Ohm resistor in series. Use a non-inductive resistor if one is readily available, otherwise a small carbon resistor will be fine. The value of the resistor is subject to experimentation; values ranging between 200 and 600 Ohms are normally found to be best.

If you need to improve the effectiveness of the ground because of poor conductivity at the point of the ground rod, connect some 66′ radials to the ground rod. Run one of them away from the ground rod, continuing in the direction that the beverage was pointed.

A terminated beverage is unidirectional in the direction that the beverage runs, i.e., from the receiver end to the terminated end. If you want the antenna to be bi-directional along its axis, leave the far end unterminated.

The beverage is a high-impedance antenna. It will perform by connecting the receiver end of the beverage antenna wire to the inner conductor of the coaxial cable feeding the receiver. I'll leave it to the

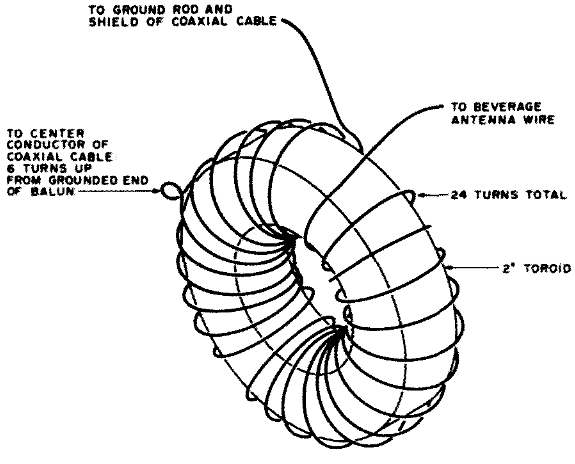

Fig. 2. A homemade 4:1 balun.

engineers to do the calculations on exact impedances and tell you to install either a commercial or homemade 4:1 balun. Almost anything to get the impedance match into the ball park will do.

I wound 24 turns of hook-up wire onto a surplus 2″ toroid, tapping it at 6 turns for the coaxial center conductor (see Fig. 2); it works just fine. If the beverage is only for amateur band use, i.e., above 160 meters, one of the small antenna tuners, such as marketed by DenTron or MFJ, will perform equally well. A fixed balun should be mounted at the receiver end of the beverage wire, whereas an antenna tuner should be placed by the receiver.

Although this beverage antenna is a *receiving-only* antenna, some users will adjust the antenna tuner for maximum by loading a small amount of power (less than 5 or 10 Watts) into the beverage. Don't forget the terminating resistor!

At the receiver, install switches or relays to listen with the beverage and transmit on your normal antenna(s). If you have a separate receiver and transmitter, that task is simple.

If you have a second ground rod available, install it at the end of the beverage wire. Tie the ground side of the fixed balun and the coaxial shield to ground with a short piece of wire.

Some final installation notes are in order here. An ohmmeter connected in series between the receiver end of the beverage wire (temporarily disconnected from the balun) and the second ground rod should read 10k to 15k Ohms, assuming the far end of the beverage is terminated. The circuit is completed through the earth. An infinite reading indicates a break in the beverage antenna wire.

If you install multiple beverages for multiple listening directions, the antenna selection device should ground the beverages not being used. Otherwise, signals built up on the other beverages (or random wires) in the area will be inductively coupled to the beverage in use, causing extraneous signal pickup and blunting of the nulls.

Conclusion

The beverage has opened new vistas for me despite a very modest station installation. The ability to hear is of paramount importance, and I attribute some excellent DX on 80 and 40 meters to that antenna. If you have the room to install a beverage, go ahead and do so. You'll be surprised at what comes out of the noise levels! ■

Design-a-Dish

—produce a proper home-brew parabola with this BASIC program

After months of chatter on the club repeater, I decided last week to join the computer nuts. They seemed to be having so much fun with their microprocessors that I didn't want to be left out. I bought a TRS-80 with Level II BASIC and 4K of memory, saving a few bucks by using my SSTV monitor instead of buying Radio Shack's monitor.

After a few hours on the manuals, I was off and running. Then, after a couple of hundred games of "Lunar Lander" and "Blackjack," I put something in the machine that ran more along my lines of interest: I wanted my TRS-80 to help me construct a parabolic dish and feed system for receiving the geostationary weather satellites that transmit facsimile on 1691 MHz. Amateur interests (including my own) range from moonbounce to Gunnplexers and even to domestic satellite TV reception (TVRO), so it appeared that the ham without a dish would be missing out on a lot of fun.

If you like to roll your own, you can save a few bucks, learn something about dishes, and not have

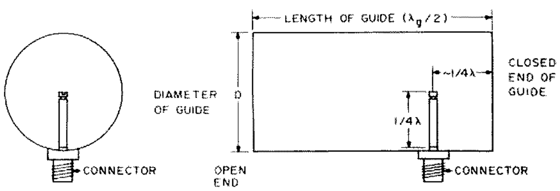

Fig. 2.

to worry about transporting a surplus ten-foot dish across town on the roof of the family Volkswagen. Many good dishes have been constructed using plywood ribs and screen or formed aluminum tubing, but most articles written in the amateur journals usually specified one size of dish and one or, at the most, two frequencies of operation. If after reading them you found that your particular application didn't fall in this category, you looked up a microwave expert or did a lot of reading on the subject.

This program, written in Radio Shack Level II BASIC, takes the drudgery out of the calculations. The hardest things it performs are square root and logarithm conversions, so it should be applicable to Level I BASIC or any other language with little or no modification. It requires the user to select one of three options: A—parabolic dish design, B—feedhorn design, or C—cutoff versus frequency for a specific diameter of waveguide. The program variables are shown in Table 1.

Program A

Program A (lines 10 to 119) allows the user to select dish size and f/d ratio independently. Then it prints out the X and Y coordinates in inches and the focal length and depth of the dish in feet. This allows you to select a specific dish diameter and play around with different f/d ratios while plotting X and Y coordinates for each change. This was always a pain even with a calculator. It then asks the user to specify the desired frequency of operation for a gain figure at this frequency. The computer will give a gain figure in dBi based on a 56-percent dish efficiency; this may be a bit optimistic but it is a good ballpark figure. It may be changed by entering your own percent figure at line 116.

The curve formula is derived from the basic $Y^2=4AX$ definition of a parabolic curve where, in this case, the known Y axis represents one half of the dish size (the other half of the dish is the same curve), 4A is a constant where A represents the focus, and X is our unknown. X represents the depth of the curve along the Y axis. We appropriately substituted F for A in the program. The program asks the user for the number of plots along the Y axis by saying, "INPUT RATE OF PLOT ALONG Y AXIS. EVERY ? INCHES". Depending on the curve perfection desired or your skill with the sabre saw, use whatever value you think necessary. I used every four inches for large dishes and scaled it down for the smaller dishes. See Fig. 1 for curve design.

Program B

Program B (lines 201 to 245) specifies the diameter and length of a circular waveguide-to-coax transition device[1] used by a number of amateurs with great success. Basically, it takes the form of a tin can open at one end and closed at the other. A quarter-wavelength rod is mounted approximately a quarter wavelength from the closed end, perpendicular to the longitudinal axis of the can and mounted on a connector suitable for coax cable. The dominant mode (the one we're interested in) is the TM_{11} mode; it lies between 1.71d and 1.31d, where d is the guide diameter, 1.71 is the cutoff for the dominant mode, and 1.31 is the cutoff for the next mode to develop (the TE_{01} mode). The diameter is based on the H_{11} and TE_{01} limits for the desired frequency of use which is input to the computer by the user. This is done by the prompt, "INPUT DESIGN FREQ OF OPERATION IN MHZ."

For example, we type in "1691", hit the enter key, and the computer prints out "CUTOFF DIA. FOR DOMINANT MODE IS: 10.535 CM." "CUTOFF DIAMETER FOR NXT LWR MODE: 15.212 CM." Aha, my 12-cm diameter lard can will do the trick!

These limits are mathematically depicted in the formulas. The program calculates and prints both limits and their average in cm, thereby giving the user

Formulas Used in Calculations By the Computer

$\lambda_o = 30{,}000/F$

Where F = Frequency in MHz; λ_o is the free-space operating frequency in centimeters (cm).

$D = \lambda_o/1.71 \text{ to } 1.31$

Where D is the diameter of the guide expressed in cm, λ_o is the free-space operating frequency expressed in cm, 1.71 is the cutoff for TM_{11} mode, and 1.31 is cutoff for TE_{01} mode expressed in cm. This gives the limits of the guide diameter.

$\lambda_g = \lambda_o/\sqrt{1-(\lambda_o/\lambda_{co})^2}$

Where λ_g is the length of the guide in cm, λ_{co} is cutoff wavelength expressed in cm, and λ_o is the operating wavelength in cm.

$\lambda_{co} = 1.71 \text{ to } 1.31(D)$

Where λ_{co} is the cutoff frequency expressed in cm. See Fig. 2.

$Y^2 = 4AX$

Where X is the X-axis plot of dish and Y is the Y-axis plot of dish; both are expressed in inches. Y represents one half the dish diameter, input to the computer in feet. Output to the user as "X" and "Y", in inches. See Fig. 1.

$G_{dB} = 10 \log (.59 [12\pi D/\lambda_o]^2)$

Where G = gain of the dish in dB, D is dish diameter in feet, and λ_o is the operating frequency in inches.

Program Line #			Program Variables
20	D	=	Diameter of dish in feet.
30	Z	=	f/d ratio.
40	F	=	Focus of dish.
70	Y	=	Vertical axis; half dish size, in inches.
70	X	=	Horizontal axis; plot points of dish depth along Y axis, in inches.
45	M	=	Input variable to plot a point every (?) inches along the Y axis.
100	S	=	Dish depth in feet.
114	T	=	Operating frequency of dish in MHz.
115	L	=	Operating frequency in inches.
116	G	=	Gain calculation (dBi).
117	H	=	Log multiplier for dB. (RS Level II uses only natural logs.)
212	D1	=	Cutoff calculation for TM_{11} wave in cm (dominant mode).
212	D2	=	Cutoff calculation for TE_{01} mode in cm.
214	CS	=	Wavelength limit average of D1 and D2 in cm.
210	O	=	Alpha character denoting operating frequency calculation in cm.
216	G	=	Physical length of guide calculation; (G/2) gives actual printout in cm.
247	X	=	Input diameter of guide to computer for cutoff and length calculations in cm.
260	Y	=	Output to user: frequency of cutoff in cm.
247	Z	=	Conversion of Y figure to inches.
300	A,B,C	=	Program selection variables.

Table 1. Program variables. Notice that some variables are duplicated, but due to user input they do not conflict in the program.

some leeway on diameter for that particular frequency. The guide length, however, is based on the computer-derived average of these limits. The actual guide length is one half the theoretical guide length, which gives a broader frequency response when tuning the vertical radiator. This was based on work done by DJ1SL.[2] It also prints out the free-space operating wavelength in cm for reference and gives the probe length and distance from the closed end of the guide in millimeters. The program begins at line 201. See Fig. 2 for a schematic of guide and dimensions.

Program C

This program (lines 246 to 261) is designed for the guy who always wanted to know the cutoff frequency of a tomato paste can in the TM_{11} mode and also to know the operating frequency in centimeters and inches, depending on what type of ruler he has in his pocket. I was too lazy to program the input for both inches and cm, so this program looks for only one thing: "INPUT DIAMETER IN CM." All outputs are as advertised. The program begins at line 246.

Initially, after the computer has requested the user to select program A, B, or C and has performed its task, it returns in this configuration for another program selection. This is done at the subroutine on line 300.■

The public, from the beginning of the era of the Wright brothers, has been enthralled with almost all activities related to the airplane. Incidents related to aircraft disasters, especially the rescue of survivors, have always captured front-page headlines. Amateur radio, therefore, is presented with a rare opportunity to demonstrate our active involvement in public service with a project that first and foremost is of lifesaving benefit, and second is

most visible, in a positive light, to our community.

This project is the early detection and subsequent location of downed aircraft by use of the ELT (Emergency Locator Transmitter) beacon transmitter carried by law in all aircraft, and activated under crash conditions.

The MBARC (Mt. Beacon Amateur Radio Club) of Poughkeepsie, New York, was already involved in RDF (Radio Direction Finding), using it to rid ourselves of jammers. A proposal was put before the membership to channel the RDF experience and enthusiasm into the ELT lifesaving program. This proposal was unanimously accepted and within 3 weeks a modified Clegg 22'er was installed and operating at our local repeater site. Since our repeater is microprocessor controlled, we were able to experiment with various control and time functions. As a matter of fact, one of our engineering problems led to an especially humorous innovation as will be explained later.

Implementation

The FCC prohibits the direct rebroadcasting of signals on the amateur frequencies other than those received by the repeater input. We contacted the FCC, and were advised that we could *indicate* the presence of an ELT signal by altering our CW ID.

Referring to Fig. 1, when an ELT signal is received, the increased agc on the Clegg 22'er, amplified by the interface, energizes K1. K1 provides an isolated closure to a digital input port on the microprocessor. If K1 remains energized for 5 minutes, our ID is varied to include an alerting 8 dots followed by a Morse code "ELT" (. .—.. —). This modified alerting signal repeats every 2 minutes. Any ham who hears this signal calls a predetermined list of personnel who, in turn, validate that it is indeed an ELT transmission and not a noise signal and subsequently notify RDF-equipped hams and the FAA.

After this has been done, the ELT mode is "controlled" off and not "controlled" back on until either the FAA advises us that the ELT has been located, or 48 hours have elapsed, whichever comes first. The ELT normal battery life is 48 hours and we don't want a continuous alerting signal, and phone calls, after the FAA has been notified. RDF-equipped hams then track the ELT to its source and take appropriate action. (See Table 1 for complete beacon specifications.)

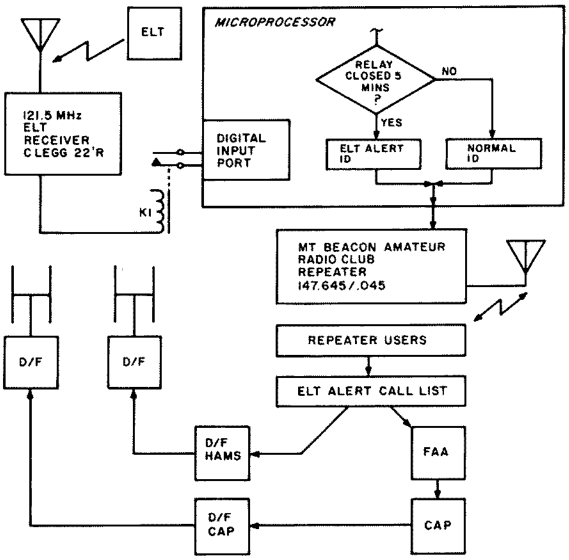

Fig. 1. Emergency Locator Transmitter (ELT) alerting system.

Electrical Interface

The electrical interface (Fig. 3) is very simple. The Clegg 22'er was modified for 121.5 MHz (Fig. 2) and RCA interface jacks added. One jack is for the agc line, and the other for 12.6 V ac to power the interface. The interface isolates and amplifies the dc agc level up to 5 times via Q1A, and feeds it to the inverted input of voltage comparator Q1B. The voltage comparator is adjusted, via R3, such that Q1B output is at −12 volts under no-ELT-signal conditions. This level ensures that Q2, the relay driver, is off.

When an ELT carrier is received, the Clegg 22'er agc voltage becomes more negative, causing the Q1B inverted input level to go more negative than the adjustable non-inverted level as set by R3. The comparator output under these conditions goes to +5 volts. This positive voltage disconnects diode D1 and allows current to flow into the base of Q2 via diode D2, turning on Q2, and in turn K1. The activation of K1 presents a contact closure to the microprocessor digital input.

The flowchart in Fig. 4(a) shows that this digital input port is sampled every second and if *all* samples in a

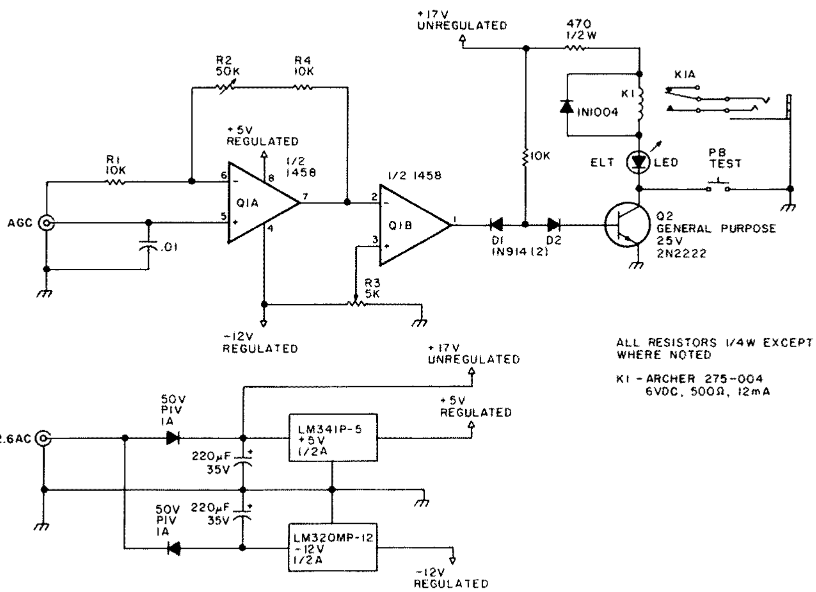

Fig. 2. Interface from Clegg 22'er to microprocessor.

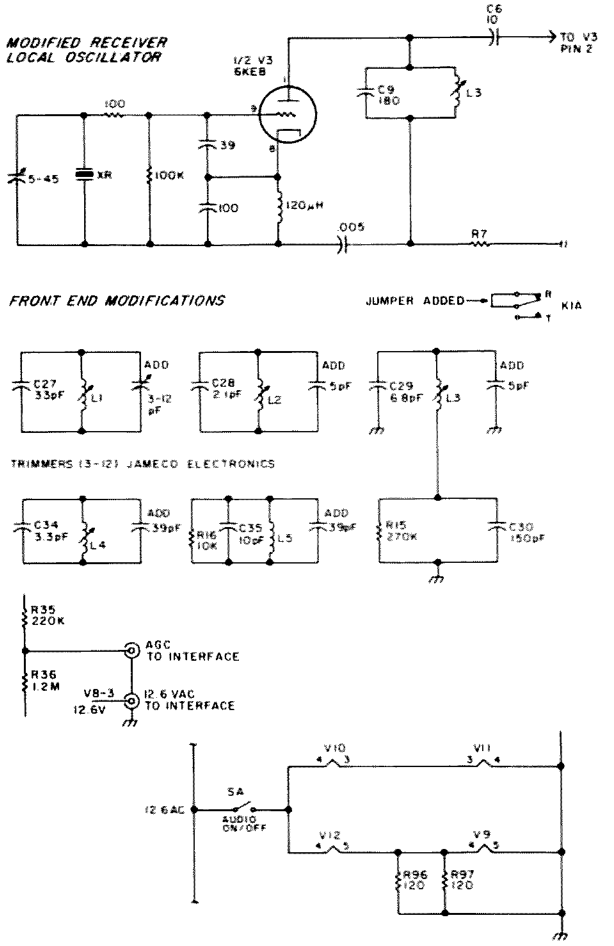

Fig. 3. Modifications to Clegg 22'er for 121.5-MHz ELT reception. XR = 8.262500 MHz for 121.5-MHz input, use International Crystal Manufacturing Co. catalog #433478 (10 North Lee, Oklahoma City OK 73102). Modifications include removal of V13, V14, and V15. Do not remove V12. This turns off audio and reduces heat generated by unused tubes. A small pancake fan was mounted on top of the cabinet to provide cooling required for 24-hour operation.

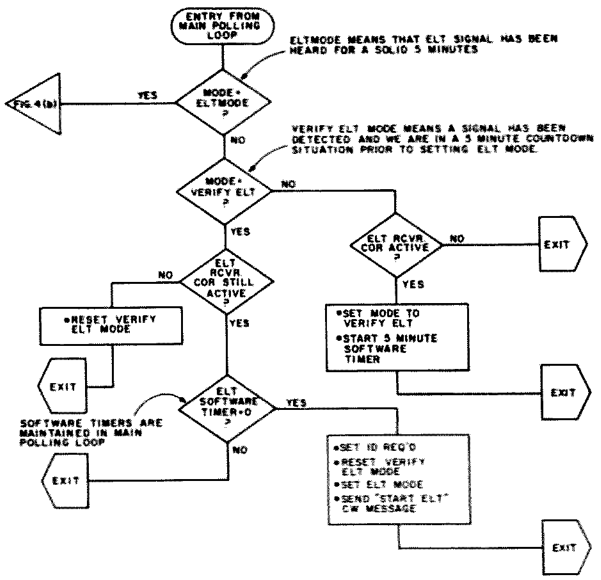

Fig. 4(a). System flowchart.

ELT Beacon Specifications (EBC-102A Data Sheet)

Operating life, room temperature	—Greater than 48 hours
Operating frequency	—121.500 MHz ± .005% and 243.000 MHz ± .005%
Modulation percentage	—100%
Sweep range	—1300 Hz to 400 Hz
Sweep rate	—3 Hz
Modulation duty cycle	—45%
Transmitter duty cycle	—100%
Peak effective radiant power	—Greater than 75 mW on both frequencies
Automatic activation	—Minimum 5 Gs for 12 ms Maximum 7 Gs for 15 ms
Temperature variation test −40° C. to +55° C.	—Frequencies within ± .005% after exposure
Low-temperature performance: −20° C.	Meets room temperature specifications after exposure
High-temperature performance: +55° C.	
Altitude performance: 50,000 ft.	
Decompression: 8200 feet to 40,000 ft.	
High-pressure performance: −15,000 feet	
Shock performance: 50 Gs, 6 axes	
Vibration test: 10 Gs	
Immersion test: 17 hours in salt water	
Waterproofness: drip 20 minutes	

Table 1.

5-minute interval detect a contact closure, then the microprocessor indicates an ELT detection and alters the repeater ID—Fig. 4(b)—as previously described. Once an ELT is detected, it will remain "detected" until the contact opens for a full 5 minutes. This was done to ensure that we wouldn't lose the ELT if someone, or something, caused an intermittent loss of the ELT signal.

Antenna

The humorous incident came about while we were discussing the antenna installation at an engineering planning meeting. In order to achieve a low angle of radiation, necessary to detect signals located on the ground, a large vertically-stacked antenna should be used; this was out of the question at our location. While describing the high angle of radiation attributed to the normal 2-meter ground plane antenna, someone piped up with: "Why don't you mount the ground-plane antenna upside down?" We all laughed, but that's just what we did (see Fig. 5) and it performed far beyond our expectations. In fact, we are considering this approach to repeater antennae in general, since most of our communications is from high to low locations.

Adjustment

With the antenna connected to the receiver, initially adjust R2 to maximum resistance, and R3 to ground level. Then, adjust R3 until the ELT LED in the collector circuit of Q2 just turns off. Adjust R3 an additional 1/8 turn in the same direction. If the ELT LED cannot be turned off, adjust R2 to a lower resistance,

and repeat the R3 adjustment.

Problems

We have encountered only one problem so far. The second harmonic of TV channel 3 is in the 120-to-132-MHz range. TV games on channel 3, incorrectly connected to a TV set with its outside antenna attached, will radiate in the 120-MHz range. We advised our close-in neighbor of this problem, and interference to the ELT receiver stopped.

Operating Experience

ELT transmitters may legally be tested during the first five minutes of every hour. We installed the ELT detector system on a Thursday evening. The following Friday a call was received that the repeater detected an ELT at 1330, which is not within an allowable 5 minute ELT testing period. A call to the FAA confirmed the ELT signal, but before any action could be taken, the ELT was shut off—they thought no one was listening! A second similar incident occurred within 2 weeks. We hope that we never have to hear the 8 dots and the ELT alerting signal, but we routinely test the detector during the legal test time, using a private aircraft transmitter.

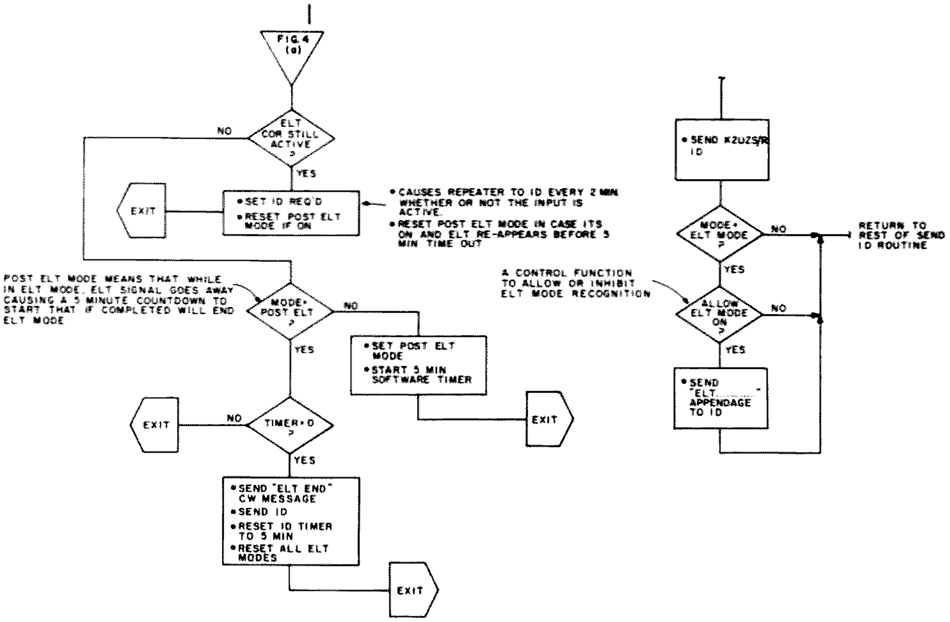

Fig. 4(b). Detail of ELT ID.

Conclusion

Future plans include upgrading the ELT detector installation from the omni-directional antenna to a controlled directional antenna such that triangulation between 2 or more repeaters would point out the initial direction to search. This would cut the search time considerably. Ideally, if we could equip every repeater station with an ELT detector, help could be on the way within 5 minutes after the ELT is detected.

No other organization has the equivalent of an umbrella of actively monitored radio stations, located ideally at high elevations. Also, there are very few organizations around that have the quantity of equipment and number of trained RDF personnel that hams can assemble to detect and search for ELTs. ■

An 820S Remote Vfo

—using the rig's counter and display

While the Clipperton DXpedition was in operation, a friend of mine down the street, Ari VE5AAO, was becoming very frustrated trying to work the split frequency with his Kenwood TS-820S. It was then we realized that an outboard vfo was a necessity for DX work and we set about putting something together from the junk box.

It turned out to be extremely simple, and another friend, Lorne VE5NO, urged (nagged) me to write it up for *73* because of the many 820S owners who might wish to build this simple project. What makes it so simple in this case is that you need not bother making any kind of frequency-readout dial—the Kenwood counter and display do it for you. Other remote vfos that I have built required the construction of some kind of dial and, even with tedious hours of calibration and dial marking (I had no counter then), the resolution and accuracy left a lot to be desired.

Photo A. The completed remote vfo.

All this is eliminated when using the Kenwood with digital readout. When transceiving with the remote vfo, the frequency displayed on the Kenwood will be that of the remote. When transmitting with the Kenwood and receiving on the remote vfo, the display will read the Kenwood vfo when transmitting and the remote vfo when receiving. A front-panel LED indicator shows when the remote vfo is active. So you can see that a mechanical dial on the remote unit would be redundant.

The Transceive/Separate switch allows one to transceive with the remote vfo or, in the Separate position, to receive with the remote and transmit with the TS-820S. The Remote/820 switch allows one to choose which vfo will exercise main control.

The heart of this very stable circuit is the Seiler oscillator; the output level

varies little when the vfo is tuned through its range, and resettability is excellent. The buffer stage uses an FET operated in class A to minimize loading on the vfo. The emitter-follower provides a low-impedance output for driving the Kenwood circuits.

Temperature compensation requirements are minimal because of the high stability of the variable oscillator circuitry. In this circuit, stability is primarily a function of the tuned-circuit components and is only slightly affected by the active device. Although not used in my unit, a negative-temperature-coefficient capacitor could be used in the tank circuit to take care of any temperature-induced drift.

Construction is straightforward but consistent with good vfo construction techniques. My vfo was built inside a 12.7 cm x 17.8 cm (5" x 7") aluminum chassis on a 6 cm x 10 cm epoxy PC board. If you prefer not to use a circuit board, any wiring method should work equally well. Mechanically, everything should be rigid.

C2 should be a good quality variable; mine came from surplus equipment complete with a good gear-reduction drive, a necessity for slow SSB tuning. L1 should be wound on a ceramic form and capacitor C4 should be a silver mica. The values of the tuning circuit components were arrived at experimentally to achieve a vfo frequency of 5.0 to 5.5 MHz. I did not use C3 for calibration purposes in my unit, but simply pruned L1 until the desired range was obtained. Depending on the capacity of your variable, the value of C4 may need altering to bring the vfo into the desired range.

I would encourage you to use parts you have available and experiment a little. In some cases, I have even pulled plates out of the variable capacitor to arrive at the range I wanted—just go slowly, and remember, you can't put the plates back in!

It is not necessary to regulate the voltage to this vfo because the voltage supplied by the Kenwood socket is regulated. The whole unit is connected to the Kenwood transceiver by a 9-pin plug which mates a 9-pin tube socket in the Kenwood rear panel.

Stability has been found to be good. From a cold start my vfo drifts 80 Hz in the first five minutes, and less thereafter. This amount of drift is really not detectable without the aid of a counter.

Good luck with your project and good DX—on split frequencies. My thanks to Brian Dunn for the photography. ■

Maximize That Multimeter

—add a few features the manufacturer forgot

Most amateurs probably have relatively inexpensive solid-state multimeters that fall somewhere in the class between old tube-type VTVMs and the digital generation of multimeters. Such "middle generation" multimeters can still suffice for many noncritical applications around any shack. After all, for occasional troubleshooting one does not need an auto-zeroing, auto-polarity, and auto-ranging digital marvel. So don't look forlornly at your multimeter and wish it were a digital with one-inch readouts; why not add a few little convenience features to it and enjoy the instrument as being a good buy at yesteryear's prices?

This article presents a potpourri of ideas which I have tried on my Heath IM-17. They can be used on almost any multimeter to improve the instrument's performance and convenience in actual use.

One thing that was all too easy to do with the Heath IM-17 was to leave it turned on when not being used and thus run down the three-dollar mercury batteries the manufacturer recommends to power the transistor circuitry. So, one of the first items added was an LED flasher circuit to indicate that the meter was turned on. The LM3909 circuit (Fig. 1) was used. The LED itself was mounted on the front panel of the meter and can be seen in Photo A, just under the letter "M" in "voltmeter".

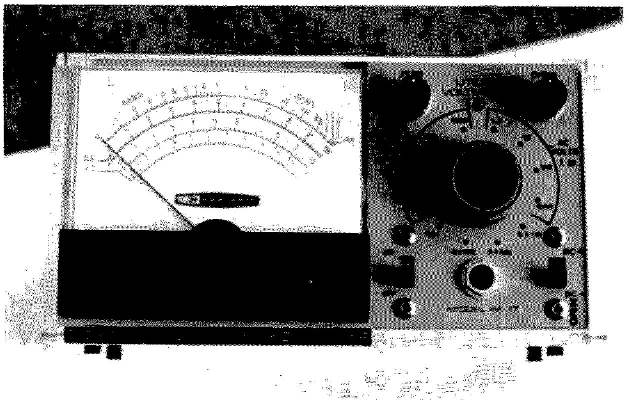

Photo A. Front panel of the IM-17.

The LM3909 itself was mounted on a piece of perforated board stock inside the meter. In the Heath IM-17, the on-off switch also switches the 1.5-volt battery used for the Ohms circuit, so pin 5 of the LM3909 was simply connected to this circuit. The LM3909 can be used with any battery voltage, however, simply by connecting a suitable series resistor to pin 5 (experiment with 1 kilohm for a 9-volt battery). Considering that the whole LM3909 circuitry cost around $1.50, its installation has paid for itself many times over in battery savings.

The IM-17 was housed originally in a plastic carrying case that folded shut. The case was fine for field work, but very awkward for bench work. So, as shown in Photo B, it was rehoused in a home-built Plexiglas™ case. One need not construct such an elaborate housing if a standard-size metal enclosure can be found. However, the Plexiglas was on hand and it is a relatively easy material to work with, using ordinary hand tools.

The next step was to modify the awkward test lead setup in the IM-17. Like many multimeters, it had three test leads: a common lead, one lead for ac/Ohms, and one lead for dc voltage measurements. The number of leads was awkward and the types of leads supplied were more suited to 10-Ampere battery circuits than transistor circuitry. As shown in Fig. 2(a), the only reason for having a separate dc lead was so that a 1-megohm isolating resistor could be used in the dc probe. Most modern multimeters do not have such a resistor, and the usefulness of such a resistor is debatable.

As shown in Fig. 2(b), the resistor was moved back into the inside of the IM-17 circuitry and this resulted in there being only two test leads needed for all functions. The resistor was re-

tained in the circuitry so as not to upset the input impedance of the dc-measuring circuitry. The accessory jack on the front panel was used for connection to the test leads. The use of the jack allows one to use a variety of test leads, shielded or unshielded, and test leads permanently connected to accessory probes.

The ordinary test leads used are small, flexible wire types with grabber-type test clips at the ends of the leads (Radio Shack 278-1160). However, there are instances when a test prod is useful. So, as shown in Photo C, a regular test prod can be used with one of the grabber test clips by means of a short length of wire attached to the test prod. A piece of insulating tubing is slipped over the grabber test clip when it is used with the test prod. This arrangement of test leads has proven to be very handy and a vast improvement over the original test lead setup.

The IM-17 has a front-panel switch marked DC+/DC−. It is simply a DPDT switch which reverses the dc test leads for polarity reversal in case one has connected the leads falsely in a circuit. In reality, I rarely used it. But what did prove to be annoying was the constant need to open and short the test leads several

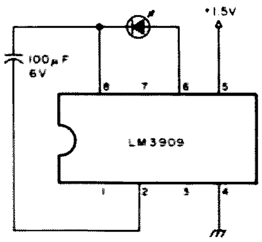

Fig. 1. An LED flasher guards against leaving the battery circuit turned on in a multimeter. The flashing rate is about 1 Hz.

times when making Ohms measurements, so that the ZERO and OHMS controls could be used to set the meter deflection. The polarity reversal switch was simply rewired to short the test leads, when desired, for Ohms adjustments; and it really does get some use in this application.

When testing any solid-state devices using resistances measurements, it is important to know the polarity of the voltage that appears at the test leads. Many VOMs have circuitry such that the red lead is really negative for Ohms measurements. Most solid-state multimeters, such as the IM-17, are wired so that the red lead is always positive. There are exceptions, however, and one should check a given instrument.

A disadvantage of most multimeters for solid-state

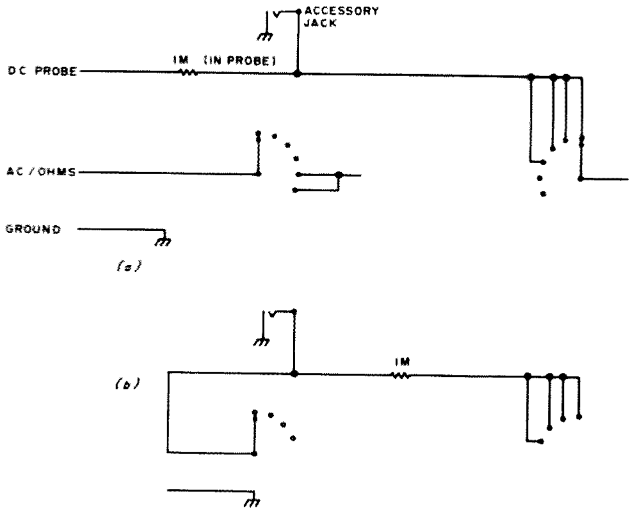

Fig. 2. Moving the 1M resistor inside the IM-17 allows two test leads (plugged into the accessory jack) to be used for all functions.

work is that they place too much voltage across the test leads. For instance, when in-circuit measuring the 10k resistor shown in Fig. 3 using a meter which has 1.5-volt Ohms batteries, the Low-Ohms range produces enough voltage across the test leads to cause the transistor base-to-emitter junction to conduct. The 10k resistor would be shunted and a false resistance reading obtained.

Most digital multimeters, on the other hand, have low-power Ohms ranges where only 0.1 volt appears across the test leads, so that transistor junctions can't conduct. There is no sense in rebuilding an existing multimeter to obtain low-power-Ohms operation, since we can obtain some of the advantages of this feature in other ways. The first thing to do is to study the resistance measurement circuit used in a given instrument. It will normally consist of the usual 1.5-volt battery with series resistances for different resistance ranges and the meter circuitry placed across the series circuit. The series range resistors determine the current that flows and, therefore, the voltage that

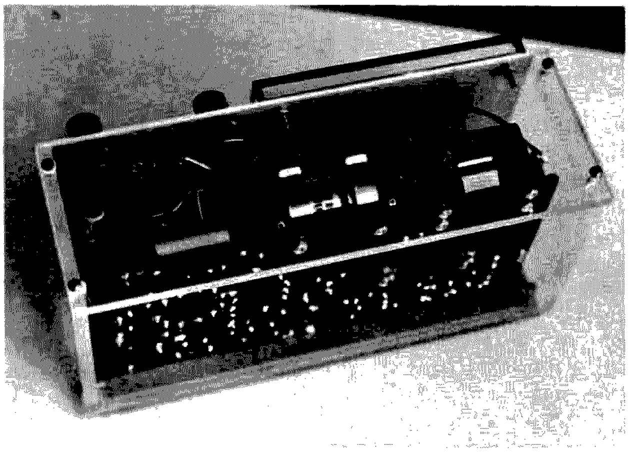

Photo B. The IM-17 mounted in a home-built Plexiglas housing.

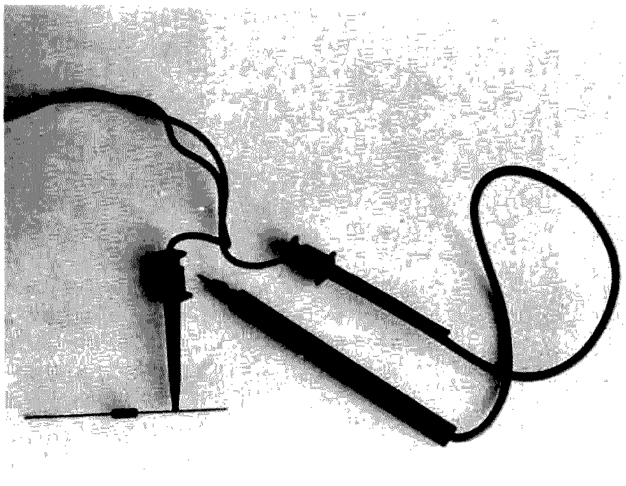

Photo C. New test leads as discussed in the text.

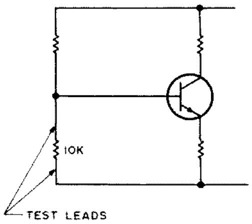

Fig. 3. If the voltage across the test leads causes the transistor base-to-emitter junction to conduct, the 10k resistor cannot be measured in-circuit.

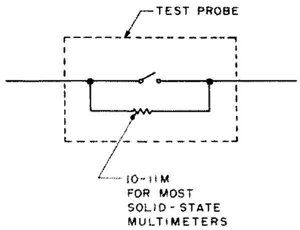

Fig. 4. A simple switchable resistor can add a 2 × range extension feature to a multimeter for dc voltage measurements.

appears across an external resistance being measured.

By exercising Ohm's law a bit, one can readily determine the maximum resistance that can be measured before the voltage across the external resistor exceeds 0.1-0.2 volts. In the case of the IM-17 on the 10 × R range, it is about 75 kilohms. So, if one has a general idea of the value of in-circuit resistors one is trying to measure, a suitable resistance range can be chosen to prevent too much voltage from appearing across the test leads. Another approach is to place a resistor across the test leads which is dimensioned to keep the voltage across it to about 0.1-0.2 volts. Then external resistors are measured as paralleled resistors. Admittedly, this is an awkward procedure but it does work where great accuracy is not needed.

A nice feature of many digital multimeters is an overrange capability when making voltage measurements. So, if one is measuring a voltage just slightly greater than that for which the range switch is set, a reading will still be obtained. Usually one doesn't err that much when setting a range switch. For instance, one might think that a voltage is 9 volts and have it turn out to be 12 volts. So, a range switch might be set to 10 volts, and not to the next step of 100 volts.

A simple way to add an overrange feature to an analog instrument is by means of a series resistor in a test lead as shown in Fig. 4. The value of the resistor has to be found by experiment to suit the input impedance of a given instrument. For the IM-17 on the dc voltage ranges, it is about 11 megohms. When the resistor is in the circuit, the voltage ranges are doubled. The 0-1-volt range becomes a 0-2-volt range, etc. Having the resistor and switch mounted in a test prod housing makes operation very convenient and fast.

Finally, it is often useful to display a brief summary of an instrument's specifications on its front panel. Often when confusing test readings are obtained, the cause is that the loading characteristics of the instrument are affecting the measurement. Note on the front panel of the IM-17 (Photo A) that the ac/dc loading characteristics are shown using a small taped label below the meter. If a given instrument has ac/dc current ranges, don't neglect to note the voltage drop across the various current ranges. Some meters have significant voltage drops on their current ranges which can lead to false readings when measuring currents in low voltage circuits. ■

Amateur Radio, Super Hobby!

—a breezy new intro to the world of hamming

Amateur Radio, Super Hobby! *by Vince Luciani K2VJ. Cologne Press (PO Box 682, Cologne NJ 08213), 139 pages, $8.95 softcover, $14.95 hardcover.*

You're trying to interest a friend at work in ham radio. You cast about for an adequate definition of what the hobby is like and what it means to you. More often than not, you can't put the right words together. You find it hard to express exactly what it is you get out of hamming. So, you do the next best thing and try to recommend some reading material. Nothing stuffy or technical and certainly none of those frightening license manuals. What you need is a breezy introduction to the world of recreational radio. Unfortunately, breezy introductions to ham radio are hard to find. Most introductory texts get mired in details, hung up on technology, and in a rut over regulations.

Your friend, her interest waning, is beginning to question the appeal of a leisure-time activity that requires tough licensing exams, a fortune spent on equipment, and an affinity for self-abuse. Eventually, she buys a membership in a racquetball club, plays once a month, and avoids the weird electronics freak she works with. You blew it.

What you should have done is given her a copy of *Amateur Radio, Super Hobby!* by Vince Luciani K2VJ. This new book is the easy reading overview all Elmers have been waiting for. Within its 144 pages, most of the aspects and appeal of hamming are isolated, identified, and examined. More importantly, the book keeps its focus on the most intriguing element of our hobby, the people. Almost 1/3 of the book is devoted to interviews with and stories about people who also happen to be hams.

The book contains 42 short chapters. The chapters present the detailed vignettes that make up the larger canvas of ham radio. Chapters cover a broad range of topics, and titles include: What Is It?, Who Can Join, How to Join, DX, Then And Now, Big People—Little People, The Benefits, Ladies in Amateur Radio, Equipment Costs, The Shack, Amateur Magazines, The Novice Exam, FCC Gettysburg, Roll Your Own, and many more.

In a particularly poignant chapter called "The First Time Through," Luciani isolates the moment of the first successful Novice QSO, a moment most of us have experienced but many have forgotten. As I read his account, I, too, remembered.

He writes, "You have stumbled your way through your first CQ call... When you finish, you stand by with fingers gripped unfeeling around a pencil you intend to write with... You almost hope no one will respond so that you might put this off for another, more relaxed, time... and then you find out. 'That's my callsign! Someone heard! Someone is answering!' May I suggest that you savor the moment? It will never come again."

In an equally vivid passage in the same chapter, Luciani captures another moment familiar to most hams but totally alien to the non-ham, the late-night QSO.

"The hour is well past midnight. The house is perfectly quiet... Lights are out, even in your ham shack, except for the soft, reassuring glow of dial lights. This is the supreme moment in which to seek the companionship of another hobby member—one who also is awaiting the predestined crossing of your lives. This, you will find, is a moment in time when the distant world seems entirely at peace. When life itself seems to hang loose and when all seems right within the security of your den. This is the moment in which to make a new friend... This, to me, is truly what amateur radio is about."

Amateur Radio, Super Hobby! is full of such moments. It is one of the few books I've read that successfully telegraphs the enjoyment and excitement of our usually misrepresented hobby in a way the non-ham can understand. As an added plus, the book provides the neophyte with sound advice on the easiest and least expensive ways to get involved with ham radio.

It is written with feeling, adequately illustrated with cartoons, carefully laid out, and produced with attention to quality and detail. It is unique in its people-oriented approach to the subject and, at present, has no equal in the area of introductory amateur literature.

If you have a potential convert to the cause of ham radio within your grasp, this book might just bring them over. At the reasonable price of $8.95, it's certainly worth the investment. And, as you yourself read it, you may find that it evokes some fond and long forgotten memories of your own ham career. It is thoroughly enjoyable and I highly recommend it.■

A Guide to Amateur Radio

—book review of an English import

A Guide to Amateur Radio by Pat Hawker G3VA. 18th edition, 144 pages, paperback, £2.99 (including postage and handling) from RSGB (35 Doughty Street, London WC1N 2AE, Great Britain) worldwide, published July 25, 1980.

After a steady diet of American radio books, it can be quite illuminating to read a book written from an English amateur's point of view. *A Guide to Amateur Radio* (published by the Radio Society of Great Britain) offers insights into hamming in another country and is an excellent all-around book on ham radio, no matter which side of the pond you stand on. While many American books immediately overwhelm the reader with facts and formulas, this book gives information in a conversational style. The author assumes that your goal is to own and operate your own radio station, not just pass an exam. Theory is described in different terms than American books use, and the fresh approach can lead to a new understanding of technical matters.

The first chapter answers many questions asked by newcomers to ham radio. Subjects covered include cost, callsigns, and how to become an amateur. The second chapter is called "Getting Started," and it prepares the reader to do just that. Propagation and the construction of listening antennas are subjects of special interest to someone who is just beginning to listen to both amateur and shortwave transmissions. Also discussed are station layout, test equipment, and different modes of transmission. Theory is consistently worked into the text at places where questions naturally arise.

A well-illustrated section on the history and development of radio gear is included, and there are short notes on about 250 pieces of radio gear in current use. A chapter entitled "Workshop Practice" covers all aspects of construction. The author describes in detail everything from materials and tools to the aesthetics of a finished product. With this background, the home-brewer can construct a project that is attractive as well as functional.

At the end of the book are tables and charts of, among other things, Q signals, callsign assignments, band allotment, and common abbreviations. There is also a sample of questions from the British license exam, which is not all that different from the US tests.

Rather than a list of abstract theories you must memorize in order to pass an exam, this book offers enticement and encouragement. It concentrates on the practical things you'll want to know as you assemble and operate your own station. After you read this book, you will be prepared to get your license, but more importantly, you'll be ready to actually use it! ■

Get Your Shack Together

There are few occasions when a certain accessory or item comes along which I personally find overwhelmingly exciting; however, the S-F radio desk is something worthy of considerable excitement! Advertisement photos don't do justice to this item; it's a beautiful and sturdy desk which could set you thinking about remodeling the complete ham shack to match this enclosure.

My first exposure to the S-F desk was at the Atlanta Convention. Its warm pecan finish attracted me like a magnet from several booths' distance. I tried everything short of taking an ax to the desk, and it maintained its sturdiness. Armspan to desk width and height was perfect, and the cutaway sides allowed me to sit sideways and stretch out at an angle I personally enjoy. Here, finally, was a desk I could live with regardless of future equipment changes, operating style changes, physical positions, etc.

Before the S-F desk arrived at my home, my gear had been spread on a 7-foot table (a door between sets of file drawers) and stuffed into a shelf unit behind the desk. Although two low-band kilowatt rigs, a QRP rig, an OSCAR rig, 2-meter FM, and two SSTV setups were included, I could only operate one setup without banging knees into drawers or moving gear each day.

My need for numerous drawers coupled with my desire for massive air circulation around a large rf amplifier ruled out the larger S-F desk (48 inches wide, rather than the standard 36-inch version; other dimensions identical). Finally the solution evolved: Install the S-F desk against a wall adjacent to the other desk, shorten the 7-foot desk to 3 feet, and use the area between desks for rf amplifier power supplies and incoming antenna leads. The station's SSTV camera also was placed in this area, permitting it to view either operating position. Then a Yucca tree was added purely for decor. The final result is two complete setups which can be operated independently or simultaneously as desired—without moving gear or banging knees.

The S-F desk is shipped in two approximately 3-foot by 1-foot packages for ease of handling. It goes together in around an hour's time, with S-F furnishing everything but the furniture polish. The desk's bottom struts and braces affix to rear sections, and are thus out of the way regardless of leg position. A small strip also is included for providing "stops" for gear in the angled rear area. Incidentally, I found the simple assembly instructions easy to follow (I'm not mechanically inclined), and all sections were a perfect fit.

Like many amateurs, I do not like to enclose radio gear or obstruct air circulation. Open areas on the S-F desk (particularly around the sides) ensure equipment cooling while also providing room for installing and removing the plastic covers I keep on my gear during periods of nonuse. What else could one ask! Since adding the S-F desk to my shack, I've begun truly enjoying the pleasures of comfortable operating and the benefits of a second desk for working on projects or articles while also tuning the bands. More than once I've fallen asleep at the S-F desk merely because of the new comfortable position never obtainable with other desks. In fact, I've even been thinking of using another S-F desk for the upcoming home office. They're great!

If you're looking for a way to package that prized equipment while also providing an extra measure of in-shack comfort, check out the S-F radio desk.

W2NSD/1 NEVER SAY DIE

editorial by Wayne Green

from page 8

Several of the new modes of communication which I have written about recently have the possibilities for getting amateur radio growing again, the way FM did. I'm most anxious to have ham experimenters get going on these and keep us up to date via *73* on progress. The recent FCC announcement that they would at long last encourage experimentation was a fantastic boost for us. Can someone at the FCC actually be listening? And reading?

MAKING MONEY

Every now and then I hear from a reader who is not making a lot of money. This is a pity when you consider the opportunities out there for making money these days. We are getting into the age of electronics, and certainly radio amateurs have a golden opportunity to take advantage of this change in the world.

A few years back, I wrote in my editorials about the possibilities for getting into the security business. A few readers paid attention to this and went for it, starting, as I suggested, on a part-time basis. Many of them have built large security businesses as a result, some going into millions of dollars.

This is still a very good business for hams to get into. It does not take an electronics genius, and some of our ham equipment is immediately applicable. For instance, while you can buy most of the accessories you need from a few major suppliers, you should know how to tackle any radio links you might want to use for a silent and very secure alarm. This is particularly good for merchants wanting to know when someone has broken into their store.

An understanding of slow scan will enable you to set up systems which will let store owners see what is going on in their place of business over the telephone. This is also invaluable for small businessmen who want to see their offices, warehouses, etc., from afar.

An understanding of microcomputers will enable you to take the next step and have the slow-scan signals processed for change to provide an alarm. The microwave and ultrasonic systems are fine for this, too. With crime increasing, there is an ever-growing need for security for businesses and homes. This is still an infant industry.

The microcomputer business is another natural for hams. The same perversity of human nature which gets people interested in hamming seems to attract people to computers. Our polls show that over 20% of the hams have microcomputers already!

In this new field there are plenty of opportunities... to open and run computer stores, to service computers, to write programs, to get into repping, distribution, designing new circuits, manufacturing, writing books and articles, advertising... it's endless. I know that I am in serious need of a wide variety of skills and interests... needing people for documentation, program evaluation, editing, proofreading, typesetting, drafting, advertising, ad sales, repping, data processing, financial management, legal organization, marketing, packaging, distribution... and so on.

The micro field, which has been growing at a rate of over 300% per year for over five years, shows no sign of slowing down. Micros are now getting into businesses and schools as well as to hobbyists and homes. The big firms are starting to wake up, which will mean all the more sales as IBM, DEC, and others plunge in. There are still abundant opportunities to make a lot of money in this field.

Another field which shows signs of unlimited growth is the satellite communications industry. Like the micro field, it started out with hobbyists, growing initially on their interest. But the *big use for* satellites will very soon be for data communication, and this means more opportunities for entrepreneurs. Hams, who have plenty of opportunity to experiment with microwaves, are in a beautiful position to take advantage of this growth.

My own recent experiments with 10-GHz communications gave me a lot of insight into the use of these microwave frequencies. If you remember, I spent a few months working with Chuck Martin WA1KPS, and we established the still-firm record of communications between New Hampshire and six other states ... seven in all. All contacts were made on paths of over 50 miles and our New Hampshire contact was over 100 miles! Most were made with simple antennas, though climbing to the top of my local mountain was the most grueling part. That was not easy!

The reception of satellite TV for homes is an exciting and fast-growing business. Prices are tumbling as mass production techniques and large-scale integration are applied to this new service. A couple years ago you had to figure perhaps $15,000 or so for a workable installation. Now they have that down to around $5,000. Our own KLM, maker of ham antennas, is one of the pioneers in this field. Many of the pioneers are hams!

As microcomputers proliferate, it will not be long before they are being used for electronic mail. Now, while a one-page message can be encoded so it can be sent over the phone wires in about one second, this still will not speed up the slowness of the phone dialing system. As more and more messages are routed over phone lines, the delays in using the dialing system are going to bog down Ma Bell.

Cool heads tried many years ago to get Bell to use separate signaling systems for dialing up numbers. This would have been much more efficient than using the communications lines. It also would have avoided all of this nonsense Bell is having with customers getting into their switching circuits with blue boxes and such. Well, the Bell folks ignored the wiser heads and now they are in trouble.

The most obvious answer to the coming congestion of the Bell lines will be to go to satellites. First we will be using radio techniques, but I think that it won't be long before the volume of traffic will dictate the use of laser links, since each of them can carry incredible bandwidths of information.

With satellite-system inventing, manufacturing, selling, servicing, installing, and so on becoming one of the biggest industries in the world, and with the ground floor wide open for you, what better business to get into right away? Much of the needed inventing can be done on the ham bands, so this is a particularly valuable opportunity for us. We can invent and pioneer the equipment they are going to be using in ten and twenty years.

Yes, Bell may be able to expand their service by using glass lines instead of wires, but I think the need for communications is going to grow much faster than Bell will be able to cope with. So much of their equipment is hopelessly obsolete... and with a need for a complete redesigning and rebuilding of their switching system, we are looking at 20 years ... and satellites are there right now, ready to handle the needed capacity.

THOSE UGLY AMERICANS

A few years ago, shortly before my first visit to Jordan, I was called on 20m by an American visiting in Israel. I mentioned that I expected to be in Jordan in a few days. He said that he and his wife were touring in Israel and would like to go to Jordan. I suggested that this was not exactly a bright idea, Jordan at that time being almost an occupied country by the PLO. He brushed that aside.

A few days later, after I'd arrived in Amman, I found a note in my hotel mailbox to the effect that this chap had arrived and would like to get together with me. I called his hotel and found that he had come by way of Cyprus. I was scheduled to have dinner with His Majesty that evening and to present my plan for the setting up of amateur radio in Jordan to the government the next day, so I suggested we get together the next evening.

It didn't take long for trouble to erupt. The next day I got word that he had been downtown and

gotten into a fight with the PLO. I'd suggested that he *not* go downtown, as I had been advised. The PLO troops were everywhere and spoiling for trouble, driving around by the truckload. The American library had just been burned out and the American Embassy compound stormed (unsuccessfully, except for a lot of broken windows and a fire-gutted car), so there was a definite strain between the US and the PLO.

Later, I found that two main things had gone wrong. First, his wife had been wearing a miniskirt, despite this being a flat no-no for Arab countries. Second, he had apparently been taking pictures of the PLO and their trucks. These two circumstances led a PLO soldier to get irritated, which quickly escalated to our ham friend being hit over the head with a rifle.

Cooler heads prevailed and the PLO later offered to take our ham and his wife on a tour of the country at their expense, but he was so upset that he told them where they could go and boarded the next plane out of the country.

It took a lot of chutzpah for a Jewish chap to come to Jordan at that particular time...just days before the civil war between the PLO and King Hussein's government. It took more to flaunt the miniskirt in an Arab country...and more, yet, to walk around downtown during the tense time between the PLO and the government...and particularly the PLO vs. the US. Openly taking pictures kind of capped it.

The next thing I heard about this charmer was a rash of complaints from India, where he had gone from Jordan. The Indian amateurs were absolutely furious because he had managed to screw up their long-planned DXpedition to the Laccadive Islands. Apparently he had bragged over the air that he had permission to go to the Laccadives, while the Indian amateurs had been unable to get such permission. The government officials were not amused and canceled the Indian trip, which had been years in the arranging.

As this chap went on around the world, I got similar reports from other countries. He was a moving ham disaster area.

Many of the transgressions of Americans came to roost when the ITU meeting was held in Geneva in 1971 to discuss the amateur use of satellites. Our group (the ARRL) found, much to its surprise, that a situation had built up in the Third World where radio amateurs had a very bad name. The confrontation could have been avoided if representatives of amateur radio had bothered to find out where we stood before the meeting. Much of the built-up frustration could have been vented and ironed out by such preliminary meetings. But, as the president of the League said, "We didn't do our homework."

The fact is that American amateurs have a long history of being arrogant, lying, devious, and ignoring the interests of other countries. One of the reasons that amateur radio is still not legal in Turkey stems from the Americans who operated there after WWII. The Turkish government allowed them to operate, but stipulated that they were *not* to indulge in message handling. So what did they do? Phone patches by the gross. They were repeatedly warned and went right on with phone patches...and amateur radio was lost for over 30 years in Turkey. Yes, those were *American* hams.

In other African countries, we have had DXpeditions come in and ask for special permission to operate, promising propagation studies in return for the permission. These were never delivered...nor were they ever intended for delivery.

Other US amateurs abused countries all over the world by operating without licenses, by signing calls of other countries, by running more power than permitted, and so on. One American ham sat in Casablanca and signed the calls of at least four other countries...contacts that are still honored by the ARRL for their awards. No one knows how many of Don Miller's contacts were invalid—for another example—but they are still accepted by the League.

Another well-known DXpeditioner signed the calls of many African countries he never visited...and even some islands. These cards are all just fine for DXCC.

Well, these transgressions get around and undermine the honor of amateur radio. They came to roost at Geneva when we lost over 99% of our satellite frequencies. They will continue to come to roost if we don't get on the stick and see that they stop. DXers, frantic for a contact with a DXpedition at any cost, do not help. DXpeditions soon discover that they can charge $50 to $100 or more for a "new" country and that everyone on the Honor Roll *has* to go along with the payment. If they don't, they lose their place on the list and the chances are good that they will never again get back where they were.

In case you want to find some uglies closer to home, just tune our DX band any evening or weekend and hear the jamming of rare DX stations by US amateurs. Every DXpedition or operator in a rare country will tell you all about it.

I operated recently from Provo Island in the Turks and Caicos Islands. That's only fairly rare, not real rare. Still, a dozen or so amateurs took the time to try to jam signals...US amateurs. I don't think there is any way to shame the people who are so unfeeling of the fun of others, so perhaps we need a different approach to this. I'm thinking in terms of a jamming certificate for the most enthusiastic jammers. In this way they will get recognition for their skills and nastiness. Also, we'll know just who they are in case we ever come up with vigilante committees, complete with tar and feathers.

I have an advantage when I go on a short DXpedition in that there are many other things which I can do if the jamming gets to be a problem. There are scuba diving trips to the coral reefs, snorkling, going around the islands taking pictures, visiting with local hams, talking with the governments about amateur activity, and eating...ever popular with me. I enjoy hamming, but I also enjoy all the other things there are to do. Chaps who go on a DXpedition and nothing else can only try to jump from one band to another to get away from the harassment.

If anyone has any good ideas on ways for amateurs to clean up our act on a worldwide basis, this forum is open.

DX

Yuri Blanarovich VE3BMV
Box 292
Don Mills
Ontario M3C 2S2
Canada

73 has selected as its new DX Editor Yuri Blanarovich VE3BMV. First licensed in 1958, Yuri has held the callsigns OK3-5292, OK3BU, OK5BU, FØSY, and VE3BMV/VP9, and has operated OK3KGH, OK3KAG, 4U1ITU, CJ3DCB, and XJ3ZZ/1. He is a four-time world champion and the all-time world record holder in the *CQ* WW and WPX Contests, and also holds a number of Canadian and North American records. As a result of his 300,000-plus contacts, Yuri has worked all DXCC countries, holds 5BDXCC, and has collected more than 200 awards.

Yuri is the founder of the Canadian Contest Championship, CAN-AM contest, and CANADX Net. He also has been president of CANADX, the IBM Radio Club, and the Ontario Contest Club, and chairman of the CANADX and CAN-AM contests, as well as a member of the *CQ* contest committee.

We welcome Yuri on board and ask our readers to furnish him directly with as much and as varied DX information as possible.

FUN!

THE POSTMAN ALWAYS RINGS 612 TIMES

From every state you answered—612 responses in all—and told us what you think about amateur radio. Now the forms have been tabulated and the results are printed below.

Were there any surprises? Well, the number of you responding was a shock—about twice as many as we projected. We were also pleasantly surprised at the time and care most of you devoted to answering the survey. If letter writing is a dying art, we have tons of evidence to the contrary.

In all, the poll seemed to touch a very responsive chord. A number of letters expressed thanks at being included in a poll for the first time (How come Mr. Gallup never comes to my door?) and urged us to run regular surveys in the future. All of your comments are being given due consideration, but our mailman won't put up with another poll for some time. Come to think of it, with an office full of completed response forms, it'll be some time before we're ready again, too.

ELEMENT 1—BACKGROUND

1) Sex:
A) Male—94% B) Female—6%

No surprises here; ham radio continues to remain a predominantly male hobby. One interesting footnote: Most YL response forms were included in the same envelope with their OMs. Very few were independently mailed.

2) Age:
A) 15 or below—0% B) 16-21—4% C) 22-39—52%
D) 40-59—25% E) 60 and above—19%

What happened to the kids? Are postage rates too high or maybe they just don't know how to write? I hope this particular question doesn't reflect amateur radio in general, or we're doomed.

3) License class:
A) Novice—8% B) Technician—10% C) General—35%
D) Advanced—31% E) Extra—16%

About par for the course.

4) Number of years licensed:
A) 1 year or less—6% B) 1-5 years—38% C) 6-10 years—6%
D) 11-20 years—23% E) 21 years and up—27%

Seems about right.

5) Do you have a new (post-March '78) call?
A) Yes—37% B) No—63%

With more than a third of all responses indicating "new" calls, they shouldn't seem strange anymore. Okay, so tell me why a huge number of replies were directed to "K-twelve-U?" That's not a "one," guys, it's an "eye."

6) How many hours a week do you devote to amateur radio?
A) 0-1 hour—6% B) 2-5 hours—27% C) 6-10 hours—42%
D) 11-20 hours—19% E) 21 or more hours—6%

On the whole, a pretty active bunch.

7) Which HF bands do you use most?
A) 80-75 meters—14% B) 40 meters—18% C) 20 meters—12%
D) 15 and/or 10 meters—44% E) Don't operate HF—12%

Only 12% on 20 meters? Sure doesn't sound that way. Eighty meters seems a bit on the low side, too. But those sunspots really seem to be helping 15 and 10.

8) Which VHF/UHF band do you use most?
A) 6 meters—6% B) 2 meters—68% C) 220 MHz—4%
D) 420 MHz and/or up—0% E) Don't operate VHF/UHF—22%

This question asked which VHF/UHF band you used most, not which band you're on. That might explain why hardly anyone picked D, since most UHF ops are probably also on 2. Nevertheless, the apparent lack of UHF activity is disturbing.

9) Which mode do you use most?
A) SSB—44% B) CW—24% C) FM—26%
D) AM—2% E) Other—4%

SSB is still tops, with FM narrowly squeezing ahead of CW for second place.

10) How much money have you spent on amateur radio within the past year? (Include QSL expenses, magazine subscriptions, club dues, and other incidental expenditures.)
A) 0-$250—32% B) $251-$500—27% C) $501-$1,000—25%
D) $1,001-$2,500—8% E) $2,501 and up—8%

Soft market.

ELEMENT 2—SOCIAL CHARACTERISTICS

11) Has amateur radio influenced your career choice?
A) Greatly—23% B) Somewhat—25% C) Not at all—52%

Even though 52% chose C, try to think of another hobby with as great an influence on its users.

12) If a Novice sent you a QSL after a QSO with no return package (sic), would you answer it?
A) Yes—96% B) No—4%

Return package? Sorry about the typo; we meant, of course, postage. In any event, the old ham spirit still lives.

13) Do you routinely look up the license class of the person you're talking to in the *Callbook*?
A) Yes—21% B) No—79%

A longtime practice, still apparently used, to self-police our bands. Unfortunately, out-of-date Callbooks *can sometimes lead to embarrassing situations.*

14) Do you think amateur radio was better 10 years ago?
A) Much better—19% B) Somewhat better—32%
C) The same—32% D) Somewhat worse—17%
E) Much worse—0%

A question of perception, since many respondents weren't active 10 years ago.

15) Do you think amateur radio was better 20 years ago?
A) Much better—27% B) Somewhat better—23%
C) The same—27% D) Somewhat worse—14%
E) Much worse—9%

Oh, for the good old days!

16) Did you ever use a "cheat book" to upgrade your license?
A) Yes—12% B) No—88%

A slightly misleading result, since many cited the old ARRL License Manual *as a "cheat book." Your FUN! columnist takes no stand on this issue.*

17) If someone offered you a million dollars, tax free, on the condition that you give up amateur radio forever, would you?
A) Yes—61% B) No—39%

Thirty-nine percent say no. Either they're already rich, have a very deep love for amateur radio, or a million bucks doesn't mean much these days. Probably the latter.

18) Has ham radio ever interfered in your personal relationships (i.e., time with your wife, husband, children, lover, etc.)?
A? Yes—54% B) No—46%

Confirming what was widely suspected.

19) Have you ever tried to interest a family member in amateur radio?
A) Yes—88% B) No—12%

An amateur's evangelical urges know no bounds.

20) Do you think most hams have a sense of humor?
A) Yes—90% B) No—10%

Then why are so many QSOs as sharp as a sledgehammer?

21) Do you get upset when you hear hams "kidding around" on the air?
A) Yes—8% B) No—92%

Save the bicarb!

22) Have you ever intentionally jammed a repeater or otherwise purposely interfered with a QSO?
A) Yes—14% B) No—86%

My goodness! Fourteen percent admit it! Heaven save us!

23) Do you think amateur radio lowers your neighbor's opinion of you?
A) Yes—6% B) No—94%

Sure, neighbors just love antenna towers and TVI. That's why they're always trying to pass laws down at Town Hall to limit our hobby. Guess they're just trying to get us to spend more time with them.

24) If your closest ham friend beat you in a major contest, how would you feel?
A) He must be a better operator than me—76%
B) Contesting is just luck—6%
C) The contest was set up unfairly—0%
D) It was easy for him to win; he has better equipment—14%
E) He must have cheated—4%

A response that would have made Jack Armstrong proud.

25) Do you make most of your friends through amateur radio?
A) Yes—25% B) No—75%

See, we do talk to other people besides hams.

26) When attending a ham club meeting, flea market, or convention, do you wear a callsign badge?
A) Yes—76% B) No—24%

Hi! My Name is John, KI2U!

27) If you answered yes to the above question, what size is your badge?
A) 1 line—10% B) 2 lines—72% C) 3 lines—15%
D) 4 lines—0% E) Larger—3%

Wonder what the 3% who indicated E wear? Billboards? Must keep an eye out for them.

28) If your closest friend won a Collins KWM-380 in a contest, would you feel jealous?
A) Yes—37% B) No—63%

What a bunch of liars.

ELEMENT 3—OPERATING HABITS

29) Do you depend on a Morse code reader or microcomputer code display for most of your CW QSOs?
A) Yes—6% B) No—94%

The ear wins!

30) What sort of CW sending device do you use most?
A) Straight key—51% B) Regular keyer—29%
C) Memory keyer—4% D) Keyboard—8%
E) Never send CW—8%

I'm sorry; I'm sorry; I'm sorry. Yes, a thousand apologies for leaving out everybody's favorite CW sending device—the semi-automatic keyer (commonly known as "The Bug"). Please don't pin my coax or set fire to my house. I confess my sin and promise to genuflect daily in front of an ad from the Vibroplex Company.

31) If required, could you solidly copy CW at the speed at which you were licensed?
A) Yes—79% B) No—21%

Hah! I'll bet that all you people who circled B used to dishonestly sign your renewal 610 back when the FCC made you attest to your code speed.

32) Have you ever purposely operated in an amateur subband you weren't licensed to use?
A) Yes—10% B) No—90%

On the whole, fairly respectable.

33) Do you think the FCC affects amateur radio in a positive manner?
A) Yes—44% B) No—55%

Washington, are you listening?

34) What do you think of the new ham exams? (Answer this even if you have never personally taken one of these new tests.)
A) Excellent—6% B) Good—30% C) Fair—38%
D) Poor—18% E) Terrible—8%

So-so marks.

35) Just for the heck of it, have you ever talked to a friend on the wrong sideband (e.g., LSB on 20 meters)?
A) Yes—33% B) No—67%

Give it a try sometime; it's fun.

36) Do you ever speak to foreign, non-English-speaking hams, in their own language?
A) Always—2% B) Sometimes—14%
C) I attempt it—20% D) Rarely—10% E) Never—54%

¿Que? Imagine if those foreign hams had the same attitude.

37) Do you think "gentlemen's agreements" have any value?
A) Always—35% B) Sometimes—63% C) Never—2%

No wonder our bands are in the shape they're in.

38) Do you feel you are competent to replace the finals in a tube-type rig?
A) Yes—88% B) No—12%

And 10% probably can't change a light bulb.

39) Do you feel you are competent to replace the finals in a transistor-type rig?
A) Yes—79% B) No—21%

This 21% probably doesn't own a soldering iron.

40) Have you ever built an electronic project from a kit?
A) Yes—96% B) No—4%

No, wait; most hams do own a soldering iron, but obviously need instructions on how to use it.

41) Have you ever home-brewed an electronic project from a book or magazine?
A) Yes—77% B) No—23%

There's hope yet.

42) Have you ever designed your own electronic project?
A) Yes—62% B) No—38%

Pretty good.

43) After meeting a ham radio acquaintance in person for the first time, do you usually think:
A) He is better looking than you thought—6%
B) He is worse looking than you thought—27%
C) He is about what you expected—67%

To me, it's always a shock: "You don't look like a 'BQV!' "

44) On the whole, compared to the general public, do you think:
A) Hams are much better looking—4%
B) Hams are somewhat better looking—8%
C) Hams are average looking—62%
D) Hams are somewhat worse looking—20%
E) Hams are much worse looking—6%

No matter what the survey shows, hams are ugly. Why do you think most aren't interested in ATV?

45) Have you ever operated a specialized mode (i.e., RTTY, slow scan, etc.)?
A) Yes—40% B) No—60%

Too bad.

46) What do you think of contesting?
A) Great—12% B) Good—17% C) Okay—38%
D) Don't like it—27% E) Despise it—6%

A split decision.

47) What do you think of DXing?
A) Great—27% B) Good—36% C) Okay—25%
D) Don't like it—8% E) Despise it—4%

Seems popular.

48) What do you think of repeaters?
A) Great—38% B) Good—38% C) Okay—20%
D) Don't like them—4% E) Despise them—0%

Best thing since sliced bread.

49) What do you think of traffic handling?
A) Great—15% B) Good—35% C) Okay—35%
D) Don't like it—11% E) Despise it—4%

What's to hate?

50) Do you ever secretly hope that a mild disaster will strike your community just so you could display your amateur radio skills?
A) Yes—25% B) No—75%

Let's move this 25% to low ground.

ELEMENT 4—A CLOSER LOOK

To conclude our poll, we've taken a closer look at these three questions:

12) If a Novice sent you a QSL after a QSO with no return postage, would you answer it? (Poll respondents who spent over $1,001 on amateur radio in the past year, only.)
A) Yes—87% B) No—13%

On the whole, worse than the average respondent. Maybe that's how many get their money—saving on QSL expenses.

19) Have you ever tried to interest a family member in amateur radio (YLs)?
A) Yes—67% B) No—33%

Not as evangelical as OMs.

42) Have you ever designed your own electronic project (Extra-class licensees)?
A) Yes—63% B) No—37%

Virtually the same result as given by hams in general. Are Extras really that much smarter?

Many and deep thanks to everyone who participated. Special thanks to AF2M and WB2LWJ for suggesting questions and counting the results.

VK/ZL/OCEANIA RTTY DX CONTEST

Contest periods:
0000 to 0800 GMT Saturday, June 6
1600 to 2400 GMT Saturday, June 6
0800 to 1600 GMT Sunday, June 7

This contest is now being organized and conducted by the Australian National Amateur Radio Teleprinter Society. Entry classes include: single-operator, multi-operator, and SWL. Each station may be worked only once per band, but may be worked on another band for further multipliers.

EXCHANGE:

Serial number consisting of RST, zone number, and time in GMT.

SCORING:

As per CARTG Zone Chart, multiplied by the number of countries worked, multiplied by the number of continents worked (6 max.). After the above calculations, world stations add 100 points for each VK/ZL station worked on 20 meters, 200 points for each on 15 meters, and 300 points for each on 10 meters. Countries count as per the ARRL list of countries, except that each VK, ZL, JA, VE, VO, and W/K district counts as a separate country. Contacts with one's own country count as zero points for multipliers.

AWARDS:

Awards will be issued for 1st, 2nd, and 3rd on a world basis and also on a country basis.

ENTRIES:

Logs must show in this order: date and time (GMT), callsign of station worked, serial number sent and received, points claimed. Logs of multi-operator stations must be signed by all operators, together with a list of their callsigns. Logs of SWL listeners must contain both numbers sent and received by the station logged. Incomplete loggings are not eligible for scoring. Logs must be received by the Contest Committee by October 1st. Address all logs to: W. J. Storer VK2EG, 55 Prince Charles Road, French's Forest, 2086, N.S.W., Australia.

Summary sheet must show callsign of station, name of operator(s), and address of same, bands used (a separate log is required for each band), the points claimed for each band, number of VK/ZL stations worked, total points claimed, and signature(s).

The judges' decision regarding the placings in the contest will be final and no correspondence will be entered into regarding the same. The logs become the property of the Contest Committee on completion of checking.

NEW YORK STATE QSO PARTY

Contest Periods:
1700 GMT June 6 to 0500 GMT June 7
1200 to 2359 GMT June 7

The contest is sponsored by the University of Buffalo Amateur Radio Society. Mobiles and portables changing counties may be worked again. NY stations may work each other.

EXCHANGE:

RS(T), serial number, and QTH consisting of state, province, country, or NY county.

FREQUENCIES:

Phone—3900, 7275, 14285, 21375, 28550.

CALENDAR

Jun 6-7	VK/ZL/Oceania RTTY DX Contest
Jun 6-7	New York State QSO Party
Jun 14-15	ARRL VHF Contest
Jun 19-20	Summer SMIRK Party Contest
Jun 24	The Wednesday Night Contest
Jun 28-29	ARRL Field Day
Jul 1	CARF Canada Contest
Jul 17-23	SWOT QSO Party
Aug 8-9	European DX Contest—CW
Aug 15-16	SARTG Worldwide RTTY Contest
Aug 15-17	Rhode Island QSO Party
Aug 22-23	Ohio QSO Party
Sep 12-13	European DX Contest—Phone
Sep 12-13	G-QRP Club CW Activity Weekend
Sep 12-14	Washington State QSO Party
Sep 26	DARC Corona—10-Meter RTTY
Nov 8	DARC Corona—10-Meter RTTY
Nov 8	OK DX Contest
Nov 14-15	European DX Contest—RTTY
Dec 26-31	G-QRP Club Winter Sports

CW—1810, 3560, 7060, 14060, 21060, 28060.

Novice—3725, 7125, 21125, 28125.

SCORING:

Score 5 points per QSO. NY stations multiply by the number of states, provinces, and countries worked. Others multiply by number of NY counties worked, 62 maximum.

ENTRIES:

Mail logs by July 10th to: Scott J. Bauer WA2LCC, 816 East Fillmore Ave., East Aurora NY 14052. Include an SASE for results and any possible awards.

SUMMER SMIRK PARTY CONTEST
Starts: 0000 GMT June 20
Ends: 2400 GMT June 21

Sponsored by the Six-Meter International Radio Klub (SMIRK). No crossband contacts, multi-operators, or partial contacts. Check logs or dupe sheets are not needed.

EXCHANGE:

SMIRK number and state, province, or country.

SCORING:

Count 2 points for each SMIRK contact, 1 point for non-SMIRK QSOs. Add QSO points and multiply by number of states, provinces, and countries worked for final score.

AWARDS:

Trophy for overall high score. Certificates for high score in each state, province, or country. Note: Unless there are fewer than 3 active 6-meter operators in a state or country, a minimum of 3 valid entries must be received from that state/country or none will qualify for an award.

ENTRIES:

Entries must be submitted on the Fall, 1980, edition of the official SMIRK log. Single copies are available for an SASE and photocopies may be used. Entries received without all requested information, legibly written, will be disqualified. A return address is also requested. Send log requests and entries postmarked by August 1st to: Don Abell WB5SND, 6821 West Avenue, San Antonio TX 78213.

WEDNESDAY NIGHT CONTEST
Starts: 2100 local time, June 24
Ends: 0200 local time, June 25

Submit your best single hour of operation! This contest is sponsored by the Bluegrass Amateur Radio Federation. Any station may contact any other station on any band below 30 MHz. Crossmode contacts are OK.

EXCHANGE:

Signal report and color of your eyes.

SCORING:

W/VE stations count 1 point each; DX stations count 2 points each. Add bonus points of 25 for WAC, 1000 for WAS, and 10,000 for DXCC and WAZ.

FREQUENCIES:

Phone—3890, 7225, 14275, 21350, 28600.

CW—3705, 7105, 14060, 21105, 27105.

All ± 10 kHz.

ENTRIES AND AWARDS:

Any log form may be used as long as the QSO time (GMT), exchange, callsign of station worked, and point value is given. Dupe sheet is not required. A certificate will be awarded to the top 3 entries. Disqualifications for claiming a duplicate contact or (and I quote the contest sponsor!) "logging on toilet paper." Logs must be postmarked within 10 days of the contest and sent to: Scott Wills WA4YOF, 340 Eagle Creek Drive, Lexington KY 40502.

CANADA CONTEST
Starts: 0001 GMT July 1
Ends: 2359 GMT July 1

Sponsored by the Canadian Amateur Radio Federation (CARF), the contest is open to all and everybody works everybody. Use all bands from 160 to 2 meters on CW and phone combined. Entry classes include single-operator, all band; single-operator, single-band; and multi-operator, single-transmitter, all band. All contacts with amateur stations are valid. Stations may be worked twice on each band, once on CW and once on phone. No crossmode contacts, and no CW contacts in the phone bands are allowed.

EXCHANGE:

Signal report and consecutive serial number starting with 001. VE1 stations should also send their province (NS, NB, PEI).

SCORING:

Score 10 points for each contact with Canada, 1 point for contacts with others. Score 10 points for each contact with any CARF official news station using the suffix TCA or VCA. Multipliers are the number of Canadian provinces/territories worked on each band and mode (12 provinces/territories × 8 bands × 2 modes for a maximum of 192 possible multipliers). Contacts with stations outside Canada count for points but not multipliers.

FREQUENCIES:

Phone—1810, 3770, 3900, 7070, 7230, 14150, 14300, 21200, 21400, 28500, 50.1, 146.52.

CW—1810, 3525, 7025, 14025, 21025, 28025, 50.1, 144.1.

Suggest phone on the even hours (GMT), CW on the odd hours (GMT). Since this is a Canadian-sponsored contest, remember to stay within the legal frequencies for your country!

AWARDS:

The CARF Canada Contest Trophy will be awarded to the highest score single-operator entry. Certificates will be awarded to the highest score in each category in each province/territory, US call area, DX country, and to the highest score from a Canadian non-Advanced amateur.

ENTRIES:

A valid entry must contain log sheets, dupe sheets, and a summary sheet showing a chart of multipliers per band/mode and score calculations. Send entry with comments to: Canadian Amateur Radio Federation, 203-1946 York Avenue, Vancouver, B.C. V6J 1E3, Canada.

Results will be published in *TCA*, the Canadian amateur magazine. Non-subscribers may include an SASE for a copy of the results.

RESULTS

RESULTS OF THE 3RD VK/ZL/OCEANIA RTTY DX CONTEST 1980

Single-Operator

1.	DJ6JC	793,282
2.	VK5RY	774,996
3.	JA6GIJ	611,038
4.	VK3KF	539,435
5.	VK8HA	481,184
6.	VK4AHD	388,080
7.	F8XT	352,432
8.	I1TXD	320,082
9.	W5HEZ	266,900
10.	DF2OK	253,680
11.	VK1GM	228,756
12.	G3HJC	227,028
13.	ZL2BR	204,536
14.	JA8ADQ	179,800
15.	VK2AHB	137,984
16.	KØPJ/6	113,164
17.	VK2AJT	122,720
18.	Y43ZK	102,436
19.	JR2TZL	91,484
20.	ZL2ALW	83,424

Multi-Operator Stations

1.	VK2TTY	1,207,340
2.	VK2DGA	520,352
3.	HB9Z	422,900
4.	DKØMM	180,420
5.	OZ8JYL	99,200
6.	LZ1KDP	95,300
7.	OK3VSZ	79,308
8.	DF5LK	37,555

SWL Stations

1. Horst Ballenberger DL SWL 64,472
2. Jaroslav Dedic 62,864

HAM HELP

I want to talk with someone who has successfully solved ignition noise problems in a 1977 Honda Accord which interfere with 2-meter operation.

Jim Weitzman K3JW
11417 Hounds Way
Rockville MD 20852

I have a power inverter/charger, model # KG-666 by Knight Kit, and need a schematic or owner's manual. I will pay any reasonable fee for a copy. Thank you.

Lowell G. Wilson
1104 Wentland Drive
Mason MI 48854

I have a model 210 Bearcat scanner and it doesn't go lower than 146 MHz. My need is from 142 MHz up. If anyone has made a modification of this kind, I would appreciate the help. Thanks.

Wm. Green WØGVT
22055 Cook Lane
Morrison CO 80465

I am interested in finding other hams with a passion for the Middle Ages/Society for Creative Anachronism.

Charles E. Martin AB4Y
PO Box 3370
Bowling Green KY 42101

NEW PRODUCTS

AEA'S PFDF RADIO DIRECTION-FINDER

AEA has announced the first product in a new line of radio direction-finders. The AEA Model PFDF is a highly accurate rf direction-finder using the Doppler spun array technique and featuring a self-contained and preprogrammed computer.

The PFDF offers 1° resolution with a 3-digit LED display. A ring of discrete LED indicators surrounding the 3-digit display gives the operator instant course bearing information.

The PFDF will work with virtually any FM receiver (including the popular scanners) by simply plugging into the receiver external speaker jack. The receiver audio gain control is set for proper level as indicated by the PFDF front-panel level indicators. A built-in audio amplifier and speaker in the PFDF allow the operator to independently adjust the monitor level. The Doppler sample tone gives the experienced operator a good indication of when multipath signals are being received. An audio filter is provided to reduce the amplitude of the tone for more pleasant monitoring.

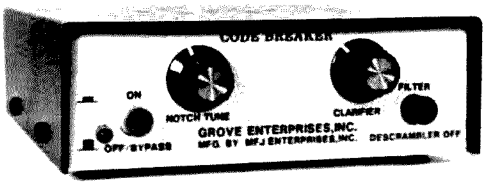
Antenna positioning is not an arduous mechanical task with the PFDF. A calibration offset bearing may be programmed into the PFDF to calibrate the antenna on a known transmitting source. This feature is especially effective in extending the frequency range of a single antenna system. It also allows calibration when the PFDF is used with more than one receiver, each having different phase delays. The offset information is stored with a separate battery keep-alive circuit when the main power switch is turned off.

Three sample modes are offered by the PFDF. A slow sample mode gives an updated bearing once per second. The fast sample mode updates the bearing three times per second on a continuous basis. The sample and hold mode is activated after pressing the function button so that the next time a signal is present (even for a fraction of a second), the PFDF will determine the bearing and display it until reset.

The PFDF is supplied with a VHF high-band antenna that will operate over a frequency range of 130 to 175 MHz. The antenna consists of four dipoles that are switched with PIN diodes driven by the PFDF computer. Other mating antennas will be made available in the future for other frequency bands.

Power for the PFDF can be derived from any 12 V dc source or from an optional internal rechargeable sealed Gel Cell battery pack. BCD output of the three-digit bearing information is available for such things as feeding another computer from more than one source for triangulation purposes.

For further information, contact *Advanced Electronic Applications, Inc., PO Box 2160, Lynnwood WA 98036; (206)-775-7373.*



Grove Enterprises' Code Breaker descrambler.

CODE BREAKER DESCRAMBLER

A product claimed to be the most advanced consumer voice descrambler ever made available to the public has been announced by Grove Enterprises.

The Code Breaker contains an internal speaker and a tunable notch filter. Simply by plugging the Code Breaker into the external speaker jack of a scanner, the listener can restore normal speech to the vast majority of scrambled speech encountered by scanner listeners. Tone masking, frequently used to thwart reception by conventional competitive descramblers, is easily eliminated by the tunable notch filter.

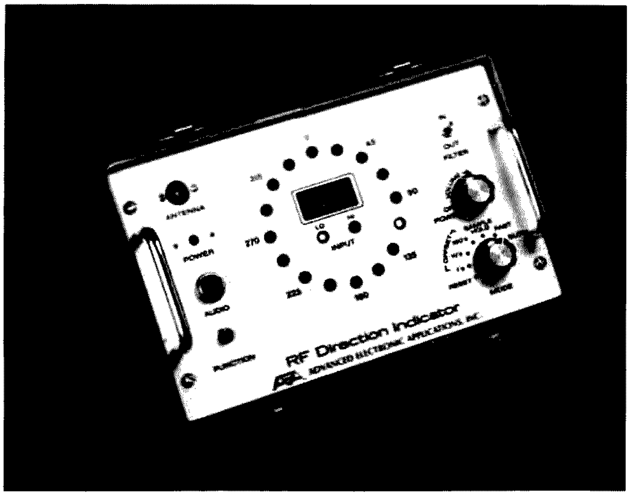
When conventional communications are being monitored, the Code Breaker filter circuit may be used to reject interference from the squeals, whines, and irritating sounds which commonly plague the busy communications spectrum. The Code Breaker is optimized for voice frequencies, improving intelligibility when used with existing receivers.

For further information, contact *Grove Enterprises, Dept. K, Brasstown NC 28902; (800)-438-8155.*

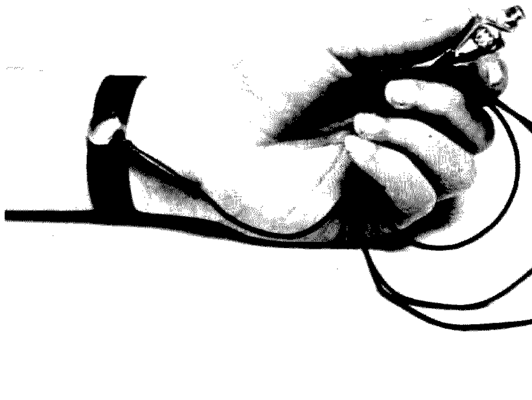
CONDUCTIVE WRIST STRAP PROTECTS DEVICES AND USERS

A new, conductive wrist strap that features an integral resistor to safely ensure constant grounding in static sensitive areas has been introduced by Charleswater Products, Inc. The CP401R conductive wrist strap features a 1-megohm fixed resistor for optimum static dissipation and user safety. Comfortable and lightweight, it attaches with a Velcro® fastener and uses a swivel snap to conveniently disconnect from the ground cord.

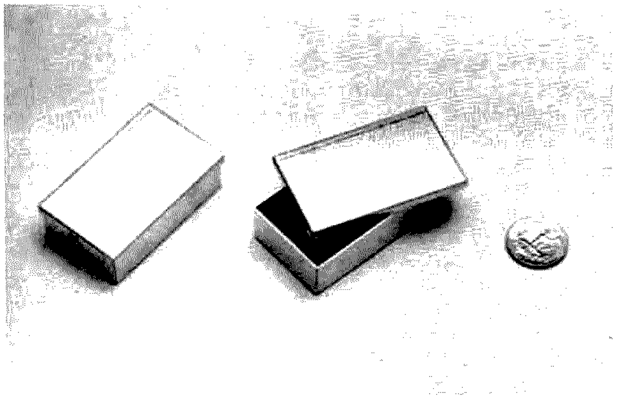
Provided with a battery clip



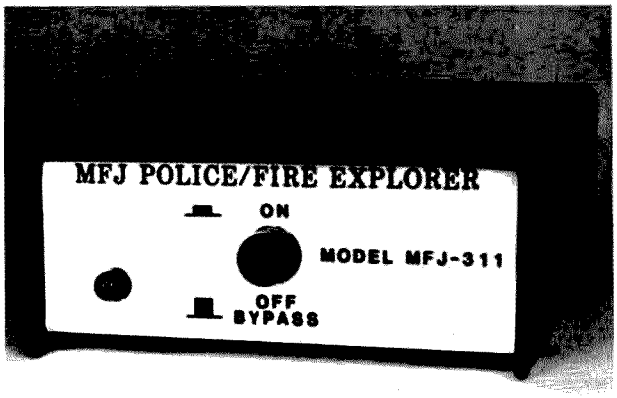
AEA's PFDF radio direction-finder.



Charleswater Products' CP401R conductive wrist strap.



Nordal Electronics' precision packages.



MFJ's Police/Fire Explorer.

for easy grounding. The CP401R has a polyester band and an insulated copper wire cord. The resistor is located close to the band for safety and the strap comes in 4' and 6' lengths.

For further information, contact *Charleswater Products, Inc., 87 Cresent Road, Needham MA 02194; (617)-449-1811.* Reader Service number 482.

PRECISION ALUMINUM ELECTRONIC PACKAGES

Nordal Electronics has introduced a new line of precision aluminum boxes for electronic packaging which can be made in any size with no tooling or setup charges. The boxes and removable covers are made of .032 aluminum and can be used to package rf circuits, amplifiers, filters, oscillators, magnetics, and other electronic circuits. They can be used alone or mounted on a PC board to provide a shielded package with a removable cover. Special packages can be made with holes for connectors, feedthroughs, standoffs, or mounting brackets.

For further information, contact *Nordal Electronics Company, 9995 Monroe Dr. #205, PO Box 20175, Dallas TX 75220; (214)-350-9515.* Reader Service number 487.

MFJ'S NEW POLICE/FIRE EXPLORER

The MFJ Police/Fire Explorer, Model MFJ-311, will convert any two-meter synthesized or vfo rig to cover the VHF high-band police and fire frequencies. If your rig covers 144-148 MHz, just insert the MFJ-311 in line with the antenna, connect power, turn on the converter, and you are ready to receive 154-158 MHz. If your rig covers a larger or smaller section of the band, then with the MFJ-311 you can receive a correspondingly larger or smaller section of the VHF police and fire band. The frequencies between 154 and 158 MHz contain nearly all FCC-allocated VHF high-band police and fire activity.

You have direct frequency readout from your rig. If your rig indicates that you are receiving 145.55 MHz, just turn the converter on and you are receiving 155.55 MHz.

A push-button switch turns the MFJ-311 on and off. In the off position, the converter is bypassed and you are ready to transmit (very low insertion swr). If you forget and transmit with the converter on, it won't burn out (up to 25 Watts).

The new Police/Fire Explorer is small (only 3" × 4" × 1") and has a mobile mounting bracket for installation in your car. It is black and eggshell white and operates on 9-18 V dc.

For further information, contact *MFJ Enterprises, Inc., PO Box 494, Mississippi State MS 39762; (800)-647-1800.* Reader Service number 483.

CURTIS 8044M ADDS SPEEDMETER OUTPUT

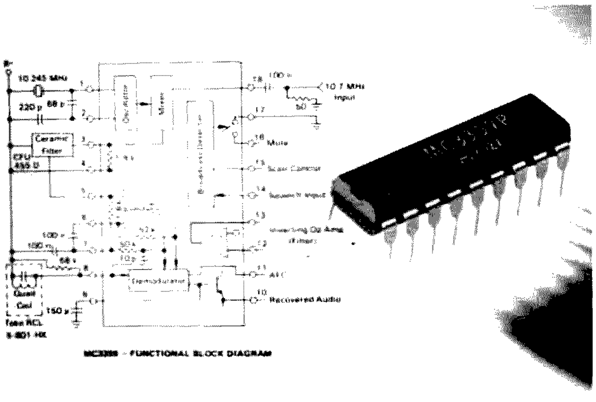
An interesting enhancement of the popular 8044 CMOS keyer has been introduced by Curtis Electro Devices. Called the 8044M, this new integrated circuit adds an output designed to drive an analog meter for speed indication. Speed indication from 6 wpm to as high as 100 wpm can be accomplished by simply adding two capacitors, a resistor, and a 100-uA meter. The meter indication can be calibrated to be well within a 5% tolerance. The reading is stable, even at the lowest speeds.

The addition of two extra pins at the end of the package allows a pin-for-pin fit with the standard 8044. One of the pins is used for a timing capacitor and the other drives the meter directly. This allows retrofitting in many existing keyers with relative ease.

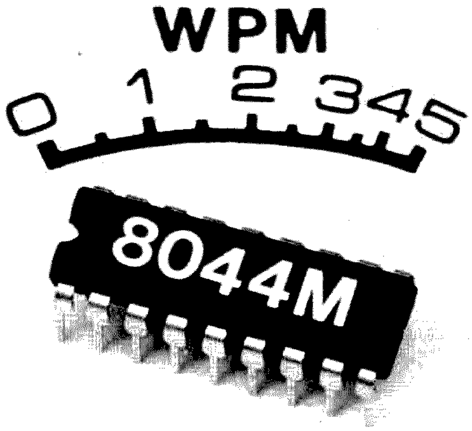
For further information, contact *Curtis Electro Devices, Inc., Box 4090, Mountain View CA 94040; (415)-494-7223.* Reader Service number 481.

IC FOR VOICE COMMUNICATIONS INTRODUCED BY MOTOROLA

Motorola now offers an FM i-f circuit with exceptionally high



Motorola's MC3359 voice communications IC.



Curtis Electro Devices' 8044M speedmeter chip.

gain and low power consumption for narrowband FM receivers and transceivers found in voice-communications and energy-management systems. It is designated the MC3359, and includes oscillator, mixer, limiting amplifier, afc, quadrature detector, squelch scan control, and op-amp (active filter) circuits.

The MC3359 provides a recovered audio output voltage (typical) of 700 mV. Current drain remains low—at 3.0 mA (typical) from a 6.0-V power supply—and the sensitivity is 2.0 uV (typically) for −3.0-dB input limiting.

In actual operation, the mixer-oscillator combination converts the input frequency down to 455 kHz, where, after external bandpass ceramic filtering, most of the amplification is done. The audio is recovered using a conventional quadrature FM detector. The absence of an input signal is indicated by the presence of noise above the desired audio frequencies. This "noise band" is monitored by an active filter and a detector. A squelch-trigger circuit indicates the presence of noise (or a tone) by an output which can be used to control scanning. At the same time, an internal switch is operated, which can be used to mute the audio.

Use of the MC3359 allows the elimination of many discrete components which would normally be employed in a similar voice communications or energy-management system and results in a considerable cost savings.

For further information, contact *Motorola Semiconductor Products, Inc., PO Box 20912, Phoenix AZ 85036.* Reader Service number 488.

SWITCHCRAFT PUBLISHES NEW CONNECTOR CATALOG

Switchcraft, Inc., has published a new 36-page catalog on audio and general-purpose connectors and ac receptacles. The catalog (No. C502f) includes product descriptions, full engineering specifications, detailed drawings, and mating charts showing connecting compatibility with similar products.

The catalog includes such Switchcraft products as Tini "Q-G" miniature connectors and accessories; "Q-G" audio connectors (including a variety of panel and wall-plate receptacles, adapters, inserts and accessories); "Slim-Line" audio connectors and accessories; various other microphone connectors, CB connectors, and phone plugs and jacks; and ac receptacles for electrical/electronic applications.

For further information, contact *Switchcraft, Inc., 5555 N. Elston Ave., Chicago IL 60630.* Reader Service number 486.

FOUR-CHANNEL REMOTE CONTROL SYSTEM

Advanced Analog Systems, Inc., has announced a four-channel remote control system kit with radio frequency carrier. It is capable of two channels of analog and two channels of digital control through the use of a pulse code modulation technique. The transmitter modulates the rf carrier with a unique series of pulses and the receiver decodes the pulses and generates appropriate analog and digital signals for the devices being controlled.

The analog information is represented by pulses of varying duration, while digital information is encoded and decoded by means of a pulse-counting technique. The pulse-counting technique was chosen to avoid the costly timing circuitry required at both the transmitter and receiver with other digital encoding schemes. The digital commands are implemented via open/short connections (SPST switches, relays, etc.). The analog information is encoded by varying a control potentiometer.

The rf carrier is modulated to produce a pulse train which consists of one long pulse (for synchronization) followed by several shorter pulses. The first two shorter pulses are pulsewidth modulated and contain the analog information for channels 1 and 2. Following the two analog-encoded (PWM) pulses, there will be either 1, 2, 3, or 4 short pulses representing the 4 possible combinations of the two digital inputs (2 SPST switches, open or closed).

A unique feature of the transmitter is a regulator which keeps the radiated output power constant even under varying supply voltages. This is very desirable in battery-powered remote control applications. Maximum output power is achieved when the transmitter is operated from a 9-V battery. The rf output is down only about 1 dB when the supply voltage drops as low as 5 V. Typical sideband amplitudes 10 kHz from the center frequency are 50 dB down, allowing close physical proximity on closely-spaced channels.

The receiver provides latched outputs for the digital information. Two bidirectional servo amplifiers with internal pulse-width detection completely decode the two analog channels. The servo amp's output is capable of bidirectional operation yet still requires only a single supply. Each servo amplifier output is capable of a 400-mA load. The dead band of each servo amp can be modified independently by changing one capacitor on the receiver card.

Amplitude modulation of the pulse-modulated waveform of up to 60% results in continued error-free transmission and decoding of the signal. The AM rejection provides a high degree of protection from interfering signal sources. This feature is extremely important for operation in industrial environments. Typical operating "radio range" is 150 to 200 feet. The digital outputs of the receiver card are capable of sinking 100 mA—sufficient for driving small lamps, buzzers, relays, etc.

Typical applications include remote switching, data recovery systems, medical data monitoring, toys and games, alarm systems, remote temperature sensing, carrier current systems, remote peripheral monitoring, environmental controls, remote motor control, communications systems, etc. The kit includes a transmitter and a receiver PC board and all components necessary to develop a complete 4-channel remote control system (antenna and battery clips are not included).

For further information, contact *Advanced Analog Systems, Inc., 790 Lucerne Dr., Sunnyvale CA 94086; (408)-730-9786.* Reader Service number 484.

Washington DC 20016

POWER PLAYS, PLOYS, AND PARLEYS

By the time you read this, the whole thing might be resolved. The FCC would have consolidated its offices and moved into new surroundings. Although they wanted to move just across the Potomac to Rosslyn VA and the idea seemed like a shoe-in, it ran into a little trouble.

You may have heard or read about the Rosslyn incident, how the FCC decided at the last minute to reconsider the move. This was all true. But here's the story your newspaper didn't tell you.

It all started last year when the FCC decided it needed more office space. Believe me—it does. Not only that, but it's scattered over five buildings in downtown Washington DC, making communications between some bureaus difficult.

So the Commission did what it's supposed to do. It asked the General Services Administration for help in finding new digs. That's the GSA's job, procuring everything from paper clips to real estate.

But the GSA, according to FCC officials, wasn't responsive. It dragged its red-taped feet and kept the situation in abeyance. Why? Who knows. Maybe just bureaucracy. In any event, the FCC got angry, enlisted some friends in high places, and got a rider attached to an 11th-hour Congressional appropriation bill that gave the FCC special dispensation to find its own property within two miles of the District, sign the lease, and move in.

Now the FCC doesn't know much about finding property, so they did what they thought was right. They used contacts, friends of contacts, uncles of friends of contacts. They used consultants, $680-a-day consultants, and they used newspaper ads. They received about ten offers, narrowed it down to two

choices, and finally decided upon a beautiful piece of land known as Rosslyn Towers. It's a beautiful place, great view of the District, and besides, most of the commissioners live in Virginia.

So, when it came time to sign the lease, they were ready. However, a new administration took control and some congressmen took a dim view of the way the FCC cut the deal.

For one thing, they believed the FCC's actions might set a bad precedent. After all, you can't have an agency getting things done quickly and efficiently—albeit a little unorthodox and perhaps straddling the ethical fence just a tad. Also, the new representatives didn't get a piece of the action and neither did their friends.

The Subcommittee on Buildings and Grounds held a hearing on the move to Rosslyn. Representing the FCC were Acting Chairman Lee, Commissioners Jones and Washburn, staff, and their lawyer.

Lee did most of the talking, related his tale of woe, and told subcommittee members that the FCC planned to vote on the move the next day and he would recommend to his fellow commissioners that they OK the lease. Subcommittee members didn't like that at all and asked Lee to hold off for a while until further studies could be undertaken.

Lee said the Commission was tired of waiting and would go ahead with the move. Subcommittee members didn't take to that either, and Representative Solomon (R-NY) asked, "Even if we brought legal actions to stop the move?"

Lee said he would stick to his guns.

Solomon didn't like that even more and said: "If you meet tomorrow and sign that lease a few days later, I guarantee that legal actions will be taken."

Lee said he would still do it.

Then Solomon, his face a little red, said: "This *is* a threatened injunction!"

And Lee, swallowing just a bit harder, said he would still recommend to his colleagues that they sign the lease and move in.

You can't just say that to a congressman and get away with it. These guys have egos, you know.

So, the subcommittee chairman, Representative Fary (D-IL), listening coolly, put on his best tough high-school principal face and said he wanted to see *all* the commissioners at a special meeting of the subcommittee tomorrow at 9:30 sharp. But Lee said that the FCC's meeting was at that time, and Fary said: "OK, after the meeting; 2:30."

And the gavel hit the wood. Hard.

Never before has a congressional subcommittee threatened a governmental agency with an injunction. Nobody even knows if they can. But it really didn't matter because the next day the FCC, in closed session, voted 3-2 not to sign any leases until the new chairman, Mark Fowler, takes office. Incidentally, Commissioners Lee and Jones voted against the measure. And the special subcommittee meeting in which the other commissioners were supposed to attend was canceled.

And that, ladies and gentlemen, is how things are done at the Center of the Empire.

SOME MORE FRIENDS IN HIGH PLACES

The Capitol Hill Amateur Radio Society, which not only has friends in high places but has members in high places, petitioned the FCC to repeal recent rules that disallow new club licenses.

Sitting at the March 19 Commission meeting, you hardly noticed the commissioners say "dismissed." They said it so fast you barely heard it. You could, however, hear them say: "Next on the agenda."

BILLS, BILLS, MORE BILLS

Every year, hundreds of bills are introduced in Congress and most of them never make it out of committee. You usually get a newsletter from your representative saying that he submitted this bill and that, and "Hey, it's not my fault if they didn't go along with my proposal to cut taxes 50%."

Such might be the case with H.R. 2203. It's not a new idea. It was submitted last session as H.R. 8445.

The new bill amends the Communications Act of 1934, permitting the FCC to use volunteers—hams and CBers—for purposes of monitoring violations of the Act by hams and CBers. It also would permit hams to administer license tests to the "least privileged class of amateur stations operator license." If I'm not mistaken, don't we already do the testing portion?

The bill got a positive response from Gerald Reese, executive director of REACT, whose letter of praise for the bill was written into the *Federal Register* but not orated on the House floor.

The ARRL also had its response to H.R. 2203 read into the *Federal Register*. The group supports the bill.

GOOD NEWS FOR BAD GUYS

HFers take note: At last word, the FCC was running fast, trying to escape Reagan's budget ax. The dust hasn't cleared, but Acting Chairman Lee said that the FY '81 budget included a program to phase out five special enforcement teams and reallocate their resources to establish ten smaller offices. Two were just opened—Little Rock and St. Louis—and they must be closed due to lack of funds. The following, that were to be opened, won't be: Phoenix, Des Moines, Salt Lake City, Tulsa, Nashville, Greensboro, Spokane, and Albuquerque.

In addition, two heavies, special enforcement teams in Detroit MI and Powder Springs GA are being closed.

Lee also said that the current program of traveling to about 77 cities on a monthly, quarterly, or annual basis to give ham and commercial license tests would be cut to an annual basis only.

How much of this will really happen is anyone's guess. All agencies plead "worst case" when their budgets are about to be reduced. However, it's fairly certain that proposed cuts will curtail FCC services, especially in Private Radio which takes a back seat to other bureaus like Broadcast or Common Carrier. If it means the FCC will leave us alone more, perhaps we should be thankful.

SOME INTERESTING THINGS

—The FCC is receiving complaints from hams that bootleggers are riding the high seas. It seems that amateur radio is sc efficient for long-haul marine traffic that some private mariners toss out the HF marine band and check into maritime mobile nets for phone patches sans ham licenses.

—A firm in Vienna VA is bouncing signals off meteor trails, using them as reflectors. Links are available 24 hours a day even though bursts are random. The key is the number of burst—billions every day! Operating under an FCC test license in the 30-50-MHz range, Telcorn, Inc. is sending data on a regular basis between its Virginia headquarters and the Watts Bar TN office, about 700 km away.

The company uses a computer-controlled uplink to automatically scan the sky for a usable meteor trail. When it's found, the company "illuminates" the trail with rf. Then data transmission begins.

Trails hover around 90 to 110 km above the Earth, each with a useful life of about 0.2 seconds. Data is sent at 4,800 bits per second. The system can't be used for voice but is full duplex.

Experiments show best results at 1 kW with a 5-element yagi. The system is cheap and easy to use, the company says. One kink is that sometimes you have to wait several minutes for a usable trail. Telcom says the system is no longer in the prototype phase and is all set for commercial application.

—In the first legal decision that long-term microwave exposure can cause death, NY State Workers' Compensation Board has awarded a $30,000 settlement to the widow of a Bell Telephone supervisor. Samuel Yannon of Staten Island died as a result of working near microwave towers atop the Empire State Building for eight years.

He left work in 1970 and filed a workers' compensation claim in 1971 saying that exposure led to his illness and inability to hold his job. He died in 1974, and his widow filed for death benefits. Bell will appeal the decision.

—In case you think teletext, the system in which words and graphics appear on your TV screen after you push the decoder box buttons, is still in the Buck Rogers mode, you're wrong. More than 25 different tests worldwide are in the works, but those tests will become part of everyday life very soon. Everyone's got a different name for it: Viewtron, Viewdata, Telidon, Antiope, Data Vision, Bildschmirtext,

Continued on page 115

KAHANER REPORT

from page 108

Electronic Information Service II, but it's all the same. Some travel over phone lines, others are broadcast by TV stations.

Right now, wars are predicted in Chicago where WGN and WFLD are in competition for their piece of the videotext pie. And in Texas, the Texas Newspaper Publishers are trying their darndest to keep Bell from testing their own information system, afraid that it will eventually cut into their classified ad revenues. (You not only can present news on videotext, but shopper's ads, movie listings, yellow pages—anything.)

Perhaps the most fascinating confrontation is between WGN in Chicago and United Video in Tulsa. UV receives WGN, one of those satellite superstations, and retransmits it to their cable customers. However, in the process they "strip" the empty, unused TV lines that WGN uses for its teletext test. Now, that doesn't bother the folks receiving the station directly, but those who pick it up on cable won't be able to receive the teletext information.

WGN is claiming copyright infringement in that the unused lines are still part of their transmission and that UV alters it without permission. UV claims that unused lines aren't part of a bona fide signal and since they have permission to retransmit the picture, they can do what they like. The courts will decide that one.

AWARDS

Bill Gosney WB7BFK
Micro-80, Inc.
2665 North Busby Road
Oak Harbor WA 98277

WORKED CYPRUS AWARD

This award is available to all licensed amateurs and requires the applicant to work 5B4 and ZC4 stations representing Cyprus. Based on the point system (see Table 1), all contacts must be made on and after July 1, 1962, to be valid.

Applicants outside Cyprus require 32 points if all contacts were on one band, 24 points if on two bands, and only 16 points if three bands were utilized. A total of 12 points must be earned for a four-band accomplishment. Stations may be worked only once per band. There are no mode endorsements.

To apply for this award, prepare your list of contacts and have it verified by at least two fellow amateurs. Forward this list and 10 IRCs to Cyprus Amateur Radio Society, Andy Panayotious 5B4BM, PO Box 1267, Limassol, Cyprus.

WORKED FAEROE ISLANDS AWARD

Known as the WAOY Award, applicants in Europe must attain a total of 35 points while all others must accumulate 20 points. To be valid, all contacts must be made on and after April 11, 1965. Mixed-mode and cross-band contacts are not allowed.

For European stations, each Faeroe Radio Association member contacted counts one point for each band, and club stations OY6FRA and OY6NRA count two points on each band. For stations outside Europe, each FRA station counts one point on 28, 21, and 14 MHz and two points each on the 7- and 3.5-MHz bands. OY6FRA and OY6NRA club stations count 4 points on each band.

Applicants are asked to have their list of contacts verified by at least two radio amateurs. Forward this list along with an award fee of 10 IRCs to FRA Awards Manager, Post Box 184, Torshavn, Faeroe Islands.

DANISH CROSS COUNTRY AWARD

Tage Eilman OZ1WL has sent us details for the Danish Cross Country Award. To be valid, all contacts must be made on or after April 1, 1970. The award is issued for either all CW or all phone. There are no band restrictions.

European stations find that the callsign is the basis for this award. Each call prefix OZ1-OZ9 and OX3 must be contacted. Two contacts with each prefix are permitted on each band with the exception of OX3 where nine contacts may be made on each band. For amateur applicants outside Europe, three contacts are permitted in each of the OZ call districts. OX3 may be worked nine times on each band. Each contact counts one point. Only OX3 stations in Greenland count for this award.

That's only the basis for the award. As for the requirements, European amateurs need to make contacts totaling 50 points while applicants outside Europe must obtain a 40-point total.

To apply, make a list of contacts and have it verified by at least two amateurs. Enclose this application and an award fee of $2.00 or five IRCs to Diploma Manager of EDR, PO Box 213, 5100 Odense, Denmark.

9G1 AWARD OF GHANA

Applicants the world over are encouraged to work toward the Ghana Award. Confirmed contacts are required with five different 9G1 prefix stations of Ghana using a minimum of two amateur bands. There are no band or mode restrictions, but this award is available for all CW, all phone, or mixed modes.

To be valid, all contacts must be made on or after January 1, 1958. The QSL cards must be submitted with your application, along with an award fee of seven IRCs. Forward your request to 9G1 Awards Manager, Postbox 3773, Accra, Ghana.

4 x 4 = 16 AWARD

Members of the Israel Amateur Radio Club are proud to announce the requirements of their four-by-four award. There are no band, mode, or time restrictions for this award, but to qualify applicants must work a minimum of 16 stations in Israel with four bands represented. Four stations on four bands each will meet the minimum requirements.

Do not send QSL cards. Prepare a list of claimed contacts and have them verified by at least two amateurs or a local radio club official. Enclose this application and an awards fee of $2.00 or 10 IRCs to the Israel Amateur Radio Club, Postbox 4099, Tel Aviv, Israel.

5N AWARD FROM NIGERIA

The Nigerian Amateur Radio Society wishes to announce its very popular 5N Award. To qualify for this award, applicants are required to work a minimum of five separate 5N stations of Nigeria. This award also is available to SWL stations on a heard basis. This award is issued for all CW, all phone, and mixed-mode contacts. There are no band or mode limitations or time restrictions.

Once you have attained the required number of contacts, have your list verified by at least two local amateurs and forward your list with an award fee of five IRCs to the Nigerian Amateur Radio Society, Oyekunie Ajayi 5N0NAS, PO Box 2873, Lagos, Nigeria.

9H1 AWARD FROM MALTA

A couple months ago, I listed awards from Malta and failed to

Zone	1.8 MHz	3.5 MHz	7 MHz	14 MHz	21 MHz	28 MHz	144 MHz	432 MHz
20	4	2	0	1	2	4	16	32
1, 2, 3, 6, 7, 10, 12, 19, 24, 25, 26, 27, 28, 29, 30, 31, 32	16	8	4	2	4	8	—	—
All other zones	8	4	2	1	2	4	16	32

Table 1. Points for Cyprus Award.

Zone	1.8 MHz	3.5 MHz	7 MHz	14 MHz	21 MHz	28 MHz	All other bands
14, 15, 16, 33, 34	5	3	2	1	3	5	25
All other areas	15	12	6	2	6	10	45

Table 2. Band points per 9H1 contact.

mention probably their most popular award program. Sponsored by the Malta Amateur Radio Society, all contacts for the 9H1 Award must be made on or after September 21, 1964 (Malta Independence Day).

The same station may be counted only once per band; only five bands may be used. Fifty points are required for one-band achievements. Forty points for two bands; 30 points for three bands; 20 points for four bands. (See Table 2.)

To apply, prepare your list of contacts and have it verified by at least two fellow amateurs. Forward this list along with your award fee of $2.00 and 10 IRCs to L. Smith 9H1BB, Malta Amateur Radio Society, Doreen House, New St. off Ganu, B'Kara, Malta.

BUDAPEST AWARD

From Hungary, we receive word about the Budapest Award being offered by BRAL (Budapest Radio Amateur League). Only contacts made after January 1, 1976, will be valid. European stations must work a total of 75 different HA5 or HG5 stations to qualify for this award. Duplicate QSOs do not count. There are no band, mode, or time limitations. Endorsements will be made if requested at the time application is made.

Have your confirmed contacts verified by at least two amateurs or a local radio club official. Send your list and award fee of 10 IRCs to BRAL Award Manager, Dezso Tarcsay HA5HA, PO Box 2, H-1553 Budapest, Hungary.

WORKED RAAG MEMBERS OF GREECE

Sponsored by the Radio Amateur Association of Greece, this award is made available to amateurs in three categories. Class 1—European stations must work 100 RAAG members, DX stations need to work 50 stations; Class 2—Europeans must work 75 SV RAAG members, DX stations require 30 member stations; Class 3—Europeans must work 50 SV RAAG members, DX stations must work 15 SV RAAG members. There are no band or mode restrictions. The club station SV1SV counts three award points and five contacts for European stations in all three classes.

Do not send QSL cards. Prepare a list of contacts and have it verified by two radio amateurs or a local club secretary. Enclose this list with an award fee of $2.00 or 12 IRCs to RAAG Awards Manager, Anastasios Panos SV1IG, PO Box 564, Athens, Greece.

PAAC AWARD

From The Netherlands, we learn of an awards program being made available by the very popular organization known as VERNON.

Sponsored by VERNON, this award requires all contacts to be made on or after June 1, 1945, to be valid. The basic PACC Award requires that the applicant establish contact with at least 100 separate PA/PI stations from The Netherlands. Endorsements also are made available for each increment of 100 stations worked.

Do not send QSL cards! VERNON asks applicants to prepare a list of qualifying contacts and have it verified by two amateurs or a local radio organization. Forward your application and the award fee of seven IRCs to Traffic Manager, VERNON, A. Sanderse PA0MOD, Obdammerdijk 2, 1713 RA Obdam, The Netherlands.

4-2-70 SQUARES AWARD

In the stack of mail received last week, I found a very interesting letter explaining a unique award being offered by our friends in England.

While this award may be impossible to achieve for the majority of western stations, operators throughout Europe who read this column might find the rules extremely challenging and within reach.

To qualify for the award, all contacts must be made after December 31, 1978, to be valid. QSL cards must be submitted at the time of application and be arranged in alphabetical order along with a checklist of the QTH squares claimed. There is no award fee, but adequate postage is required for the safe return of your QSL cards. All applicants must be RSGB members.

Awards are issued in four categories: fixed stations, alternative stations, portable stations, and mobile stations. These categories cannot be mixed. Award requirements are:

70 MHz—20 squares, 4 countries
25 squares, 6 countries
30 squares, 8 countries
35 squares, 10 countries

144 MHz—40 squares, 10 countries
60 squares, 10 countries
80 squares, 18 countries
100 squares, 20 countries

432 MHz—30 squares, 6 countries
40 squares, 10 countries
50 squares, 13 countries
60 squares, 15 countries

Forward your award claim to Award Manager J. Hum G5UM, 27 Ingarsby Lane, Houghton-on-the-Hill, Leicester LE7 9JJ, England.

MAN ON MOON

We will once again be operating from the Neil Armstrong Air and Space Museum in Wapakoneta OH, the home town of Neil Armstrong, first man to set foot on the moon.

This is the 12th anniversary operation in commemoration of Neil Armstrong's historic feat [feet, too—yuk, yuk—Ed.]. The dates and times of operation are as follows: July 18-19, from 9:00 am July 18 to 8:00 pm July 19.

We will be operating two stations on the following frequencies depending on propagation conditions.

CW—7.075 to 7.125
phone—7.250 to 7.300
phone—3.950 to 4.000
CW—14.1 ± 10 kHz.
phone—14.300 to 14.350
phone—21.400 to 21.450

All frequencies may not be used, but we will operate on as many as possible. We will use the callsign WD8RVZ. A commemorative QSL will be available, SASE required.

US and Canadian amateurs QSL direct to WD8RVZ, all others please use the bureau. Visiting amateurs may check in on 147.93/.33. "The World of Amateur Radio" will be shown. For further information, contact Gary W. Stolzenburg WD8RVZ, 717 W. Benton Street, Wapakoneta OH 45895.

HIGHLAND GAMES AWARD

Local amateurs in Midlothian IL will be operating a Special Event Station during the Scottish Highland Games in that community.

A commemorative certificate suitable for framing will be issued for any contact made with a Midlothian station during the Games. Look for them on 10 through 80 meters Novice and phone, 0000 GMT June 13 until 2400 GMT June 14, 1981.

To receive this certificate, send QSL and postage—no envelope—to the amateur contacted. For further information, contact Bill McGreevy KA9DES, 14820 Trumbull, Midlothian IL 60445.

FIELD DAY AWARD

The Puget Sound Council of Amateur Radio Clubs will issue a handsome certificate for contacting any three of the six participating council clubs in the 1981 Field Day. Those clubs and their calls are: Boeing Employees Amateur Radio Society (K7NWS); Hams Amateur Mobile Service Club (WA7LAW); Mike & Key Amateur Radio Club (K7LED); Mt. Baker Amateur Radio Club (K7SKW); N. Seattle Amateur Radio Club (W7DA); Radio Club of Tacoma (W7DK).

To qualify for the certificate, you must exchange QSL cards with those three Field Day stations you have contacted. Send those QSLs and one dollar to Scotty Huntley K7CYZ, 802 S. Lawrence St., Tacoma WA 98405. Your QSLs will be returned with the certificate.

TOM SAWYER DAYS

The Hannibal Amateur Radio Club, Inc., will issue a special events certificate from the National Tom Sawyer Days celebration operating from Mark Twain's boyhood home town, Hannibal MO, on July 4-5, 1981. Hours: 1500-2100 UTC on Satur-

day, July 4, and 1700-2100 UTC on Sunday, July 5. Frequencies: 7.245, 14.290, 21.390 MHz, and Novice CW on 7.125 and 21.125 MHz. To receive the certificate, send a large 9" x 12" SASE and your personal QSL card confirming the contact to Hannibal Amateur Radio Club, Inc., WØKEM, 2108 Orchard Avenue, Hannibal MO 63401. For information, contact Clifford H. Ahrens NØBQN, President, Hannibal Amateur Radio Club, Inc., (314)-221-4060 or (314)-221-8618.

FORT NECESSITY

The Uniontown Amateur Radio Club (W3PIE) will be sponsoring a special event on July 4, 1981, starting at 1201 GMT through 2100 GMT to commemorate the historic Fort Necessity American Revolutionary War battlefield. A commemorative certificate will be available to amateurs sending an SASE (4" x 9" or larger) and postmarked not later than July 31, 1981. The operating frequencies (±QRM) will be: CW—21,145 MHz; phone—14,345 and 28,545. Please send correspondence to Uniontown Amateur Radio Club, PO Box 433, Republic PA 15475; Attention: John Cermak WB3DOD.

GLENDIVE MT CENTENNIAL

In observance of the Glendive MT centennial, the Lower Yellowstone ARC will be operating a special event station on July 4, 1981, amidst the festivities in the downtown area. Operating period will be from 1600Z to 2300Z on 7240 and 14280-290, and exchange will be name and signal report. Send a 4" x 9½" SASE to Larry Melton KB7BO, 711 Snyder Ave., Glendive MT 59330, for commemorative QSL.

THREE RIVERS FESTIVAL

The Fort Wayne Radio Club of Fort Wayne IN will have on the air special event stations to celebrate the annual Three Rivers Festival. There will be two operating stations on the air simultaneously, using the calls W9TE and W9IWX. At the time of this writing, 10, 15, and 20 will be used.

A special certificate will be offered to all amateurs contacting these stations during the special event. All amateurs wishing a certificate should send QSLs and a self-addressed, stamped business-size envelope to Fort Wayne Radio Club, PO Box 15127, Fort Wayne IN 46885.

The dates of the special event stations' operation will be July 18-19, 1981. Transmission times are constant during the two days, including the nighttime hours on the 18th.

FRIENDSHIP DAY

Friendship Day 1981 is being celebrated this year by the Allegany Highlands Amateur Radio Club by setting up a commemorative station (KA2CGV) in Friendship NY. This station will be on the air to make as many QSOs as possible on August 2 from 1700 UTC to 2400 UTC. KA2CGV will operate on the following frequencies: phone—7.280, 21.380, and 28.680; CW—7.060, 21.060, and 28.060. To get your special commemorative certificate, send a QSL card and an SASE to Allegany Highlands Amateur Radio Club, PO Box 373, Friendship NY 14739.

Allow me to remind readers of this column that the *73 Magazine* Awards Portfolio is in full swing. If you are interested in learning about one of the most comprehensive programs available, experience the challenge offered by more than twenty individual award incentives, then turn to the September and October, 1980, editions of *73 Magazine*. There's something in it for everyone!

LOOKING WEST

Bill Pasternak WA6ITF
c/o The Westlink Radio Network
Suite 718
7046 Hollywood Blvd.
Hollywood CA 90028

There is a rather important piece of legislation before the US Congress right now. It's titled H.R. 2203, and it has a direct bearing on the future of the US Amateur Service. Its purpose is actually twofold: First, it permits the FCC to legally utilize the talents of volunteer amateur radio operators as "auxiliary ears for the FCC" in monitoring both the Amateur and Citizens Radio Service for those who violate the rules of either.

The bill also addresses another important problem, that of legally continuing the Novice Licensing Program using volunteer examiners. You might remember that an FCC lawyer found the latter to be an illegal program since the current law strictly forbids the use of non-FCC personnel to perform FCC duties. While the Commission has continued to issue Novice class licenses using volunteer examineers, it has been looking for a permanent solution.

The bill you are about to read is the answer. It deals with both problems in a simple, uncomplicated way. It makes use of the talent available within the amateur community, while keeping ultimate authority on regulatory matters within the purview of the Commission itself.

Ray Frost WA6TEY has worked closely with Congressman Dannemeyer's staff in regard to its preparation. To that end, Frost had solicited input from the amateur community. The result of many months of preparation is now before Congress itself. The bill reads as follows:

H.R. 2203

A bill to amend the Communications Act of 1934 to permit the Federal Communications Commission to employ voluntary services for purposes of monitoring violations of the Act by amateur and citizens band radio service station operators and for purposes of preparing and administering examinations for certain amateur station operator licenses.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section 4(f) of the Communications Act of 1934 (47 U.S.C. 154(f)) is amended by adding at the end thereof the following new paragraph:

"(4)(A) For purposes of monitoring any violation of any provision of this Act, and of any regulation made by the Commission pursuant to this Act, relating to amateur station transmissions, the Commission, without regard to part III of title 5, United States Code, may (i) recruit and train any individual licensed by the Commission to operate an amateur station: and (ii) accept and employ voluntary and uncompensated services of such individual. For purposes of recruiting and training such individual, the Commission, without regard to part III of title 5, United States Code, may accept and employ voluntary and uncompensated services of any amateur station operator organization.

"(B) For purposes of monitoring any violation of any provision of this Act, and of any regulation made by the Commission pursuant to this Act, relating to transmissions of any citizens band radio service station, the Commission, without regard to part III of title 5, United States Code, may (i) recruit and train any individual licensed by the Commission to operate a citizens band radio service station: and (ii) accept and employ voluntary and uncompensated services of such individual. For purposes of recruiting and training such individual, the Commission, without regard to part III of title 5, United States Code, may accept and employ voluntary and uncompensated services of any citizens band radio service station operator organization.

"(C) For purposes of preparing or administering any examination for the least privileged class of amateur station operator license established under section 303(1) of this Act, the Commission, without regard to part III of title 5, United States Code, may accept and employ voluntary and uncompensated services of any individual who is licensed by the Commission to operate an amateur station and whose license is not of such class.

"(D) Any person who provides voluntary and uncompensated services under this paragraph shall not be considered, by reason of having provided such services, a Federal employee for any purpose.

"(E) For purposes of this paragraph, the term 'citizens band radio service station' has the meaning given such term in sections 95.401 and 95.603 of title 47, Code of Federal Regulations, including any amendment

to such term as hereafter may be made by the Commission.".

Sec. 2. Section 605 of the Communications Act of 1934 (47 U.S.C. 605) is amended by adding at the end thereof the following new sentence: "This section shall not apply to any receipt, divulgence, publication, or utilization of the contents of any amateur or citizens band radio service station transmission by any individual in the course of providing voluntary and uncompensated monitoring services to the Commission under subparagraph (A) or (B) of section 4(f)(4) of this Act."

From my point of view, H.R. 2203 is a necessity. First, it's a very cost-effective measure in these inflationary times. If passed, it will mean that the FCC will no longer be able to cry poverty in regard to the enforcement of its rules. This is especially important in regard to cases of chronic malicious interference. Cutbacks in the FCC's budget already have been announced.

In mid-March, retiring FCC Chairman Robert E. Lee told a congressional subcommittee that the Reagan budget ax will force a 25% reduction in the agency's Compliance Program, and Field Operations Bureaus in Beaumont TX, Savannah GA, Cincinnati OH, Pittsburgh PA, and Washington DC will be closed down in fiscal 1982. Also, the Monitoring Station in Anchorage AK will be terminated, as will a number of the Commission's Special Enforcement Teams.

The FCC also is dropping quarterly travel to 77 cities for the administration of amateur and commercial exams. In fiscal 1982, these trips will become *annual* occurrences. Some sources say that they may be terminated entirely if monies are not available. This would mean that obtaining an amateur ticket other than Novice could become almost an impossible task for some. Either travel whatever distance is necessary at your own expense or wait for "next year" should you fail! And, if all this were not enough, Lee predicts that the processing time for an amateur license, which is currently 41 days or less, will increase significantly. Expect it to become a minimum of 65 days at best.

Obviously, the Reagan budget places the FCC in a bind. It also places the amateur community in a similar position since these cutbacks seriously endanger the vitality of our service. At least in part, H.R. 2203 offers some relief from this. If enacted, it will take part of the burden off the Commission's shoulders. It will mean continuance of Novice license testing. It will mean that we can expand our efforts to self-regulate our service, and that those who violate the terms of their licenses will not be permitted to continue their activities just because the Commission doesn't have the funding to weed them out. It can help keep our amateur bands from becoming carbon copies of the 11-meter band.

Whether you like or dislike the measure, I urge that you reread it several times and voice your opinion on it. In regard to the latter, your comments should be addressed to the members of the Congressional Subcommittee on Telecommunications, Consumer Protection and Finance. A complete list of all those involved with this committee appears at the end of this column. Also, if you find yourself in support of the measure, why not drop a QSL card to its sponsor, Congressman William E. Dannemeyer, 1032 Longworth Bldg., Washington DC 20515. This as a way of saying thanks to the congressman for his active interest on our behalf.

Also, another QSL to Ray Frost WA6TEY, 14421 Hope St., Garden Grove CA 92643, might be apropos in this case. Without Ray's input, there is no telling what H.R. 2203 might have read like. Thanks to him, it's a rather positive step that helps foster a vital Amateur Service while helping to continue the deregulation process. As you can guess, I support the bill. You must make up your own mind.

FCC ENCOURAGES AMATEUR RADIO EXPERIMENTATIONS

Consistent with a recent Commission amateur radio definition that, "The Amateur Radio Service is for technically-inclined persons who wish to learn about and experiment with radio communications equipment and operating techniques" (Commission Order of November 6, 1980), interested radio amateurs are encouraged to experiment with new methods of transmission and new radio technologies.

The Commission realizes that in certain instances proposed experiments may conflict with existing rules, and may therefore require a Commission rule waiver. The Commission is willing to grant rule waivers for many different experimental purposes, including:

- Spread-spectrum modulation techniques
- Packet-switching networks
- Radioteleprinter codes, other than ASCII and Baudot
- "Beacons" for propagation studies
- Medium-scan television
- Frequency and/or amplitude "compandoring"
- Digitized voice techniques
- Digitized video techniques
- "Trunked" repeater systems
- EME communications

For example, on March 6, 1981, the Private Radio Bureau granted Special Temporary Authority (STA) to 25 radio amateurs affiliated with the Amateur Radio Research and Development Corporation (AMRAD) to experiment with spread-spectrum transmission. (Spread-spectrum is an application of broadband transmission that appears to make more efficient use of congested frequency bands than does conventional narrowband transmission.)

On August 15, 1980, an STA was granted for two years to a radio amateur to conduct experiments in digital phase-shift keying in the HF phone band, where slow-scan television is authorized. During November, 1980, four amateur licensees were granted a rule waiver to permit transmissions of the digital teleprinter code for the purpose of conducting experiments to develop an error-free mode of amateur teleprinter communications. These recent examples represent only a small segment of the many avenues of experimentation open to licensees in the Amateur Radio Service.

Licensees wishing to conduct experiments within the amateur bands should first refer to the Commission's rules to determine if a Commission rule waiver is required. If the experiment may be conducted in accordance with the rules, no communication with the Commission is required. However, if a proposed experiment will conflict with any of the Commission's rules, the licensee conducting the experiment must write to the Commission and request a waiver of the specific rule(s). Waiver request letters should be addressed to: Federal Communications Commission, 334 York Street, Gettysburg PA 17325; Attention: Technical Section.

The content of the waiver request letter should cover complete details of the proposed experiment, including all technical parameters, specific frequencies to be used, and a justification for the project. The Commission will approve or deny your request in writing, and no experimentation may commence until the written approval is received.

FCC NO LONGER ISSUES LICENSES TO NEW AMATEUR RADIO CLUB, MILITARY RECREATION, OR RACES STATIONS

Due to the large number of inquiries the Commission is re-

ceiving pertaining to the licensing of club, military recreation, and RACES stations in the Amateur Radio Service, the following information is provided.

In May, 1980, the FCC adopted a Third Report and Order amending Part 97 of the Commission's rules. This action simplified the licensing and callsign assignment system for such stations in the Amateur Radio Service. Section 97.37 was amended with a new paragraph (b) which reads as follows:

> (b) Only modification and/or renewal station licenses will be issued for club and military recreation stations. No new licenses will be issued for these types of stations.

The text of Section 97.171 was amended also, with the addition of a new paragraph (b) which reads as follows:

> (b) Only modification and/or renewal station licenses will be issued for RACES stations. No new licenses will be issued for RACES stations.

A change in the trustee of a club, person in charge of the military recreation station, or responsible civil defense official will be treated as a modification to the existing station license.

In addition, a change in the station location or a change in the name of an existing station will be construed as a license modification. No new callsign will be assigned.

The desire for a new license seems to arise most often in connection with club stations. The club members can select a licensed amateur radio operator as a trustee for the station and then use the trustee's primary callsign as the club's callsign. This would be considered as a modification to an existing license.

The Federal Communications Commission Private Radio Bureau Chief, Carlos V. Roberts (second from right), presents a Special Temporary Authority to experiment with spread-spectrum transmission to Hal L. Feinstein WB3KDU (far left) and Paul L. Rinaldo W4RI. Dr. Michael J. Marcus (far right), Chief, Technical Planning Staff of the Commission's Office of Science and Technology, witnesses the ceremonial occasion at the Commission's offices, March 6, 1981. Messrs. Feinstein and Rinaldo are two of 25 amateurs affiliated with the Amateur Radio Research and Development Corporation granted the Special Temporary Authority for experimentation.

RTTY LOOP

Marc I. Leavey, M.D. WA3AJR
4006 Winlee Road
Randallstown MD 21133

It's June! And with the month come all kinds of good things, not the least of which is this month's edition of RTTY Loop, which marks the beginning of our fifth year!

I sincerely appreciate the interest you all have expressed in RTTY, and in this column, over the past four years. Many newcomers have asked about the availability of older material from the column. Art Galvez KA7GTP of Eugene OR is one who writes that he received an old copy of *73* as a gift, and was interested by the magazine's contents, especially RTTY Loop. He wonders if an index to old columns is available, or if we plan to publish a compilation of old columns in book form.

Well, Art, that is exactly what is planned. Over the next few months I hope to extract what I can from the first few years of RTTY Loop, and we hope to offer it in book form to those who may have missed it or who want to add it to their libraries. Watch this column for details. Don't forget the other *73* Radio Bookshop publications on RTTY, which are advertised in the magazine. They provide a valuable source of RTTY information. Above all, I hope you plan to continue reading *73*, where more articles of interest appear than anywhere else, not to mention the continuing saga of RTTY Loop.

Moving right along, another big item in June is Field Day. I know that many of the clubs are gearing up for that big weekend, June 27-28, but how many of them are actively courting the press? One of the biggest complaints I hear at gatherings of hams is that this paper or that magazine carried an article that somehow cast a bad light on amateur radio.

One of our boosters, the Stark RTTY Group out in Massillon OH, did a bang-up job of publicity in last year's effort, as Fig. 1 shows.

Why don't you try it? Write up a press release, five hundred words or so, describing your club and its efforts and send it off to local publications. Don't just concentrate on the big daily papers—send one to the neighborhood weeklies and shopping center giveaways. They are all eager to receive news of local activities, and something like this is that much good news for the readership. Send it in early, don't forget to provide some means of contacting an individual for clarification or more detail, and enjoy the spotlight.

Way back when, it took a boat-anchor transmitter and a clunky old grease-monger machine to get on RTTY. Now, with computer-controlled stations and video terminals, more and more hams will be giving it a fling. To this end, Dr. R. B. Gober W5ZNN, a dentist who is the Mayor of Corsicana TX, sends in a letter with several questions. "Will," he writes, "interference from automatic, computer-controlled RTTY stations become a problem when these stations come on the air with no operator present?" Much as nets now declare certain frequencies in the 75-meter phone band unto themselves, he wonders about claims of frequency ownership by mailboxes, ASCII groups, and the like. He also wonders about providing DX windows, and possibly revamping the band segments.

I really don't know the answer to these questions. I would hope

Stark RTTY to participate in nationwide ham radio field day
Nationwide field day set for ham radio clubs
Hamming it up
Stark radio unit in U.S. event
Ham radio club to conduct test

Fig. 1. Samples of positive amateur radio publicity by the Stark RTTY Group of Massillon OH.

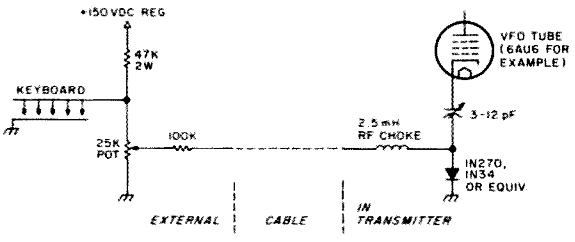

Fig. 2. Shift-pot circuit.

that as RTTY becomes more common, and I have no doubt that with the popularization of ASCII it will, some form of band plan will emerge that will keep everybody happy. It would seem as though a frequency hog is a frequency hog, whether operating SSB on 75 or RTTY on 20, and that to solve that problem we have to deal with the basic relationships hams have with hams, rather than trying to put down this group or that.

Clearly, when and if automatic stations become common, it will still be the operator, present or not, who will be responsible for preventing interference. I am afraid that if we do have a proliferation of interference-causing automatic stations, the powers that be will step in and we won't have the problem any more, because we won't have the privilege of running such a station. I would encourage anyone developing an automatic station to provide for ample monitoring to prevent stepping on others.

Okay, gang, let's get practical now, and down to basics. Francis W. Sorovec WD9HPA from Fort Wayne IN is frustrated as the devil in his attempts to get onto RTTY. Francis states that he currently operates upside down on 20 meters, with his Swan 350. He got an old Ranger II transmitter and would like to know how to hook the whole thing together.

The shift-pot circuit has been covered before in this column, back in January, 1978. It uses a diode switch to place a small capacitance on the frequency-determining circuit of a vfo, thus lowering the frequency. By applying the bias voltage during space, a correct (low—space; high—mark) FSK signal is produced. Because of the characteristics of the circuit, you can vary the voltage applied to the diode, and thus vary the apparent capacitance, changing the obtained shift. A simple diagram of such a circuit is shown in Fig. 2.

The transmitter in question, the Ranger II, resembles many other transmitters of its era in that it uses a pentode, a 6AU6, as the vfo tube. Connecting the high end of the capacitor to pin 7 of the 6AU6, the cathode, will enable the circuit to shift the frequency appropriately. Why a trimmer? Different circuits need different amounts of capacitance. Once it is adjusted, the trimmer need never be touched again, and I have built these shifters using a small, fixed mica capacitor in the 12-pF range. The potentiometer, located external to the capacitor-diode assembly, should have enough range to allow adjustment to either 170-Hz or (shudder) 850-Hz shift. Hope this helps, and maybe we will work on the air.

As I write this column, the second Greater Baltimore Hamboree and Computerfest has just ended. Last year's meeting was highlighted by the appearance of Wayne Green; the ARRL graced this year's group. I was quite impressed by the increased showing of digital equipment among the flea-market offerings. We are, at long last, beginning to see an end to the World War II boat anchors, and more and more of the "first-generation" computer equipment, circa 1975, is showing up for secondhand purchase. I was stunned by what many of the guys were asking, though. It will take some time for the market for recycled computer hardware to develop, but it will only do so if items are offered for what they are worth, not what they cost originally or what it would cost to replace them now.

For example, I saw several older computer terminals being offered for close to what they cost *new* during the mid 1970s. Now, I know that a new fancy terminal may cost five or six hundred dollars, or more, but that does not mean that an old one that cost $250 new is still worth it.

Flea-market and secondhand equipment provides a valuable function in amateur radio, getting newcomers started with a minimum of investment. Much of the equipment is used for a year or two, then resold to another ham down the line to get him started. I am afraid that offering equipment five years old and several levels out of date at nearly new prices does little to encourage such trade. That's my opinion. Any comments?

In the way of new equipment, I have purchased several items, and a few things have become available, for review in the future. I hope to examine more than the "strict" RTTY equipment, that is, terminals, demodulators, and the like. Any or all equipment that is of interest to the RTTYer is fair game here, and, hopefully, I will be able to cast some light where none was before. In the planning stage now, for example, are reviews of several items usually ignored by the magazines, but vital to the functioning of a RTTY station. More on that in the months to come.

Next month I will conduct my annual (it seems) session on how to get your computer onto RTTY. Many of you have written with interesting experiences in computer RTTY, and I hope to share many of them with the readership and pass along a few tips of my own. Where's that gonna be? Why, right here, in RTTY Loop!

FCC

Amendment of the Commission's Rules To Provide for Exception to the 50-Watt Power Limitation in Two Additional Military Areas, and To Provide for Communications With Satellites by Amateur Radio Stations Within Certain Military Areas

AGENCY: Federal Communications Commission.

ACTION: Final rules.

SUMMARY: The Commission is adopting rules in the Amateur Radio Service to relax a limitation to allow stations located in restricted areas near designated military installations and operating, in the future, in the Amateur-Satellite Service to communicate with satellites with power up to 1,000 watts (equivalent isotropically radiated power). The Table of Frequency Allocations is also amended to specify two additional areas. Amateur-Terrestrial communication in the restricted areas will remain subject to a 50-watt power limit.

EFFECTIVE DATE: April 8, 1981.

ADDRESS: Federal Communications Commission, Washington, D.C. 20554.

FOR FURTHER INFORMATION CONTACT: John B. Johnston or Maurice J. DePont, Private Radio Bureau, (202) 632-4964.

SUPPLEMENTARY INFORMATION:

Adopted: February 11, 1981.

Released: February 26, 1981.

In the matter of amendment of § 97.61(b)(7) of the Amateur Radio Service Rules to provide for exception to the 50 watt power limitation in two additional military areas, and to provide for communications with satellites by amateur radio stations within certain military areas; amendment of § 2.106, Table of Frequency Allocations.

By the Commission: Chairman Ferris not participating.

1. The Commission received a letter from the Radio Amateur Satellite Corporation (AMSAT), requesting the Commission's assistance in removing the 50 watt transmitter power limitation, in § 97.61(b)(7) of the Rules, applicable to amateur radio stations in certain parts of the country operating in the 420–450 MHz band. AMSAT states that, in order to use any new satellites that will be launched in the future, user stations will require 500–1,000 watts effective radiated power, an order of magnitude higher than that required to use previous amateur satellites. As a consequence, it anticipates that there will be as many as several thousand amateur radio stations using the new Phase III–A satellite that will require a waiver of § 97.61(b)(7) to permit higher power than 50 watts. AMSAT feels that amendment of the rule would eliminate the need for rule waivers.

2. The Frequency band 420–450 MHz is allocated to the Amateur Radio Service on a non-interference basis to the Government Radiolocation Service (See § 2.106 of the Commission's rules, Table of Frequency Allocations and Footnote US 35 thereto). Within this band, the frequencies 435–438 MHz are allocated to the Amateur-Satellite Service (ASAT), on condition that no harmful interference is caused to the other services, Government Radiolocation and Amateur Radio (See § 97.415, Footnote 1). Section 97.61(b)(5) requires that amateur radio stations operating in the frequency band 420–450 MHz not cause interference to the Government Radiolocation Service. Section 97.61(b)(7) identifies certain areas of the United States where amateur radio stations must have special authorization from the FCC Engineer in Charge (EIC) and the Military Area Frequency Coordinator (MAFC) before the station may transmit

in the 420–450 MHz band with more than 50 watts input power.

3. In its request for assistance, AMSAT suggests that the Commission pursue the matter with the Interdepartment Radio Advisory Committee (IRAC) to determine whether the military would have any objection to deletion of the 50 watt power limitation. AMSAT offers three alternatives that it would consider to be suitable. They are:

A. Modify § 97.61(b)(7) to increase the transmitter power limit from the present 50 watts to 250 or 500 watts in the 420–450 MHz band.

B. Modify § 97.61(b)(7) to delete the 50 watt limit in the 435–438 MHz ASAT frequency band. Then the 1,000 watt limit specified in § 97.67(a) would apply between 435-438 MHz.

C. Modify § 97.61(b)(7) to apply only to amateur stations transmitting with antenna radiation patterns below elevation angles of 10 degrees, thus removing the 50 watt power limit for amateur radio stations communicating with the satellite.

4. The Commission took the matter up with IRAC. IRAC reported that the current restrictions, upon which § 97.61(b)(7) is based, are valid and are required by the military services. In addition, IRAC determined that two additional areas must be added to those now specified in § 97.61(b)(7) where power must be limited to 50 watts, unless, as mentioned in paragraph 2, special authorization has been obtained. The first area is within a 50 mile radius around Otis Air Force Base, Massachusetts. The other is within a 50 mile radius around Beale Air Force Base, California.

5. IRAC also said that it could permit amateur radio stations within any of the military restricted areas to communicate with satellites, on ASAT band frequencies 435-438 MHz, with power not to exceed 1,000 watts equivalent isotropically radiated power. However, those amateur radio stations would have to maintain a minimum transmitting antenna elevation angle of 10 degrees.

6. Amateur radio users who engage in amateur satellite operations will benefit from the relaxation of the rules herein ordered. Even though they are within any of the military restricted areas they can use 1,000 watts power as long as their antennas comply with the elevation angle specified. However, amateur radio users whose stations are located in the specified military areas and who engage solely in terrestrial operations will be required to accept the 50 watt power limit (unless waived) since amateur usage of frequencies in the 420-450 MHz ban is predicated on a non-interference basis to the Government Radiolocation Service in that band.

7. We are also amending § 2.106, Table of Frequency Allocations, Footnote U.S. 7, to reflect in that rule section the two additional military areas.

8. The specific rule amendments that we are adopting are set forth in the Appendix. Authority for the amendments is contained in Sections 4(i) and 303 of the Communications Act of 1934, as amended. We are dispensing with the prior notice and public procedure provisions of the Administrative Procedure Act as unnecessary (see 5 U.S.C. 553(b)(3)(B)) since the military services: (1) require a power restriction for terrestrial communications of amateur radio stations located near military installations; and, (2) could not permit, because of potential interference to military activities, any further concessions for amateur satellite operations.

9. Accordingly, it is ordered, effective April 8, 1981, that Parts 2 and 97 of the Commission's Rules are amended as set forth in the attached Appendix.

10. It is further ordered That this proceeding is terminated.

11. Information concerning these rule changes may be obtained from John B. Johnston or Maurice J. DePont, (202) 632–4964.

(Secs. 4, 303, 307, 48 Stat., as amended, 1066, 1082, 1083;k 47 U.S.C. 154, 303, 307)

Federal Communications Commission.

William J. Tricarico,

Secretary.

A. Part 2 of Chapter I of Title 47 of the Code of Federal Regulations is amended, as follows:

Section 2.106 is amended by adding new paragraphs (e) and (f) to Footnote U.S. 7 to read as follows:

§ 2.106 Table of frequency allocations.

* * * * *

U.S. Footnotes

* * * * *

U.S. 7 * * *

(e) In the State of Massachusetts within an 80-kilometer (50 mile) radius around locations at Otis Air Force Base, Massachusetts (latitude 41°45' N., longitude 70°32' W.).

(f) In the State of California within an 80-kilometer (50 mile) radius around locations at Beale Air Force Base, California (latitude 39°08' N., longitude 121°26' W.).

* * * * *

B. Part 97 of Chapter I of Title 47 of the Code of Federal Regulations is amended, as follows:

1. In § 97.61, paragraph (b)(7) is amended by adding new subparagraphs (v) and (vi), as follows:

§ 97.61 Authorized frequencies and emissions.

* * * * *

(b) * * *

(7) * * *

(v) In the State of Massachusetts within an 80-kilometer (50 mile) radius of 41°45' N., 70°32' W.

(vi) In the State of California within an 80-kilometer (50 mile) radius of 39°08' N., 121°26' W.

2. In § 97.421, a new paragraph (c) is added as follows:

§ 97.421 Telecommand operation.

* * * * *

(c) Stations in telecommand operation may transmit from within the military areas designated in § 97.61(b)(7) in the frequency band 435–438 MHz with a maximum of 611 watts effective radiated power (1,000 watts equivalent isotropically radiated power). The transmitting antenna elevation angle between the lower half-power (−3 decibels relative to the peak or antenna bore sight) point and the horizon must always be greater than 10°.

3. A new § 97.422 is added to Subpart H of Part 97, as follows:

§ 97.422 Earth operation.

Stations in earth operation may transmit from within the military areas designated in § 97.61(b)(7) in the frequency band 435-438 MHz with a maximum of 611 watts effective radiated power (1,000 watts equivalent isotropically radiated power). The transmitting antenna elevation angle between the lower half-power (−3 decibels relative to the peak or antenna bore sight) point and the horizon must always be greater than 10°.

[FR Doc. 81-6850 Filed 3-3-81; 8:45 am]

BILLING CODE 6712-01-M

Type Acceptance of Equipment Marketed for Use in the Amateur Radio Service

AGENCY: Federal Communications Commission.

ACTION: Final rule (second report and order).

SUMMARY: This document extends the effective date of the existing regulations that require type acceptance of all external radio frequency power amplifiers and amplifier kits capable of operation below 144 MHz, affecting primarily those amplifiers used in the Amateur Radio Service. This extension is necessary as the present regulations are due to expire on April 28, 1981. The expiration of these regulations would allow the marketing of external amplifiers designed for illegal operation in and around the Citizens Band Radio Service.

DATES: The effective date of the order is April 28, 1981.

ADDRESS: Federal Communications Commission, Washington, D.C. 20554.

FOR FURTHER INFORMATION CONTACT: John A. Reed, Office of Science and Technology, Washington, D.C. 20554 (202) 653-6288.

SUPPLEMENTARY INFORMATION: In the matter of amendment of Parts 2 and 97 of the Commission's Rules to require type acceptance of equipment marketed for use in the Amateur Radio Service.

Second Report and Order

Adopted: March 23, 1981.

Released: March 28, 1981.

By the Commission: Chairman Ferris not participating; Commissioner Jones absent.

1. On March 20, 1978, the Commission released a Report and Order in the above entitled matter (FCC 78–107, 43 FR 12662). That document implemented type acceptance procedures and certain technical requirements for external radio frequency power amplifiers and amplifier kits that are designed for operation below 144 MHz. The effect of that order was to require type acceptance for the majority of amplifiers used in the Amateur Radio Service (ARS). Type acceptance is a procedure whereby the Commission approves radio transmitting equipment as being capable of complying with the necessary technical specifications. Such approval, where required, is necessary before the equipment may be marketed. See 47 CFR 2.901 *et seq.* In this specific case, the type acceptance procedure allows the Commission to determine whether the external amplifiers are capable of meeting those FCC technical standards that are designed to minimize the possibility of interference and, also, to determine whether the amplifiers are intended for use only in the ARS and not in or around the Citizens Band (CB) Radio Service.

2. As noted above, compliance with the revised technical standards to allow for the commercial manufacture and marketing of these external amplifiers is enforced, in part, through our type acceptance procedures. The standards were implemented due to the large number of amplifiers being marketed and promoted for illegal operation in and around the CB Radio Service. Such illegal use of external amplifiers created a severe interference problem to television reception and to the reception of other radio services. It was estimated that in fiscal year 1976 that about four million persons and perhaps as many as ten million persons experienced interference to televisions reception from CB radio stations. About half of this interference was caused by or intensified by the illegal use of these amplifiers. It was also predicted that this interference would significantly increase unless countered by Commission action.

3. These interference problems are detailed in earlier reports, as cited in the reference Report and Order in paragraph one and in the Notice of Proposed Rule Making (released February 28, 1977) for this docket, and will not be further repeated here. It was clear that when the Commission issued its Order on the subject in 1978, it was faced with resolving a serious national problem. In fact, the interference caused by the illegal use of external amplifiers was so severe as to require immediate implementation of the technical standards and type acceptance requirement by this Commission. Because of this rapid implementation, the technical regulations and the type acceptance requirement were made effective for only three years so that the effects of this action would be subject to a mandatory review prior to the expiration date of April 28, 1981. It was expected that this three year period would allow the Commission additional time to investigate other methods of controlling the promotion and use of external amplifiers in radio services other than the ARS and to monitor the effectiveness of the new regulations.

4. During this three year investigation period, other methods of controlling the manufacture and marketing of external amplifiers were studied. One such method was to require the showing of an appropriate amateur license prior to the purchase of amateur transmitting equipment (FCC 79-586). However, as we concluded in our first Report and Order in this Docket, no other method was considered to offer the effectiveness provided under the current type acceptance program. The problem with attempting to require retailers to ask potential buyers of amateur equipment to display their amateur licenses before they may make a purchase is that it is uncertain whether this Commission has the legal authority to impose this requirement.[1] Even if the Commission had such authority, there are two other problems. First, this type of regulation would be burdensome for retailers. Second, it is more effective for the Commission to enforce its regulations through contact with a limited number of manufacturers (i.e., through type acceptance) than with a vast number of sellers.

5. The effectiveness of the current type acceptance program in halting the promotion of external amplifiers for illegal applications has led this Commission to believe that the program should be continued. Numerous manufacturers and distributors of amplifiers designed for illegal operation in and around the CB service have ceased manufacture and marketing, although legal action was required in some instances. The majority of this litigation has already been detailed in previous Commission releases and will not be repeated in this item. Other cases are still under investigation with court actions pending and, therefore, will not be discussed. However, certain manufacturers are still promoting their non-type accepted amplifiers for illegal operations. Some U.S. Attorneys have questioned the advisability of prosecuting these manufacturers for violation of the existing type acceptance requirement due to the impending cut-off date of the regulations. These U.S. Attorneys feel that it would be inappropriate to prosecute a manufacturer for violation of a temporary regulation. Instead, most prosecutions have been for violations of the regulation that prohibits the manufacture and marketing of any external amplifier with amplification capability between 24.00 MHz and 35.00 MHz § 2.815(b) of the Commission's regulations). This form of prosecution would be sufficient provided all of the amplifiers promoted for CB operation operated within that banned frequency range. Unfortunately, many do not operate within that frequency range as manufactured. For example, without the type acceptance requirement, manufacturers would have no restrictions on producing amplifiers that can be easily altered by purchasers to operate with CB radio equipment even though those amplifiers are designed to operate above or below the prohibited frequency range. Thus, it is necessary to invoke a violation of the type

[1] The provision in the Communications Act of 1934, as amended, that provides the chief support for this requirement is Section 302(a) (47 U.S.C. 302(a)). This Section authorizes the Commission to "* * * make reasonable regulations governing the interference potential of devices * * *" and further states that these regulations apply to the sale of devices. This Section has been relied on by the Commission to establish standards for radio "devices" and to prohibit retailers from selling noncomplying devices.

acceptance regulation to cover all of the available amplifier models. That action requires a removal of the cut-off date for type acceptance in order for these regulations to be more generally effective. In light of this and the information contained in the preceding paragraphs, a continuation of the present type acceptance requirement would be in the public interest.

8. The Administrative Procedure Act permits federal agencies to forgo the usual notice and comment procedures in rule makings if "* * * public procedures thereon are * * * unnecessary." (5 U.S.C. 553(b)(3)(B)). Prior notice and comment procedures concerning a continuation of the current type acceptance requirement are unnecessary for a variety of reasons. First, the possibility of a permanent type acceptance requirement was previously subject to public comments in this Docket in the original Notice of Proposed Rule Making, 42 FR 12204, released February 28, 1977. It is not anticipated that requesting additional comments on the subject would provide the Commission with further useful information. Second, in our Report and Order in Docket No. 21117, adopted February 18, 1978, released March 20, 1978, 43 FR 12682, we indicated that the Commission might make the temporary type acceptance requirement permanent. In paragraph 12 of that Order, we stated "If at the end of this three year period it is determined that the type acceptance requirement is still necessary and that it has indeed reduced the problems caused by these amplifiers, this program can be continued by further Commission action." During this three year period, we have not received any adverse comments regarding the type acceptance requirement. Third, in our Report and Order in Docket No. 21117, we found that the type acceptance requirement itself imposed only a slight burden on manufacturers.

In paragraph 13 of that Order (while discussing § 2.1005(b) of our regulations), we stated:

> * * * No piece of radio equipment from any service should be marketed before a number of samples are tested to determine that the equipment is in compliance with our regulations. As these tests should be performed regardless of the requirement for type acceptance, the only additional expense that type acceptance would cost the manufacturer or supplier is the few hours of paperwork to compile the application and the time delay in marketing during which the Commission processes this application.

Fourth, all the Commission is now doing is making a rule permanent that was found to be in the public interest in our Report and Order in Docket No. 21117. Since we are merely continuing an existing rule, there will be no additional impact on manufacturers. Finally, as discussed above, after extensive and protractive consideration, we do not believe that there are any viable alternatives to a continuation of the type acceptance requirement.

7. The enforcement actions by the U.S. Attorneys and the Commission's Field Operations Bureau against the manufacturers of those amplifiers intended for operation around the CB service and the reduction in the availability of these amplifiers to the public have demonstrated that this method of controlling the illegal operation of these amplifiers is effective. However, the continued, though smaller, illegal market necessitates retaining these regulations. Therefore, the expiration date of the type acceptance requirement for external radio frequency power amplifiers and amplifier kits is deleted, as shown in the attached appendix.

8. Other changes to these regulations, as also shown in the appendix, will be made in accordance with the provisions of Subsections 553(b)(3)(A) and 553(b)(3)(B) of the Administrative Procedure Act (5 U.S.C. 553). These subsections allow the Commission to finalize regulations without the necessity of providing prior notice or seeking comments when the changes involve interpretative rules or "* * * when the agency for good cause finds (and incorporates the finding and a brief statement of reasons therefor in the rules issued) that notice and public procedure thereon are * * * unnecessary, or contrary to the public interest." When the regulations establishing type acceptance requirements for external amplifiers were implemented, there was a considerable rush in their preparation in order to place them into effect at the earliest possible time. This rush was due to the large number of manufacturers promoting their amplifiers for illegal operation and because of the severity of the interference problems resulting from the use of those amplifiers. As a result, some editorial errors in the regulations occurred and some regulations that were either awkward or unclear were adopted. The language of these regulations has therefore been reworded to correct the editorial errors, to clarify the requirements and to refine the statement of the requirements. Since the meaning of the regulations remains unchanged, it is considered unnecessary to issue a further Notice of Proposed Rule Making on this matter. Additionally, the prompt clarification of the existing regulations is in the public interest since the changes will make the regulations more understandable and encourage compliance. Any new problems which may arise in the specific wording of the Part 97 regulations can be considered under Docket No. 80-729 which looks toward a rewrite of the amateur regulations into a "plain language" format.

9. It should also be noted that the Commission's policy concerning waivers of the amplifier technical requirements or the type acceptance requirement is unchanged. The type acceptance requirement may still be waived for those amplifiers designed for industrial, scientific or medical (ISM) applications. Additionally, waivers of the technical requirements will be considered for those amplifiers designed to operate within the frequency range of 50.00 MHz to 54.00 MHz as long as the amplifiers can not be easily converted to operate at lower frequency ranges.

10. In view of the foregoing, this Commission is of the opinion that the amended regulations, as described above and in the attached appendix, are in the public interest, convenience and necessity. The authority for these amendments is contained in Sections 4(i), 302, 303(e), 303(f) and 303(r) of the Communications Act of 1934, as amended. Accordingly, it is ordered, effective April 28, 1981, that Parts 2 and 97 of the Commission's Rules and Regulations are amended as set out in the attached appendix. It is further ordered that this proceeding is continued.

(Secs. 4, 303, 307, 48 Stat., as amended, 1066, 1082, 1083; 47 U.S.C. 154, 303, 307)

Federal Communications Commission.

William J. Tricarico,

Secretary.

Appendix

PART 2—FREQUENCY ALLOCATIONS AND RADIO TREATY MATTERS; GENERAL RULES AND REGULATIONS

A. 47 CFR Part 2 is amended as follows:

1. Section 2.815 is amended by revising paragraph (c) to read as follows:

§ 2.815 External radio frequency power amplifiers.

* * * * *

(c) No person shall manufacture, sell or lease, offer for sale or lease (including advertising for sale or lease) or import, ship or distribute for the purpose of selling or leasing or offering for sale or lease, any external radio frequency power amplifier or amplifier kit capable of operation on any frequency or frequencies below 144 MHz unless the amplifier has received a grant of type acceptance in accordance with Subpart J of this Part and Subpart C of Part 97 or other relevant Parts of this Chapter. No more than 10 external radio frequency power amplifiers or amplifier kits may be constructed for evaluation purposes in preparation for the submission of an application for a grant of type acceptance.

Note.—For the purposes of this part, an amplifier will be deemed incapable of operation below 144 MHz if the amplifier is not capable of being easily modified to increase its amplification characteristics below 120 MHz, and either:

(1) The mean output power of the amplifier decreases, as frequency decreases from 144 MHz, to a point where 0 decibels or less gain is exhibited at 120 MHz and below 120 MHz; or

(2) The amplifier is not capable of even short periods of operation below 120 MHz without sustaining permanent damage to its amplification circuitry.

* * * * *

2. Section 2.1001 is amended by revising paragraph (f)(2) to read as follows:

§ 2.1001 Changes in type accepted equipment.

* * * * *

(f) * * *

(2) Modifications made pursuant to this Paragraph are limited to equipment used at licensed amateur radio stations.

* * * * *

3. Section 2.1005 is amended by revising the introductory text of paragraph (c) and paragraph (d) to read as follows:

§ 2.1005 Equipment for use in the Amateur Radio Service.

* * * * *

(c) Any supplier of an external radio frequency power amplifier kit as defined by § 97.3(z) of this Chapter shall comply with the following requirements:

(1) * * *
(2) * * *
(3) * * *
(4) * * *
(5) * * *

(d) Type acceptance of external radio frequency power amplifiers and amplifier kits may be denied when denial serves the public interest, convenience and necessity by preventing the use of these amplifiers in services other than the Amateur Radio Service. Other uses of these amplifiers; such as in the Citizens Band Radio Service, are prohibited (CB Rule 21 of this Chapter). Examples of features which may result in the denial of type acceptance are contained in § 97.77 of this Chapter.

PART 97—AMATEUR RADIO SERVICE

B. 47 CFR Part 97 is amended as follows:

1. Section 97.75 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 97.75 Use of external radio frequency (RF) power amplifiers.

(a) Any external radio frequency (RF) power amplifier used or attached at any amateur radio station shall be type accepted in accordance with Subpart J of Part 2 of the FCC's Rules for operation in the Amateur Radio Service, unless one or more of the following conditions are met:

* * * * *

2. Section 97.76 is amended by revising the introductory text of paragraph (a) and subparagraphs (a)(1) and (a)(5) to read as follows:

§ 97.76 Requirements for type acceptance of external radio frequency (RF) power amplifiers and external radio frequency power amplifier kits.

(a) Any external radio frequency (RF) power amplifier or external RF power amplifier kit marketed (as defined in § 2.815 of this Chapter), manufactured, imported or modified for use in the Amateur Radio Service shall be type accepted for use in the Amateur Radio Service in accordance with Subpart J of Part 2 of the FCC's Rules. This requirement does not apply if one or more of the following conditions are met:

(1) The amplifier is not capable of operation on any frequency or frequencies below 144 MHz. For the purposes of this part, an amplifier will be deemed to be incapable of operation below 144 MHz if the amplifier is not capable of being easily modified to increase its amplification characteristics below 120 MHz, and either:

(i) The mean output power of the amplifier decreases, as frequency decreases from 144 MHz, to a point where 0 decibels or less gain is exhibited at 120 MHz and below 120 MHz; or

(ii) The amplifier is not capable of even short periods of operation below 120 MHz without sustaining permanent damage to its amplification circuitry.

(2) * * *
(3) * * *
(4) * * *

(5) The amplifier is purchased in used condition by an equipment dealer from a licensed amateur radio operator who constructed or modified the equipment in accordance with § 2.1001 of the regulations and the amplifier is further sold to another amateur radio operator for use at their licensed amateur radio station.

LETTERS

QUASIMODO

Cal Ritchey's story in the January issue ("Over the Hump and into History") was good reading. Aircraft crews were indeed scattered over several countries, including India, Nepal, Bhutan, Burma, and what is now Bangladesh, while flying the Hump from India to China, during WWII. Stories that today sound like amusing after-dinner anecdotes once were crises in the lives of flying personnel of the Air Transport Command.

The ATC carried war supplies from India to fighting bases in Burma and China from July, 1942, until August, 1945. More than 650,000 tons of critical material were airlifted from India to beleaguered China. This incredible feat kept China in the war, a reality which kept more than one million Japanese troops in occupied China until the end of hostilities. The irony of political developments in that area of the world since WWII can never diminish the accomplishments of the relative few who wrote the ATC chapter in the chronicle of the Hump.

The Army Airways Communications System (AACS) with 4th Wing headquarters at Hastings Mill near Calcutta, India, played a very important part in the history of Hump flight communications. Col. Mandelbaum commanded from early 1942 until the end of 1945 when the remaining squadrons were transferred to European Wings. During this period, AACS provided the equipment, men, and services to install, maintain, and operate flight facilities, including control towers, homing beacons, radio ranges, and instrument landings systems, at some of the larger airfields. Point-to-point facilities, (voice, CW, and radioteletype) were also AACS activities. At some bases, in India, all Army Air Force administrative and operational communications were handled by AACS.

Many of the men in AACS were amateurs before they came into that service. Many became hams after leaving the Air Force. The AACS operation under the 4th Wing covered India, Burma, China, and Thailand, and immediately after Japan's surrender, French Indo-China (Vietnam) and Singapore.

The 4th AACS Wing had four groups, each with several squadrons. The squadrons had a large number of detachments, with operational and maintenance personnel varying from 6 to 25 men. They were radio transmitter, receiver, power-generator, maintenance, and installation people, as well as operators for CW, voice, and radioteletype. Crypto equipment was also in many of these installations. Operational personnel were mostly involved in control-tower and point-to-point communications. Squadrons had their own aircraft for transportation and flight checks of navigational aids.

Having worked in the 128th AACS Squadron of the 4th Wing, as assistant operations officer, I can appreciate Cal Ritchey's story of flights over the Hump with 19-year-old kids, in the C-46, C-47, DC-6, and the infamous B-24/C-87! The 128th was scattered over the Assam Valley and was operational in all the ATC bases closest to the Hump. Therefore, it handled all of the bad flight mishap contacts from the three established air routes from India to Kunming, China, and one to Chengtu, China.

But there were fun times also. As CO of the detachments located in Saigon, Bangkok, and Singapore, we used the Collins 2-kW point-to-point transmitters (with rhombics!) on 20-meter phone and CW in early 1946! At Bangkok, we had HS1S$ (*Here Siamese One Sad Sack*) and at Singapore, VS1QEU. About 300 stateside contacts were made, with traffic to next of kin, mostly about returning back to Uncle Sugar!

AACS continued as an Air-Force operation until July 1, 1961, when it was changed in name to Air Force Communications Command, with headquarters at Scott Air Force Base, Illinois. The old AACS veterans now enjoy annual reunions and a weekly ham net. Those interested in the '81 get-together or getting on the AACS mail roster should contact me.

CODE OR LATIN?

I just finished reading Leaky Lines from the April issue and thought I'd pass along my thoughts regarding no-code requirements.

I have no objections to a no-code requirement as long as the theory exam is tough as nails. I think a ham should be more proficient in the theory of electronics and radio than the average ham is now and I see no profit in making someone learn the code to get a license, if he never intends to use it, as long as he is very technically proficient. An exam similar in difficulty to the FCC 2nd Class Radiotelephone exam would suit me just fine as an alternative to someone learning code. As a matter of fact, I would prefer to talk on the air (verbally) with someone who was technical rather than someone who "knew the code once" and memorized the technical exam.

The statistics are that only one in three passes the 2nd Class Radiotelephone exam, this in spite of the tremendous number of Q & A manuals available for memorization purposes. I tried to memorize a Q & A manual to get my First Class license but gave that up and enrolled in a CIE course and passed my license exam on the first try because I had learned, not memorized, the theory. This also makes me not care if Dick Bash wants to help out the memorizers with his Q & A books. I don't really see much difference between his books and other Q & As for the commercial ticket.

I am not in favor of making it easier to get a license by removing the code requirement if at the same time the theory exam is not made much tougher. Perhaps a two-class system similar to the telephone vs. telegraph licenses of the commercial portion of the FCC licenses would be an idea. If you want to send via telegraphy, you have to take a code test in addition to the comprehensive theory exam. This way, we might start eliminating those who talk to the backside of the mike, those who constantly hold the mike 2 feet away to cure "over-deviation" on 2-meter FM, and those who think that if the swr is 1:1 the antenna must be radiating.

Do you really see much advantage in making doctors learn Latin in this day and age?

Thom Page W6KXS
Los Angeles CA

WEEDING OUT

The April *73* article by Andrea Favara HR1ADF, "The Honeymoon Is Over—hints and kinks for ham husbands" (p. 98), is good advice and may help a wayward male ham.

Now having been single for eight years after being married for eight should qualify, to address the subject of introducing a girl friend to your mistress: the amateur radio fraternity. The article by Andrea did *not* address the dating picture. I was not a ham when I was married, lest any Monday-morning quarter-back thought *that* caused the little Ms. to depart our modest home.

When I meet a lady who seems to enjoy my company as much as I like hers, I don't get into the hobby until we have found other common ground like biking, hiking, plays, or whatever it might be. Soon thereafter I will say that I have a mistress in my basement I would like her to meet.

Usually they just leave—never to be seen again. Simple phone calls go unreturned. This is part of the "weeding-out" process. Now the confident and self-assured lady follows me down the steps and meets my shack. I fire up the low-band rig and chat a few moments with a fellow ham. Then I pull the plug and prepare to close down the shack and head upstairs.

Now the real moment of truth is near. Some have said, "Gee, that's neat, but isn't it expensive?" Just a few have asked me why we were leaving and insisted we stay and make more contacts. They ask how the keyer works and press for a demonstration. "Let's see the antenna." "What's this two-meter stuff?" "What are you building over here?" "Gee, these cards are neat?" "Did you read all these books?" "What's a ham-

fest?" and on and on. One beloved friend brought an expensive bottle of wine after an upgrade.

At least these are women with whom my hobby would not hinder a more serious relationship. I never badger them into the hobby. They know they are invited at anytime into my strange radio world. All of these women I have met who appreciate my hobby themselves have hobbies of a similar intensity.

I would consider it a great honor to be with a women who might say to me, "Today I'll be in the studio painting. No phone calls. Don't bother with lunch and don't stay up for me. I'll be out when I am done. And, yes, I love you."

I could understand, appreciate, and respect a woman with such a drive!

Tim Skoning KB9PA
Dundee IL

WRINKLES

"The Great Aluminum Cover-Up," March, 1981, by Don Stauffer WB0YTH was read with interest. But I do not plan to abandon the simple, easy processes I have developed in this shack, over the past 25 years as a ham.

When we take a mini-box that is crappy, cruddy, painted-over, ratty looking, or whatever, we give that box a brand-new professional finish, quick as one, two, three.

All surfaces of the old box are thoroughly sanded with a swirling motion, then dried with either a paper towel or shop towel. Then we simply take G. C.'s "Wrinkle Finish," either grey or black, and give it a good even coat. Momma's oven force-dries and wrinkles our work beautifully!

We set the oven on the lowest temperature, which is a tad under 200°, put the work into the oven, and close the door, peeking in around ten minutes later to see how the cracking is coming along.

When the entire piece has wrinkled evenly and beautifully, we simply slip the plate holding the box from the oven and then cool it on top of the cooktop of her kitchen stove.

God only knows how many beat up boxes we have turned into new pieces, a delight to behold. We also have thoroughly cleaned with detergent some of the Heathkit® cabinetry, sprayed them with black wrinkle finish, and baked them into new pieces. I guess I have the only black, wrinkled Heathkit cabinetry in the world—unless some other hams happened to dream up the idea used by the quickie car painting firms, where they run your newly-sprayed car through a bank of heat lamps and promptly dry the newly painted finish.

I experimented with a scrap piece of metal many years ago, and when this turned into a beautiful wrinkle job, other projects followed. Microphone cases and bases, anything and everything around the shack that needs a *new look* is now resprayed and shoved into the oven.

A final helpful hint, though, if you plan to re-crackle or re-wrinkle any of the Heathkit wrap-around cabinetry. Take a new drill bit and re-perforate the top and bottom areas of the cabinetry above and under the rf cage. Your Heath gear will run much, much cooler.

Paul Marlowe K4SDW
Altamonte Springs FL

SELFISH ATTITUDE?

Last year, 1980, the ARRL executives made a submission to the FCC requesting an extension of phone privileges to certain grades of American radio amateurs in the 20-meter band. In my opinion, this will merely extend the California kilowatt QRM further down the band at the expense of "rest-of-world amateurs." It may be considered a selfish attitude, but I hope the FCC rejects this proposal because I think that rest-of-world amateurs are entitled to some spectrum space free from "American kilowatt SSB."

If radio amateurs outside the United States wish to work American amateurs on SSB, it is only necessary to operate in the American phone band. However, to work rest-of-world amateurs on SSB, it is usually necessary for rest-of-world amateurs to operate between 14100 and 14200. The proposed expansion of US phone operations will increase the difficulties of rest-of-world amateurs when working DX stations outside the US, and I wonder if the ARRL executives considered this when they put forward the proposal. Remember, the whole band is available for CW, and I personally see no reason to increase the number of SSB operations in that portion of the 20-meter band, i.e., 14100 to 14200.

Tauranga, New Zealand

NEXT WEEK

I'm taking this moment to thank you for your help in my getting my Novice license. What help?—you might ask. I'm referring to the Beginning and 6+ code tapes.

Six weeks ago, I was despairing with regard to the International Radiotelephone Code, as it is known in much of the world (I don't hear the term used here), and then I received your tapes. I was then enrolled in a ham class the next day and my instructor said that if I had the 73 tapes, I should have no problem and would not need to purchase the tapes that the class had.

How true! On the fifth week of class—surprise! It was time for the Novice exam, and I had thought it was "next week"! I was certain that I could not pass the code exam that night, and I almost postponed it a week. I am very glad I did not! I took both elements of the exam, and now I'm waiting for my call! I'm also continuing my class and should be a Technician in another month or so.

I'm so enthusiastic about the *73* code tapes that I'm going to buy a set for my brother when he gets back home on leave, and my girl friend is using my tapes to learn the code. Also, let me add that I tried—and failed—learning the code ten years ago using (I believe) both the ARRL and USN courses (all those tapes!), but the *73* tapes made me feel comfortable with code immediately.

Once again, thank you.

Keith Glen Littlejohn
Huntington Beach CA

WRITE

In the November, 1980, issue of *73 Magazine*, as part of Wayne's editorial, the ham community was told about the House of Representatives Bill 7747. I, being a congressional letter writer since Mr. Carter put a 5.5% pay cap on the military (I was on a Fleet Ballistic Missile Submarine, the *USS Stonewall Jackson SSBN 634*, at the time), have become quite good at it.

I wrote to every congressman listed in your editorial. The best reply that I received came from a congressman that I didn't write to, by the way. I believe you should continue through your editorials to tell the hams what became of H.R. 7747, and thank those who wrote for making the system work. That might make it easier for them to write next time.

Thomas I. Nofsinger KA2ERV
Virginia Beach VA

INVERSION!

There have been a number of band plans discussed in *73*'s pages in recent months, but none so simple and effective as the one that occurred to me last night: Invert the 40m band! Rather than have Extra CW from 7.000 to 7.025, Advanced/General CW from 7.025 to 7.300, Novice CW from 7.150 to 7.200, and any phone from 7.150 to 7.300, put the Extras on 7.300 to 7.275, the Advanced/General CW on 7.275 to 7.000, the Novice band on 7.200 to 7.150, and phone operation from 7.150 to 7.000.

The benefits are enormous! SSB activity, requiring more bandwidth and therefore wider filters, is now operating free from the ravages of the megawatt foreign broadcast stations. The CW operators would be able to work around the broadcasters with much less significant QRM problems.

The drawbacks to such a plan are not as important, but need to be enumerated: 1) Any change must overcome inertia, a serious potential difficulty. 2) The most likely change to existing antennas will be lengthening—harder to do than shortening. 3) Crystal users will be displaced—hopefully not significant. 4) Our overseas friends, presently able to use the lower portion of the band for phone operation, will have more company they may not like. 5) The 40m band plan would then be a maverick, different than the other HF bands.

I feel that these drawbacks are very minor in comparison to the gain: a usable 40m phone band. I am quite serious in this proposal. What do you think?

Issaquah WA

Plain Talk on Plain Language Rules

Tim Daniel N8RK
73 Magazine Staff

Editor's Note: The opinions expressed in this article do not necessarily reflect those of 73 Magazine.

In 1963, the amateur radio community was stunned by RM-499. This FCC proposal resulted in a furious debate over the merits of "incentive licensing." For many hams, these changes were a bitter pill to swallow. It was the mid 1970s before many old-timers accepted the inevitability of incentive licensing that RM-499 brought about.

A few years ago, the CB craze swept the nation and it was time for yet another FCC bombshell to arrive. The prospect of a no-code license reared its ugly head in Docket 20282. Other proposals included a simplified "dual-ladder" license structure and a new way to measure transmitter power. With the implications of incentive licensing in the back of many minds, amateurs presented overwhelming opposition to 20282 and the no-code license.

Enter the 1980s, and a sweeping proposal to convert the present rules into "plain-language" form. Because of Docket 80-672's length, it cannot be reproduced here in its entirety. Instead, this article will present an overview of how the plain-language rules came about and what substantive changes are proposed.

The obvious question is: "Why do hams need new rules?" The Commission's answer is: "The existing rules are not written to take into account the wide range of applicants and licenses. For this reason, the rules are not as useful as they should be." Are the current rules "unnecessarily complex and difficult to understand"? The FCC thinks so, how about you?

First CB, Now Amateur Radio

The drive to remove gobbledygook from FCC regulations began in December, 1976, when Part 95 was divided into four subsections, encompassing mobile radio, radio control, Citizens Band, and technical standards. By early 1978, the Carter administration's executive order to make all government regulations understandable to John Q. Public had begun to sink in. Among the first examples of "FCCese" to be rewritten were the CB rules.

According to John Johnston of the Private Radio Bureau, the CB rewrite was the product of cooperation between involved citizens and FCC staffers. The final version was, in the words of the Commission, "met with widespread acclaim." The new CB rules now serve as an example for other government departments.

The style and format of the new Citizens Band rules were duplicated when a plain-language version of the radio control rules was proposed. When the Commission turned its attention to the amateur rules, they were convinced that their formula was a proven success. The exact details of who authored Docket 80-672 and how long it took are not known. However, the Commission does claim that direct citizen involvement was not needed nor used in preparing the proposed rules.

New Words for Old Rules

The basic format for the plain-language rules involves presenting a rather general question, followed by a detailed answer. The new rules are oriented to a target audience that is probably younger and less educated than the average ham. Simplifying the rules so that they could be more easily understood involved using the grammatical first and second person. To emphasize the difference between required actions and permissible actions, the Commission makes heavy use of the words "may" and "must."

The proposed rules contain a total of 111 questions and answers. The majority of the questions fall under Subpart A—Amateur Radio Service. Subparts B and C deal with RACES and ASAT,

the Amateur Satellite Service. The fourth subpart, D, offers an explanation of the technical standards that your amateur station must meet. Topics include the 10-meter amplifier ban, power measurement, and standards for video or digital emissions.

In order to make the new rules consistent with international regulations, the proposed title for Part 97 is "Amateur Telecommunications Services." If you have recovered from the shock of a new name for your hobby, then you might want to consider the suggested description of amateur radio.

PROPOSED RULE

§ 97.1 (AR Rule 1) What is the Amateur Radio (AR) Service?

The AR Service is for persons interested in the technical side of radio communications. They use the service only for their own personal satisfaction and get no financial benefit from its use. They learn about radio, communicate with other operators around the world, and find better ways to communicate by radio.

For some unexplained reason, the new definition offers no mention of enhancing international goodwill or the valuable role that amateurs play when there is a disaster. These two areas shouldn't be overlooked.

In almost the same breath that the FCC claims that "we do not propose to change the structure of the Amateur Radio Service in this rulemaking," they give details about three changes that are found in the new rules.

Eliminate Logging

"First, we propose to eliminate all logging requirements. We are substituting for the existing logging rule a new rule requiring licensees to keep certain items in their station records."

PROPOSED RULE

§ 97.57 (AR Rule 57) What do I have to keep in my station records?

(a) You must keep the following items in your station records for all types of operation:

(1) A copy of each letter telling the FCC of your name or address change;
(2) Your license (or other authorization) or a photocopy;
(3) A current copy of the Amateur Telecommunications Services Rules, with amendments;
(4) A copy of each response to an FCC discrepancy notification;
(5) Each written permission you receive from the FCC; and
(6) A copy of any other correspondence to or from the FCC about your AR station license or your license (or other authorization).

(b) When your AR station is in repeater operation, you must keep a computation of its AHAAT and ERP (see AR Rule 44) in your station records.

(c) When your AR station is being remotely controlled (see AR Rule 43), you must keep the following items in your station records:

(1) The names, addresses and AR station call signs of all control operators you have authorized;
(2) A functional block diagram and a technical explanation that describe operation of the control link; ("Control link" is the equipment that accomplishes remote control between a control point and a remotely controlled station.)
(3) A description of measures taken to protect the station from access by unauthorized persons;
(4) A description of the measures taken to prevent unauthorized operation by activating the control link or by some other means;
(5) A description of the measures for shutting down the station if the control link stops working correctly; and
(6) A description of the means used to monitor the transmitting frequencies.

(d) You must keep your station records for the term of your license (or other authorization).

Rules Must Be On Hand

"We propose to require licensees to keep an up-to-date copy of the Amateur Telecommunication Service Rules. This proposed requirement should help licensees know and understand the rules better and promote self-regulation by licensees. This, in turn, will result in better radio operation and more efficient use of the limited radio spectrum."

PROPOSED RULE

§ 97.51 (AR) Rule 51) Do I need to have a copy of the Amateur Telecommunications Services Rules?

(a) You must keep a current copy of Part 97, FCC Rules for the Amateur Telecommunications Services, in your AR station records. The Amateur Telecommunications Services Rules are published periodically by the Government Printing Office.

(b) You must stay up to date with changes to the Amateur Telecommunications Services Rules. Changes are found in the Federal Register and in other publications.

Station Inspections Detailed

"Finally we propose to exercise the authority granted in Section 303(n) of the Communications Act and require that licensees make their stations available for inspection by an FCC representative. We think that this requirement is necessary to encourage compliance with the rules."

PROPOSED RULE

§ 97.56 (AR Rule 56) Do I have to make my AR station and its records available for inspection?

(a) If an authorized FCC representative requests to inspect your AR station and its records, you or the control operator must make the station and its records available for inspection.

(b) The FCC may inspect your station and its records at reasonable times. The FCC considers that a reasonable time to inspect your station is any time during the business day or any time your station is transmitting or has just finished transmitting.

Unnecessary and Unintended Hardships

The proposed changes that are acknowledged by the FCC are just part of the story. Unfortunately, the authors of the plain-language rules changed key words and phrases that result in some very different meanings than you find in the old rules. Unless these areas are clarified, the operation of many amateur radio stations could be adversely affected. Because of the varied nature of ham radio, it is almost impossible for any one individual to spot all the slipups. Here are several problem rules that have been brought to the attention of *73*:

Proposed AR Rule 41 requires that "at the end of two-way AR communications, you must also transmit the callsign of the station you were communicating with." WA8MHO points out that this rule does not account for the needs of roundtables or nets. The present rule (97.84) allows the use of a "generally accepted network identifier." In this case, the simplified rule ends up being a hindrance for some amateurs.

W2JTP notes that proposed rule AR 33 takes away the privilege to "retransmit either live or delayed, transmissions of any AR station, except when your station is in repeater operation or auxiliary operation."

This rule would eliminate the storage and retransmission of RTTY and slow-scan TV pictures. It would put an end to the practice of having another station record and then retransmit your audio for test purposes. This rule would also eliminate the retransmission of ARRL and other bulletins.

The existing rules prohibit only the *automatic* retransmission of signals from a nonrepeater or nonauxiliary station. Drop the word "automatic" and a new and bothersome regulation is born.

A third example of the attempt to simplify gone sour can be found in AR Rule 30 as noted by both WA8MHO and W2JTP. The existing rules allow antennas to be as high as 200 feet unless you live near an airport. If you want antennas higher than 200 feet, then, in some instances, a special application is needed. The proposed rule is worded such that it discourages the installation of any antenna that will be more than 20 feet higher than the building it is attached to. This new rule amounts to little more than a poor imitation of the Citizens Band rule governing antennas.

The proposed Technical Standards give a lengthy description of the technique the FCC will use to measure power levels and bandwidth. There is no mention of the techniques that the average ham can use to ensure that he or she operates legally. To be absolutely certain that your emissions do not exceed the power or bandwidth limits, you need the same kinds of sophisticated test equipment the Commission uses.

Your Vote Counts

Many, if not all, of Docket 80-672's flaws could have been eliminated if the FCC had involved the public (i.e., active hams) in an advisory capacity. Instead, we have been presented with rules that are a near carbon copy of the appliance operator approach the Commission used with CB.

Declaring the proposed rules to be a total loss is unfair. In many cases, the process of simplification has rid the rules of ambiguities. Docket 80-672 goes a long way to eliminate the phenomenon of three FCC officials giving three different interpretations of the same rule. It would be foolish to criticize the idea of reducing the complex jargon that confuses people instead of informing them. While it is hard to challenge the motive behind the new rules, it is unfortunate that the methodology and resulting proposal leave something to be desired.

Rather than condemn or accept the proposal in its entirety, you should scrutinize every rule that affects your operation. Ask questions. Does the new rule make sense? Will it hinder my enjoyment of ham radio? Is unofficial FCC policy being turned into an official rule?

Let the FCC know what you think. The deadline for comments is June 19, 1981. To be a formal participant, you should file the original and five copies of your comments by the June 19 deadline. If you would like each Commissioner to get your remarks, file 11 copies. The FCC will consider all input, regardless of the number of copies submitted. If you have something to say, now is the time to speak out. Be sure to let *73 Magazine* know, too.■

SOCIAL EVENTS

Listings in this column are provided free of charge on a space-available basis. The following information should be included in every announcement: sponsor, event, date, time, place, city, state, admission charge (if any), features, talk-in frequencies, and the name of whom to contact for further information. Announcements must be received two months prior to the month in which the event takes place. They should be sent directly to Editorial Offices, 73 Magazine, Pine Street, Peterborough NH 03458, Attn: Social Events.

ROCHESTER NY
MAY 15-16

The Atlantic Division/New York State Convention, combined with the Rochester Hamfest, will be on Friday and Saturday, May 15-16, at the Monroe County Fairgrounds, Rte. 15A, Rochester NY. Commercial exhibits will be open from 1:00-9:00 pm Friday and from 8:30 am until 6:00 pm Saturday. A huge outdoor flea market will open at 1:00 pm Friday and run continuously until closing Saturday evening.

Programs include an NTS Forum with Bob Halprin K1XA, Asst. Comm. Mgr., ARRL; a League Forum with Pres. Harry Dannals W2HD, Directors Jesse Bieberman W3KT, Stan Zak K2SJO, and others. Other programs wil be on antennas, transmitters, VHF, and for beginners, presented by Bill Myers K1GQ, Pete O'Dell KB1N, and Ray Heaton WAØDYZ. There will also be an ARES forum and section and local net meetings. A highlight of the day will be the 2nd annual W2RUF Memorial Code Contest. Ladies' programs will be presented all day at hamfest hotel headquarters, the Marriott Thruway. Bus transportation will be provided from the fairgrounds to the hotel and to shopping malls.

The annual awards banquet will be Saturday evening at the Marriott. At midnight the Wouff Hong ceremony will be presented. All are welcome to participate.

Registration is $5 at the gate. The banquet will be $11. Flea market permits will be $2 per parking space. For info, write PO Box 1388, Rochester NY 14603 or call (716)-424-1100.

RICHLAND WA
MAY 30-31

The Tri-City Hamfest Council will hold its second annual Tri-City Hamfest and Computer Fair on May 30-31, 1981, beginning at 9:00 am at the Community House, Richland WA. Admission is $3.00 and children under 15 will be admitted free. The Saturday evening banquet will feature as speaker the NW ARRL Director, Mary Lewis; tickets are $15.00 each. Other features will include seminars, a door prize and raffle, a swap shop, antiques, vendors, and computer demonstrations. Talk-in on .04/.64, .16/.76 and .52.

INDIANAPOLIS IN
JUL 12

The Indianapolis Amateur Radio State Convention and Hamfest will be held on Sunday, July 12, 1981, at the Marion County Fairgrounds. For further information, write Indianapolis Amateur Radio Association, Box 11086, Indianapolis IN 46201.

CHARLESTON SC
JUL 18-19

The Charleston Amateur Radio Society, Inc., will hold its eighth annual Charleston Hamfest on July 18-19, 1981, at the Omar Shrine Temple, 44E Battery Street, Charleston SC. There will be overnight security guards and refreshments available. For more information, contact the Charleston Hamfest Committee, PO Box 30643, Charleston SC 29407, or phone (803)-747-2324/496-3660.

A Timely New Product

—the MFJ-102 digital clock

While inexpensive digital clocks are plentiful on the marketplace, the new MFJ-102 is a step above the average.

Featuring a low-profile aluminum-accented black cabinet, the clock functions around a brilliant fluorescent display. The 5/8-inch characters are clearly visible across the largest room, even in bright ambient light.

For the ham shack, a simple switch setting selects the 24-hour mode. Hours and minutes are always displayed; seconds may be called up by pressing the top bar.

The 102 also may be switched to display 12-hour time, complete with an AM/PM illuminated indicator, for local nets and routine domestic use.

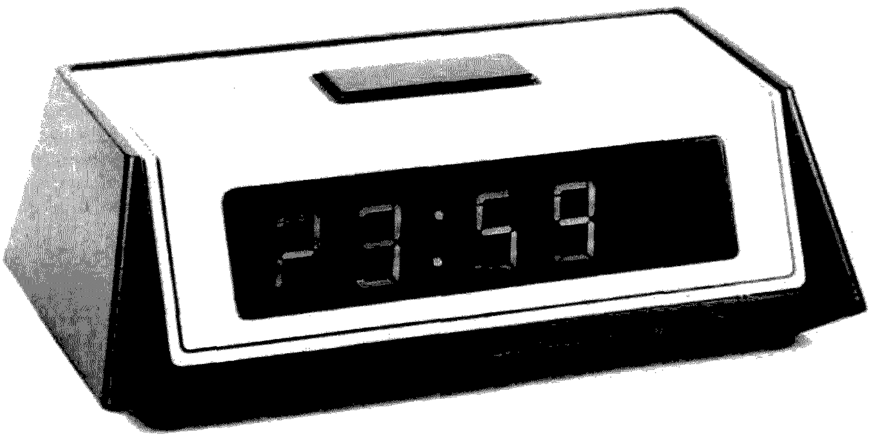
The clock also has an internal alarm complete with snooze button. The alarm doubles as a handy 9-minute ID timer—great for those who conveniently forget those legal IDs!

Time synchronization with WWV is a snap. Fast and slow set buttons allow easy reset, and to prevent accidental bumping of the reset buttons, a lock switch is provided.

Power interruption is always a problem for accurate-time buffs, but the MFJ-102 first-digit display segments will blink repeatedly until reset following a power-line interruption.

Although the clock comes set for American 120 V ac, 60-Hz line power, foreign 50-Hz operation is possible by merely shorting a pair of circuit pads on the PC board. 220- and 240-volt operation may be accommodated with the use of an external voltage-dropping transformer.

We found the MFJ-102 to be flexible, reliable, and easy to read. At $32.95, it represents a good value for the ham shack. For further information, contact *MFJ Enterprises, Inc., PO Box 494, Mississippi State MS 39762; (601)-323-5869*. Reader Service number 476.■



The MFJ-102 digital clock.

HAM HELP

I need a MITS manual on Altair 8800 BASIC which I can purchase or copy and return.

Carl S. Peterson N6CSI
219 E. Ashland Ave.
Visalia CA 93277

I am writing an expanded history of Wake Island and would like to hear from anyone who has operated from Wake/Peale/Wilkes Islands as a ham, commercial, or military radio op.

I am also interested in converting/repackaging a Gonset 6-meter Communicator for CW/FM/SSB, as well as borrowing the manual/schematics for the rig (I will pay postage).

Frank P. Nollette, SMSGT, USAF
KA0AOJ/KH6
7702C Kikanai Loop
Hickam AFB HI 96818

I am interested in obtaining a schematic or any other information on an old TV Analyzer Scope, model #1076, manufactured by B & K Mfg. Company, Chicago IL. Thanks.

A. B. Wells WA5COH
PO Box 50
Tunica LA 70782

I am looking for an FV-401 external vfo and/or matching speaker to buy at a reasonable price. Also, does anyone know anything about PI2MN or 5N20/HB9BVL?

Todd D. Greenleaf KA1CFQ
108 Edward Ave.
Pittsfield MA 01201

Need wiring diagram package No. WDP-0203 for a 32ASR with Centralized Selective Calling System and SA150 Accessory/Interface Unit. Will pay copy costs and/or mailing.

Terry Simonds WB4FXD/1
PO Box 1558

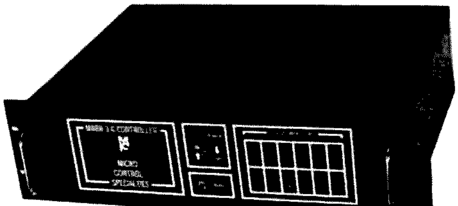
★ YOU ASKED FOR IT ★

A COMPLETE REPEATER STARRING THE MARK 3C SUPERCONTROLLER



ALL the unique features which make Mark 3C the acclaimed leader in repeater control —

- Autopatch
- Reverse patch
- Autodial
- 40 Functions
- 13 Morse messages
- Custom tail messages
- Digital tone decoding
- Microprocessor control

MARK 3-C CONTROLLER $1095

AND NOW, even the repeater is built in —

- Receiver sens. 0.25 UV
- Super crisp audio
- Transmitter output 2W

PLUS options —

- Power amplifiers (pick your level)
- Sub-audible tone
- Control receivers

MARK 3CR REPEATER
144-220 $1645.

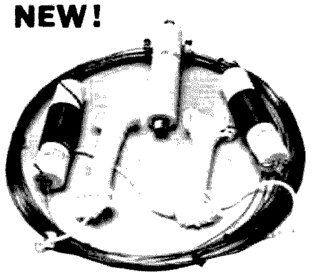
BASSETT HELIUM TRAP ANTENNAS — BASSETT HELIUM MOBILE ANTENNAS

NEW!



Heavy duty inductors with transparent tube covers.

The result of nearly two years of continuous development and nearly fifty years of amateur and commercial antenna design and manufacture Bassett helium filled antennas are for the amateur who demands the very best in American made automatic bandchange systems and mobile antennas that are compatible with all transceivers including the new "no tune"units. Trap systems are fundamental dipoles on each band and do not require antenna tuners.

- Helium filled traps impervious to all weather
- Maintains precise resonance and efficiency
- Systems easily handle legal amateur power
- Multiband amateur and MARS with one coax
- Fully compatible with"no tune" transceivers
- Short enough to fit on a small 50'by 100' lot
- Rugged white traps only 1"diameter, 5" long
- Uses your RG-8 or RG-58 coax in any length
- Center"isolator" equipped to accept a PL-259
- Solid Copperweld, stainless, nylon end lines

- Helium filled for a lifetime of high efficiency
- Completely adjustable to precise resonance
- Power handling capability to 750 watts PEP
- Beautiful white 32" Fiberglass lower section
- Stainless 38" 17-7 tapered top whip section
- Very low weight. VAC-20 weighs 6.5 ounces
- Low wind drag. Holds vertical at high speed
- All chrome plated polished brass hardware
- Models for all bands with a 2 meter collinear
- Mates with any standard 3/8-24 mobil mount

MULTIBAND BROADSIDE DIPOLES

VAC-40/75--$69.50	VAC-20/40/75--$89.50	VAC-10/15/20/40-----$119.50
VAC-20/40--$69.50	VAC-15/20/40--$89.50	VAC-15/20/40/75-----$119.50
VAC-15/20--$69.50	VAC-10/15/20--$89.50	VAC-10/15/20/40/75--$149.50

SINGLE-BAND MOBILES

VAC-2 collinear for 2 meter mobile---$39.50
VAC-6, VAC-10, VAC-15, VAC-20 ---$39.50
VAC-40---$44.50 VAC-75---$49.50

NEW! VAC-10m/18m/24m-----$89.50
For the 3 new amateur bands

Postpaid to 48 States. Florida residents add 4% Fla. sales tax.
Prices and specs subject to change without notice or obligation.
Special systems available for any use. Write for price quotes.

OSCAR ORBITS

Courtesy of AMSAT

The OSCAR satellites are subject to atmospheric drag, of course, and the present period of intense solar activity has accentuated the problem. During this period, our sun has been expelling huge numbers of charged particles, some of which find their way into the Earth's upper atmosphere, increasing the density (and thus the drag) there. It is through this region that the OSCARs must pass. OSCAR 8, in a lower orbit than OSCAR 7, is the more seriously affected of the two.

If the drag factor is not considered when OSCAR calculations are performed, long-range orbital projections will be in error. For example, by the end of 1979, OSCAR 8 was more than 20 minutes ahead of some published schedules. The nature of orbital mechanics is such that extra drag on a satellite causes it to move into a lower orbit, resulting in a shorter orbital period. Thus, the satellite arrives above a given Earthbound location earlier than predicted.

Using data supplied to us by Dr. Thomas A. Clark W3IWI of AMSAT, the equatorial crossing tables shown here were generated with the aid of a TRS-80™ microcomputer. The tables take into account the effects of atmospheric drag and should be in error by a few seconds at most.

The listed data tells you the time and place that OSCAR 7 and OSCAR 8 cross the equator in an ascending orbit for the first time each day. To calculate successive OSCAR 7 orbits, make a list of the first orbit number and the next twelve orbits for that day. List the time of the first orbit. Each successive orbit is 115 minutes later (two hours less five minutes). The chart gives the longitude of the day's first ascending (northbound) equatorial crossing. Add 29° for each succeeding orbit. When OSCAR is ascending on the other side of the world from you, it will descend over you. To find the equatorial descending longitude, subtract 166° from the ascending longitude. To find the time OSCAR 7 passes the North Pole, add 29 minutes to the time it passes the equator. You should be able to hear OSCAR 7 when it is within 45 degrees of you. The easiest way to determine if OSCAR is above the horizon (and thus within range) at your location is to take a globe and draw a circle with a radius of 2450 miles (4000 kilometers) from your QTH. If OSCAR passes above that circle, you should be able to hear it. If it passes right overhead, you should hear it for about 24 minutes total. OSCAR 7 will pass an imaginary line drawn from San Francisco to Norfolk about 12 minutes after passing the equator. Add about a minute for each 200 miles that you live north of this line. If OSCAR passes 15° east or west of you, add another minute; at 30°, three minutes; at 45°, ten minutes. Mode A: 145.85-.95 MHz uplink, 29.4-29.5 MHz downlink, beacon at 29.502 MHz. Mode B: 432.125-.175 MHz uplink, 145.975-.925 MHz downlink, beacon at 145.972 MHz.

At press time, OSCAR 7 was scheduled to be in Mode A on odd numbered days of the year and in Mode B on even numbered days. Monday is QRP day on OSCAR 7, while Wednesdays are set aside for experiments and are not available for use.

OSCAR 8 calculations are similar to those for OSCAR 7, with some important exceptions. instead of making 13 orbits each day, OSCAR 8 makes 14 orbits during each 24-hour period. The orbital period of OSCAR 8 is therefore somewhat shorter: 103 minutes.

To calculate successive OSCAR 8 orbits, make a list of the first orbit number (from the OSCAR 8 chart) and the next thirteen orbits for that day. List the time of the first orbit. Each successive orbit is then 103 minutes later. The chart gives the longitude of the day's first ascending equatorial crossing. Add 26° for each succeeding orbit. To find the time OSCAR 8 passes the North Pole, add 26 minutes to the time it crosses the equator. OSCAR 8 will cross the imaginary San Francisco-to-Norfolk line about 11 minutes after crossing the equator. Mode A: 145.85-.95 MHz uplink, 29.4-29.50 MHz downlink, beacon at 29.40 MHz. Mode J: 145.90-146.00 MHz uplink, 435.20-435.10 MHz downlink, beacon on 435.090 MHz.

OSCAR 8 is in Mode A on Mondays and Thursdays, Mode J on Saturdays and Sundays, and both modes simultaneously on Tuesdays and Fridays. As with OSCAR 7, Wednesdays are reserved for experiments.

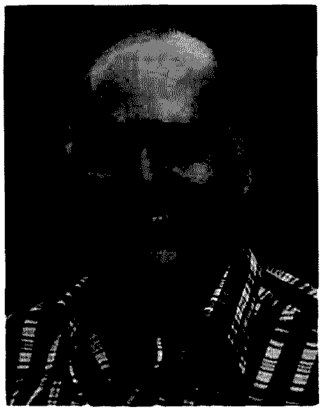
W2NSD/1
NEVER SAY DIE
editorial by Wayne Green



DAYTON!

No matter what any hamfest claims, there is no question but that Dayton is the biggest of 'em all. Indeed, if you want to get your car or van into the flea market on Saturday, you'd better get up mighty early. Even parking within walking distance of the show calls for an early start.

Thousands of happy hams were seen carrying or dragging home trophies from the flea market. Others were haggling with the few dealers who attended this year, trying to get the price down another dollar on a new rig. One chap had a price on his heart's desire from every dealer in the place. I know he had to have spent the better part of a day doing nothing else. If anyone offered to pay him at the rate he was using his time to save a buck, he would have been furious.

There were some new items . . . lots of them. Probably the most popular new development is the Morse code keyer/reader, with RTTY and ASCII provisions. A couple of years ago we saw one or two of these . . . this year they were all over the place. If the number of these gadgets being designed and made has any effect on amateur radio, we're in for a lot of high-speed CW and RTTY in the next few years.

Another mushrooming interest which was represented in force was the satellite TV makers. Several well-known ham firms have gotten into this field . . . and more are coming. I've just been waiting for the ground around our ham shack to thaw so we could plant a couple of small dishes and see what they grow into.

QST EVENTS

With the announced retirement of Baldwin, rumors have been flying about Harry Dannals taking over the spot upon *his* retirement, which surprisingly just precedes Baldwin's. While the move may not be all that beneficial to loyal *QST* subscribers, frankly *I'm* delighted.

The *QST* people stayed away from Dayton this year, almost totally. I don't know whether that had to do with the awful mess over Don Miller or whether *QST* is on the outs with the Hamvention. Miller was certainly there, as were thousands of furious Indiana hams, so perhaps it was a good time to avoid that heat. Did I smell some tar being boiled?

Dannals, who is a company man through and through, has been working at Sperry, if my memory serves. I thought it was really nice of the HQ gang to sort of look the other way as far as that stupid restriction they have about letting people who work for firms making radios not be eligible as directors. I think Dannals has been working as a union organizer or shop steward at Sperry.

In looking over the roster of HQ people who might be tapped for the top spot, I really can't think of anyone I'd rather see running things. Be sure to do all you can to get your director to see that Dannals is properly honored for all of the fine work he has done for *QST* . . . and its subscribers.

One of the *73* spies was able to sneak into the *QST* Forum at Dayton (using a wig). He reported that much of the time during this meeting was spent in the airing of complaints about the inadequacies of the latest *QST* repeater list.

CHARLOTTE

One of the things I really enjoy about Dayton is that just about everyone in amateur radio is there. Unfortunately, there is such a mass of people that it is possible to go for three days and still miss seeing a number of good friends. I would like to personally thank the several thousand people who recognized me wandering around and who took the time to say hello and say nice things about the magazine. And, yes, I know you enjoy the editorial "but don't always agree with what I write." I could be smart about that and point out that we don't have an IQ test as part of the subscription acceptance, but on the other hand, I reserve the right to change my mind about things. Also, there may be cases where I have not been able to get all of the facts . . . or, forbid!, where *you* may not have all of the facts.

Which brings me to Charlotte. Out of the whole weekend I got one single hard time. I was told that I had at sometime said something bad about the Charlotte ham club. Boy, if I did, I have absolutely no recollection of it. I can't even imagine what would occasion anything like that. Heck, I used to live in North Carolina . . . got my W4NSD call while I was there. And I *loved* the place. I was in Southern Pines and I made more friends there in a week than I find possible in most places around the country in a year. North Carolinians are the most friendly people in the whole country and I have nothing but good feelings about 'em. I am very dismayed that anyone thinks otherwise.

I have to admit that the chap I talked with seemed to have no sense of humor at all. I do have a

TOOTING OUR OWN HORN

We're extremely pleased to report that two long-time *73* authors walked away with the top awards at this year's Dayton Hamvention. It's the first time these prestigious awards have gone to journalists.

The Ham of the Year Award went to Eric Shalkhauser W9CI. "Shaw" is the author of the "History of Ham Radio" series which appears in *73* and in *QCC News*. He was honored ". . . for his very long dedication to amateur radio and its history."

Bill Pasternak WA6ITF is familiar to *73* readers as the author of our "Looking West" column. Pasternak and Bill Orenstein KH6IAF received the Hamvention's Specific Achievement Award ". . . for their contribution of time and effort to the operation of the Westlink Amateur Radio Network." Westlink is a weekly, prerecorded summary of amateur radio news distributed on cassette to many ham clubs and repeater groups.

Congratulations to the winners. It's great to have you as a part of the *73* team!

W2NSD ON-THE-AIR SCHEDULE JULY, 1981

7	40m-80m CW (Novice)
14	20m-40m Phone
21	15m-20m Phone
28	15m-20m CW

Look for us in the first 25 kHz of the General portion of each band. We'll be on the higher frequency band first.

problem with this in that I am serious only a small part of the time. Thus, when people start taking everything I say or write seriously *they* have a problem. I tend to take advantage of this at times, I'm afraid.

I mentioned Dannals earlier . . . and one of his great charms for me is his total lack of humor. He takes everything I write or say seriously, so we get along superbly . . . hi.

ST. LUCIA DELAY

In the May issue of *73* I mentioned that I was planning to get on the air from St. Lucia around the 16th and 17th of the month. Well, I got into trouble over commitments made for the TRS-80 Expo in New York the following weekend. My magazine, *80 Microcomputing*, is the sponsor of the show, so I suddenly found myself with a bunch of television and radio appearances in New York starting the 18th to hype the computer show. Rather than cut my trip to St. Lucia to a couple of days, I decided to move it to the middle of June.

Even that date is going to be a bit tight for me since I will probably have to get over to Ireland to attend the opening of our Instant Software plant in Dublin sometime in June . . . and I was hoping to attend the yearly reunion of the crew of my old submarine, *USS Drum*, which is at Mobile, Alabama . . . tied up next to the battleship *Alabama*.

And, with a new computer magazine being readied for a fall start, I will be needed more than a little at home. The new magazine, in case I haven't mentioned it before, will be aimed directly at businessmen and will be the first computer magazine to be published in English . . . rather than a subset of English known as computerese.

The new magazine has generated a good many problems . . . such as the need for about 50 people plus the space to put them. If you are ever up this way, stop in and marvel at how many people we are able to pack into a 230-year-old home . . . plus six other local buildings. The staff is up to 175 right now, with no end in sight.

At any rate, my plans are to get down to St. Lucia, rig in hand, and get on the air for a few

Well . . . I Can Dream, Can't I? by Bandel Linn K4PP

"You will create a magazine called *73* . . . In July, 1981, you will publish your 250th issue . . ."

days to say hello to as many friends as possible. I'll QSL all contacts. Tim Daniel N8RK of the *73* staff will be along, as will Chuck Martin WA1KPS of Tufts Electronics. Since stopping his ads in *73*, his business has slowed way down, so he figures he might as well take a vacation before running more ads and getting so busy he won't be able to leave.

I'll probably spend half of my time under water, scuba diving and taking pictures, and the other half hamming and adding a pound or two to my already substantial waist. I'll be looking for as many of you as I can contact on 20m, 15m, and possibly a bit on 10m and 75m. I like 20 the best.

TURKS AND CAICOS

Unless you're a ham, it is unlikely that you've ever even heard of these islands. After operating from there for a few days, I can assure you that about 75% of the hams don't know where they are either.

It all started out during the winter. Jeff DeTray, my Assistant Publisher/Editor, got struck with wanderlust and had cooked up a scheme to go to the Turks and Caicos Islands for the March DX contest. Tim Daniel N8RK, also of the *73* staff, was going, too, so they could operate around the clock as a multi-operator, single-rig station.

Having recently read a review in *Undercurrent* of the skin diving at Provo, the island to which they were heading, I invited myself along. What can you say when the boss invites himself on *your* DXpedition? The news was received with strained grace by Jeff and Tim. Jeff even offered to send and get my license for me.

Tim and Jeff headed out a couple days early to get their contest station and antennas hooked up. I ran schedules with them on 15m to see how they were doing. They'd gotten VP5TDX for Tim and VP5JDT for Jeff. They were not tickled with these calls, perhaps having hoped for something simpler for the contest, like VP5A. My ticket hadn't come through yet. Hmm.

Sherry, Chuck Martin, and I took off from Boston on March 5th, landing first in Miami... where I made a few contacts on

This is South Caicos Island... and fairly typical of the relatively uninhabited islands making up the group. There's an airport at the lower right.

One of the cab drivers at Grand Turk is Art VP5AQ. We lucked onto Art when we zipped downtown between flights to check into our ham tickets. Chuck got his ticket (VP5KPS) and I'm still waiting for mine.

With hotel space for only a few dozen guests, the Turks and Caicos Islands are not yet a full-fledged mecca. With service by Air Florida, hotels are abuilding. Reciprocal ham tickets are relatively simple to get... if you do your homework ahead of time. The Grand Turk airport is a short flight out of Miami. They're just building the new terminal building.

This is the cottage where our contest station mowed 'em down. It's part of the Third Turtle Inn. I was lucky enough to have the room next to the contest station, thus not missing hearing a contact, even in the wee hours of the morning. After a couple of nights of that, I moved.

2m. Next we went via Air Florida to Grand Turk Island.

There was just a bit less than an hour between the time our plane arrived and when the TCNA (Turks and Caicos National Airlines) plane was due to leave for Provo, so Chuck and I grabbed a cab and headed for town to see about our missing ham tickets. It was one of those amazing coincidences when we found that our taxi driver was VP5AQ! He took us to the licensing office and we eventually got a gal to check through the license applications. Though Jeff had sent mine in a week before Chuck had sent his, they had absolutely no record of mine! The magistrate was out at the moment, but they said our licenses would be issued that day and mailed over to Provo for us.

We dashed back to the airport to catch the plane to Provo. We needn't have rushed so much. Despite confirmed reservations, when the plane was ready to load we were told that they had just two seats left. . . which of us would volunteer to wait until the next day? We looked at each other, but were unable to discover any volunteers.

A fellow named Harold came up and said he had a plane and would be glad to take us to Provo on a charter. His price was more than TCNA, but it seemed to be the only transportation, so we agreed. We began to have second thoughts when he told us that his was a small plane and that we would have to go without our bags. . . which he would pick up the first thing in the morning and bring over for us at six o'clock.

Oh well. . . if we don't go this way we'll have to find a place to stay on Grand Turk and be delayed a whole day in getting to Provo. We were not all that encouraged about this part of the adventure when Harold rolled his plane out of the hangar and backed a car up to it for a jump start. We piled into the Piper and were off, heading about 50 miles across the water to Providentiales Island at the far end of the Turks and Caicos group. . . and the Third Turtle Inn.

Tim Daniel VP5TDX (N8RK/1) of the 73 staff, happily DXing away, racking up CW contacts. . . which are a lot of fun until QSL time arrives.

It doesn't take much of a setup to work a lot of DX. This simple station, operated in between scuba diving trips, leisurely meals, exploration, and a lot of local rag-chewing, still managed over 2,000 QSOs in a couple of days. That's Chuck sitting back in his "Whereinthehell's Providentiales?" tee shirt. My W2NSD hat is on the couch.

This is the Latitude 22 hotel, right next to the Third Turtle Inn. Chuck set up his VP5KPS station there. . . in the end cottage. Even with a simple traveling dipole, he got out on all bands. Next time. . . an amplifier and a beam!

Here I go, over the side, with my scuba gear, down to take some pictures. The GREEN TEAM tee shirt comes from the company volleyball team, the Peterborough winners this year, coming from behind to wipe out Byte *and all of the other volleyball teams.*

The scenery underwater is even more magnificent than that above. We went diving down the sea wall of coral which started from a bottom of about 50 feet and went down far beyond the depth of my new Casio 100m watch. . . which flooded out at 85 feet. Tsk.

I'm game for anything, so I didn't worry. That's one of the main reasons I got rid of my own plane when I first was starting *73 Magazine*. I knew that if I continued to fly I would sooner or later finish myself off. I had a lot of adventures during the two years or so I was flying. I'm just not careful enough to survive indefinitely at that sport.

When we arrived at Provo, Harold bounced the plane down the runway and we piled out. It was too dark for him to take off again. We arrived with perhaps two gallons of gas left, just enough to get to South Caicos . . . perhaps. Oh well, Harold would take care of everything the next morning bright and early. Sure he would.

A short taxi ride to the Inn . . . a taxi ride in these islands seems to cost $10 minimum if you haggle, $25 if you don't. Jeff and Tim were moderately delighted to see us. They, too, had had to charter a flight to Provo, though they managed to get a more professional pilot. We found out later, from a TCNA pilot, that Harold had no license, his plane was not certified . . . and he had no insurance. Ooops!

The Inn and Provo are absolutely gorgeous. The weather is gorgeous. The ocean and beaches are gorgeous. Flowers are everywhere. It soon became obvious that Jeff had no intention of letting loose of his mike for anyone . . . he was in ham heaven . . . in a rare country with the bands piled high with stations calling. I mumbled about one of the rigs being from my ham shack . . . he didn't hear me. Luckily Chuck had packed an extra rig, which we eventually got on the air . . . otherwise I might have had to do Jeff serious bodily damage.

The dish and studio building of WIV. The antennas pick up TV from Miami during openings. They also send the satellite signals via channel 7 to a hilltop, where a solar-powered transmitter rebroadcasts on channel 4 for the whole island. It's free for now, but Bob intends to encode the signals and charge . . . much like cable TV.

Here are some of the monitors, switching, and other paraphernalia needed to put on a professional television broadcasting service.

The TV studio is, for the time being, the kids' playroom and living room for Bob and his family. Once the house is built next door, they will move there and be able to put on live TV from this studio. Talk about living in a goldfish bowl!

This 20' dish is outside the new WIV television studios. Yes, I know they can't use a "W" prefix in Turks and Caicos. Their answer: "Who says so?" We arrived on a very unusual day . . . when the sun was exactly behind the satellite, thus creating a good deal of sun noise on the signal. Notice shadow of the LNA (low-noise amplifier) in the exact center of the dish. It happens about once a year. That's me, Coop, and Chuck, with Sherry carrying my camera bags.

The video recorders can furnish programs when the satellite channels are barren, which is seldom. They do allow television programs run at weird times to be sent during prime time. The station receives the satellite signals, converts them to channel 4, and rebroadcasts them for the island populace. When the station is complete, they will be able to put on locally-done programs as well as satellite and video tape programs.

We settled down to dinner...which was fine. The prices were scary, particularly for a registered skinflint like me. I never really was able to relax and forget the money those damned meals cost. Hoot mon! But then nothing is cheap in these islands. Power runs 35¢ a kWh, to give you an example. And I mentioned the two-mile $10 taxi rides.

The next morning, dressed in my suit since my island clothes and bathing suit were still over on Grand Turk, we sat around and talked ham radio, ate a very expensive breakfast, and leisured. Along about 10 am I talked Chuck into going to the airport to see if our bags were in yet...six o'clock, you remember? That's the last we saw of Chuck until dinner time.

It turned out that Harold was still hanging around. Chuck got him going and went with him in the death ship to South Calcos for gas...and then on to Grand Turk for the bags. While he was there he pooped downtown again and got *his* ham ticket. There was nothing there for me...thanks, Jeff. So eventually VP5KPS and our bags were back in the air, heading again to Provo. They made it, against rather stiff odds. Chuck mentioned having to fix the compass in the plane and that the radio went out during the trip. Lot of water down there.

The next morning Chuck had his rig set up, but the scuba trip was about to leave, so Chuck, Sherry, some other guests, and I headed out to the reefs in a small power boat. I had my diving gear and a Nikonos IV camera along. It was very rough going...and the trip took over a half hour. The nervous part was when we had to go over the reef. We had to wait for just the right wave and go with it over the reef so we wouldn't get stuck on it and perhaps lose the boat. This drama did not help Sherry, whose complexion was beginning to match her GREEN TEAM tee shirt.

Nothing bothers me, so I

Continued on page 120

This is the view out of the front of the Cooper establishment. Miles of perfect beach. Oh well, it probably won't be long until there are hotels from one end of the beach to the other. The government owns the beach and it will always be kept public, which is a good move.

Providentiales (Provo) looks weird from the air. There are access roads all over the place. The idea is to sell vacation home sites, so they have already put in the roads. It's a little difficult to get to... but not impossible. You have a fantastic climate year 'round... some of the best swimming you can ask for... remoteness. You get your water from catchments on your roof or in the yard and keep your water in a cistern under your house.

Bob Cooper VP5D. Bob is one of the pioneers of the home reception of satellite television. His monthly publication, Coop's Notes, is the main source of information for the field. Bob's been at this longer than anyone else and is the guru of satellite TV.

This is Tim, resting up a bit during lunch. I never did get pictures of Jeff, who just wouldn't leave the rig, even for meals. Note the ever-present HT.

Chuck Martin VP5KPS/WA1KPS, the owner of Tufts Electronics, the largest ham store in New England and, if ham sales continue to drop and force others out of business, perhaps the largest in the east.

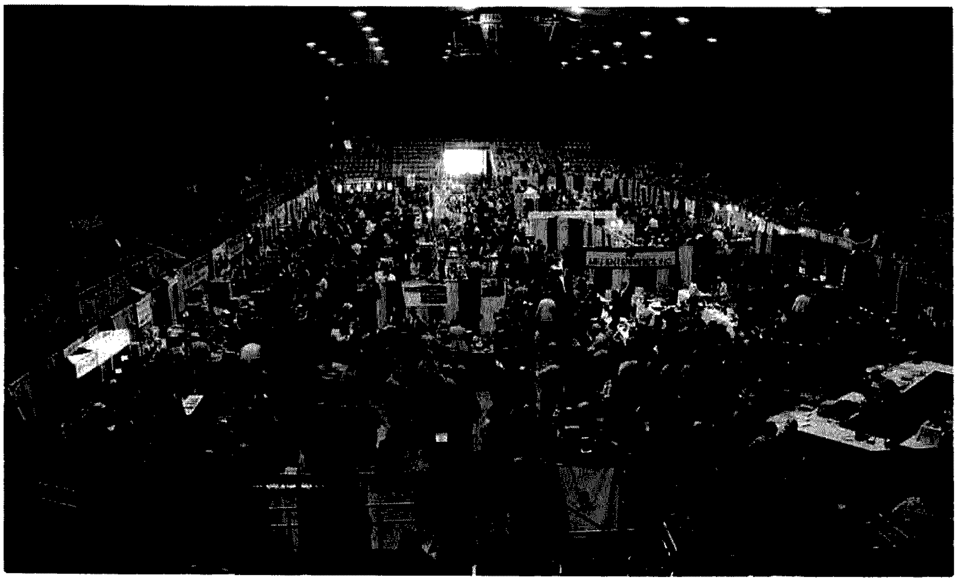
Paul Grupp KA1LR
73 Magazine Staff

Dayton Dilemma '81

—which new gear do you buy?

If you're a ham, chances are good that you'll find something of special interest to you going on at the annual Dayton Hamvention. Part of the fun for almost everyone who goes is nosing around to see what new equipment is available. I went to Dayton this year specifically to look at new products, and there were plenty there to see! If there is any trend to spot, it is unquestionably the growth of interest in RTTY communication. The most interesting and innovative products shown this year were designed for that mode, and RTTY equipment seemed to be everywhere. Folks looking for other types of gear weren't dissappointed either—there were new transceivers, tuners, amplifiers, and other hardware much in evidence. In this article, you'll find gear listed by category, and in alphabetical order for fairness. Be sure to take a close look at the last category of equipment (RTTY). If you're not interested in RTTY yet, there are a lot of manufacturers out there who are after your attention.

Of course, deciding what is new and what isn't can be a formidable task. We decided to include only those products that were first announced at Dayton or announced just a few weeks previously. If you know of something that should have been included but wasn't, please accept our apologies—the decision of the *73* judges is final. Enjoy!

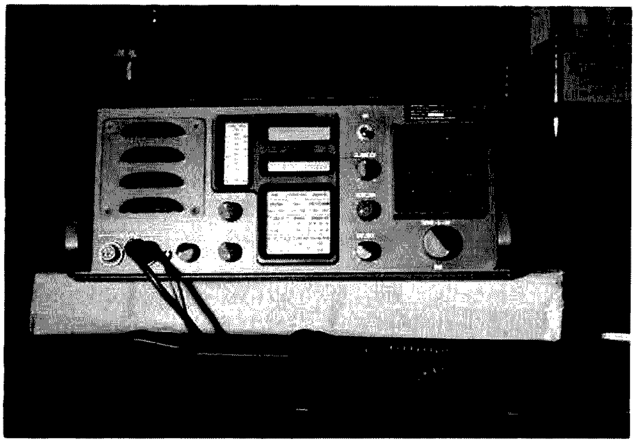


Dayton '81!

New Rigs

Starting with the most esoteric, Advanced Receiver Research of Burlington CT was showing the TR10GA, a 10-GHz full-duplex FM/CW transceiver with provisions for an internal or external gunnplexer. The transceiver requires 13 V dc at 0.5 Amps, and is equipped with a tripod mounting ring.

Cubic Communications was showing a rig to cause the most jaded DXpeditioner's heart to flutter—the Astro-C HF SSB transceiver designed for commercial and military use. At $8000 it's not for everyone, but in all seriousness, it may have a few things going for it. The thing is built to take abuse and, in the words of the manufacturer, is designed for "...continuous operation in the severest of environmental conditions." The front panel offers a waterproof and blast-protected speaker, a few knobs, a key pad for function selection, and an LCD readout to keep you informed of what the transceiver's microprocessor controller is up to. 10 memories are maintained by a lithium battery with a



Cubic's Astro-C.

The new Icom 730.

projected life of ten years! No need to carry a remote vfo either—split operation is a snap. Frequency coverage is from 1.6 to 30 MHz, in 100-Hz steps, in your choice of SSB, CW, AM, and RTTY. Power output is 100 Watts SSB/CW and 25 Watts AM. In case you are wondering, the Astro-C is not just a 102BX in olive drab—the 7" × 17" × 17" 42-pound beast is designed to bring high performance to the battlefield. Planning a DXpedition to Spratley Island? This has got to be the ideal rig!

A little more conventional is the DenTron HF-200D HF transceiver, shown in prototype form and slated for release sometime this summer. Hopefully the new digital readout will help this rig fare better than DenTron's previous efforts in the field.

For a lot of us, the Icom IC-730 stole the show. By now you've seen the pictures. I spent about half an hour experimenting with the controls, using the minimal antenna that Icom had plugged into it at the show. I was very impressed. I'm a confirmed audio nut and the receiver audio quality seemed to be better than what the IC-701 provides. Whatever you think of the novel configuration of the i-f shift, you'll have to admit that it functions beautiful-

Santec's 440-MHz HT.

ly; it should be love at first sight for CW addicts! The 730 continues the Icom tradition of packing the maximum number of useful features into a small package. The layout is one of the most functional I have seen and should be equally at home as a main rig or in a vehicle.

The Icom 22S is seeing yet another re-release, this time as the IC-22U. Banished is the diode programming and rotary channel selector—they've been replaced with push-button channel selection of 800 channels. The rig has got to win some kind of an award for longevity!

Japan Radio Company, still looking for a US distributor, was showing a fascinating (and expensive!) set of HF twins that have been on the Japanese market for a while but haven't had wide-spread distribution in the US yet. The NRD-515 receiver offers continuous coverage from 100 kHz to 30 MHz, in PLL-synthesized 100-Hz steps. Design is of the up-conversion dual-conversion variety, with a first i-f at 70.455 MHz. Features include passband tuning, digital readout, bfo pitch control, four i-f filters, and completely modular design. The NRD-515 is one of the few receivers that could do a first-class no-compromise job as both an SWL rig and a ham receiver. The NSD-515 transmitter is equally versatile, covering 160-10 meters (including the new WARC bands). Features of the transmitter include speech processor, VOX, FSK input terminal, and 100 Watts output. Used with the NRD-515, the transmit and receive frequencies can be set from either vfo, and split operation should be a breeze. All things considered, this pair of rigs could become quite popular in the US—I hope Japan Radio finds a distributor!

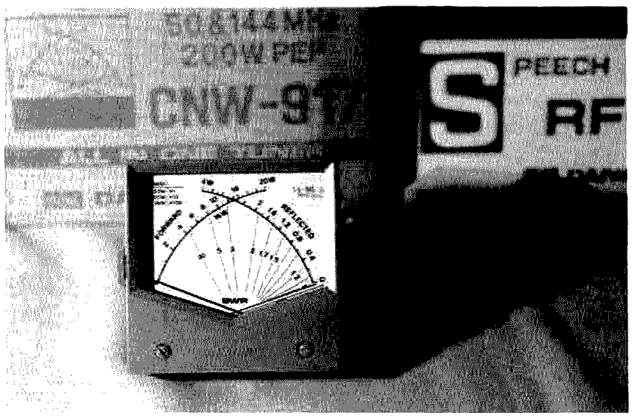
Kenwood was showing the TS-530S, a new rig that took many of us by surprise. The 530 offers many of the features of the venerable TS-820S, in a package that matches the TS-830S flagship. If sales of the 520S that this rig replaces are any indication, this rig will be very, very popular.

Moving abruptly to the UHF spectrum, Santec was pleased with the interest shown in their ST-7T 440-MHz synthesized handheld. The unit tunes 2000 channels in 5-kHz steps, with thumbwheel-switch frequency selection. Control operators for repeaters should be happy about the standard 16-tone DTMF pad and the optional synthesized CTCSS encoder. High power output is rated at 3 Watts, medium at 1 Watt, and low at .05 Watt.

Ten-Tec displayed a new compact HF rig, the Argosy, offering a lot of features at an inexpensive price. The solid-state finals provide 40-50 Watts output rather than the usual 100, and the readout is analog only. On the positive side, features include RIT, notch filter, and a built-in swr meter. At $549 list, they'll no doubt be getting a lot of orders!

Yaesu's new FT-290R multi-mode portable 2m transceiver should be of special interest to types who want to get a lot of mileage out of their equipment. Built-in batteries allow mountaintopping fun with two Watts out on FM and SSB. Put the rig indoors with an amplifier brick and

FT-290R from Yaesu.



Daiwa's 1.8-to-60-MHz swr meter.

The DenTron Clipperton T.

Heath's SA-2000 tuner.

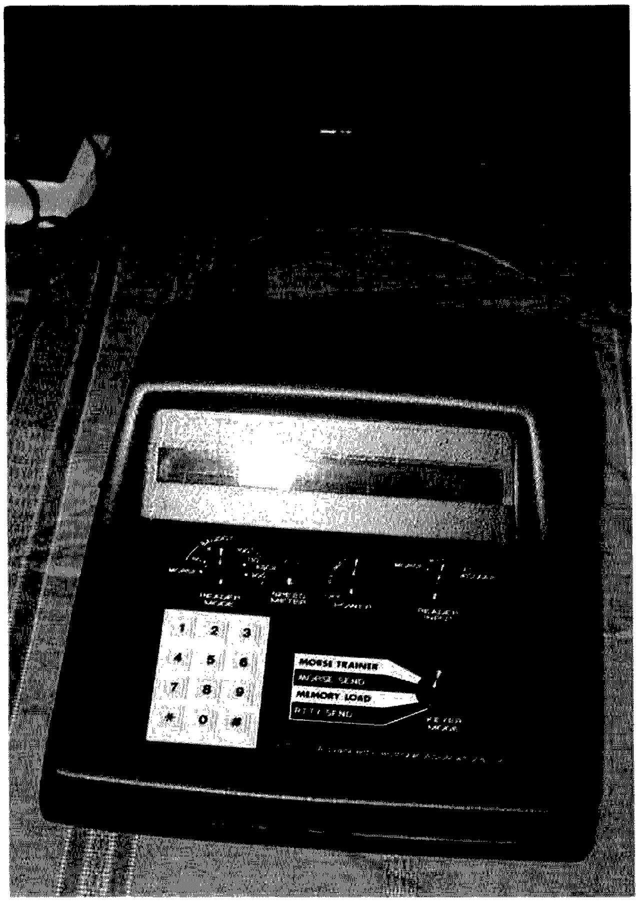
the LSB/USB capabilities will let you into the world of OSCAR. Wherever you use it, the five memories should add to the fun.

Amplifiers

A good handful of new amplifiers was shown. As with the transceivers above, the emphasis was on evolution, rather than revolution.

2-meter DX and EME addicts will no doubt be interested in DenTron Radio's Clipperton-V 500-Watt two-meter linear. Drake introduced a relatively inexpensive 1.5-kW unit for the HF bands—the L-75 160-15 amplifier.

Heath was showing two new linear amplifiers for 2 meters—the VL-2280 and VL-1180. Both offer 75 Watts out for 10 Watts of drive. The 2280 sports a built-in ac power supply that will power both the amplifier and a transceiver; it should be an ideal companion to one of the multi-mode 2-meter rigs. The 1180 operates on 12 V dc and is designed for mobile use.



The MBA-1 from AEA.

Icom showed a compact 10-Watt amplifier for the 2-meter band. Designed to mate with the IC-2AT, it should be right at home with any of the other popular hand-helds,

Last but certainly not least, Lou Anciaux of Lunar Electronics was showing the 4-40P linear 2-meter amplifier, which also features a receive preamp with a better than 2-dB noise figure. One-to-four-Watts input yields 10-40 Watts out. Should be the ideal companion for Yaesu's new FT-290R multi-mode portable!

Antennas

There were plenty of new antennas in evidence. Daiwa showed a very interesting line of mobile antennas, including a duoband 2-meter and 450-MHz model with 2.5-dB gain on 2 and 5.5-dB gain on 450.

Hy-Gain introduced the V2 3-dBd-gain vertical antenna for 2 meters. Claiming a low angle of radiation and effective decoupling of the feedline, Hy-Gain is competing with the Cushcraft ARX-28 and the AEA Isopole in the high-technology gain antenna race.

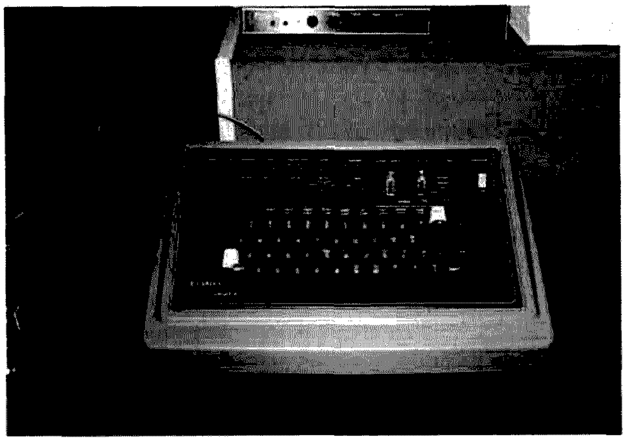
KLM had a variety of new antennas to announce, from 40 meters on up to two. There are two new shortened beams for 40 meters, one with three elements and one with two. For two meters there was the JV2 2-meter vertical with 5 dB of omnidirectional gain. Also shown was the 144-148-4X four-element beam, with a folded-dipole driven element. The antenna is supplied with an RG-142 balun, rated to 2 kW. The rear-mounted antenna has a claimed gain of 8.5 dBd.

Lunar introduced a pair of beams for 430 MHz and 2 meters, with 19 and 11 elements, respectively.

Miscellaneous Items

AEA is entering the FM direction-finding sweepstakes with the PFDF radio direction indicator, operating on the Doppler principle. The unit offers several sophisticated features, including an automatically-triggered sample and hold circuit for instant pinpointing of the kerchunker variety of wild turkey.

Daiwa introduced more new products than any oth-



Drake RTTY/CW keyboard.

er manufacturer and with good reason. Daiwa markets an extensive line of high-quality products in Japan and their new distributor in the US plans to import a good many of those items. Included in the lineup is a very compact audio CW filter with built-in amplifier and speaker, a speech processor, two world map rotators, an incredible variety of compact cross-needle swr meters, and a cordless mobile microphone, complete with speech processor!

DenTron Radio was showing the prototype model of the Clipperton-T 3-kW antenna tuner, which should be available later this summer. The tuner offers full metering and lots of other nice features, and is of course an ideal companion to the Clipperton-L linear amp.

HAL's CT-2100/KB-2100.

For proud owners of the Drake 7-line with a taste for matching equipment, there was the Drake CW keyer. Front-panel controls are limited to speed and volume, so this unit appears to be designed for the casual CW op.

Elkhart Industries is cashing in on the current keyboard craze in ham radio with two new enclosures for keyboards and computers.

Heathkit had a new antenna tuner that adds an swr meter to their previously-available tuner. Of special interest to Field-Day ops is the surprisingly compact gas-in, ac-out generator. By the time you read this, the *73* gang will have put one through the wringer during this year's Field-Day festivities!

Last on our list of miscellaneous introductions was Radiokit, offering the K9CW contest keyer in kit form—contest season is just around the corner!

RTTY/CW Gear

As promised, I've saved the best for last. The big news at Dayton was unquestionably computerized RTTY/CW gear. New keyboards, readers, and computer interfaces were available everywhere I looked, and could very well represent the ham trend of the eighties.

I had a very difficult time tearing myself away from the AEA booth, where all concerned were justifiably proud of their MBA-1 Morse, Baudot, and ASCII reader. Kept as a deep dark secret until the first day of the show, the MBA might be an ideal way for hams to get into RTTY. It sports a 32-character vacuum display designed to give the user plenty of time to read high-speed messages and especially to help copy weak signals in high-QRM situations. The MBA seemed able to track speed changes extremely well, suggesting that it might do an excellent job of copying sloppy CW. The most innovative aspect of the MBA is its MBA-01 code converter option, which allows you to join the RTTY crowd and transmit in ASCII or Baudot with a Morse keyer! This is such a great idea that I can't imagine why it hasn't been done before, but in any case it's available now and provides an interesting and practical alternative to a keyboard.

Commsoft showed their new software package for the Heath H-89 computer. The system uses almost any demodulator and provides a three-level split-screen display, pretype buffer, disk-based autostart/mailbox system, automatic CW ID, and excellent user's manual. I was pleased to note that the manual provided lots of information about operating on RTTY for the first time, what to look for in transmitters and receivers for RTTY, and an extensive list of RTTY books and publications.

Crown Microproducts had the ROM-113 computer interface up and running with the TRS-80 Model III computer, and software for both the Model I and III has been improved, offering more buffer memories and a host of new features. Hams contemplating purchasing a computer and RTTY interface will be interested to know that the new TRS-80 Model III reportedly causes virtually no interference to ham gear, unlike its noisy predecessor.

Drake is making the Tono Theta 7000E CW/RTTY terminal available in the US sometime this summer. Fea-

tures include seven 64-character memories with battery backup to retain memory when power is off, 53-character keyboard buffer, auto word-wrap, scope outputs, automatic T/R switch, two-page display memory, split-screen video, and a well-shielded cabinet for RFI protection. Interestingly, the 7000E will operate on 13 V dc at one Amp, which opens the way for some interesting mobile or portable work!

HAL no doubt is feeling pretty smug about the new interest in RTTY, and they were showing two new RTTY/CW terminals: the DS-2050 KSR and the CT-2100/KB-2100. The 2050 is essentially a DS-2000 terminal and an ST-5000 demodulator combined in one compact package. The system is loaded with the usual pretype buffers, status indicators, and pretype-while-receiving features. Considering its relatively low price, the DS-2050 KSR might be an ideal way to get into RTTY communications.

The CT-2100/KB-2100 combination is HAL's upmarket terminal and offers virtually every feature the dedicated RTTY fanatic could desire. The CT-2100 receive terminal can be used alone, but the KB-2100 is needed to transmit. HAL has obviously been listening carefully to RTTY enthusiasts, and this new combination is the result of that research.

TRS-80 owners might be interested in the Macrotronics, Inc., terminal which is offered in two models—one for the 16K Level II TRS-80 and one for the 16K Model III. Macrotronics deserves some kind of an award for the most number of features available in a computer/interface RTTY system. There are 16 soft-sectored buffer memories, a four-word user-defined WRU, a complete terminal-status display line, word-wrapping, pretype buffers, and more. The hardware side includes a six-stage active-filter CW demodulator, a hardware clock, and a multi-stage active-filter RTTY demodulator. By terminating the data and address busses at the computer end of an active buffered cable, Macrotronics has effectively reduced RFI caused and suffered by the computer. Sounds interesting!

Microlog got into the act with the new ACT-1 stand-alone terminal (sorry about that pun!). Like the HAL DS-2050 KSR, demodulator, AFSK generator, and terminal are all included in a single cabinet. The ACT-1 includes all the usual features as well as a few unusual ones. A random-code generator and a hand-key input are provided for Morse practice, and the unit can be used as an SSTV generator. Also included are several test messages, SELCAL, autostart, and a real-time clock.

For the do-it-yourself CW-only operator, AJR Electronics of Evansville IN is offering PC boards and manual for their Skipjack keyboard. The estimated final cost is about $200, depending on how careful a parts shopper you are. Special Morse characters are available (AR, KN, etc.) and speed is adjustable from 7-104 wpm. A 64-character buffer is provided with LED indicators to let you know how full it is.

Well, that about wraps it up! There was something for everybody at Dayton this year, and you'll be reading extensive reviews on many of these new products in *73* in upcoming months. Got something you'd particularly like to see reviewed? Drop us a line and let us know—we appreciate your input! ■

The Fun-Ceiver

—easy-to-build companion to February's QRP Fun-Mitter

The Fun-Mitter 5-Watt transmitter ("The Fun-Mitter—A Goof-Proof Rf Project," *73 Magazine*, February, 1981) confirmed my ideas about hams and home-brew. Hams are, indeed, anxious to build their gear if they can be sure of success once they have done the building! Judging from the response, the Fun-Mitter provides the amateur with the kind of gear that interests the first-time and the short-of-time home-brew enthusiasts.

Goof-proof projects also will appeal to hams with a limited amount of test equipment. Many times a project is bogged down when, upon completion, the device doesn't work correctly and a great deal of time must be used to debug and/or redesign it.

Photos by Dave Jehu

View of Fun-Mitter, companion receiver, and audio amp.

This project follows the same ideas as for the Fun-Mitter—to provide a simple companion receiver that also is goof-proof. It can be built for either 80 meters or 40 meters and provides an ideal receiver to further your all-home-brew station. It can also be used with other transmitters or can be used by itself as a standby or portable receiver. As with the transmitter, the receiver uses a minimum of parts and can be assembled easily in an afternoon.

The design criteria and design goals for the receiver are similar to those for the transmitter. There basically are six goals for the design:

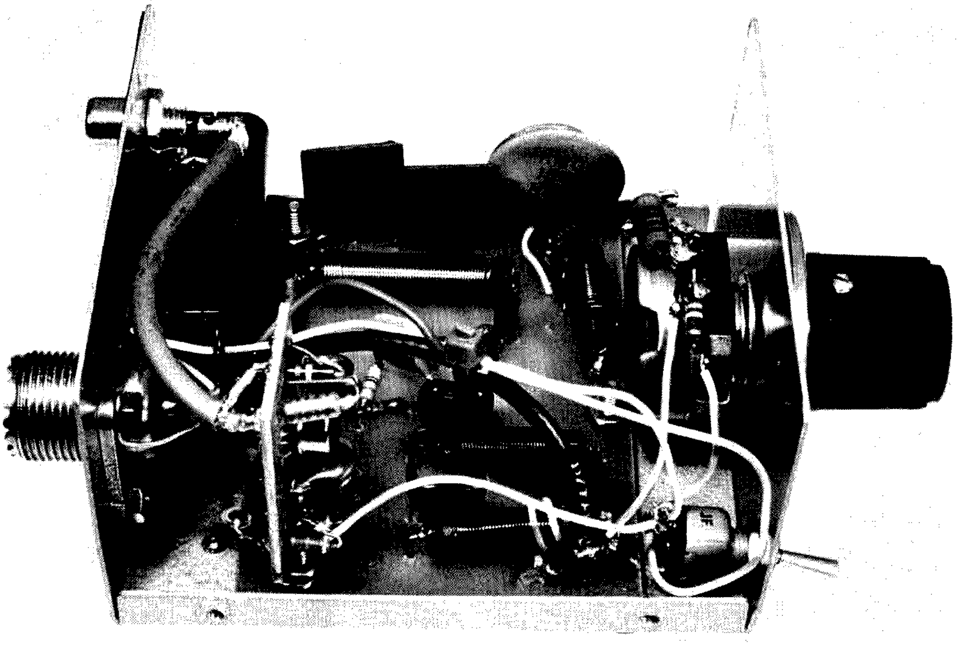
- Compatible with Fun-Mitter.
- Same size as Fun-Mitter.
- Costs less than $30 with new parts.
- All parts available from Radio Shack.
- No variable capacitors or tuning adjustments.
- As simple as possible.

The finished receiver meets the six goals. It will tune any 70-kHz segment of the 40-meter band or any 50-kHz segment of the 80-meter band. Sensitivity is very good. The selectivity is adequate in the basic receiver and can be improved with the optional audio filter. As can be seen in Fig. 1, the receiver is very simple. Only a tuning knob and an on-off switch are used. This makes construction and operation easier but does not compromise performance.

Designing the receiver (as with all home-brew rigs) was a great deal of fun. Setting goals in advance provided a challenge that took me through four revisions of the receiver board. Originally, the receiver utilized a JFET detector and op-amp audio stage but it evolved slowly to its current form. Fortunately, Radio Shack introduced dual-gate MOSFETs in the 1981 catalog and that provided the impetus to continue. The dual-gate MOSFET provides a more sensitive, easier-to-match-impedance detector than does the JFET. Although it has drawbacks, such as AM detection and hum, it makes for a good direct-conversion detector. These drawbacks are reduced considerably by utilizing a double-tuned input network and by using an enclosed case with a battery supply.

Radio Shack rf chokes were again used as resonant-circuit inductors and, again, perform quite well. They are modified as described later to provide the necessary inductances for the circuit. The physical size of the chokes, however, necessitated a larger PC board than might otherwise have been used.

Variable-frequency tuning is provided by using general-purpose diodes as voltage-variable capacitors. The voltage to the diodes is varied by a front-panel potentiometer which in turn changes the capacitance of the diodes to vary the frequency of the oscillator.



View of inside of companion receiver.

Circuit Description

The receiver is the ultimate in simplicity but still performs quite well. It is shown in schematic form in Fig. 1. As can be seen, it is a direct-conversion receiver utilizing a product detector, Q1, and a variable-frequency oscillator, Q2, which operates at the same frequency as the incoming signal.

L2, C1 and L3, C3 comprise a double-tuned input network which provides good out-of-band signal attenuation. L1 matches the 50-Ohm antenna impedance to the high impedance of gate 1 of the MOSFET. To construct L2 and L3, the same procedure is used as was used for the Fun-Mitter. For 80 meters 8 turns should be removed, and for 40 meters the choke should be left intact. Small-gauge hookup wire or magnet wire can be used for L1.

Audio output is taken from Q1 through a .1-uF capacitor (C7). C6 is used to bypass the detector drain at high frequencies. The audio output is routed to J2. From there the audio is routed to a 200-mW Radio Shack audio amplifier through a

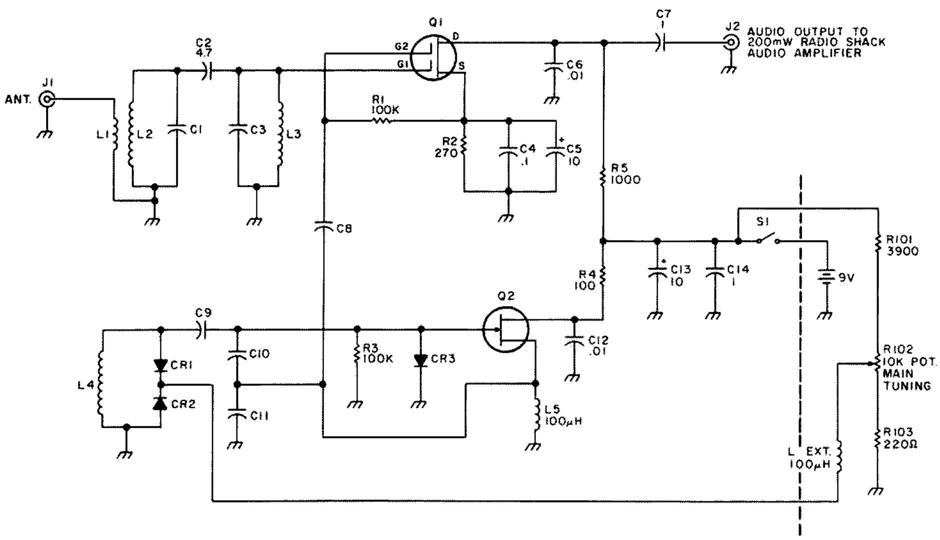


Fig. 1. Schematic of companion receiver.

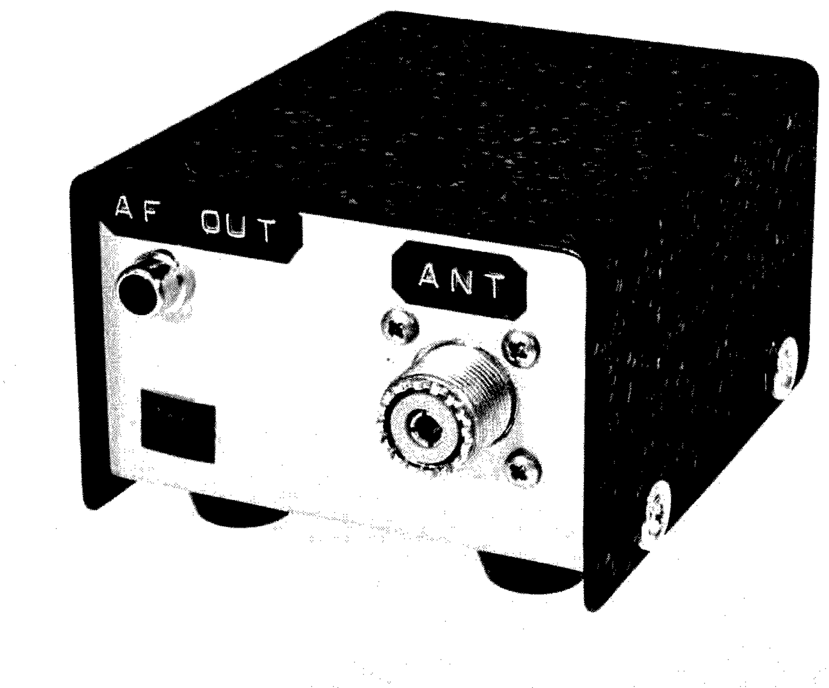

View of back of companion receiver.

shielded cable. This is a significant departure from normal design procedures but it was done for several reasons. Not including any audio amplification on the receiver board made the receiver much simpler. This, in turn, makes the receiver easier and faster to assemble.

There are no layout problems with the external amplifier due to the high gain needed for direct-conversion audio chains. Also, no audio gain control (or associated wiring) is needed on the front panel. The only drawback to the external Radio Shack amplifier is its $12 price tag. I feel the advantages more than outweigh this cost, however, and the amplifier can be used for other projects. Once the decision was made to use the external amplifier, the project really began to take shape. The simplicity of the rig was finally realized! (Only two transistors and no audio control!)

Other than the product detector, the only other section of the receiver is the vfo. Designing a stable, simple vfo from Radio Shack parts was definitely a challenge. However, the design of Fig. 1 provides one. The circuit is configured as a parallel-tuned Colpitts oscillator. The frequency-determining components are L4, CR1, CR2, C9, C10, and C11. Stable capacitors must be used for C9 through C11. Ordinary disc ceramic capacitors will tend to cause the receiver to drift over time. In order to meet the design goal of using all Radio Shack parts, some ingenuity must be used with these capacitors. Radio Shack does sell a packet of 100 capacitors (part number 272-801) that contains a large number of capacitors marked NPO. This denotes a capacitor that doesn't change value with temperature.

I found in several packs that the values needed existed with the NPO designation. If the values given in the parts list do not exist in the packet you purchase, use the parallel- and serial-capacitance formulas to obtain the needed capacitance: For parallel capacitors: $C_T = C_1 + C_2 + \ldots$ For series capacitors: $C_T = 1/(1/C_1 + 1/C_2 + \ldots)$. These NPO capacitors will yield very acceptable drift characteristics. After a five-minute warm-up the receiver has no noticeable frequency change. If you have silver mica capacitors available, they will perform even better.

L4 consists of a single modified inductor for 40 meters. For 80 meters, the same size inductor is placed in series with an unmodified inductor to provide the needed inductance. As mentioned in the Parts List, the last three turns of the modified inductor should be spread out over the rest of the inductor body to provide a method of setting the operating frequency.

The receiver is powered from an internal 9-V battery. Current drain is approximately 5 mA, so the battery life should be long. The use of the internal battery eliminates the problem of a separate supply or reg-

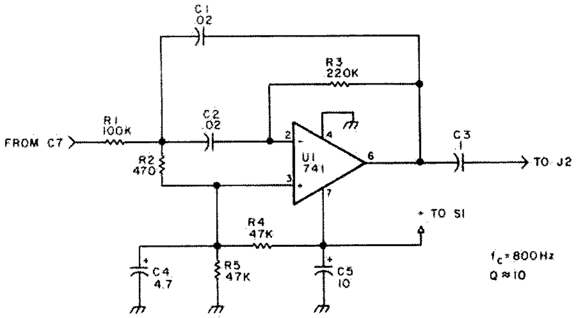

Fig. 2. Optional audio filter.

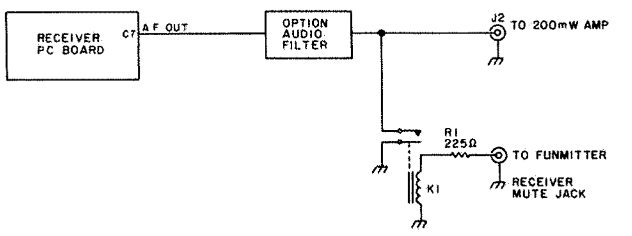

Fig. 3. Wiring of filter and receiver mute options. K1—SPDT miniature relay (275-216); R1—three 680Ω, ½-W resistors wired in parallel.

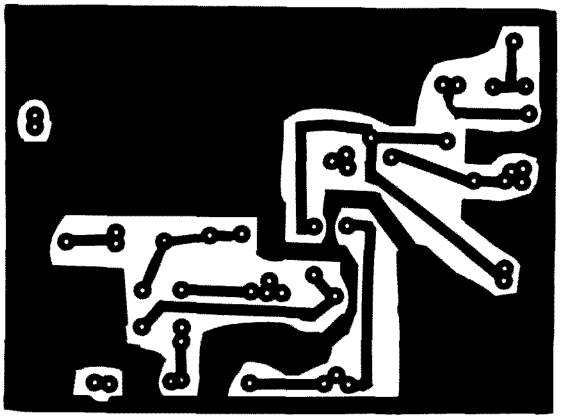
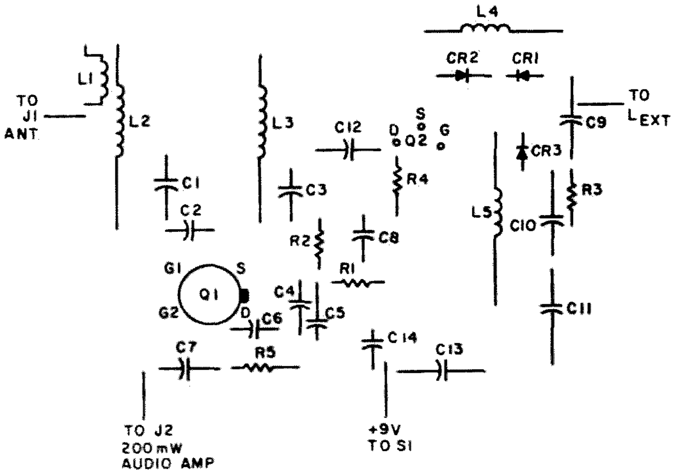


Foil side, receiver PC board.



Component layout, receiver PC board (foil side shown).

ulator for the receiver. It also aids in reduction of hum caused by the 60-Hz power-line frequency that is common with ac-operated, direct-conversion receivers. Again, simplicity is the key word!

Options

Two options have been designed for use with the receiver to make operation more enjoyable. An audio filter, shown in Fig. 2, can be added before the audio amplifier to provide good audio selectivity. The filter is a bandpass type with a center frequency of 800 Hz. The filter will cause signals to peak at 800 Hz.

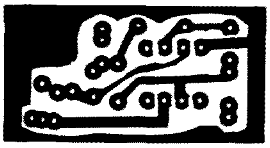
The filter is inserted at the af output (after C7). The PC board can easily be mounted inside the receiver box. Ideally, a front-panel switch should be added which will either bypass or include the audio filter. This will make tuning much easier. If the switch is not included, tune very slowly across the signals or the band will appear dead! For best results with the filter, headphones should be used. This is because the high-Q filter will cause an unpleasant ringing at the higher audio levels needed for speaker use.

The second option allows the receiver to be silenced during transmit. If this is not done, the audio level from the receiver can become quite uncomfortable during transmit. Most designs use a transistor switch to short the audio to ground, but for simplicity sake I chose to use a relay—as shown in Fig. 3. This provides a very easy method to mute the receiver audio and can be added to the receiver at any time. Control voltage comes from the transmitter. A phono jack can be added to the FunMitter and wired to the receive side of the transmit/receive switch, as shown in Fig. 4.

Construction

The receiver is constructed on a 2¼" × 3" single-sided PC board. Although the layout of the board can be changed, it should be emphasized that the receiver needs to be built on a PC board. Point-to-point wiring or breadboard wiring can lead to wiring errors and also can create unwanted ground loops in the receiver. Loading time of the parts on the PC board should be less than one hour.

For best operation, the board should be mounted in an enclosure. A very suitable one is mentioned in the Parts List. Front- and rear-panel controls and jacks should be mounted for best use and looks. If the Radio Shack cabinets are used, the metalwork becomes an easy task. The

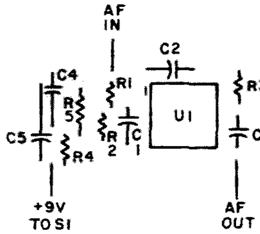


Foil side, filter PC board.

light-gauge aluminum can be drilled easily with a hand drill, and the holes enlarged with a file or knife.

The tuning potentiometer and its associated resistors and inductor should be mounted on the front panel. Small-gauge wire can be used between 9-V and R101 and between one side of L (external) and the PC board. Coax should be used between the antenna connector and the PC board. Audio cable should be used for the connection from C7 on the PC board and the phono connector, J2. Audio cable should also be used between the receiver and the audio-amp input.

Mount the board at least ¼" above the cabinet base



Component layout, filter PC board (foil side shown).

so that the PC traces will not short to ground. The PC board should be mounted in such a way that both the front-panel controls and the battery will fit easily. The battery can be tucked neatly between the board and the rear panel and a 9-V battery clip used to connect it to the circuitry. Dress the battery wires neatly along the side, away from the components, and attach them to the on-off switch.

Operation

Before the receiver is turned on, a few simple checks should be made. Vi-

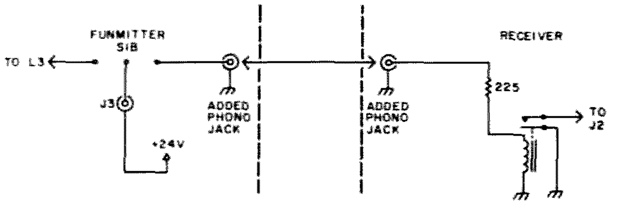


Fig. 4. Needed modifications to transmitter and receiver to include receiver mute option.

*For 80 meters, for CR1, CR2 use two 1N914 in parallel (piggyback).

sually inspect all the traces on the PC board to make sure that there are no solder or etching shorts between pads. Also check all soldered connections to make sure that there are no cold solder joints. Components should also be checked for loading accuracy.

If an ohmmeter is available, a reading of approximately 200Ω should exist between the hot side of S1 and ground (with S1 off!). If the ohmmeter reads near zero Ohms, then a short exists somewhere and the PC board and all wiring should be reinspected.

After these checks have been made, the receiver is ready for frequency adjustment. All of the receivers I have constructed have worked the first time, and yours should not be an exception. The only adjustment to be made is that of adjusting L4 for the correct frequency. For either 80 or 40 meters the procedure is the same.

Using another receiver, listen for the vfo signal. To do this, hook a length of wire to the antenna connector of the listening receiver. Drape the other end of this wire near the companion receiver's PC board. Tune the listening receiver to the bottom of the segment to which you desire to set your tuning range (for instance, 3700 kHz on 80 meters). Using a non-metallic tool, compress or widen the 3 adjusting turns of L4 until the vfo signal is heard on the frequency you are tuned to. This adjustment will need to be done slowly and may need to be repeated once or twice until you are right on frequency.

That is the only adjustment necessary. For best results, the receiver should be operated initially without the 800-Hz filter (or with it bypassed). This will allow you to familiarize yourself with the receiver. You may find you don't even need it. I prefer headphones because the brain seems to do a great deal of filtering for you when using them. Any 8-Ohm phones can be used provided an adapter is made to connect the amplifier output to them. (The amplifier output is a mini-jack, whereas most 8-Ohm headphones have ¼" standard plugs.)

A 50-Ohm resonant antenna will provide best results. If the receiver is to be used with the Fun-Mitter, a short coax jumper can be used between the two. If the receiver mute option is used, a short wire should be connected between the two and it should be verified that the audio disappears when the transmit-receive switch is switched to transmit.

The receiver provides surprisingly good results. Because of the simplicity and low cost, several receivers can be built for different frequencies. I have even built one for a 75-meter SSB net for use as a monitor receiver.

Conclusion

All home-brew contacts can now be completed with the construction of the receiver. The companion receiver provides the simplest method, without compromising performance, to complete your station. In the months to come, a vfo, amplifier, and other projects will be presented which will further enhance your station. ■

PC boards are available from the author: Receiver PC board —$7.00 ppd; Filter PC board—$3.50 ppd. PC boards for the Fun-Mitter transmitter (*73 Magazine*, February, 1981) are also available from the author—$7.00 ppd.

The Kenwood TS-130S
—a good rig done better

When Kenwood introduced the TS-120S some time ago, it was an instant success. There weren't many rigs like it available at the time and Kenwood's engineers managed to cram an incredible number of useful features into a very small box.

After WARC, Kenwood decided to upgrade their HF transceivers to include the new amateur frequency allocations, and the TS-130S was one of the first of the improved rigs to appear on the dealers' shelves. Not content to merely add a few new positions to the bandswitch, Kenwood listened carefully to TS-120S owners and included some useful new features in the package. For example, when mobiling an HF rig, every Watt of transmit power counts, and the lamentable omission of a speech processor from the 120S has been corrected in the 130S. Many CW operators like to be able to choose between wide and narrow CW filtering, depending on band conditions. With the 120S, once the narrow filter is installed, it is automatically selected whenever the mode switch is in the CW position. CW operators have been placated by the addition of a wide/narrow filter switch on the front panel of the 130S. Small changes? Maybe, but they can make a big difference if they happen to be important to you!

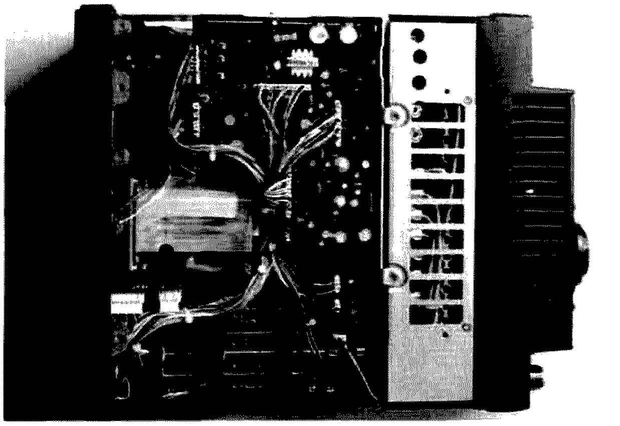
After owning an Icom IC-701 for over a year and using a Yaesu FT-707 for the last several months, I thought I would round out my experience with small HF rigs and get a Kenwood TS-130S. Here is what I discovered.

Kenwood's TS-130S HF transceiver.

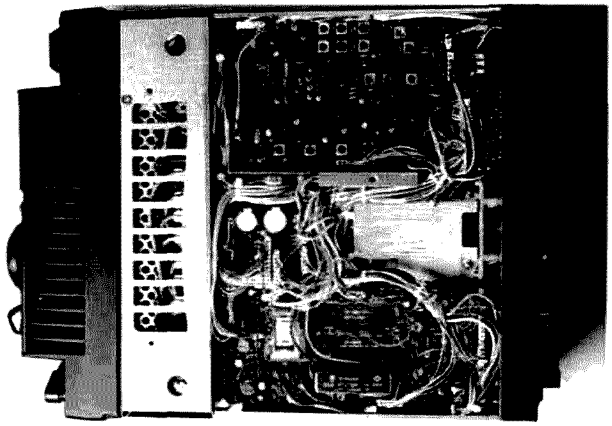
The Features

When you sit down in front of a 130S for the first time, it doesn't take long to discover that while it is small, it *is* a complete rig. In fact, it incorporates almost all the features of much larger transceivers like the TS-820S. Here are a few of the facilities available to the operator of the 130S: full filtering available for both CW and SSB, i-f shift, RIT, speech processor, complete VOX facilities, built-in relay for linear-amplifier switching, digital and analog readout, 25-kHz calibrator, noise blanker, and 80-10 meter coverage, including the new WARC bands. Not bad for a rig of any size!

The good stuff isn't just inside the rig. There is an extensive line of matching accessories for the 130S, including several different types of remote vfo's, an external speaker for hi-fi audio fanatics, several microphones, an antenna tuner, a mobile mounting bracket, a monitor scope, and a phone patch. Kenwood has understood for years that hams like to have



Top view of the 130S.



Bottom view of the 130S.

a lot of accessories to choose from for their stations (are you listening, Icom?) and they are doing their best to provide them.

When the 130S arrived, it saw a couple of months' service in the *73* ham shack, where it performed well. Its microphone, remote vfo, and linear amplifier connectors are compatible with those on the TS-830S, allowing fast changeover for both rigs. In side-by-side comparison with the 830S, the 130S fared remarkably well. Any differences in sensitivity were deemed inconsequential, but the 830S was a slightly better performer in the selectivity department. Our admittedly subjective tests indicated that when both rigs were tuned to the same frequency, under certain conditions adjacent frequency "garbage" caused slightly more interference to the 130S than it did to the 830S. Otherwise, the 130S kept right up with its bigger brother. The i-f shift is several orders of magnitude more useful than similar controls on some other transceivers. It really works! The internal speaker provides better than average audio quality, although it occasionally rattles when driven to the high levels favored by some staff members. When the rig is plugged into an external speaker, it provides typical Kenwood hi-fi audio at any practical level. The headphone jack on the front panel is wired to ac-

The NCG-15 SSB/CW Monoband Transceiver

—a moving tale of mobile hamming

Ever been curious about that NCG-15 15-meter SSB/CW QRP transceiver that's been advertised in *73* lately? I have. In fact, I've been seeing tantalizing ads for it since 1978 in *CQ HAM RADIO*, Japan's premier ham radio magazine. When the rig finally appeared on Columbia's shore, I knew I had to have one. At $235, it seemed almost impossible to go wrong, so I promptly fired off an order.

By the time the rig arrived, I was more than a little curious and excited. Careful unpacking yielded the rig itself, a U-bracket mobile bracket, a package of hardware, a Hi-Z handheld microphone, and a perfectly atrocious operating manual. Whoever is responsible for that manual couldn't have more than a nodding acquaintance with the English language! Fortunately, schematics are a universal language, and that essential document appears to be adequate for any service or modifications that a ham might contemplate.

The manual may be less than useful, but the rig is so straightforward that no manual is needed. Within three minutes of connecting the rig to a small 12-volt supply and a fifty-foot random wire, I was exchanging signal reports with F6EXL, near Paris! After signing with him, I had a pleasant QSO with a ham in Florida, and then with another in Arizona.

For the next couple of months, though, the rig languished unused on the shelf. I am inflicted with an incurable case of DXitis, and with my marginal antenna system, when I heard someone I wanted to talk with I always reached for one of the more powerful transceivers in my arsenal. I could see that the QRP rig wasn't going to see much action until I installed my tower, an operation scheduled some two months in the future.

One day as I sat in my shack lost to the world, idly spinning the knob on my IC-701, my gaze came to rest on the NCG-15, and a lightning bolt of inspiration struck. Why not mobile the NCG! At this point some explanation is necessary. When I bought my IC-701 two years ago, I had great plans for mobile operations with it. I bought a mobile mount for it, and a Hustler mobile antenna with resonators for 40, 15, and 10 meters.

I soon discovered that the Icom's chances of seeing mobile operation were slim. Once it was wired into the home station with ground, linear control, antenna, keyer, speaker, and other accessory cables, pulling it out to use it in the car threatened to be a for-

The Incredible Shrinking Antenna

—give your vertical a top hat

You might not believe it if I told you that you can build a vertical antenna for 40 meters that has a 2:1 swr bandwidth of over 1 MHz, is highly efficient, is only 12′ high, and will withstand wind velocities to an extent that it will probably never blow down.

It probably sounds too good to be possible. And yet, it can be done easily using a technique that I have seen very little of at amateur frequencies: oversized capacity hats. The antenna described here was built from the remnants of an old 14AVQ 4-band trap vertical, a few feet of wire, and three ordinary porcelain insulators.

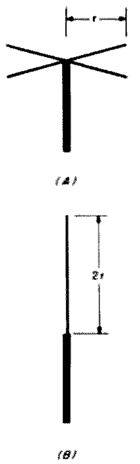

Fig. 1. A Capacity hat of radius r increases effective antenna height by twice its radius, or 2r. That is, the antenna at A and the antenna at B will have about the same resonant frequency if the lower section (thick line) is identical in both cases.

Capacitive Loading

Take a drive around your local ham neighborhood and observe the trap vertical antennas being used. Most of them have a little top hat consisting of three or four prongs about a foot long. What is the purpose of this little thing? Basically, it increases the capacitance of the high-voltage end of the antenna. Capacitive loading brings down the impedance value at the top of a vertical antenna, reducing chances for "corona" effects. It also increases the bandwidth somewhat on the lowest band; not much, but a little is better than nothing. The capacity hat also makes the antenna look much more sophisticated and *increases* the wind loading. (Isn't that great?)

Actually, capacitive loading is under-utilized on the 40-, 80-, and 160-meter amateur bands. While the radius of the capacity hat on a commercially manufactured trap vertical is about 12″, which translates to an electrical length of 0.008 wavelength on 40 meters or 0.004 wavelength on 80 meters, it is possible to have a capacity hat radius of up to about 0.1 wavelength without producing detrimental effects on antenna efficiency. This is true because most of the radiation from an antenna occurs where the current is highest, and that's near the bottom of a quarter-wave vertical.

In general, a capacity hat of radius r, consisting of three or four elements, increases the effective height of a quarter-wave vertical by about 2r. This is illustrated in Fig. 1. The physical size of 0.1 wavelength is about 12′ at 40 meters, 24′ at 80 meters, and 48′ at 160 meters.

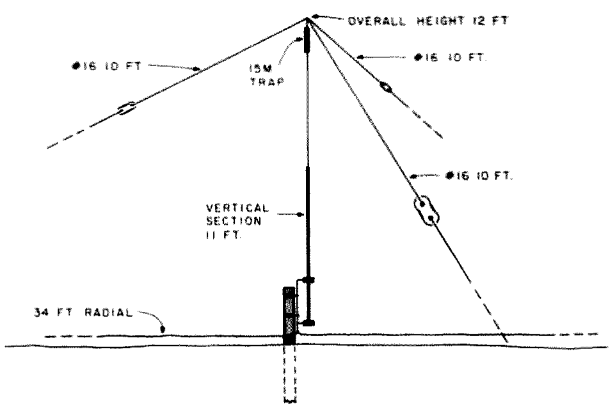

Fig. 2. The basic design of the 12′ 40/15-meter vertical. The trap and base mount are from the original 14AVQ. The capacity hat wires were attached to the top of the trap via an ordinary hose clamp. The fine details of construction are not critical, and the builder may use whatever methods suit his situation.

The 40/15-Meter Vertical

Fig. 2 shows the design of the 40- and 15-meter antenna I constructed. Actually, I

designed the antenna with only 40 meters in mind, but it turned out that the lengths and inductance values required were close enough to allow the inclusion of 15-meter capability. The entire antenna system is resonant as a quarter-wave vertical on 40, and the 11′ section underneath the 15-meter trap operates as a quarter-wave system on 15.

I installed six radials, each 34′ long, simply by laying them on the grass (after warning the landlord to have me remove them before he cut the lawn!). This is admittedly a marginal system; actually it takes dozens of radials to make a ground-mounted vertical optimum. But, being basically lazy (and frugal), I felt quite content with only six. This proved to be entirely adequate on the air.

Using the formula that the 10′ radius of the capacity hat translates to about 20′ of additional height for the antenna, you can see that the effective height of this vertical is pretty close to a full quarter wave on 40 meters. Actually, the swr bandwidth is astonishing. Fig. 3 shows the swr measurements across the 40-meter band.

Of course, you may say that Fig. 3 doesn't tell us much about the antenna; after all, a dummy load would have a swr curve every bit as flat, and even lower! And, if this antenna were radiating almost nothing but happened to have a ground resistance close to 50 Ohms, you might get a curve similar to that shown in Fig. 3. This is a valid point. So, I checked out the swr on 20 and 80 meters; it should be very high if the antenna is working properly—it is. The broad resonant response of this antenna is, no doubt, attributable to the effects of the gigantic capacity hat.

One note if you happen to have a 4-band trap vertical and are thinking about trying this idea: The radius of the capacity hat may vary a little bit, depending on the ground characteristics in your vicinity and the Q of your 15-meter trap. However, the radius should be between 8′ and 12′ in almost any situation.

On the Air

Then came the ultimate test, the real checkout. There's only one way to see whether an antenna works after all the engineering and swr checking is done. The question was, of course: Will this antenna "get out"?

On the air, the antenna performed as expected for a vertical. Nearby stations (within a radius of about 300 miles) were relatively weak, and stations further away were strong. A lot of DX was heard and worked, especially from Europe in the evening and Japan and New Zealand in the morning. Many of these DX stations were as strong as stateside W2 stations.

I'm not about to make any extraordinary claims for this antenna. In operation, it seemed to outperform the original 14AVQ with respect to DX; it proved essentially the equivalent of a full-size, 33′ structure which I subsequently built and tested. This little antenna certainly is more physically rugged than the full-size job. The latter strained perilously against mere 20-mph winds, while the little 12′ antenna was indifferent to gusts in excess of 40 mph. By indifferent, I mean that it hardly moved. And, of course, during a heavy thunderstorm, I would much rather have a 12′ metal structure in my yard than a 33′ metal structure!

Considerations for 80 and 160

Since 40 meters is my favorite band by far, I did not consider applying this technique to 80 or 160. However, these low bands are even better candidates for the idea than 40 meters.

If you are interested in building an antenna of this kind for 80 or 160 meters, remember that the maximum radius of the capacity hat is 0.1 wavelength, or 24′ on 80 and 48′ on 160. These values are probably best. Why go for anything shorter? As for height, choose the maximum height you feel comfortable with. On 80 meters, 16′ would be a good choice, since the coil or trap would allow resonance on 20 meters also.

In place of the trap, it is recommended that an air-core coil be used, which can be tapped until the proper value of inductance is obtained. The trial-and-error process may take a while, but resonance should be very broad, so the task should not be that difficult. ■

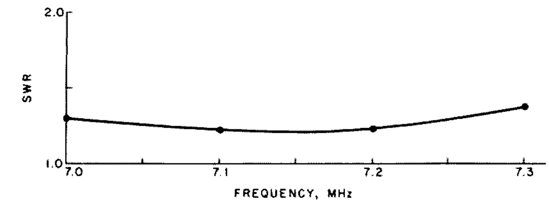

Fig. 3. The swr curve for this antenna is almost flat. The exact value will depend on the number of radials used and the conductivity of the ground. Anything less than 2:1 is generally regarded as acceptable. The important characteristic here is the flatness of the curve, indicating a very low Q attributable to the large size of the capacity hat.

The Micro Control Specialties Mark 3CR

—a hassle-free repeater that does it all

Not so very long ago, if you wanted to put a repeater on the air, you had two choices. You could buy a commercial repeater from Motorola, GE, or RCA at a breathtaking price, or you could kludge-together something on your own, producing a unique blend of home-brew, amateur market, and commercial equipment. Over the last few years, several firms have been marketing repeaters specifically designed for the amateur market, without the hefty price tags of commercial equipment. At first, these "amateur-grade" repeaters were sneered at by the old stalwarts of the VHF bands. Recently, the performance and capabilities of these repeaters have improved to the point where they can no longer be ignored.

The Micro Control Specialties Mark 3CR repeater is an excellent example of what can be done by an enterprising company that sets out to meet the unique needs of the amateur community. Its microprocessor controller is the most versatile and practical I have ever seen—it would take a book to describe all its capabilities! In this review, I'll try to give you a general idea of what the repeater is capable of, and how it performs in day-to-day use.

Physical Characteristics

Physically, the repeater is rather unassuming—it is mounted in a box on a standard 19" rack panel, 5-1/4" high and 12-1/2" deep. On the front panel are two knobs, two switches, a mike jack, and a cluster of 12 LEDs. Period. One of the knobs is the squelch control for the main receiver; the other is the volume control for the local speaker. The switch on the left of the mike jack is the power switch, and on the right is the "command" switch. More on the command switch later. The LEDs on the right-hand side of the front panel are status indicators. Some are assigned at the factory, others are free to be assigned to specific tasks by the end user.

If the front panel fails to indicate the vast range of functions available to the owner of a Mark 3CR, comprehension will surely dawn after even the most cursory examination of the rear panel. It sports two terminal strips with a total of 30 connection points for control of external devices, and six phono jacks for various audio inputs and outputs. An octal socket allows access to various voltages for metering purposes, and a pair of banana connectors is provided for a 12-volt backup power supply, such as a deep-cycle marine battery. Three SO-239 connectors are provided for antenna connection to the receiver, transmitter, and an onboard control receiver.

Radio Amateur's License Manual

—don't memorize, learn!

Radio Amateur's License Manual, *American Radio Relay League, 225 Main St., Newington CT 06111.*

Any book that gets as far as a 78th edition has to be doing something right. The American Radio Relay League's *Radio Amateur's License Manual* is a classic. It has nurtured thousands of hams from Novice to Extra. Over the years, the *License Manual* has tried to keep pace with changes in the rules and exam content. With "memorize-the-answers" publications gaining in popularity, I was interested to see how the League's tried and true "Publication #9" kept up.

The *Radio Amateur's License Manual* has always offered something for everybody. In the space of 175 pages it includes coverage of the Technician/General, Advanced, and Extra class exam subjects, plus a copy of the FCC's Part 97 rules and regulations. Among the other useful bits of information are details about international regulations, reciprocal licenses, and third-party agreements. Rounding out the broad range of topics is a list of addresses for the FCC field offices and a frequency allocation chart. All this in one 8½"×11" softbound book that costs $4.00.

The ARRL editorial staff has done a good job of presenting a tremendous amount of material in a limited space. If you are very dedicated and have a solid background in amateur radio practices and theory, the *License Manual* will probably get you through the exams on the first try. Less experienced readers will want to use other materials to supplement the contents of the ARRL book.

As a firm believer in learning rather than just memorizing, I like the "new" *License Manual*'s style. The large format lends itself to a lot of figures and diagrams that help clarify technical topics. There are multiple-choice questions at the end of each section. No, they are not pirated from the FCC exams, but they do make a nice way to review.

For the majority of the hams contemplating the purchase of this book, all the lists, rules, and other extras are not as important as a pertinent, well-explained discussion of the topics on the exams. Each of the exam topics is covered, but not always in the depth required to be confident in answering the test questions. The approach used in this guide resembles shooting in the dark at a very small target, with a limited amount of ammunition. While the 78th edition of the *Radio Amateur's License Manual* is not a bull's-eye, it is better than completely missing the target.■

The CCD Antenna—Another Look

—theoretical justification and answers to some frequently asked questions

Response to our first article (*73* for October, 1978) describing the high-gain Controlled Current Distribution antenna, has been exciting. Many telephone calls and letters have come from coast to coast, universities, and from out in the Pacific.

Enthusiastic comments and data were volunteered by Professor Arthur Erdman W8VWX of Ohio State University. His experience is quoted with his kind permission:

"My previous 14-MHz inverted dipole was 45 feet from earth at the center, and surrounded by five trees. It was fed with low-loss 300-Ohm twinlead and a tuner, and produced very poor DX results. Then, a CCD was built and substituted for the inverted dipole, at the same height and using the same tuner and feedline. The results are amazing! My DX is summarized:

14-MHz Inverted Dipole

1. Could work *only* the S-9 DX stations—my reports were S-4 to S-5.
2. Never any answers to my DX CQs.
3. Last one in a pileup.

14-MHz CCD Antenna

1. Can work DX stations I can scarcely hear!
2. After ordinary CQs, more DX stations answer.
3. Usually 5th to 10th in large pileups!"

The Ohio State University Electrical Engineering Department feels that further research into the CCD principle is definitely justified. Professor Erdman will direct the investigation, utilizing already-written computer programs.

Additional data are presented in this article that will be helpful in constructing and understanding the superior antenna. There also is a section on theory. Finally, the questions most often asked are addressed below, in the order of most concern to those interested in the CCD's advantages.

150 WATTS CCD ANT

Fig. 1. A sample log sheet from W8VWX, while using the CCD antenna and 150 Watts input.

Testing

Previous comparisons of CCD antenna performance against a reference dipole at 7 MHz had been cumbersome, due to the sheer distances required to separate test antennas from the Ferris Model 32-B laboratory-type field-intensity measuring instrument. But to con-

struct a valid antenna range for HF antenna measurements becomes a monumental task: building an adequate, level ground plane of suitable dimensions, maintaining constant spacing of test antennas, and clearing of vegetation.

VHF frequencies permit closer control of test conditions, due to both smaller radiators and antenna range dimensions. A Taco/Jerrold Model AIM 719-B laboratory-level field-intensity instrument covering 54 through 900 MHz and calibrated to 1 dB was purchased, and construction of a VHF antenna range was begun.

A section of level land was selected, and vegetation cleared to a radius of 63 feet (approximately 9.2 wavelengths at 144 MHz). Projecting near-future plans to test many CCD beam configurations, a ground plane twenty feet square was constructed, using close-mesh woven wire. A rigid support post for test antennas was mounted at plane-center, with a compass and means for accurately spacing radiators at specific heights above the effective ground.

Two independent power sources were provided: commercial 115-volt and lead-acid storage battery. Operation solely from the battery would quickly reveal any distortion of radiated field patterns which might result from reflections by commercial power feedlines. Also importantly, the more constant battery power would eliminate errors in pattern measurements that could result from commercial power fluctuations.

Five different designs of 2-meter CCD radiators have been used at W4FD to consistently activate repeaters 90 miles away while using one-Watt power. The CCD design selected for the initial range measurements was 7 feet long, made up of 40 sections of ¾-inch OD aluminum tubing, each 2 inches long. (Except: two sections at the feedpoint and also the two at each end are 2½ inches long.) The 38 fixed capacitors connecting these are each 24 pF.

Two identical simple dipoles were constructed of ¾-inch OD aluminum tubing, each 3′¾″ long. One serves as the reference dipole, the other as the field-meter antenna, located 9.2 wavelengths from the test antennas.

For valid comparisons of the CCD versus the reference dipole, the precise adjustment of equal input power to each is most critical, and was greatly facilitated by use of a line-to-antenna impedance-matching system which we call the "trombone match."

Some disturbing variations in field-meter readings were caused by the movement of personnel. By also applying the trombone match, immunity to such movements was achieved, and uniform readings were then possible from any convenient position.

Careful preliminary measurements were first made with power to the range supplied through a 115-volt ac line laid flat on the ground and laborously positioned at 90 degrees to the test antenna during measurement at each 10-degree point around the range. Then the ac source and line was completely removed from the range and replaced by storage battery. The same readings were again taken at each 10 degrees of azimuth for both the CCD and reference dipole test antennas, each mounted in exactly the same position. Absolutely no difference in values was found (the AIM 719-B instrument is easily read to 0.1 dB).

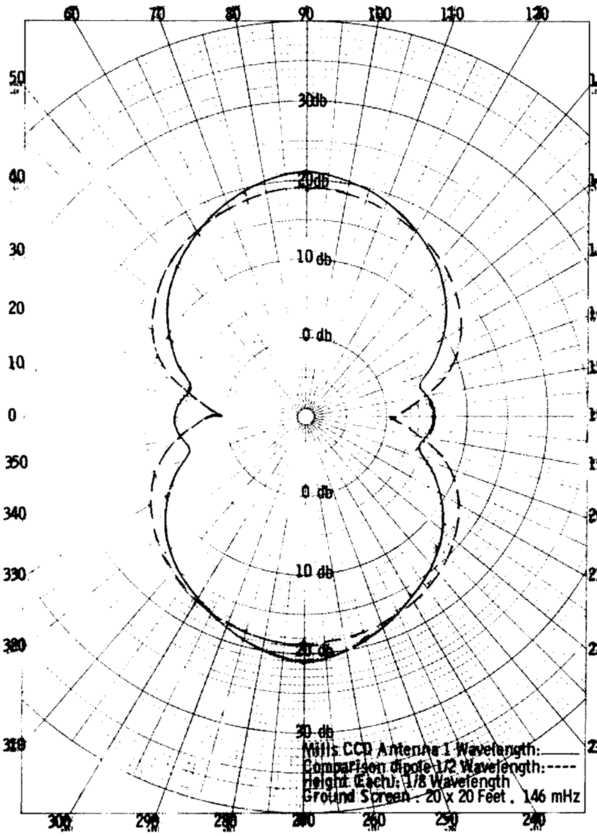

Fig. 2.

As mentioned, the 2m range was fitted with a flat, close-mesh ground plane 20 by 20 feet square, and the new Taco/Jerrold Model AIM 719-B laboratory-level field-intensity instrument, which covers 54 through 900 MHz and is calibrated to 1 dB, was used. In order to eliminate the possibility of pattern distortion by proximity of the transmiting equipment, an excavation underneath the ground plane contained the TS-700 SP 2-meter transceiver and power source.

The new range will be used to make vertical pattern slice measurements at varying angles, equidistant from ground, to reveal the low-angle characteristics which are so vital to DX communications. It also will be used to study the effects of adding capacitive loading discs at the CCD radiator ends, to extend current flow even more to the antenna ends. Following this, measurements will be made of patterns radiated from multi-element CCD arrays, showing the gains and advantages which can be obtained when employing all-driven or parasitic elements. The trombone match will be utilized to provide equal power division to driven array elements.

Some Theory

An antenna is a transducer for coupling rf energy into space. Its function is analogous to that of a loudspeaker and its system of baffling which functions to couple low frequency energy into the air to achieve efficient sound reproduction.

Over many long years, we have become accustomed to regard space as being "empty." This is because early scientists and physicists advanced a medium theory whereby radio and other magnetic energy

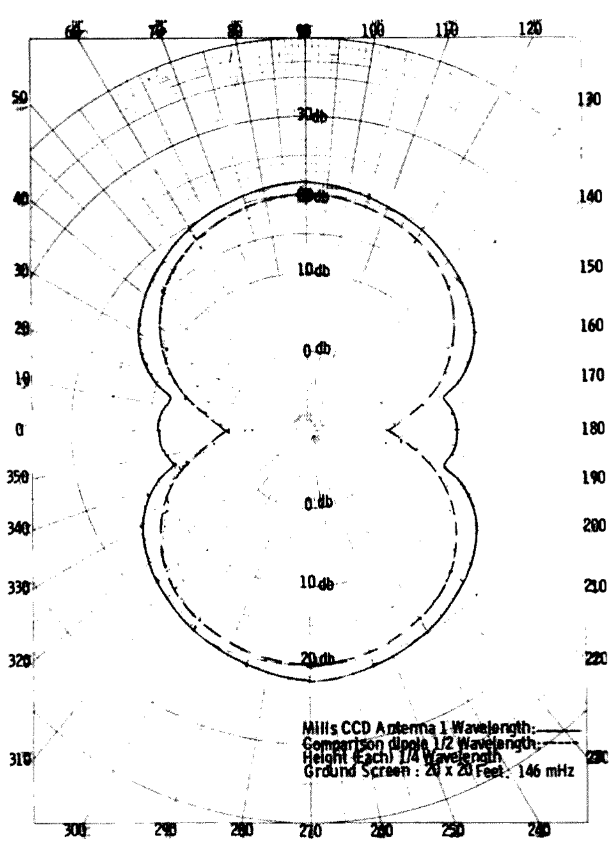

Fig. 3.

fields traveled through the "ether," an unfortunate choice of words, which suggested that propagation was through a medium of gas. That concept has fallen into disuse. However, the vast radiation energies now known to be resident in space provide ample reason fo. keeping an open mind to any new explanation of electromagnetic theory.

We express an opinion that consideration should be given to the theory that light itself, that ever-present photon, may be the medium through which many forms of radiations are propagated through space. Some known facts lending credence to this theory include: 1) Light is known to have definite mass (as does any "solid") a determinant in its velocity which is 186,000 miles per second (the same velocity as other known radiations). 2) Light is "bent" by the presence of intense magnetic fields, as theorized by Dr. Einstein and proven by actual tests. 3) The sun's light rays, interacting with our planet, form ionized radiation around it. 4) Light may be said to be "modulated" by vortical changes in the temperature of the light-emitting body, as sunspots create intense magnetic fields which occasionally disrupt communications as far away as our planet. 5) Stars throughout the universe emit light; even planets may be said to emit photons, although the level is below the detection threshold of human eyesight. (Light is present, even in the darkest cave, only our unaided eyes are not sensitive enough to detect its low level). 6) A photon is a single quantum of electromagnetic energy. Maxwell's equations form the basis of classical electromagnetic theory, but quantum theory requires that we postulate the existence of photons to carry the energy of electromagnetic radiation. Quantum field theory pictures the coulomb forces and magnetic forces between particles as being associated with a kind of photon exchange beween particles. The pressure of sunlight is very small. It has, however, been observed to have a measurable effect on the orbits of earth satellites, particularly on that of the large satellite *Echo I*, launched in 1960.[1]

Questions and Answers

Q. My real estate seems too small for the CCD antenna dimensions given. What are my options?

A. Several space-saving arrangements are possible without reducing CCD efficiency. When mounted as an inverted dipole, much less ground space is required. Also, since the new design is a low-impedance device with greatly reduced high-voltage points, it may be arranged effectively in a zigzag configuration. Another space-saving plan is to mount the middle portion horizontally and allow the ends to hang vertically. This latter scheme will add vertical polarization to the composite pattern, which is beneficial during some propagation conditions. When antennas for different bands are desired but space is limited, they may be efficiently fed by a single feedline. The low-Z property of the CCD renders it very tolerant to nearby trees and structures, with much less detuning and losses than is experienced with a conventional dipole. This factor reduces the space requirements, and, surprisingly, a CCD radiator performs very well on DX when only 7 feet above ground. So, the importance of tall supporting towers is greatly reduced and most city lots will accommodate 14-MHz and higher frequency CCD antennas which will rival a rotary beam in performance.

Q. Why is one full wavelength at the lowest operating frequency used instead of some shorter length?

A. At approximately one physical wavelength, a desirable condition such as cancellation or near-cancellation of the wire section inductive reactance by the capacitive reactance of the next adjoining capacitor in the series chain results. Also, a great reduction of end effects occurs when the overall radiating system is made resonant. Reflections from the radiator ends are markedly reduced, so that a traveling wave may move efficiently from the transmission line and the radiator into space.

Q. I have a number of capacitors on hand other than the values specified in the guidelines table. May these be used efficiently in a CCD antenna?

A. Yes, definitely. It is necessary only to adjust section wire lengths and the number of sections proportionately. For example, suppose that 470-pF capacitors are on hand and a 7-MHz CCD is desired.

First, find the even number of wire sections required, finding K for 7 MHz from Table 1 in original article: 470 pF/8.48 = 56. Overall antenna length (from Table 1) is 140 feet or 1680 inches.

Next, find the length of each wire section: 1680/56 = 30 inches. The number of capacitors is always 2 less than the number of wire sections; 54 in this example.

Q. How many capacitors are necessary in the CCD, and should they have a high-voltage rating?

A. There is no set number of capacitors required. Within practical reason, the larger the number of capacitors used, the more uniform the current distribution and the more effective

the radiator. In general, 40 to 60 fixed capacitors will provide very effective current smoothing throughout the antenna. (Upward of 1,000 capacitors have been successfully employed at W4ATE.)

Best broadside gain results when all capacitors are of equal capacitance. When as many as 40 capacitors are connected in series with wire sections of the CCD radiator, the rf voltage applied across each individual capacitor is quite small (typically under 80 volts, even with 1 kW input to the final amplifier). This permits the use of conventional-sized polycarbonate (most stable), polystyrene (lightest weight), silvered mica, mica, dipped mylar®, and other low-loss capacitors. The capacitance tolerance should be within 5%, which narrows the off-the-shelf choice to the first three types named. Wider tolerance capacitors may be used provided that they are selected by accurate measurement to the 5% tolerance required. Any units selected should have substantially strong wire leads or terminals.

Q. What type of antenna will perform best inside a building or attic (assuming no metallic Faraday shielding is present)?

A. Definitely, the CCD type of radiator. It should be remembered that the high-voltage, high-impedance characteristics that exist over the large outer portion (away from the center) of the conventional dipole produce high dielectric loss in the radiator even though the walls, ceiling, and roof are of dry wood and shingles. Therefore, design your antenna as a current-operated device free from points of high voltage throughout, and the dielectric losses from the surroundings will be greatly reduced. W4FD had these advantages amply demonstrated while working DX with attic CCD antennas on 10, 15, and 20 meters under the previous call W3UZ, in Washington, DC.

The increasing trend toward condominium and apartment living with their restrictions against outdoor antennas, presents another application where an indoor CCD will provide performance which is much superior to the conventional indoor dipole. Even where outdoor antennas are employed, very little dielectric loss will occur when the CCD antenna is strung through trees or shrubbery.

Q. Why does the CCD antenna produce good signals and provide good DX reception at heights of only six to eight feet (albeit down about 10 dB from one elevated to ½ wavelength) whereas a simple dipole at the same low level usually does not?

A. This is a question for which all the answers are not yet formulated. However, it is believed that there are several reasons for the improved performance of the CCD at very low elevations. First, it is known that low-angle radiation (the requirement for DX) occurs in the center, highest-current portion of the conventional dipole, and for the simple horizontal dipole at low heights, the radiation resistance is known to drop off very rapidly, nullifying most if not all of the low-angle radiation. Not only is the dipole then coupled closely to its ground "image" but the "hot spotting" center current produces excessive ground losses, as does the dielectric end effect. That energy which would have been reflected at least partially at lower angles (assuming a ½-wavelength height) is sporadically reflected at higher angles, chiefly useful for close-in communications.

In sharp contrast, the low-mounted CCD antenna stretches out the antenna current to the very ends of the radiator (when end-loading capacity-producing discs are added). Now the antenna current is no longer bunched at the center portion, but tends to produce a focus or aggregation of lower-angle currents across the radiator. When the CCD is mounted at widely varying heights, the center feedpoint impedance variation is only a fraction of the excursions produced when the height of a simple dipole is changed the same amount.

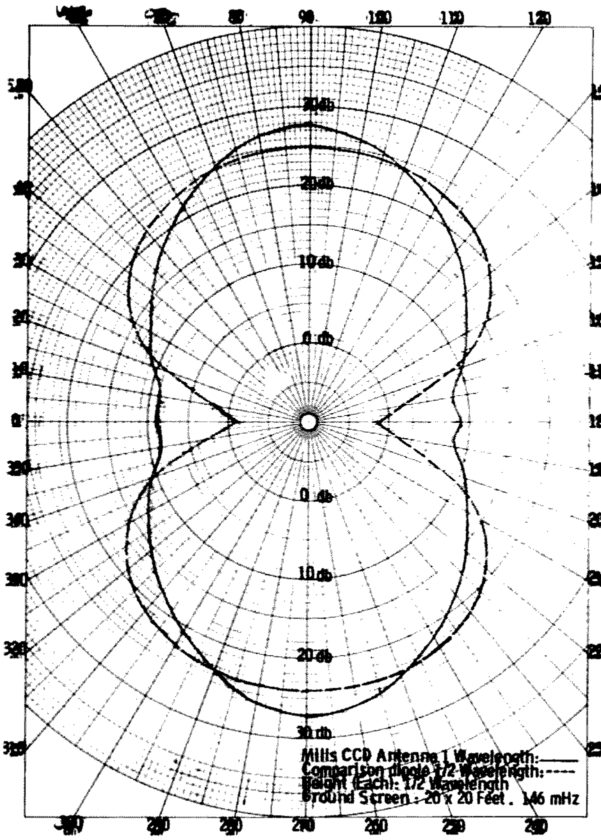

Fig. 4.

During actual tests, DX beyond three or four thousand miles has been worked with the CCD antenna lying flat on the ground, although the reported level is then down 20 to 30 dB. Field Day hams take note!

Q. How does the bandwidth of the CCD antenna compare with the conventional dipole bandwidth?

A. A CCD antenna which contains near or equal capacitance values and wire section lengths has a three to four times wider bandwidth than the usual dipole counterpart. Extremely wide bandwidths have been attained (at some sacrifice in gain) when the capacitor values and radiator section lengths are made progressively smaller, beginning at the feedpoint and with the smallest values at the radiator ends. This form of CCD results in a reflection-free radiator with waves *traveling* in only one direction from the feedline, through the antenna and into space, *without* standing waves. Measurements show that voltage and current disappear at the antenna ends. This configuration has produced a UHF radiator that is matched across 340 to 550 MHz.[2]

Q. What are the antenna resistance (load impedance) characteristics of the CCD antenna?

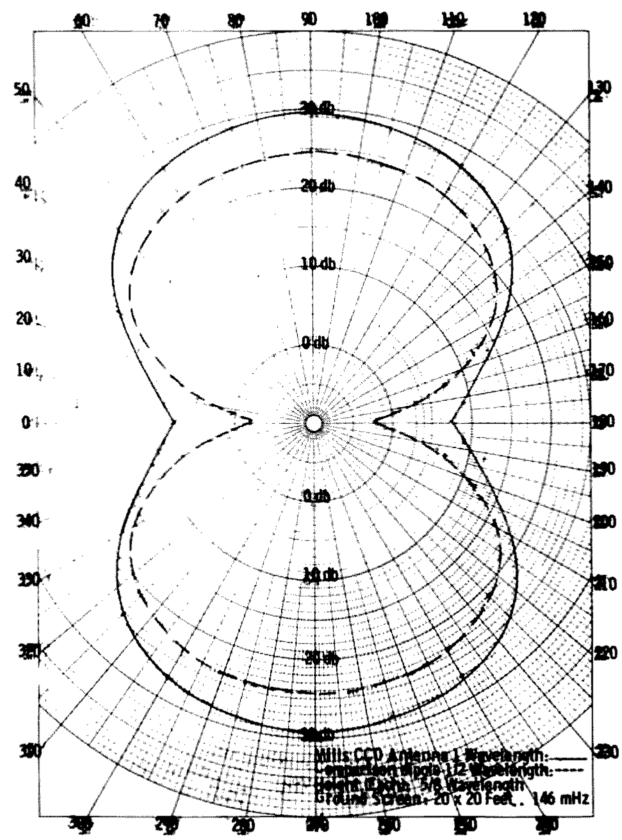

Fig. 5.

A. The load impedance of a conventional horizontal dipole (antenna resistance at resonance) may vary as much as 10 times or more, with wide variations in antenna height. The controlled-current distribution antenna resistance change is only a fraction of this for the same variations in height. Indeed, the main determinant of the antenna resistance will be the design selection of the wire section lengths and capacity values, together with any loading screens employed at the radiator ends. With capacitor and wire section values within the ranges covered by the formula, antenna resistance values around 250 Ohms may be expected.

Thus, 300-to-450-Ohm, open-wire balanced line used with a transmatch will work well with very long transmission line lengths. For shorter lines, 50-to-73-Ohm coaxial line with a 4-to-1 balun at the antenna terminals works quite well. The very high ratio of radiation resistance to loss resistance and the greater aperture of the CCD produce a much greater signal than can be realized with the conventional dipole design.

Q. How effective is a 160-meter horizontally-polarized CCD antenna, both as a nighttime skywave radiator and a ground-wave daytime antenna?

A. The results from testing the 160-meter CCD under these conditions will agreeably surprise many readers. Nighttime performance was as good or better than with the best of conventional antennas. Our mutual friend John Sharpe W5AB at Houston, Texas, is broadside on the southwest lobe of the W4FD 160-meter CCD, and reported both CW and SSB signals were never below S9. He further reported that 90% of the time the signal was 20 to 25 dB over S9. Contacts were made on two different nights on 1808 kHz, with the same reports. The power input was 100 Watts to the Swan 160X equipment. Daytime coverage has been 80 to 100 miles with the same input power.

Q. Is there a value of radiation resistance in Ohms which, if maintained, will produce optimum radiating efficiency?

A. This question has been of great interest to us for some time. Although no firm answer has yet been formulated, there are indications suggesting such a possibility. The following is intended to arouse interest among members of the amateur fraternity, to encourage experimentation along these lines.

Assuming that light may indeed be the medium in which signals are propagated through space and that the intrinsic impedance of space itself is 377 Ohms, would a continuous radiation resistance of 377 Ohms (or even crossing through this impedance value many times), produce optimum coupling efficiency to the radiator? This is a most intriguing question.

The radiation resistance of the simple dipole sweeps through 377 Ohms only twice. It occurs a number of times in the collinear antenna and even more in the rhombic. Each type of antenna produces an ascendingly improved efficiency. The CCD antenna produces scores of sweeps through 377 Ohms. Aside from any theoretical considerations, tests with the multi-section CCD suggest that there may be some optimum (if continuously maintained) radiation resistance such as 377 Ohms.

Q. How may I determine that capacitors out to the very end of my CCD antenna are all functioning?

A. In a properly constructed CCD (wire lengths and capacitors correct according to formula), defective capacitors will be revealed by exploring the radiator with any simple voltage or current indicator while *low* power is applied. The indicator may be a hand-held neon or fluorescent lamp, a miniature dipole feeding a solid-state diode and sensitive dc current meter, or a dip meter in the diode mode. Starting at the feed point, be sure that an indication of rf is present while the indicator is moved out to the extreme end of each half of the CCD. If a point is reached where no indication is obtained, the last capacitor passed over may be defective. If, however, an rf indication is lost at *both* ends of the antenna and at approximately the same distance from the feedpoint, the wire section lengths may be shorter or the capacitors may be larger than specified by the formula. Both values should be carefully verified.

Also, it is possible that one is attempting to operate the CCD below its resonant frequency, in which case it functions as a high-pass filter, preventing rf from traveling beyond a few sections from the feedpoint.

To explore this possibility, temporarily feed twice the design frequency, i.e., 14 MHz to a 7-MHz CCD, and repeat the preceding rf probing tests. If indications of rf are then obtained out to the radiator ends, the capacitors are functioning, and steps must be taken to resonate the CCD to a frequency near the low-frequency end of the design band, as described earlier.

Wire sections which are shorter than specified by formula will prevent rf from reaching the antenna ends because the X_C will be much larger than the X_L. Also, when wire sections

which are too short are used, one may continue to add any number of sections and never achieve resonance! This can be very baffling and discouraging until the importance of making X_L approximately equal to X_C is realized.

Q. Will you please furnish the calls of some successful builders of the CCD antenna so that I might contact them and profit from their experiences?

A. Yes; we believe that the following constructors will willingly share their ideas regarding the CCD when you furnish an SASE:

K2GGN, W2IMU, W2SVJ, W4DNX, W4KIX, W4OQT, W4KXC, W8VWX, WD4DSX, AC5P, K8AA, AA6US, WB8RGN, and KK4X.

Q. Can the CCD antenna be operated at harmonics of the fundamental frequency?

A. Yes. But please note that the positive inductive reactance, X_L, and the negative capacitive reactance, X_C, move in diametrically opposite directions, when the exciting frequency is changed, to a series circuit such as the CCD. Therefore, harmonics as we are accustomed to regard them, will *never* occur close to whole number multiples. For example, in a reasonably well-balanced chain of alternate wires and capacitors in series, with fundamental resonance at 14 MHz, a second "harmonic" indication at average antenna height occurs at slightly over 1.6 times the fundamental frequency.

These relationships between fundamental and "harmonic" frequencies in a typical, balanced CCD are shown graphically in Fig. 1 of our previous article. In another example (from the same graph), in order to produce a second harmonic near 28 MHz, a CCD radiator would necessarily have a fundamental resonance near 17 MHz. In a futuristic example, the harmonic of a CCD designed for the new 18-MHz band falls neatly near 28.9 MHz!

Actually, this offbeat harmonic relationship provides a great advantage in practical operation. Instead of the wide swings in load impedance experienced with a conventional dipole when changing from even to odd harmonics, the CCD user employing a transmatch will find relatively small changes in loading. Moreover, the effects of improved current distribution and smoothing out of the broadside radiation field pattern will carry over to the second and third frequency multiples.

Q. Is there a simple formula or formulas which I may use in a step-by-step manner to calculate with reasonable accuracy, the design parameters for a CCD operating at any frequency within the HF bands?

A. Definitely yes.

Formula 1. $S-2 = fC/59.35$, where $S-2$ = number of capacitors, S = number of wire sections, and f = resonant frequency in megahertz. (Note: 59.35 is an empirically derived constant.)

Formula 2. $L_T = 984/f \times 12$, where L_T = total length in inches (for 1 wavelength) and f = resonant frequency in megahertz. 984 is double the usual 492 because the CCD is one wavelength overall.

Formula 3. $L_S = L_T/S$, where L_S = length of sections in inches, S = number of wire sections (from Formula 1), and L_T = total length in inches (for one wavelength).

These three simple formulas can be combined in a single comprehensive formula. However, it has been found that less confusion results when specific parameter values are determined by using the formulas in the above order. A sample calculation is contained in the answer to the following question.

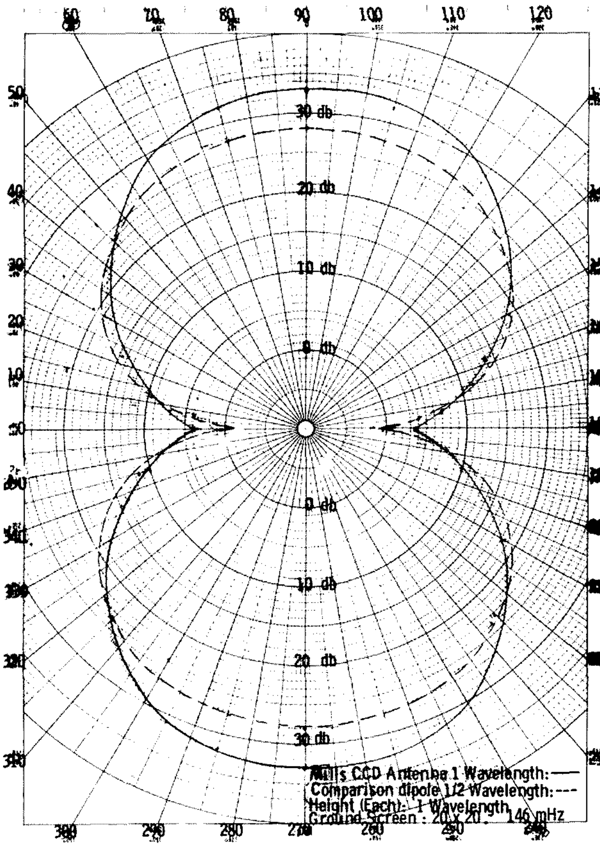

Fig. 6.

Q. I have on hand 50 fixed mica capacitors, each 390 pF in value. Do I have enough of them to construct a 7-MHz CCD antenna, assuming that I have a sufficient amount of #14 copper wire? How do I determine all antenna dimensions?

A. Applying Formula 1: $S-2 = (7 \text{ MHz} \times 390 \text{ pF})/59.5 = 46$ capacitors. Then, $S = 46+2 = 48$ wire sections.

Applying Formula 2: $L_T = (984/7 \text{ MHz}) \times 12 = 1686.85$ inches overall length.

Applying Formula 3: $L_S = 1686.85/48 = 35.14$ inches, the length of the sections.

In summation, we have 46 fixed capacitors, each 390 pF, 48 wire sections, each 35 inches long, and a total CCD antenna length of 1686.8" or 140.57 feet.

Wire sizes 18, 16, and 14 all have a sufficiently small length-to-diameter ratio when utilized at the 7-MHz operating frequency.

Q. Can the CCD antenna be operated effectively on frequencies either above or below its resonant frequency?

A. It should be recognized at the outset that this type of radiator is a very broad characteristic type of high-pass filter. It will perform well at all frequencies above its resonant point, but should not be used on amateur bands whose frequencies fall *below* resonance. The broadband nature of this antenna is such that it will operate most efficiently on the lowest frequency band for which it is designed, even in instances where resonance occurs at or near the high frequency end of a band. It is most desirable that the CCD be made resonant within the

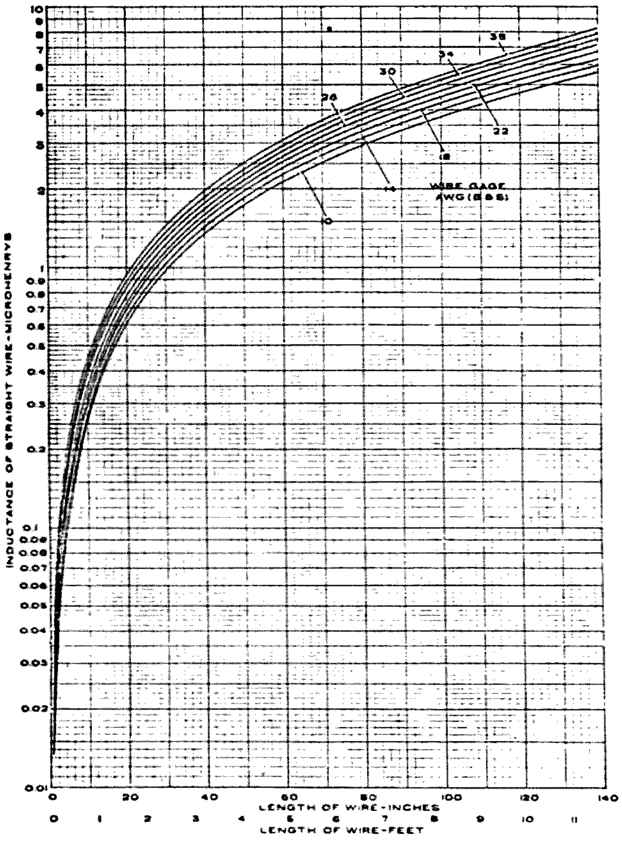

Fig. 7. Graph for determining the self-inductance of straight lengths of wire.

lower frequency half of the band.

Q. What effect does height-above-ground have on the radiated pattern of the CCD antenna?

A. Although complete pattern data has not yet been obtained and analyzed, preliminary measurements made with a commercial field-intensity instrument at the 2-meter range indicate that the sharper pattern lobes occur when the CCD is elevated 1/2λ or higher. At heights of 5/8λ and above, side levels (off the radiator ends) are 22 to 24 dB below the broadside lobes. Dropping the height from 1/2λ to 1/8λ gradually collapses the major broadside lobes. At the 1/4λ height, the broadside-to-side radiation differs by slightly more than 12 dB. At 1/8λ elevation, the difference is even less. See Figs. 2 through 6 for various elevations.

It is interesting to note that the off-end radiation begins to increase markedly below 1/4λ height, and can become almost equal to the broadside value as the elevation is reduced below 1/8λ.

These preliminary measurements were made with both the test antennas and the field-intensity instrument antennas horizontal to flat ground, well in the clear and at the same height. The probing point was 5λ away. A ground-plane screen had been installed at this time.

The test CCD antenna was rotated through 360 degrees and field-intensity readings were taken at each 15-degree interval between full broadside and 30 degrees. Between 30 and 0 degrees, readings were recorded at each 7.5 degree point. Directly off the CCD ends, minor lobes were noted which were approximately 1 dB above the minimum skirt levels of the side radiation. A power input of 1 Watt at 146 MHz was used during all pattern measurements.

Q. What are the advantages gained by the use of capacity-loading disc screens at the ends of a CCD radiator?

A. Although the use of loading discs is not essential to efficient operation of the CCD, some of the valuable refinements are increased radiation resistance, improved broadbanding, improved current distribution, almost complete elimination of end effects, and final adjustment of resonant frequency.

In particular, more current will then flow in the very ends, resulting in a more efficient radiator. Wire screens are recommended over solid discs, for reduced wind resistance. For the 7-MHz band, 16-inch diameter discs are suitable, the diameter increasing in inverse proportion to frequency, for other bands.

The constructor will find that the added discs cause a slight lowering of the antenna's resonant frequency. By adding the discs one at a time and noting a slight frequency decrease with each addition, a positive indication is obtained that all sections are functioning.

A CCD is installed as an inverted dipole at W4ATE, where it is found convenient to replace the discs with small fixed capacitors soldered between the radiator ends and the supporting wire, which is grounded. The desired value of capacitor may be determined by the temporary use of two variable capacitors which may be adjusted for proper operation and then replaced with fixed capacitors.

When loading discs are not employed, it is suggested that the two outer wire sections be dimensioned about 50% longer than the others.

Q. Is there a method whereby a directional array of multi-elements can be optimally adjusted at a particular frequency, or even changed to another band within a few minutes without conflicting reactions?

A. Definitely, yes, where the CCD antenna system is utilized in directional arrays. The method involves a full tuneup of all the radiating elements (CCD or conventional) directly from the operating position, with a simple means for power division to the individual elements. The scheme eliminates the troublesome common-point junction bottleneck and uses an inexpensive tube or solid-state amplifier feeding each antenna element to permit rapid system tuning without interaction problems, which many amateurs already recognize with conventional systems.

Q. Is there a method, particularly adaptable to solid-state linear amplifiers and to transmatch tuners, whereby the conventional, cumbersome wide-spaced tuning capacitors can be eliminated from tank, and the open-end or toroidal coils be henceforth ferrite-loaded and five or six amateur band tanks placed in the area now occupied by one tank?

A. Fortunately, yes. The method involves a controlled-voltage distribution (CVD) system, a blood brother of the CCD scheme developed at the same time. The basic plan is very much like the CCD in that capacitive loading is utilized.

Q. Although my CCD antenna usually produces a stronger signal than my reference test antenna, there are times when my reference antenna produces the stronger signal. Why is this?

A. It is well known that

under certain conditions of sunspot activity and other circumstances in which the Earth's field-ionization pattern is altered (as caused by the sun's activity), the usual ionized layers existent at a particular time of day can become greatly changed. Signals normally bent to Earth by the reflecting action of one or more ionized layers may, because of alterations in the usual layer heights and thickness, be reflected to a higher or lower angle than usual.

Since the CCD antenna is known to produce a considerably lower reflection angle, any circumstance which changes the reflection angle from the ionized layer(s) at which the antenna maximizes, will necessarily produce a weaker signal. Many amateurs who use both horizontal and vertical radiators often find that one or the other polarization produces a stronger signal. Since the CCD antenna's radiation angle can be even lower than that produced by either of the aforementioned conventional antennas, it not only becomes a very helpful third form of advantage, but, on occasion, can receive signals otherwise not even detected. Also, several observers have noted that under most circumstances the CCD antenna will produce the least signal fading.

Q. How may I determine the inductive reactance of straight-wire sections, for further experimental study?

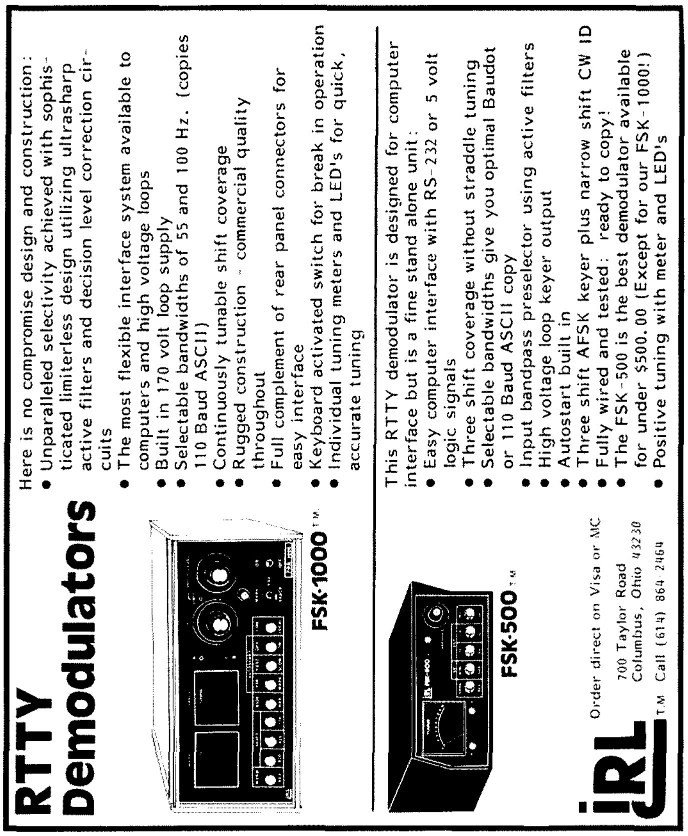
A. This information does not appear in standard wire tables, but may be derived after the inductance value is calculated according to the formula $L = l(2\log 4l/d - 3/2)10^{-3}$, where L = self-inductance, l = length of wire in centimeters, and d = diameter of wire in centimeters. However, the design chart in Fig. 7 more readily provides the self-inductance values of various copper or aluminum wire sizes useful for CCD antenna construction.

For example, to find the inductive reactance at 7 MHz of a piece of #14 copper wire which is 35 inches long, first locate 35 inches along the bottom of the chart. Trace directly up to the curve for #14 wire. From that point, go to the left edge of the chart and read approximately 1.33 μH.

Last, insert this value into the usual formula, $X_L = 2\pi fL$, where f is frequency in MHz and L is inductance in microhenrys:
$X_L = (6.2832)(7)(1.33) = 58.4$ Ohms.

Q. Can a CCD dipole be used as a basic element or building block for more complex arrays?

A. Yes. The CCD principle may be employed in most existing systems and configurations with improved efficiency. The resulting radiation patterns will be different from those with conventional arrays.



Final Remarks

We are grateful for the enthusiasm and suggestions of commercial antenna engineers and many amateurs who have phoned or written: Frank K8AA, for comparison tests with 7-MHz European stations, using less than one-Watt input to his CCD, Ben W5TM, for suggesting static protection resistors across the phasing capacitors, the encouraging notes of Dick W2IMU and Art W8VWX, and for useful construction ideas from the imaginative mind of Larry AA6US.

Larry's experience is typical of CCD builders: "Out here in Los Angeles, I suffer from the "copper curtain" syndrome. California kilowatts wipe out fellows using 100-200 Watts like myself. Oh, we can rag chew with ZLs across the Pacific, but spanning the long overland haul to Europe was unheard of for me. But last night on 14 MHz, I was reading a TA2 in Turkey and G3 stations on the inverted-dipole, 7-MHz CCD antenna. I could not hear them at all on either my 14-MHz dipole or a 130-foot, all-band doublet up 60 feet. Also, when using the CCD my signal reports are usually two S-units above my tried and true 7-MHz double-extended Zepp."■

The History of Ham Radio
—part XVI

Reprinted from QCC *News*, a publication of the Chicago Area Chapter of the QCWA.

In 1920, the urge to span global miles via amateur wireless communication was the radio amateur's prime endeavor. The *sine qua non* of hamdom.

In the pre-WWI years, maximum distances were covered via relay routes from one location to another wherever amateur operators were active. They relayed messages from station to station by the fastest and most direct routes. To span great distances, to direct messages across the continent in one hop, to succeed in crossing the Atlantic, the Pacific, was just a wish and a hope to dream about.

Officially, the International Amateur Radio Union received its start on March 12, 1924. A preliminary negotiation meeting was held in Paris. See Photo A. For the first time, ARRL President Hiram Percy Maxim and a group of amateur representives from thirteen countries assembled at the Hotel Lutetia. There was no doubt that worldwide international association was needed to bring about a common understanding toward an eventual world organization.

Early 1920

Soon after the armistice was signed, amateurs in the United States were authorized to resume radio operation in their typical former fashion. However, it did not take long for them to realize that the rotary-gap generator had to give way to the vacuum tube. No longer would the desire to belong to the 200-meter club give satisfaction when it was discovered that the shorter waves held the solution to greater and more reliable DX.

What chance of being heard did signals have crossing the Atlantic if there were no listeners?

Where were the amateurs in foreign countries available to participate in tests?

December 1919

In England, a group of wireless enthusiasts were gathered at an outdoor field day. They were just ordinary experimenters, having organized themselves into a club called the Three Towns Wireless Club of Plymouth (Photo B). They had no permit to use either transmitting or receiving apparatus, since a license to operate was not available. The club secretary was authorized to write a

letter to the American Radio Relay League expressing a desire and a sincere hope that the League might resolve to become an international association for the exchange of ideas and mutual information for future activities and planning.

The American amateurs, who enjoyed wireless privileges not available to their English or French counterparts, were well aware of the plight of their foreign brethren, who were constantly imploring their governments to grant them similar operating privileges.

February 1920

As early as February in 1920, Captain F.G. Loring, RN, one of the club members, suggested the following at the first annual conference of the Affiliated Wireless Club of England:

1) To issue receiving licenses freely to all approved persons, with exceptions as regards the use of valves in certain limited areas.

2) To issue 10-Watt licenses wherever this can be done without interference with government installations to approved applicants who can satisfy the Post Office that their personal qualifications, apparatus, knowledge of the subject, and objectives are sufficiently good to justify the grant. License will not be granted for mere intercommunication purposes.

3) To issue licenses for the use of power exceeding 10 Watts in special cases.

4) To issue licenses for the use of an artificial aerial when desired. Here the applicant has in view some definite object of scientific research of general public utility.

5) To issue special permits for specific tests of apparatus on any power and wavelength over and above the conditions of the license. Application for such permit will have to be made in writing at least a week before the test. Such permits to be issued to persons who can satisfy the Post Office that they have occasion to try out in practice an arrangement which had been thoroughly prepared in the laboratory.

6) Make provision that all transmitting licenses be restricted as regards both waves and hours of working.

Early 1921

The ARRL made plans and contacted British radio amateurs and experimenters hoping that they would listen in the vicinity of 200 meters to signals coming from United States amateur stations. All of these planned schedules, however, were unsuccessful.

The few French amateurs also had serious misgivings concerning participation. Their efforts in being allowed to erect receiving aerials fell on silent ears. Officially, any grant given by their government stipulated that reception of only time signals and meteorological information would be allowed, provided they registered and paid an annual tax to the Director of Posts and Telegraphs.

Late 1921

During the fall and winter months of 1921, amateurs made a serious attempt to span the Atlantic. In England, Philip B. Coursney, British 2JK, editor of the *Radio Review* (London), agreed to take complete charge of the receiving stations in England and other European countries where amateurs would be listening and logging signals heard. The ARRL, by request of its Board of Directors, dispatched Paul F. Godley, an American amateur, over to Scotland in an attempt to record any amateur signals crossing the Atlantic. Using his own home-built receiver, the "Paragon," Godley was very successful in recording United States amateur station signals. (Part VI, "History of Ham Radio," *73 Magazine*, October, 1978.)

June 1922

The Board of Directors of the ARRL established a new committee designated the International Advisory Committee of the ARRL, whose function was to aid in the development of amateur relay routes in foreign countries. The League did not deem it wise to undertake the formation of foreign branches of the ARRL, even upon request, but agreed to assist in the formation of societies "for and by the amateur" in such countries. One of the more significant tests conducted by the amateurs during the year 1922 proved conclusively that signals originating from east coast United States amateur stations could be heard by English and French amateurs.

July 1922

Even at this date, the British amateurs were still expressly forbidden to transmit general calls, news, etc. Transmissions were permitted for an aggregate maximum of two hours in each twenty-four-hour period, provided that no transmission would commence without previous listening in on the wavelength which was to be used, and provided that no single transmission would last more than ten consecutive minutes. Wavelengths allotted: 150 meters to 200 meters inclusive for Spark, CW, and Telephony.

Fall 1922

By the fall of 1922, the British amateur enthusiast,

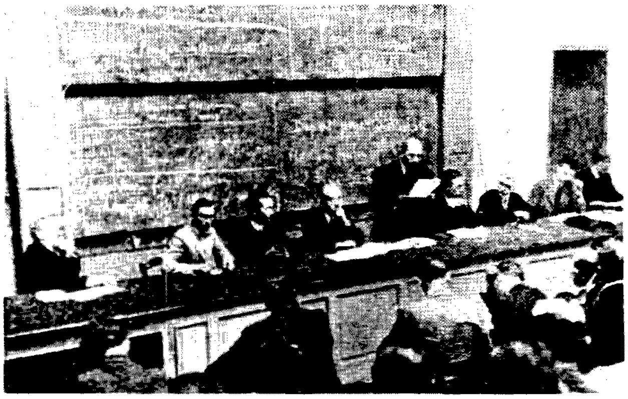

Photo E. The Amateur Congress in session. The Bureau sits at the long table. Left to right: M. Tirman, president of the Legal Congress; Lloyd Jacquet u20Z and Leon Deloy f8AB, interpreters; M. Belin, president of the Amateur Congress; M. Beauvais, Secretary; Jean G. Mezger f8GO, interpreter; Mr. Maxim; Mr. Warner; a stenographer. (Photo—Delano, Paris.)

undaunted, finally obtained permission from the Postmaster General to form a British Wireless Relay League and to solicit correspondence with British radio amateurs. Conditions in other European countries still gave amateurs no outlet for participation in even simple listening pleasures. Governments in general passed decrees which forbade the use of simple test equipment, at the same time acknowledging that it was impractical to regulate the receiving of wireless signals by decree.

1922-1923

During the winter of 1922-1923, a series of tests arranged by the ARRL resulted in signals being copied both in England and on the continent. The French wireless enthusiasts, few in number, having obtained permission to operate by declaration to the Postal Telegraph Administration, enthusiastically prepared themselves to fully participate. A few of their number, and especially Leon Deloy, French 8AB, were successful in obtaining licenses to build up to 1000-Watt transmitters.

1923

The year 1923 was a year of triumph. Many tests were planned and carried out successfully. Two-way schedules were met and both oceans were crossed. Reports of reception came from Australia, from China, from Iceland, and from all over South America. With such gratifying results accomplished to the surprise of the various governments, it became possible for the British amateurs to be granted permission to organize The Amateur Society of Great Britain and obtain licenses to operate up to 1000-Watt transmitters. In Australia, a radio league was formed under the auspices of the Wireless Institute of Australia, its object being to organize a system of relay communication routes throughout Australia and New Zealand.

The second International Amateur Radio Convention, held in Chicago, brought together amateurs by the thousands. They came from every location in the United States, from France, England, and Canada. Actual two-way communication across the Atlantic via amateur wireless took place for the first time on November 17, 1923.

1924 and the IARU

The numerous conventions, the daily exchange of messages between amateurs now worldwide, the many committees formed to discuss plans and to formulate decisions . . . all of these activities gave the Board of Directors of the ARRL an opportunity to initiate a most imposing event, culminating in a meeting of all international amateurs. In March, 1924, there was convened in Paris, France, The Congress of International Amateur Union. During several preliminary meetings at this congress, a temporary committee of organization was named. All assembled agreed that a second meeting would convene in the following year in Paris.

Delegates from the various national societies of radio amateurs met at the *Faculte des Sciences* in Paris on April 17, 1925, in the first International Amateur Congress. They elected officers, adopted a constitution, and formed four national sections. All agreed that the International Amateur Radio Union would henceforth be the coordinating vehicle to foster international amateur two-way communication. Membership was available to anyone interested in the objectives of the Union. Twenty-five or more members from each country would organize as a National Section and be part of the Union.

The IARU thus brought all radio amateurs together under one canopy. ■

The Radio Amateur's Conversation Guide

The Radio Amateur's Conversation Guide *by Jukka Heikinheimo OH1BR and Miika Heikinheimo OH2BAD. Published by Transelectro-America, 2301 Canehill Ave., Long Beach CA 90815.*

There's no question about it—English is the *lingua franca* of the ham bands. When working DX, few American hams ever pause to consider that the person on the other end of the QSO may be speaking a language that is not his native tongue. Still, in most countries in Africa, Asia, and Europe, if a ham is speaking English, chances are good that he went to a lot of trouble to learn it. To a ham who has spent many years in countries where English is rarely spoken, some of the comments heard from Americans about the linguistic abilities of foreign hams seem a bit hypocritical. I always wonder how well-acquainted the complainer is with French, Spanish, Russian, or even Arabic! In my humble opinion, the South American station who can barely get out his signal report and QTH in English is light years ahead of his American counterpart who refuses to venture even two words in Spanish.

In all fairness, it is rather hard for Americans to pick up the proper vocabulary in another language. Bearing this in mind, OH1BR and OH2BAD have taken on the formidable task of producing a conversation guide for hams. 147 phrases commonly used on the air are given in English, German, French, Italian, Spanish, Portuguese, Russian, and Japanese. Having trouble copying the suffix of that EA9 station in Ceuta? No problem—just say "No he copiado su indicativo!"

Once you make the decision to learn a bit of another ham's language, you are on the way to making your hobby far more meaningful. There is nothing about the English language that makes it inherently superior to other languages, and the fact that you are struggling to learn another ham's language can create instant bonds of friendship and understanding. If nothing else, you will become acutely aware of the effort required to hold a conversation in another language.

How is the book laid out? Well, an English phrase is listed, followed by the translation in seven different languages. Some of the phrases are only marginally useful, such as "The sensitivity of my receiver is 1 microvolt" or "I have been QRT for five years." Others you may find yourself using frequently, like "I know only a few sentences in . . ." or "Please send me your QSL."

I'm not going to list all 147 of the phrases here, but the general topics include starting a QSO, pleasantries, signal reports, name and QTH, equipment and antennas, weather, signal quality, contest jargon, and the all-important QSL. Also included is a list of phonetics and numbers in each of the languages (very useful when exchanging addresses!) and a dictionary of words unlikely to be found in a more traditional dictionary.

With the exception of Russian and Japanese, the phrases are printed in the original language, with no attempt made to phonetically spell them. A set of cassettes is offered as a companion to the book, to aid in learning pronunciation. The tapes weren't supplied with our review copy of the book, so I can't comment on their usefulness. Without the tapes, a raw beginner at a language may have difficulty with pronunciation, since phonetic spellings or pronunciation hints are not offered in the book. For example, "Sorry, but I did not understand completely" is written as "Sumimasenga kanzenniwa rikaidekimasen" in the book's Japanese translation. The same phrase in German is "Tut mir leid, ich habe nicht alles verstanded." I don't know about you, but not knowing the first thing about the proper pronunciation of these languages, I have a rough time guessing how these phrases are supposed to sound. In my case, the French translations in the book are easy going, because I remember enough of my college French to pronounce the words properly. Someone else who knows some German but never studied French may find the French difficult and the German a piece of cake. If you haven't studied a particular language at some point in your life, you'll want to get someone more knowledgeable to teach you the basics of pronunciation, or check out the cassettes that go with this book.

One use that doesn't require pronunciation help is writing QSL cards. You might enjoy filling out a card in the other ham's own language as much as I do, but be careful: You might get an extensive reply that you won't be able to translate!

However you use this book, it is a bargain at $10.00 and deserves a place in the ham shack of every DXer interested in something beyond a mere signal report.■

Aerial Heirlooms

—towers from the past

The history of the early days of radio is well established and documented. It has been searched and researched until it is now uncommon to uncover something truly new on the subject of Marconi's early experiments.

But history, besides being a great healer, is perhaps the greatest forgetter. In the end, only the highlights of the first, the greatest, the most powerful, etc., finally survive the test of time. Often the fascinating glimpses of work by common people and events close to the historical highlights are forgotten forever.

Likewise, only a few historical objects can be preserved. It is relatively easy to preserve a spark-gap transmitter, crystal receiver, telegraph key, or pair of headphones when compared to the monumental task of preserving the towers or antennas. But without these truly historical items, there could never be radio memorabilia. Old towers eventually rot or rust away, fall prey to wind, lightning, salty sea air, or other elements, and are finally completely lost. For example, at Poldhu, England, where the first transatlantic signals were broadcast, all that remains is a Cornish granite memorial. Hardly a trace can be found of the famous towers which graced the spot for 33 years. For this type of historical object, we must rely on photographs, if there are any, and written records about them.

Recently, I rediscovered a tape recording which combined the rare personal insights of one who worked on early Marconi projects with some almost forgotten details about Marconi's early tower construction. The tape was made by a man who helped construct some of the early towers used by Marconi.

This rare personal glimpse is from a speech made by Reverend Wilfred Wallis, speaking in February, 1956. My father, Loren Greiner WØGTW, had the foresight to tape the brief speech. Now, with the help of Mrs. B. Hance, the Marconi Company Historian, I have been able to corroborate part of the facts given by Reverend Wallis (who died in 1973 after serving the United Methodist Church in Pawnee City, Nebraska, for 20 years) and add some fascinating details about those early towers.

After the first transatlantic transmissions and Marconi's diligently objective diary notation that "sigs were heard at 12:30, 1:10, and 2:20 on December 12, 1901," the growth of radio communications took a giant leap. The discovery that radio signals could travel long distances was literally the light at the end of an aeons-long tunnel of isolation for ships who were

Photos courtesy of Marconi Company, Ltd., Marconi House, Chelmsford, Essex, England.

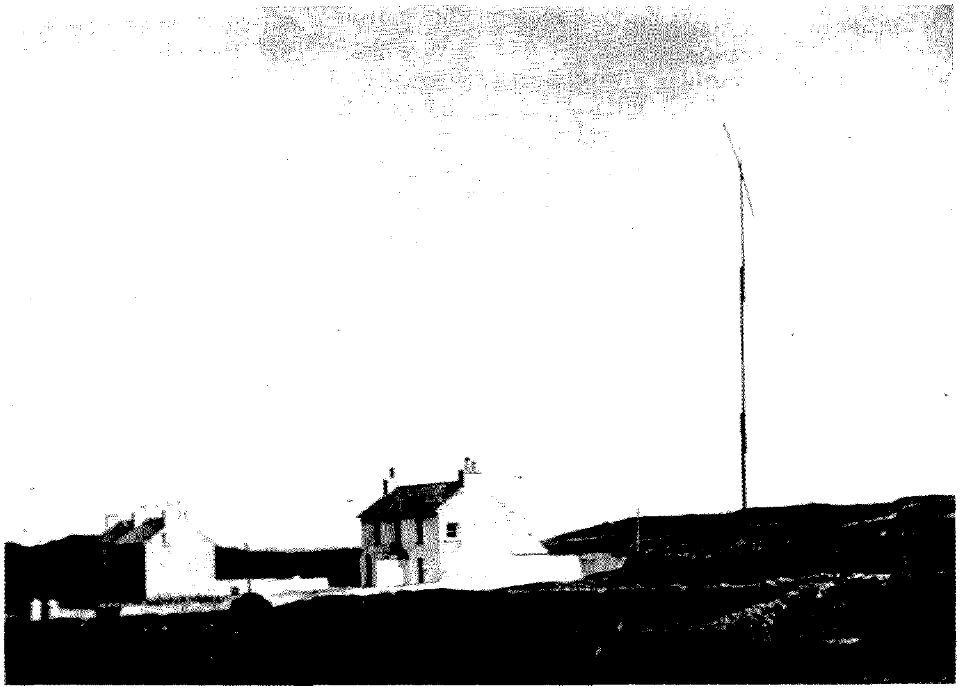

Photo A. The Marconi wireless station at Crookhaven, Ireland, shows the use of three lapped pole towers fashioned from ships' masts.

out of touch with the world for the duration of their voyages.

Immediately, experiments were begun to improve receiver sensitivity and study propagation to find a way to improve on the reliability of transmissions. About this time, other transmitting and receiving stations were installed by Marconi and others. Finally, on June 4, 1903, the silence barrier for ships was truly broken when the prestigious Cunard ship line began a series of onboard daily newspapers called the *Cunard Bulletin* to help travelers keep in touch with the rest of the world.

About this time, Reverend Wallis contributed, in a small way, to the development of radio communication. Here, in his own words, is the story of his involvement.

"I was an apprentice in the shipbuilding yard. I was in what was called the mast-making department. They moved the apprentices from one department to another, every six months, to learn this phase of shipbuilding, then some other, and so on. At each stage you would have an instructor for that department.

"So, I was in the mast department, and word came one day that we were to build three sets of masts in two parts—what they called a lower mast and a top mast: One fits onto the other. As I remember, they were to be 180 feet long. We would take pine trees that they would keep in the yard all the time, and then cut them down and make them round to make a straight mast.

"Ordinarily, in those days, most of our masts were steel, but we also made wooden masts for some of the smaller ships and for some of the boats. So, we had the order for these sets of masts, and everything was sort of secretive. We didn't know a great deal about it, although my instructior was one of the men who had a great deal to do with it. He was in charge of the work on them. They were to be set up at one harbor, the long harbor. In fact, it was large enough to house all the British ships. There was always a number of ships there. There they could come out the open part of the harbor, what they call the Land's End. That was the first station to be built in this particular series. The second station using the next pair of masts was to be at Scilly Isle; the third was to be at Roche's Point in Ireland.

"So, the masts were finally finished and all the fittings put on them, and being an apprentice, I had the disappointment of my life. The instructor got to go over to Ireland to set up the mast there and another man was sent to the other places. When I tried to go, they said 'No! Apprentices are not allowed to go out of the country.' "

Although the masts constructed by Reverend Wallis were made of two parts, many early towers were made of masts from three poles, as shown in Photo A. Each pole had its own set of guy wires. It seems only fitting that a service so related to ships at sea should have its early towers made of

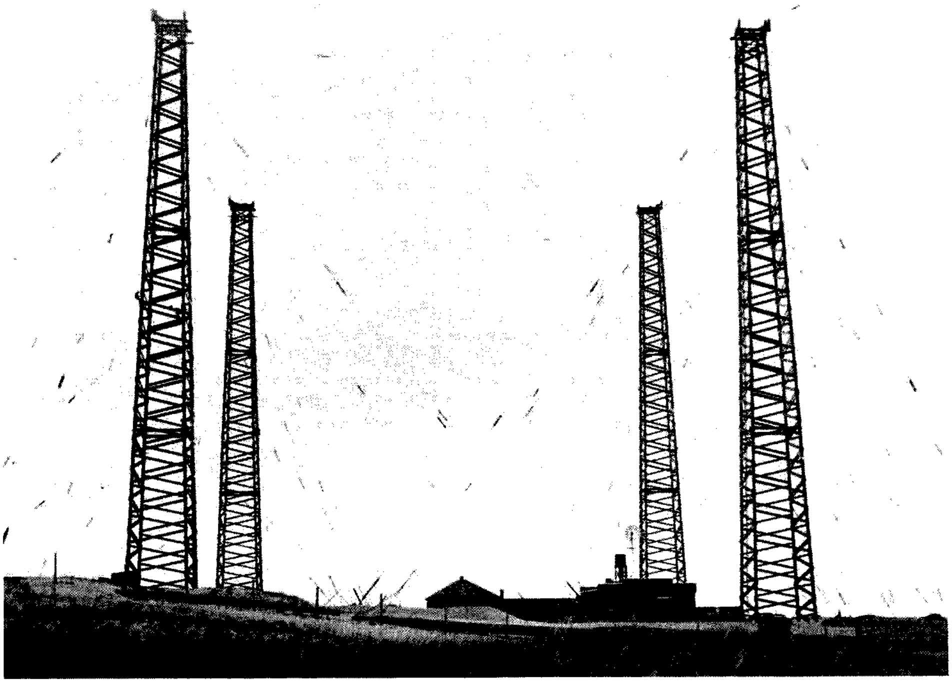

Photo B. These Cape Cod towers were made of wooden planks similar to those described in the text. Close inspection reveals a man about halfway up the tower on the far left (look for him on the left edge of the tower).

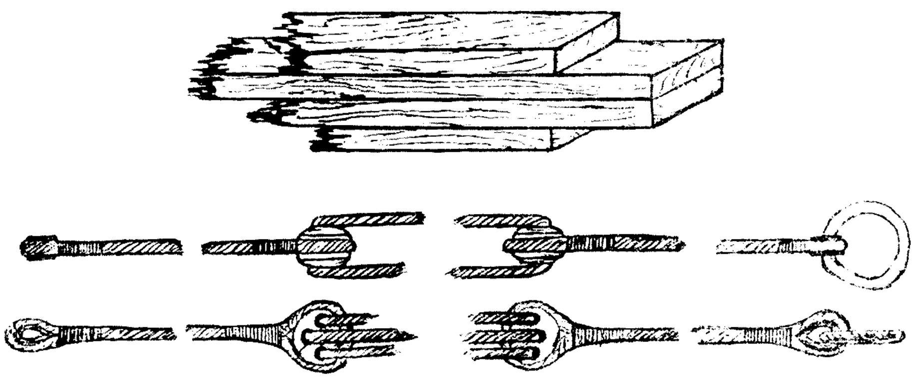

Fig. 1. Drawings from tower specifications for the Marconi wireless station at Poldhu, England. The upper drawing shows the arrangement of planks in a four-sided tower. The lower drawings show the construction of lanyard insulators. These towers were to be built after the first signal crossed the Atlantic.

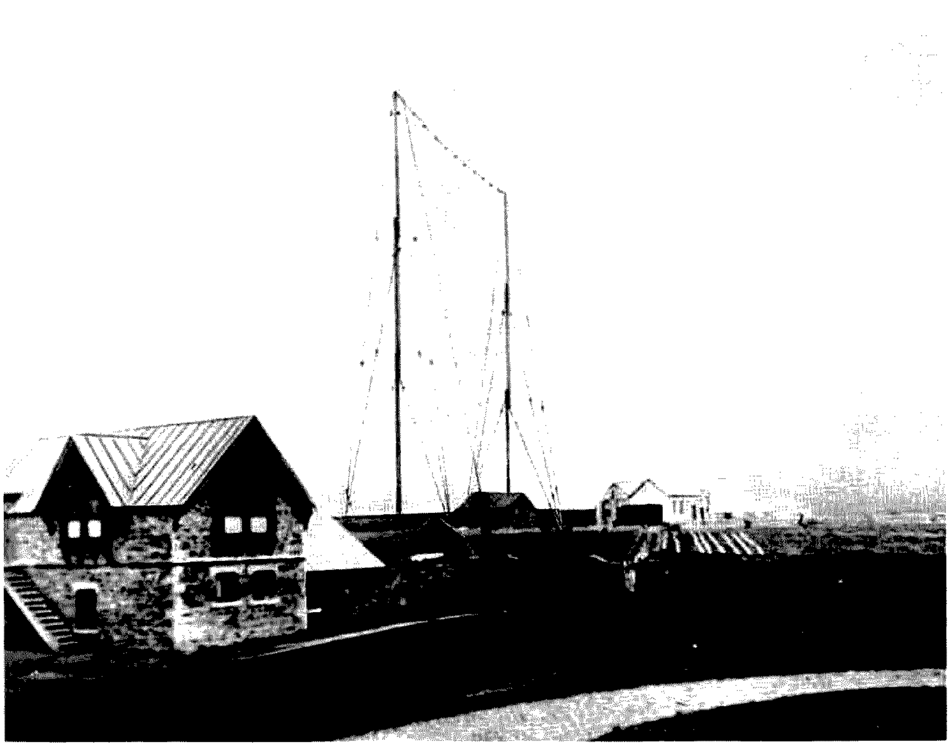

Photo C. This is the Poldhu wireless station from which the first transatlantic signals were sent. As with most early towers, these, too, were made from lapped poles like those used in ships' masts.

the four towers were each guyed with ten wires called "stays." The guys were to be connected at the top of each tower, and at the middle, rather than below the top as with typical modern construction. Guy wires were of 13/16" steel wire with a breaking strength of 18 tons. Upper guy wires were to have two insulators, while lower guys were to have only one insulator.

In today's world, where every broadcast tower uses high-quality porcelain insulators, it is hard to imagine how radio pioneers might have improvised their insulators. The answer lies in the details of the stay in Fig. 1. Marconi's specifications call for "elm deadeyes spliced in ... connected by means of 3" circumference hemp rope lanyard, having a breaking strain of 2.5 tons in single length or a total of 15 tons in the six parts."

these ships' masts erected on land.

Being an apprentice, Reverend Wallis's view of the operation was no doubt tempered by his position, and the fact, as he noted, that the whole operation was somewhat secretive. Records from the Marconi Company shed light on a few of the problems of building radio towers from ships' masts.

Comments by E. A. N. Pochin, a Marconi assistant, have been preserved in the Marconi Company archives. They indicate that one of the major problems was that all of England did not have enough large logs to make some proposed towers, and the designers were faced with project delays of two months if they chose to wait for larger logs to be imported from the United States. As Pochin wrote in July, 1901, less than six months before the first transatlantic transmission:

"I made it perfectly clear to Messers Blythe and Pascoe that the logs must be sound, and insisted on their quotation specifying the fact of the timber being for mast work to prevent their pleading ignorance." (This sounds like most any purchasing agent making sure he's covered in the event the vendor doesn't deliver the goods.)

In any event, the work on the mast was to continue on the assurances from the builders' chief carpenter that the best available logs would "work up perfectly clean." Final approval, however, rested with Marconi.

Even as the first signals were crossing the Atlantic, plans were being drawn up for replacement towers at the Poldhu transmitting station. Specifications dated December 9, 1901, called for four-sided towers like those shown in the often published photographs of the Glace Bay, Nova Scotia, station.

When finally erected, these towers must have been an impressive sight. The four wooden towers were to be placed in a square, with 210 feet to a side. They were to be 215 feet tall, with three and a half feet of that height buried in a concrete foundation. Each tower was a gigantic twenty-one and a half feet square at the bottom and nine feet square at the top.

In today's world, we would think the wooden construction would be standard materials like 2 × 4s or perhaps 2 × 12s. Not so. Records indicate the tower legs were made of boards sized 11" × 3" × 12'. Four planks were arranged together as shown in Fig. 1. Zigzag braces were made of 9" × 3" wood and bolted at each end with 3"-square washers under each bolt head and nut. For extra strength, they had diagonal tie bolts every seven and a half feet.

In order to brace the towers against the possibility of 92-mph winds at Poldhu,

The entire guy wire, including insulators, was to be covered with "two good coats of Stockholm tar." Finally, each tower was to be painted with two or three coats of paint, with no specific color specified.

In the years after Reverend Wallis's participation in the construction of Marconi's pole towers, I know he felt proud to have been a small part of such tremendous events which contributed to greater safety on the seas and better communication between continents. In the same way, the other men and women who participated in unknown but important ways to the building of other Marconi towers and equipment must have known of the importance of their work to these earthshaking events. Perhaps this short glimpse into that forgotten part of history can help us all to honor average people, without whom the more famous pioneers could have never succeeded. ■

Amateur Telemetry

—monitor your repeater's vital signs with this simple system

A telemetry system is a system for making a measurement of some property such as voltage, current, or temperature, and transmitting the measurement to a remote observer via a communications link. Telemetry systems may be either analog or digital and may be designed to transmit either a single measurement or up to several hundred measurements over a single communications link.

Telemetry systems in the world of commercial communications often are very complex, designed to transmit many channels of information over communication links using sophisticated digital techniques. The telemetry system decribed in this article is an elementary, single-channel, analog system and is designed to transmit voltage readings over a communications link such as a two-meter FM channel. The system is not complicated and can be built by most experimenters who have minimal experience with solid-state electronics.

The basic test circuit given may be breadboarded and tested in an evening, while the practical system will take two or three evenings more. The completed practical system will enable an experimenter to monitor a voltage remotely, using either a telephone line or an FM or AM radio link. There is no special equipment needed to build and test these circuits. The only equipment needed is two meters capable of measuring from 0 to 10 V and a pair of earphones to check the operation of one of the circuits.

Simple Telemetry Systems

Fig. 1 shows a telemetry system in one of its simplest forms. This system monitors a door closure by using a transmitter and a receiver in conjunction with a carrier-operated relay. When the door is closed, the transmitter is turned on, sending a carrier to the receiver at some remote location. The receiver detects the carrier, and the carrier-operated relay activates a light.

This basic system is a single-channel digital system and, although limited in its capability, is perhaps one of the most common telemetry systems. Systems of this type usually use telephone lines to transmit contact closure information. Examples are the remote fire and burglary alarms offered by numerous protection and security firms. These security systems offer door entry and fire monitors which activate a relay which, in turn, sends a current down a telephone line to activate a light or audible alarm at a police station or security office.

Another simple telemetry system is shown in Fig. 2, a diagram of a simple analog telemetry system. In this case, a long pair of wires connects the voltage to be measured to a remote

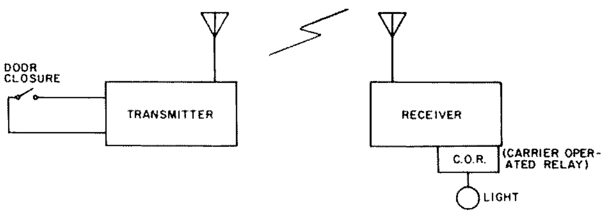

Fig. 1. Simple digital telemetry system. Door closure turns the transmitter carrier on, which activates the light.

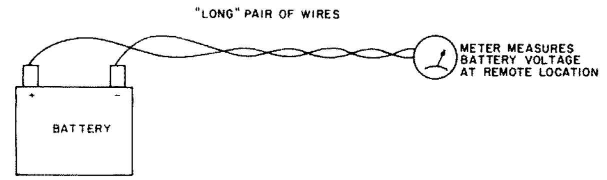

Fig. 2. Simple analog telemetry link. Because of resistance in the wire, there is a voltage drop in the wire. Actual meter reading is $V_{BAT} - V_{DROP}$.

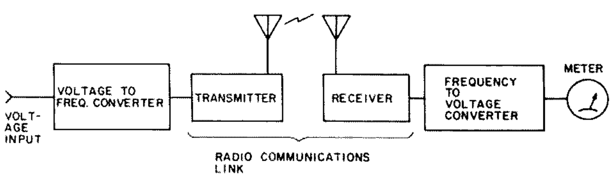

Fig. 3. A single-channel, analog telemetry system.

meter. This system is common, but normally is limited to cases where the distance between the two points is relatively short—perhaps less than 100 feet. This system suffers from accuracy problems since a voltage drop will occur due to the resistance in the wire. The actual reading at the remote location will be V − IR, where I is the current through the meter and R is the resistance of the wire. If large gauge wire is used (to keep the resistance low) or if the distance is kept short, there will be no problems; if the distance is great, however, the remote reading may be erroneous.

As an example, assume that we wish to measure the voltage of a 12-volt battery at a distance of about 25,000 feet (about five miles). If 24-gauge wire is used (with a resistance of about 21 Ohms/thousand feet), the wire will have a resistance of about 525 Ohms. If the meter draws one milliampere, then the voltage drop will be about 1/2 volt. Obviously, the large amount of wire has introduced an error at the meter end. Admittedly, a calibration chart could be made up to correct for the errors, but where will you come up with five miles of wire and how will you string it? While this problem is a bit exaggerated and may seem farfetched, the problem is encountered daily in remote areas. The solution, of course, is to use a radio telemetry system.

A Radio Telemetry System

The problem of monitoring the contact closures shown in Fig. 1 is handled easily by a radio communications link; the problem as shown in Fig. 2, is not. The remote metering problem uses a dc voltage, and there is no way to put dc voltage directly into the transmitter, as if it were a pair of ires. Some means must be used to convert the dc voltage into a form that can be transmitted by radio. While there are numerous methods to do this, one of the easiest is to use a tone-modulation system in which a tone frequency is produced as a direct function of the voltage to be measured. This technique is used to transmit electrocardiograms and other voltage measurements via telephone lines, and may be adapted for radio communications systems.[1]

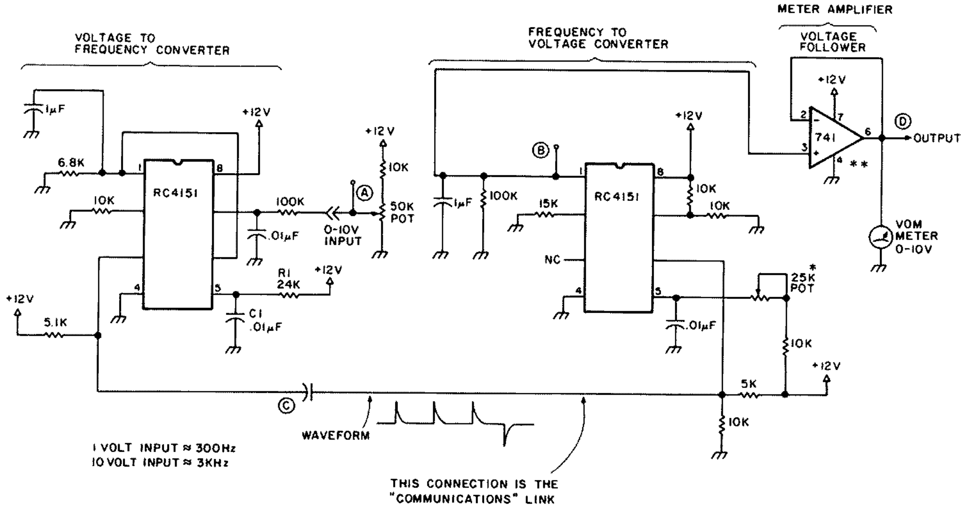

*Fig. 4. Breadboard test setup for voltage-to-frequency, frequency-to-voltage converters. Note: 12 V is a nominal value. May be any voltage from 8 to 15. *Calibration pot—adjust so that VOM is the same as point A. **Pin numbers shown are for 741 in the 8-pin DIP package.*

Fig. 3 shows a single-channel, analog telemetry system. In this example, the voltage to be measured is converted to a tone frequency. The frequency tone modulates the transmitter portion of the radio link, while the receiver demodulates the received signal and sends the tone to a frequency-to-voltage converter. The converter drives a meter to indicate the measured voltage.

Fig. 4 shows a breadboard example of a voltage-to-frequency/frequency-to-voltage telemetry system. This circuit consists of three parts, a V/F (voltage-to-frequency) converter, an F/V (frequency-to-voltage) converter, and a meter amplifier. For ease of testing and experimentation, I recommend that this circuit be breadboarded on a Global Specialties or Radio Shack (276-174) breadboard. This circuit is not difficult to build and should work the first time that it is turned on. The input voltage is not critical and may be any voltage from 8 to 15 V. If a 12-volt battery or supply is not available, an inexpensive 9-V transistor battery may be used. Note that measurements shown on the circuit diagrams were made using 12-V power.

A pair of earphones may be connected to point C through a 0.01-uF capacitor to give an audible indication of the operation of the circuit.

The Raytheon RC4151 V/F, F/V integrated circuit is used in this design in order to reduce the parts count and construction time. Other methods may be used,[1] but this chip reduces the construction time of a practical telemetry system to two or three evenings. The RC4151 can be programmed to operate over any frequency range from 1 Hz to 100 kHz by choosing R1 and C1 according to the expression $f=0.75/R1C1$, where f is the output frequency with an input voltage equal to the supply voltage. Using the components shown in Fig. 4, the frequency will vary over a range of 0 to about 3.1 kHz for inputs of 0 to 12 volts. The F/V converter will convert to voltage over the same frequency range.

The circuit can be tested over this range by connecting voltmeters to points A and B (a high-impedance voltmeter, 1 meg or better, must be used for point B). Point A will indicate the input voltage, while point B will indicte the output voltage. In an ideal circuit, these two points will track together, always giving the same reading. In the real world, however, the voltages may differ due to component variations. The resistor and capacitor connected to pin 5 of the RC4151 determine the frequency range of the circuit. If the values of the components used with the V/F and F/V chips are identical, then the two units will track perfectly and the input and output voltages will be the same. If, however, component variations occur, then the

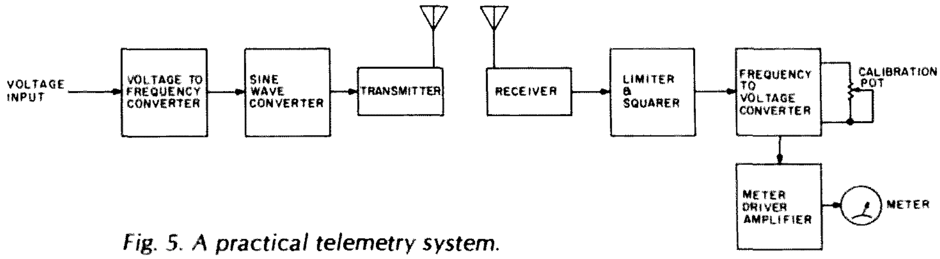

Fig. 5. A practical telemetry system.

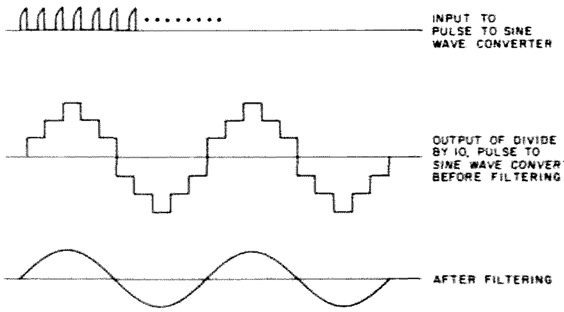

Fig. 6. Waveforms of pulse-to-sine-wave converter.

two circuits may be calibrated by adjusting the 25k pot so that the voltages are identical. This adjustment need be made only once to calibrate the units over the entire voltage range. For ease of calibration, set the input voltage to about 6 volts and adjust the pot so that the output indication is 6 volts.

If a high-impedance voltmeter is not available, then connect any voltmeter to point D. Point D is the output of the F/V converter after going through a meter amplifier configured as a voltage follower. The voltage follower has a gain of one and is used as a buffer between the high-impedance output of the RC4151 and a lower-impedance meter. The voltage follower is configured for a single-supply voltage, and because of this will operate only over the range of 2 to 10 volts. Keep this limitation in mind when using the voltage follower as part of your test setup. If you use a voltage of less than 12 volts, then the voltage follower will follow voltages to about 2 volts less than the supply voltage.

The RC4151 has a linear relationship between voltage and frequency. If the device is set to deliver an output of 3000 Hz for an input of 10 volts, then the output would be 300 Hz at 1 volt, 600 Hz at 2 volts, and so on. If a frequency counter is available, this can be verified by connecting the counter to point C and noting the change in frequency while varying the input voltage.

This basic test circuit has some limitations and is not suitable for integration directly into a communications link. First, the output of the RC4151 is a pulsed output similar to a square wave with a nonsymetrical duty cycle. This pulsed output will not properly modulate a transmitter such as an FM transmitter. Second, the F/V circuit requires a pulse input with a fast negative-going pulse. The output from a receiver will be sine wave for the most part and will not be decoded properly in the F/V converter. Note that in this test circuit the F/V converter, under some conditions at around 9 to 10 V, will not see a good input pulse and will become a bit unreliable, producing fluctuations in the output voltage.

A Practical Telemetry System

Fig. 5 is a block diagram of a practical telemetry system. In this diagram, two items have been added to the breadboard test setup to make a practical telemetry system. A sine-wave converter has been added to the output of the V/F converter and a limiter has been added to the input of the F/V converter.

The sine-wave converter in this design is based around a 4018 Johnson counter. This circuit generates a staircase output, approximating a sine wave, for every 10 input pulses (Fig. 6). The output of the sine-wave converter is fed to a simple RC filter to smooth the staircase output to a good sine-wave approximation. Note that the output of the sine-wave converter, after the simple filter, is not constant with changes in frequency but decreases as frequency increases. This is of little consequence for this experimental telemetry system since a limiter is included with the receiving system. For a sophisticated system, an automatic gain-control circuit could be placed after the filter to provide constant amplitude output.

Since the sine-wave converter divides by 10 during the process of converting the pulse input to a sine-wave output, it is necessary to increase the frequency range of the V/F converter by a factor of 10. This is

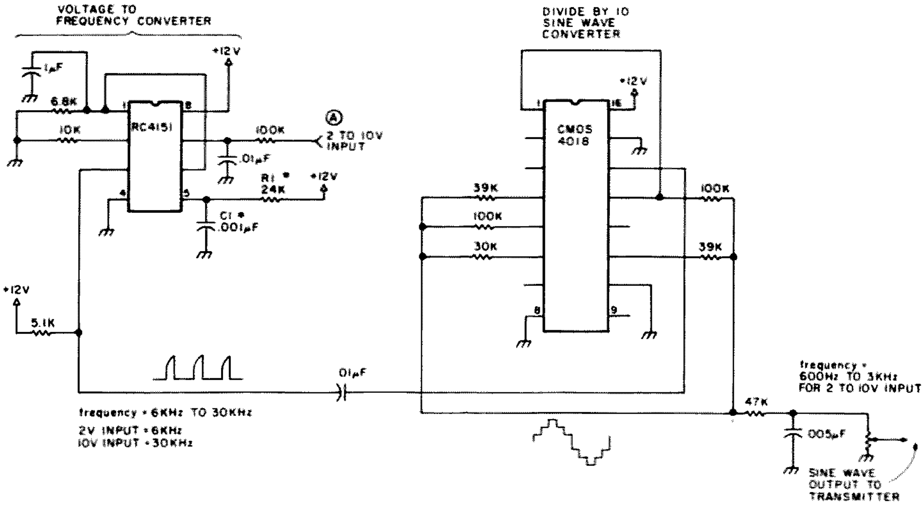

*Fig. 7. Practical voltage-to-frequency circuit. *For best results with frequency-determining components, use low temperature coefficient, high-tolerance components.*

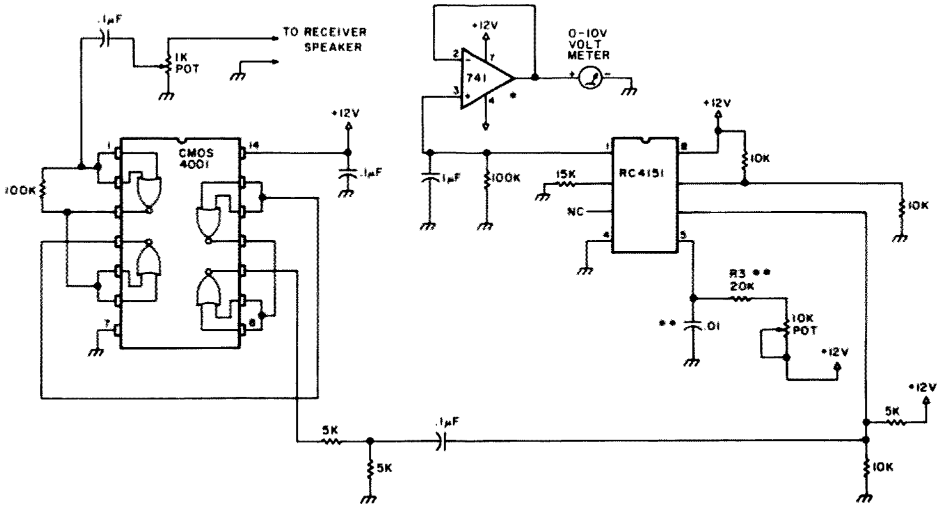

*Fig. 8. Practical frequency-to-voltage circuit. *741 pin connections for 8-pin DIP. **For best results with frequency-determining components, use low temperature coefficient, high-tolerance components.*

done by decreasing the value of C1 to 1/10 of the previous value. The V/F converter then will operate in the 0-to-30-kHz range, and the output of the sine-wave converter will be in the 0-to-3 kHz range. This frequency range was chosen since many transmitters and phone lines have a maximum transmittable frequency of about 3 kHz. The frequency range of the system may be changed easily as required merely by changing the frequency-determining components.

The lowest transmittable frequency, usually about 300 Hz, also must be considered. Since the meter amplifier in the circuit is limiting the minimum voltage to 2 volts, the minimum frequency transmitted will be about 600 Hz, which is above the lower limit of most communications systems.

When monitoring a voltage or making a measurement via a telemetry system, it is important to consider the overall stability of the system. If off-the-shelf resistors and disc ceramic capacitors are used, the stability of the system will be poor. These components will change value as they age and as the temperature changes, giving results that may vary from day to day and hour to hour. In order to maintain a stable, reliable system, low-temperature coefficient, high-tolerance components must be used. For the frequency-determining resistors connected to pin 5 of the RC4151s, precision 1%, low-temperature coefficient resistors of the RN60D variety should be used. For the frequency-determining capacitors connected to the same pins, either mylar™ or polyester film capacitors should be used.

On the receive end, a 4001 CMOS chip is biased into the linear region to act as a high-gain amplifier. The remaining gates are connected into the circuit to help shape the input pulses into square waves with a steep negative-going edge. This limiter will limit with an input of about 0.3 to 0.4 volts peak-to-peak, and should have sufficient gain so that it can be connected to the speaker terminals of most receivers. The output of this limiter is then directed to the input of the F/V converter.

As previously mentioned, the meter amplifier (voltage follower) will operate over a voltage range of 2 to 10 volts, corresponding to a frequency range of 600 Hz to 3000 Hz. The inclusion of this amplifier into the circuit limits the measurement capabilities of the system to the range of 2 to 10 volts. This is not a serious limitation for most purposes, and can be overcome at the transmitting end, if required, by using a scaling technique I will describe later.

The practical telemetry system may be calibrated by measuring the input voltage at point A of the V/F converter (Fig.7) and adjusting the 10k pot on the F/V converter (Fig. 8) so that the meter readings are identical. Note that it is of no importance to know the exact frequency range of the V/F and F/V converters. It is important only to calibrate them so that their ranges are identical. For calibration purposes, merely feed the output of the practical V/F circuit to the input of the limiter of the F/V circuit. The calibration will not change when the units are connected into a radio link.

If the 3-kHz maximum audio frequency of the sys-

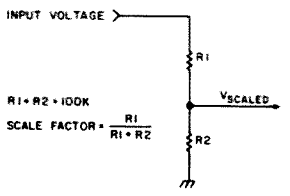

Fig. 9. Input scaling.

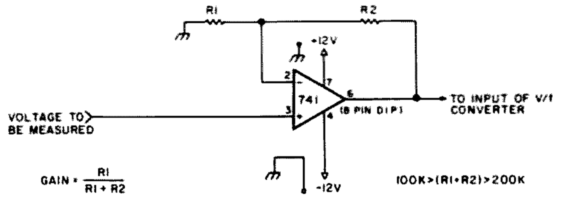

Fig. 10. An input amplifier.

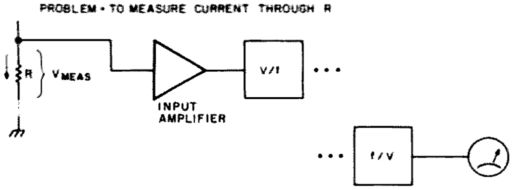

Fig. 11. Current measurement. Example: Assume R = 100Ω. I_{MAX} to be measured = 0.010 Amps (10 mA). Then V_{MEAS} = 0.01 × 100 = 1 volt. The amplifier must have a gain of 10 to bring the V/F input up to 10 volts maximum. The meter will read from 0 to 10 mA.

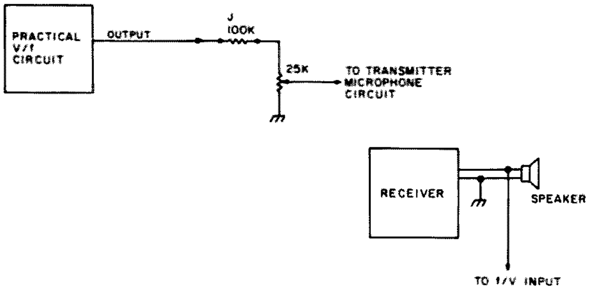

Fig. 12. Interfacing. Replace 100k with 500k or larger, to reduce output.

tem is outside the passband of the receiver and transmitter being used, then the range may be lowered by changing the value of resistor R1 of the V/F converter, according to the formula R1 = .75/C1f. To lower the maximum frequency to 2500 Hz, R1 should be changed from 24k to 30k. On the receiving end, the 20k resistor, R3, should be changed to about 25k. Note that R3 should be about 5k less than R1 to allow for the adjustment range of the 10k pot.

Input Scaling

The practical telemetry system can handle input voltages over a wide range by using a scaling circuit on the input to the V/F converter. For example, if the maximum input voltage is to be 20 volts, then a 2-to-1 voltage divider on the input would provide a 2-to-1 scale factor on the receiving end (Fig. 9). In this example, an input of 20 volts would provide a reading of 10 volts on the receiving end. The scale factor in this case would be two. All meter readings would be multiplied by 2 to give the correct reading. While scale factors may be anything, it is convenient to use whole numbers.

If the maximum input voltage to be measured falls below the 2-to-10-volt range of the system, an op-amp dc amplifier can be placed on the input as shown in Fig. 10. As an example, suppose that the maximum input voltage is to be 0.1 V. The amplifier would need a gain of 100 to bring the input of the V/F converter up to 10 volts. A gain of 100 can be obtained by making R1 = 1k and R2 = 99k.

Current measurements can be made by measuring the voltage drop across a resistor and then using Ohms law to determine the current. The amplifier in Fig. 10 can be used for current measurements provided that the resistor, through which the current is flowing, has one end grounded. Fig. 11 is a block diagram of a current-measurement system.

The 2-to-10-volt limitation of this telemetry system should not prove to be much of a limitation. In most cases, it is not necessary to measure completely down to zero. If it is, then it will be necessary to add a 2-volt offset to the input of the V/F converter and subtract a 2-volt offset from the meter amplifier. Offsetting techniques will not be discussed in this article, but will be left to the ingenuity of experimenters.

Interfacing

The V/F and F/V portions of the practical telemetry system may be interfaced to almost any AM or FM transmitter or receiver available today. The system cannot be used with a single-sideband communications link, however, since any receiver tuning error will change the received tone and this will change the meter reading. Fig. 12 shows the interface to a typical FM transmitter and receiver. Care should be taken not to overload the input stage to the transmitter. If the transmitted tone sounds distorted, then additional resistance should be added where shown.

Applications

Applications of the practical telemetry system are limited only by the imagination. This system may be used to monitor measurements from a remote repeater site such as emergency battery voltage, power output, building temperature, discriminator voltage, and first limiter voltage. The V/F output could be placed periodically on the repeater signal by using a timer, thus using the repeater to transmit the remote measurements. A touchtone™ decoder at the repeater site could be used to switch various inputs to the V/F converter so that many different parameters from the remote site could be monitored upon command.

Conclusion

This article is not meant to be the last word in developing a telemetry system and does not begin to cover all possibilities and all of the various techniques that could be used to make an analog telemetry system. The article was written to provide a starting point for the average experimenter who is interested in telemetry, to help him modify, enhance, and fit the ideas given to his particular application. It is hoped that this article will encourage telemetry experimentation. ■

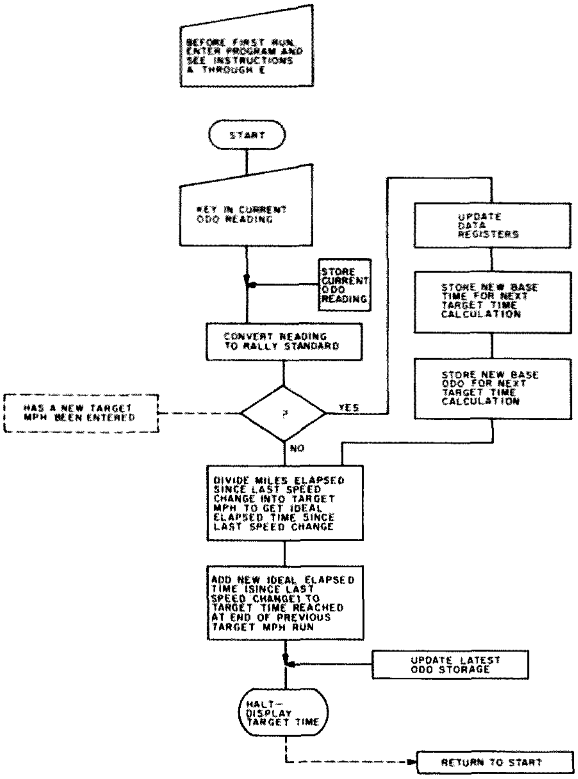
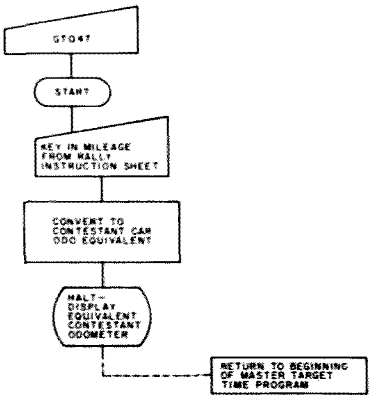
Rallying the HP-55

—gentlemen, start your calculators!



Rallybuster flowchart.



Auxiliary flowchart.

Many of the ham radio operators I have known also rally their sports cars. There seems to be something of a kinship between the precision required for rallying and the technical affinities of amateur radio.

Here's a program for your HP-55 calculator (which can be adapted to

Display Line	Code	Key Entry	Comments
00			KEY IN current odometer reading and punch R/S.
01	33	STO	Saves current odo for use as new base odo for
02	07	7	possible change in instruction speed.
03	34	RCL	Compares instruction speed from last calculation
04	09	9	with current instruction speed in R8
05	34	RCL	(see instruction H) to determine if a new
06	08	8	"target mph" has been encountered. If none,
07	32	g	program pointer jumps to step 19.
08	−19	GTO19	
09	33	STO	If steps 03-07 detect a new speed in R8, this
10	09	9	sequence resets the data base. This has the
11	34	RCL	effect of terminating a rally section driven
12	04	4	at a given speed and setting the termination
13	33	STO	mileage and TARGET TIME as the base for the
14	01	1	section at a new speed. Thus, each section at
15	34	RCL	a given mph is treated, in effect, as a
16	03	3	separate rally "leg." Therefore, encountering
17	33	STO	a speed change *must* be the occasion for an odo
18	00	0	entry and program run. See instruction H.
19	34	RCL	Steps 19-22 save current odo reading in R3 for
20	07	7	use in the next calculation if it entails a
21	33	STO	change in instruction speed.
22	03	3	
23	34	RCL	The base odo at the beginning of the current
24	00	0	instruction speed is recalled and subtracted
25	51	—	from current odo reading and the result converted,
26	34	RCL	using factor in R6, to rallymaster's
27	06	6	odo standard.
28	81	÷	
29	34	RCL	Recalls latest instruction speed and divides it
30	08	8	into miles traveled to determine proper time
31	81	÷	elapsed since last speed change.
32	32	g	Time elapsed since last speed change is converted
33	01	→H.MS	from decimal time to format HH.MMSS.
34	24	FIX	Sets four decimal places to ensure that result
35	04	4	will be displayed as HH.MMSS.
36	34	RCL	Recalls base time from last speed change to be
37	01	1	added to time elapsed to derive TARGET TIME
38	31	f	for ideal arrival at current odo reading.
39	41	H.MS+	
40	33	STO	New TARGET TIME is saved in R4 for use if next
41	04	4	calculation involves a speed change.
42	−00	GTO00	Pointer returned to step 00 for next calculation.
43	34	RCL	This auxiliary program, accessed by keying
44	06	6	GTO43, will convert an instruction sheet
45	71	x	mileage to your odo's equivalent. It
46	34	RCL	accommodates navigation errors (see
47	05	5	instruction K) and cars without a trip
48	61	+	odometer. Calculator returns to master
49	−00	GTO00	program for next TARGET TIME calculation.

Program listing.

A TYPICAL RALLY

Before Setting Out

A. Load program, set switch to RUN, and key BST.

B. STOre your assigned starting time in R1, as clock time in format HH.MMSS, or 00.0000 if you're using a stopwatch.

C. STOre in R8 and R9 the initial assigned speed from the rally instruction sheet.

D. STOre your beginning odometer reading in R0, R3, and R5. This will be 00.0 for a trip odo, but for a car without one, can be any number appearing on the odometer.

E. STOre 1.0 in R6. (See instruction F.)

Upon Completing The Calibration Run

F. STOre the odometer conversion factor in R6. This is derived by the formula:

$$\frac{\text{Your car's odometer reading}}{\text{Rallymaster's instruction odo}} = \text{Conversion factor}$$

Note: For armchair test runs, simply use 1.0 in R8.

During The Rally

G. Keep track of your status. Simply KEY IN your current odo reading and punch R/S. Displayed result is your TARGET TIME to that mileage.

H. When rally instructions require a speed change, *first* KEY IN your current odo and punch R/S. This gives you a TARGET TIME readout for that mileage and (more important) resets the data base for calculations to be made at the new speed. *Then* KEY IN the new speed and STOre it in R8.

I. As with any HP-55 program, you can extend battery life by keying the decimal point to quench the display. *But*, press CLx before your next odo entry; if you don't, you'll be entering .325 instead of 32.5, for example.

J. If you wish to convert an instruction mileage to your car's odo, KEY GTO43. Then KEY IN the instruction-sheet figure and punch R/S. Calculator automatically returns to 00 for your next TARGET TIME calculation.

K. If you find you've made a bad turn and must backtrack, determine the total mileage error (usually double your backtrack distance) and add it to the odo settings in R0, R3, and R5 by keying it into the display and pressing STO + 0, STO + 3, and STO + 5. After doing this, you can continue to enter mileages as they appear on your odometer as though you'd made no navigation error. Readout will show that you have a specific amount of time to make up. Conversions using instruction J will also be accommodated.

Registers

R0	Base odo reading	R5	Beginning odo
R1	Base time	R6	Conversion factor
R2	Available (see below)	R7	Current odo
R3	Saves latest odo	R8	Instruction speed
R4	Saves TARGET TIMEs	R9	Saves last instruction speed

R2 is available to keep track of accumulated points. After initial entries, normally only R8 (speed changes) is hand entered. All other registers are updated by the program, but R0, R3, and R5 are also modified by adding error miles (see instruction K).

Sample Rally

Rally instructions in hand, and having synchronized your digital wristwatch with the rallymaster's, you prepare for victory by following instructions A through E. After (A) loading the program, you (B) STOre your assigned starting time of *1:09 PM* in R1 as 1.0900, and (C) STOre in R8 and R9 the first speed called for in the instructions, which is *22.5 mph*. Then (D), you STOre your beginning odometer of *14,631.6* in R0, R3, and R5. Finally (E), you STOre 1.0 in R6. Precisely at 1:09 PM, you're flagged onto the route, which begins with a calibration zone, often 10 miles in length. Soon, you begin checking your status:

Odometer	Readout	Your Watch	Status
14635.1	1.1820	1:18:20	Exactly right (it would seem).
14637.7	1.2516	1:25:09	Driving fast (7 seconds).
14640.6	1.3300	1:32:59	Running 1 second fast.
14641.5	1.3524	1:35:25	Arrived here 1 second late.

At this point, your instructions tell you that you've finished the calibration zone and that its total length has been exactly 10.0 miles. You determine that your odometer has measured this distance as 9.9 miles (by entering your current odo reading and subtracting the contents of R5 from it). Following instruction F, you now divide your car's 9.9 by the rallymaster's 10.0 and find the calibration factor is .99, which you STOre in R6 (erasing the 1.0 you used in instruction E).

Being a perfectionist, you now recompute the first portion of the rally, which you attempted to run at 22.5 mph. You do this by again KEYing IN your odo of 14641.5 and punching R/S. *Now* the corrected readout gives you this information:

14641.5	1.3540	1:35:45	Your status is that having taken 20 seconds to figure the conversion factor, you're just :05 behind schedule. The readout says you should have arrived here at 1:35:40, and your watch says the time is 1:35:45.

Now navigating according to the clues in the rally instructions, you continue on at 22.5 mph and check your progress:

14647.5	1.5150	1:51:45	You've gained 10 seconds, making up the 5 you were behind and adding a margin of 5.
14651.0	2.0115	2:01:10	Still running fast 5 seconds.

A bit further on, you encounter a speed change (following a rally instruction that says "At sign DONUTS change to 36 mph."). Having rehearsed carefully for this, you now follow instruction H with dispatch, entering your mileage of 14653.5 and getting as output, 2.0759. Having done this (and seeing that you're still 5 seconds ahead because your watch reads 2:07:54), you KEY IN the new speed (36) and STOre it in R8. Now your status checks yield this kind of information:

14655.5	2.1121	2:11:16	Still a 5-second margin.
14660.0	2.1856	2:18:52	Margin reduced to :04.
14662.3	2.2248	2:22:42	Now running fast :06, a reasonable margin.

Suddenly you realize, because the instructions just don't make sense any longer, that you missed a turn clue and you're off course! No matter, for your HP-55 will get you out of this pinch. Reversing course in a handy driveway, you note that your odometer reads 14664.4. KEY that INto the HP's display, and press ENTER. Now you watch (more carefully this time) for the turn clue and discover it. As you do, you KEY IN your new odo reading of 14665.6, hit the minus key, and see a readout of − 1.2. KEYing CHS gets rid of the pesky minus sign, and then you double that figure (2,x) to 2.4, which is the exact error you've made. Following instruction K, you now KEY STO + 0, STO + 3, STO + 5.

Now you're running behind schedule, obviously, but how much? Your HP-55 will tell you. Give it your odometer as input, and it'll tell you what time it should be!

14664.7	2.2248

Aha! 2:22:48! Same readout as your last calculation before you realized you were lost! (You were probably watching the HP-55 do its stuff instead of watching for clues!) but now your watch reads 2:26:18, and it's clear that you have time to make up. 3.5 minutes (3:30) to be exact, though there's no critical need yet to determine just how bad the situation is. Better to watch for clues than to be punching HP-55 buttons just now! It's sufficient to know that you're behind, and that as you catch up, your HP-55 output will begin to look more like your wristwatch time. So you continue, driving faster than the instruction mileage in an attempt to catch up. And you calculate, eventually:

14670.7	2.3254	2:33:30	Having gone 50 mph since picking up the route again, now you're only :36 late.

But here, while still :36 behind ideal time, you see a clue that commands a speed change. Since a tenth of a mile has passed since your calculation, you run another one (following instruction H):

14670.8	2.3304

You don't bother to compare this with your watch, knowing you are behind anyway. But you do KEY IN the new instruction speed of 25.6 mph and STOre it in R8. Now you can do another calculation to check your status:

14671.0	2.3333	2:33:52	Good! Now you're only :19 behind schedule. Run just a bit faster than the 25.6 called for, and soon you'll be fine.
14673.1	2.3831	2:3829	Great! In the last 2.1 miles you not only made up your deficiency of :19, but you're now running ahead by 2 seconds.

At this point, you realize that your HP-55 has not only kept you constantly informed of your status, but it also has discounted the error mileage and is still giving you results based strictly on input from your odometer readings—with no need for you to adjust! (If it could only spot the clues, too!)

Now you come upon an instruction which reads, "At 41.4 accumulated mileage, turn left." Here's a situation where you need to know what that "41.4" is on your car's odometer. No problem. KEYing GTO43, you then KEY IN the 41.4, and get as readout, 14674.9860. This rounds to 14675.0. At that odo reading, you make your left turn. As you do, you run another check, knowing that your HP-55 has returned to step 00 and is ready for a TARGET TIME calculation:

14675.0	2.4259	2:42:56	You're running ahead :03.

Now, still moving at the latest rally instruction speed of 25.6 mph, you round a bend and sight the rally's first checkpoint. Foot off the gas, you coast in and run a calculation just as you are stopwatched in by the checkpoint captain:

14675.3	2.4344	2:43:44	Great! No points here! (It should be so easy!)

In practice, of course, the "you" in this exercise should be the rally navigator, who manages TSD while the driver drives and watches for clues. And while this exercise shows that the HP-55 program can accommodate a rally car with no trip odometer, the numbers will usually be less complex in a rally-equipped sports car. Either way, the program handles *all* the number-crunching for you: mileage conversions, accumulated mileage errors, and reverse mileage conversions.

One last reminder: Keep your batteries charged!

---

other programmables) that will help you hit those rally checkpoints on the nose.

Since road rallying is a time-speed-distance (TSD) competition in which the driver and his or her navigator attempt to arrive at checkpoints at precisely calculated times, seconds (or hundredths of minutes) are critical. By the usual scoring methods, every hundredth of a minute early or late at a checkpoint counts as a point. Would-be winners strive for the lowest possible number of points by following route instructions accurately and by precisely maintaining the speed called for in the rallymaster's instructions.

Winning rallyists are successful because they manage TSD calculations well, drive with precision, and keep their eyes peeled for the often obscure clues that show up in the instructions. It's important to spend the minimum possible time doing TSD calculations, because those roadside clues are crucial.

For advanced rallyists, this can mean dedicated computers, electronic or mechanical, tied into their car odometers—but that's an expense that only the fanatics can afford.

The program set forth here not only turns your HP-55 into a TSD manager, but also converts your car's odo reading, almost always at variance with that of the rallymaster when he laid out the course and wrote the instructions, to the odo standard being used by all contestants. It also can be used on casual practice runs to sharpen a driver's ability to hold a given average speed despite variations caused by road conditions and traffic.

During execution, the on-

ly input the program requires (aside from speed-command changes, which are STOred in Register 8) is your odometer reading. As output, it displays a TARGET TIME at which you should have reached that odometer reading. Then, a quick comparison with your time standard (stopwatch, wristwatch, or car clock) tells you whether you're running fast, slow, or on the button. Most drivers attempt to run slightly ahead of schedule, reasoning that they can more easily lose time than gain time as they sight a checkpoint.

The program provides two bonuses. It allows you to correct automatically for misspent mileage after a navigation error, and it provides an auxiliary six-step "reverse mileage conversion." While you'll mostly want to have the program automatically convert your car's odometer readings to TARGET TIMEs, sometimes you'll want to look ahead by converting the other way—from instruction-sheet mileages to your car's odometer. Both features are covered here in the instructions.

The program, with comments, and the operating instructions explain details of the program's calculation. You might want to cut them out and mount them on opposite sides of cardboard as an addition to your rally kit.

Some armchair runs are called for, of course, before you, your favorite navigator, and your HP-55 set out to devastate the competition. But in operation, the program is straightforward and designed for easy use in the competitive environment of a rally. With a little practice, you should be cutting points off your checkpoint times next weekend.

Good luck—and drive to survive! ■

Icing on the IC-2A Cake

—nonstandard offsets for Icom's hand-held

Photos by Vic Klein WA4THR

Photo A. The Icom IC-2AT.

Robin Rumbolt WA4TEM
1134 Glade Hill Drive
Knoxville TN 37919

When I first saw Icom's new synthesized handie-talkie, the IC-2A, at the Dayton hamfest, I was impressed by its small size and modest current-drain specifications. I had to dismiss it for my use though, because it was not capable of working odd repeater splits. Furthermore, Icom's representative at the hamfest told me that any modification for odd splits would be difficult if not impossible to make. Since I am caretaker for a repeater with an odd split (1.14 MHz) this handie-talkie was obviously not for me.

Several months later, I began to realize that a synthesized portable rig was becoming a necessity. I didn't need fancy scanning and many-memory capabilities, but I did need ruggedness and long battery life. The IC-2A came to the forefront of my mind.

After conferring a little more with the folks at Icom, I decided to take a chance and see if I could modify the radio for my odd split. I ordered one, and three weeks later I had what I consider to be the perfect handie-talkie.

This modification requires no holes to be drilled or extra switches added, does not change the functions of any of the existing controls, and is completely reversible at a later date, thereby not decreasing the rig's resale value.

Switch Settings	Binary Code	Function
Simplex +600	00	Duplex with odd offset
Simplex −600	01	Simplex
Duplex +600	10	Duplex with +600-kHz offset
Duplex −600	11	Duplex with −600-kHz offset

Fig. 1. DUP-SIMP switch outputs after modification.

How It Works

There are three transmit offset crystals in the IC-2A's synthesizer system. They are for simplex transmit, +600-kHz transmit, and −600-kHz transmit. These crystals are switched in and out by the use of a dc voltage to forward bias selected switching diodes. This means that the DUP-SIMP switch and the (−600)-(+600) switch are merely switching dc voltages and not the crystals themselves. Since two switches are available, with only slight modification two on-off binary bits could be made available. Two binary bits have four possible combinations. These combinations and what they represent after modification are shown in Fig. 1. Only three of the four combinations are used normally. Thus, we have a fourth combination available for switching in the odd split.

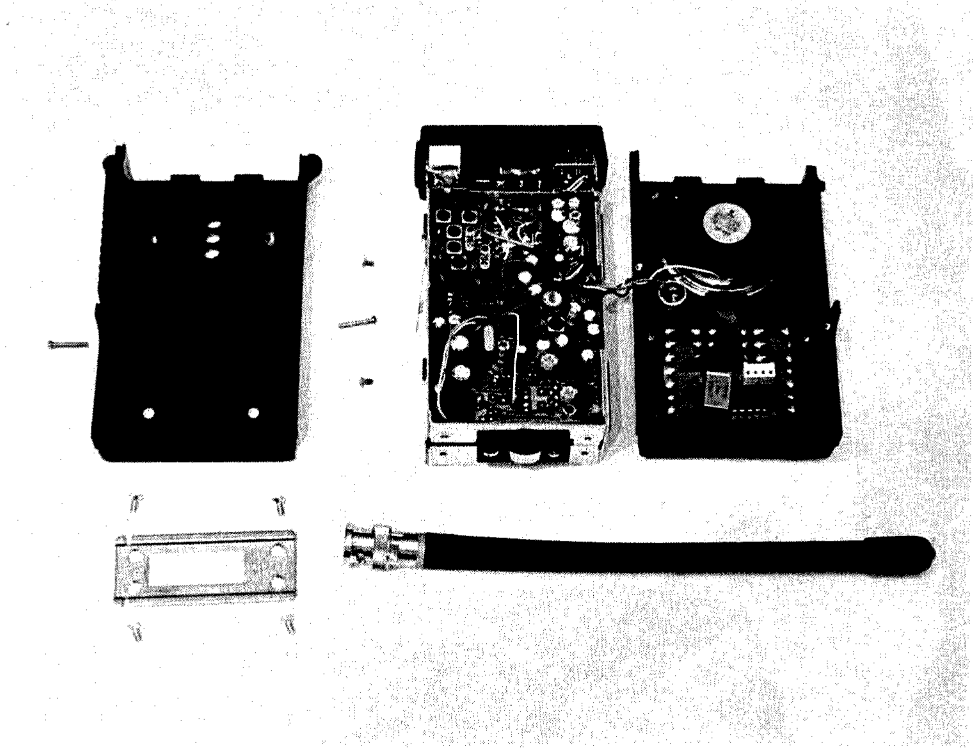


Photo B. A disassembled IC-2AT.

To decode the two binary bits of information from the switches into four dc output lines for the crystal switching circuits, I chose a CD4051 analog demultiplexer integrated circuit for the job. This IC merely routes an input signal, be it ac or dc, to an output line addressed by a binary input. Since this IC is CMOS, it adds only a negligible few microamps of current to the *transmit* battery drain.

The resulting circuit for the entire modification is shown in Fig. 2. Note that the diode switching circuit for the odd offset crystal is identical to the circuit used for the other offset crystals. The two coils shown, LB89 and LB91, are fairly critical so it is best to order them directly from Icom at the address shown at the end of this article. The diodes, 1SS53s, are also critical. 1N914s did not work in my unit. The 1SS53 diodes also should be ordered from Icom. Information for crystal ordering is in Fig. 3.

Installation

The Icom people did a very good job at miniaturization and getting the most into the least amount of space. Consequently, this modification should be attempted only by persons with very good eyesight and a steady hand, a very small-tipped, *low-wattage* soldering iron, and experience in working with miniature circuitry. Others would best serve themselves by turning the project over to a trusted friend having the above qualifications.

Begin the modification by first cutting the unused pins off each of the two coils. Then bend the two remaining leads out at right angles. Wire the remaining components, except for the IC, as shown in Fig. 4. Electrical tape should be wrapped around the crystal to keep it from shorting out other connections. Flex the crystal leads as little as possible to keep from breaking them off. All leads should be kept as short as possible. The entire circuit should also be kept as flat as possible. (No circuit board is used because there just isn't any room for it.) Once this circuit is wired, set it aside for a while. Do not install it in the rig at this time.

Remove the battery pack

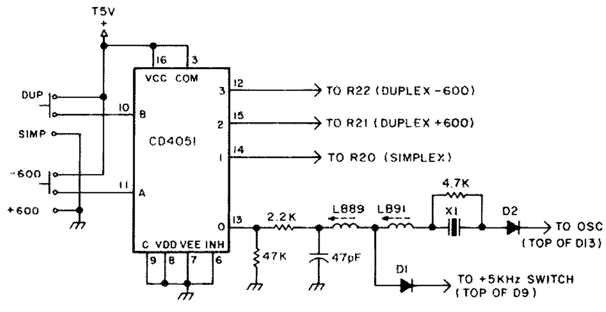

Fig. 2. Odd-split circuit schematic.

Crystal operating frequency = 35.00125 MHz + offset/4

Example: For a repeater with 146.40 input/147.54 output, offset needed = −1.14 MHz

Crystal frequency = 35.00125 MHz − 1.14 MHz/4 = 34.71625 MHz

Order: series resonant, 3rd overtone ±.005% tolerance, HC-18 holder with wire leads.
$5.50 from Jan Crystals, 2400 Crystal Drive, Ft. Myers FL 33907 (813)-936-2397.

Fig. 3. Crystal frequency calculation and ordering information.

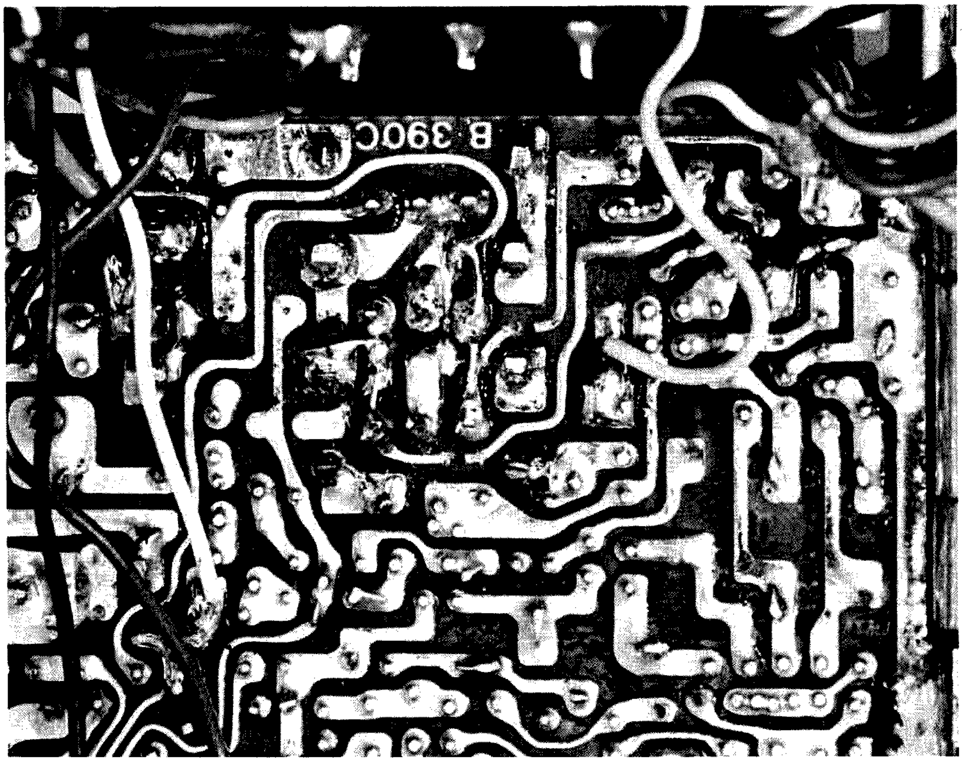

Photo C. Foil side of the PLL circuit board after the traces have been cut and the jumpers installed.

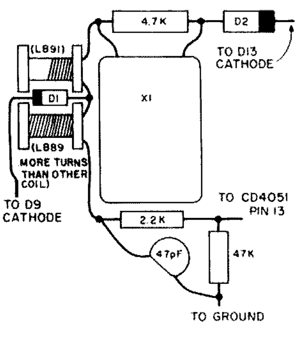

Fig. 4. Wiring pictorial.

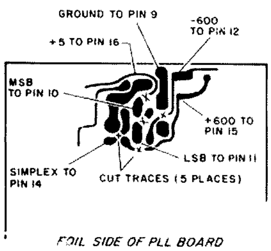

Fig. 5(a).

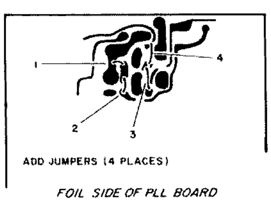

Fig. 5(b).

from the IC-2A. Then take out the four Phillips-head screws holding on the battery clip. Next remove the two Phillips screws on either side of the transceiver case. Now the case back cover can be removed by lifting it from the bottom and pulling it outward. Turn the rig so that the push-to-talk switch is on top, and locate the two Phillips screws that hold the chassis halves together. Remove them and swing the chassis halves apart. Aren't those hinges nice!

On the foil side of the board, containing the switches, there is a jumper wire about ½-inch long that serves to hold down several other wires. Carefully remove this jumper, but note where it attaches since it will need to be replaced later. Move the wires beneath the jumper to one side, cut the five traces as shown in Fig. 5(a), and add the jumpers as shown in Fig. 5(b). The PC should look like Photo C after the cuts and jumpers are installed.

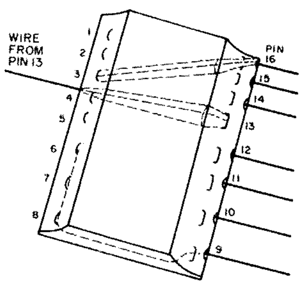

Fig. 6.

Now set the rig aside for a few minutes and get out the CD4051 CMOS IC. Normally, a CMOS IC should be handled as little as possible, but that is not possible in this situation. My only suggestion to avoid static damage in the steps that follow is to work on a grounded metallic surface in as humid an atmosphere as possible. The next step is to carefully cut off the "skinny" portion of each IC lead.

Using small-gauge wire such as wire-wrap wire, solder a minimum-length jumper between pins 3 and 16 of the IC. Solder a 2-inch piece of small-gauge wire to pin 16. Then jumper pins 6, 7, 8 and 9 together leaving a two-inch wire extending from pin 9. Continue by soldering 2-inch individual lengths of wire to each of pins 10, 11, 12, 14, and 15. Solder a 3-inch wire to pin 13. Carefully pull the leads out perpendicular to the IC, parallel to each other, and all on one side of the IC. Then bend the 3-inch lead on pin 13 to the other side of the IC. Remember to use as little heat as possible, allowing the IC to cool between each connection. Once all the wires and jumpers are soldered on, wrap the IC with electrical tape as shown in Fig. 6.

Take the tape-wrapped IC and, inserting it from the component side of the PLL board, route the connecting wires between the top edge of the circuit board and the flex printed circuit attached to the thumbwheel switches. The wire from pin 13 must remain on the component side of the board. Be sure that pin 16 of the IC is toward the switches. The IC should fit nicely into the upper-left corner of the rig when viewed from the back side, as shown in Photo D.

Now solder all wires coming from the IC (except for the one coming from pin 13) to the points shown in Fig. 5(a). When you're confident that everything is right, locate the ½-inch jumper removed earlier. Solder one end of it down. Group all the loose wires pushed aside earlier under the jumper. Then, being careful not to melt any insulation, tack the other end down at its original point. Reclose the chassis halves and put the two Phillips screws back in place.

The last task, now, is to install the coil-crystal assembly. First, make a double thickness of electrical tape about ¾-inch long and place it over the area on the

component side of the PLL circuit board where the flex circuit from the thumbwheels attaches to the main board. This is directly over IC1 and just to the left of the shielded enclosure. Make sure that the tape covers all the protruding solder connections. Now take the coil-crystal assembly and fit it on the taped-over area so that one lead of the 47k resistor goes over the shielded enclosure and so that the coils point to where the battery case is normally. Solder the lead from the 47k resistor to the shielded enclosure. Your assembly should now look like that shown in Photo E.

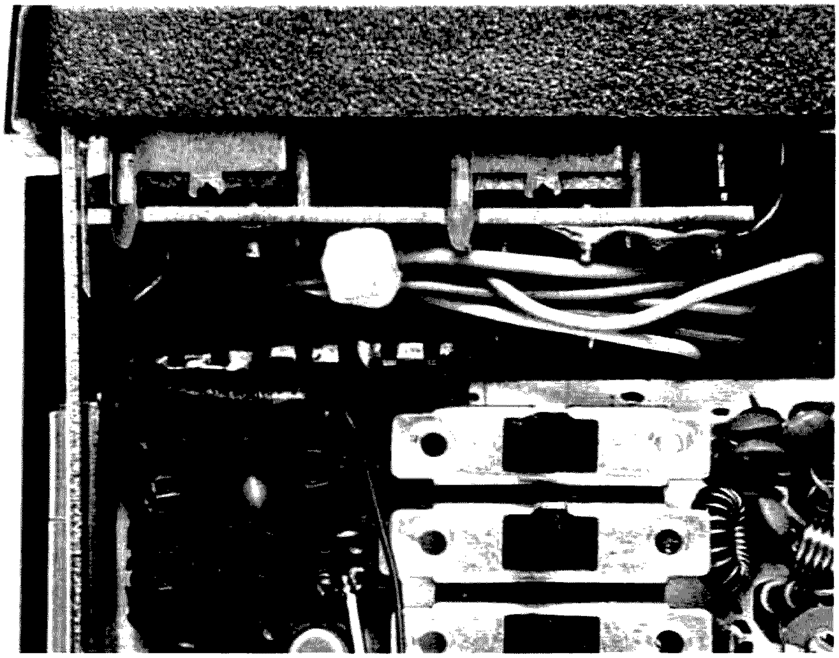

Photo D. Placement of the tape-wrapped CD4051.

Solder the cathode lead of D2 on the coil-crystal assembly to the cathode lead of either D12 or D13, which can be found in a group of four cathode leads sticking up just below the three other offset crystals and to the left of the switches. Make this a quick, low-heat solder connection to avoid overheating any of the diodes.

The next step is to find the cathode lead of D8 or D9. These diodes are a pair which can be found above the offset crystals to the left of the switches and immediately to the right of a couple of coil forms. Quick-solder one end of a piece of small wire to one of these cathode leads. The other end of the wire attaches to the cathode lead of D1 on the coil-crystal assembly. Finally, connect the lead coming from pin 13 of the

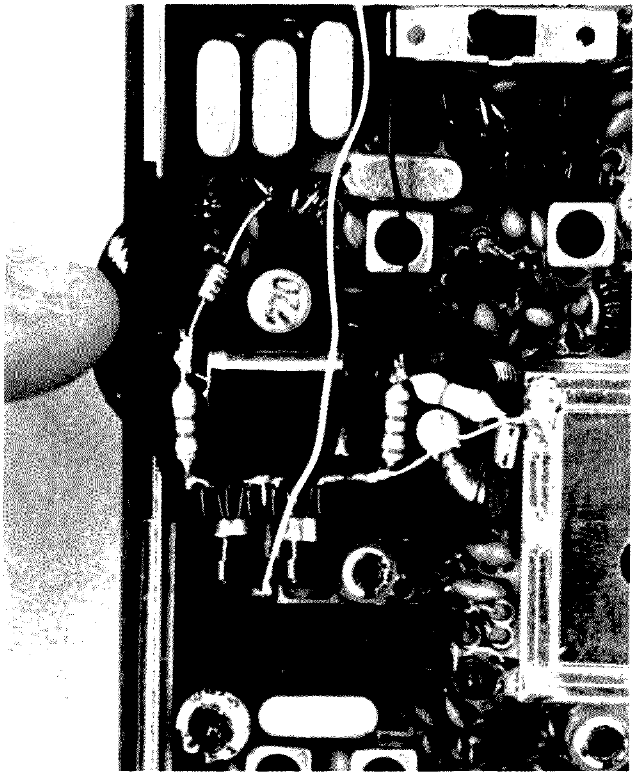

Photo E. Placement and orientation of the coil-crystal assembly.

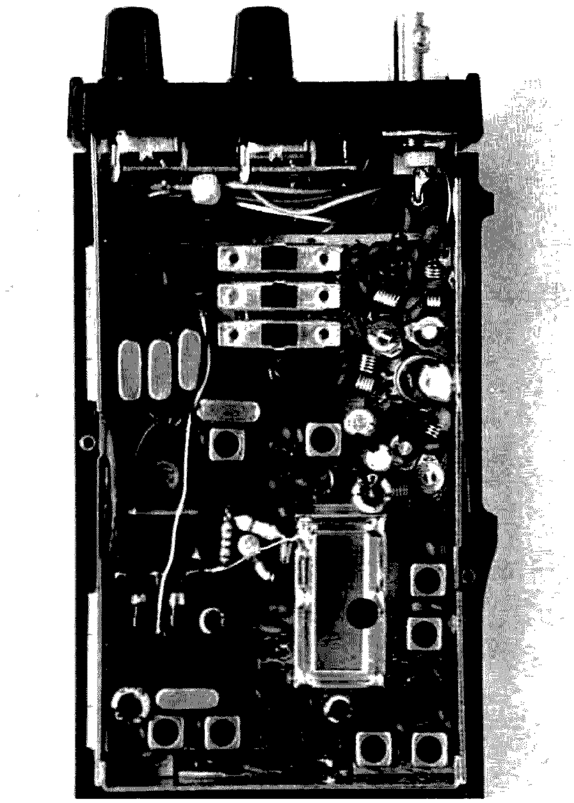

Photo F. The PLL circuit board after modification.

CD4051 to the junction of the 2.2k and 47k resistors on the coil-crystal assembly. This completes the modification.

Check Out

Before putting the case back together, connect the battery to the rig with a couple of jumper leads and turn on the rig. Everything should function normally except when the switches are set for simplex and +600. This combination should switch in your odd offset crystal.

A frequency counter should be used to check the offset frequency. Adjust LB89 on the coil-crystal assembly to adjust the frequency. Then switch the +5-kHz switch on and adjust LB91 to 5 kHz higher. Switch back then to 0 kHz and readjust LB89. Repeat this procedure a couple of times until both frequencies are correct. When the frequencies are to your satisfaction, cover the coil-crystal assembly with one more piece of tape and reassemble the case.

Conclusion

This modification has been made to several IC-2As in my area with complete satisfaction. While no undesirable side effects have been observed to date, I cannot, however, assume any liability for damages or faulty operation incurred by the installation or use of this modification.

Special thanks to Bill Tackett KN4N for offering the use of his week-old IC-2AT as the guinea-pig rig for development of this modification, and to Vic Klein WA4THR for the excellent photographs.

Coils and diodes can be obtained from Icom America, Inc., 2112 116th Avenue, N. E., Bellevue WA 98004. ■

Flexible Couplings

—for every project there is a reason. . . turn, turn, turn

In constructing a remotely-tuned antenna matcher for my ham station, I ran into the problem of coupling a variable-capacitor shaft to a pot shaft. (The pot is used to transmit information on the position of the variable capacitor.) The amount of space I had in the unit was not great enough to permit use of a flexible insulated coupling that is commercially available. Also, misalignment of the shafts was unavoidable due to the lack of space. The sideways force on the shaft of the pot also was of concern.

A simple solution came to me after I had racked my brains on this problem for a couple of days. Why not use some rubber grommets connected together with some heat-shrink tubing? Well, I tried it and it worked. Now I could finish up my antenna matcher.

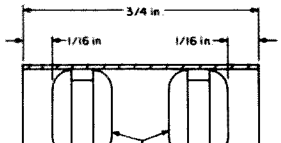

Fig. 1. Cutaway view showing placement of grommets in heat-shrink tubing.

Construction

The shaft size must be measured before selection of grommet size. Selection of heat-shrink tubing can be made next. The pot shaft and capacitor shaft were 1/4" diameter in my antenna matcher. I selected grommets with an inside diameter of 3/16". This fit tightly enough on the shafts so that the pot could turn without the grommet slipping.

Next, a size of heat-shrink tubing was selected that would let the grommets slip into the inside of the tubing. The heat-shrink tubing, when shrunk, must grip the grommets tightly.

As shown in Fig. 1, the length of tubing I used was about 3/4". Longer lengths can be used—more on that later. The grommets are pushed into each end of the tubing leaving about 1/16" of tubing overhang. Next, shrink the tubing with the grommets in place. That's all there is to it.

Limitations

There are some limitations to this type of homemade coupling. First and foremost is the amount of torque that is required to turn the shaft. In my case, the pot shaft takes very little torque to turn. Mount the grommet on whatever is to be coupled and try turning the grommet with you fingers. If the grommet rotates instead of the shaft, this type of coupling will not work. Something else must then be considered.

The heat-shrink tubing can be longer than I used by inserting a piece of rubber hose into the tubing. The length of hose is determined by the length of the tubing minus the total width of the grommets plus the 1/16" overhang of heat-shrink tubing on each end. The diameter of rubber hose must not be greater than the outside diameter of the grommets nor smaller than the inside diameter of the grommets. When the heat-shrink tubing is shrunk, it will grip the inserted rubber hose and add support to the extra length. Some trial and error assemblies may be necessary to get the results you need.

This type of coupling can melt if it is too close to some component that produces much heat. Also, make sure there is no grease or oil on the shafts when mounting the coupling or slippage may result.

In conclusion, this grommet and heat-shrink tubing combination has been working fine in my antenna matcher. As long as the torque requirements are taken into consideration, this coupling works great and, most important, it is cheap to make! ■

The Bobtail Curtain: Round Three

—wherein this author turns two previous articles upside down

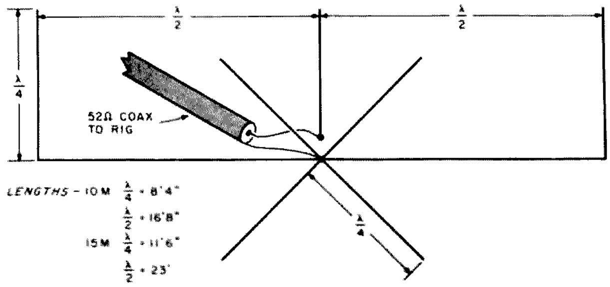

Fig. 1. The upside-down Bobtail curtain. Direction of radiation is broadside. The radials are each one-quarter wavelength long and spaced 90°.

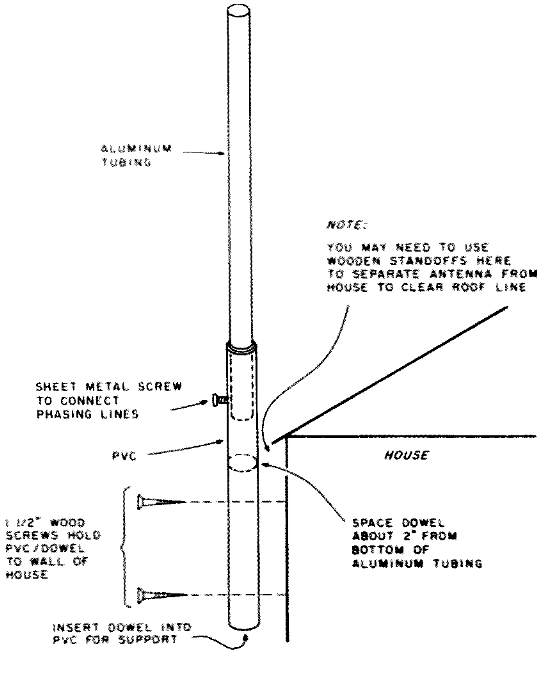

Fig. 2. Vertical element mounting details. Note that this mounting method is not strong enough to support vertical elements for 20 meters.

Alan Kaul W6RCL
21717 Lassen Ave., Apt. 223
Chatsworth CA 91311

The first time W8HXR wrote about the Bobtail curtain in *73 Magazine* (May, 1980, p. 44), I thought it sounded like an interesting antenna but the elaborate matching device was far too elaborate for me to build. The second time he wrote (*73 Magazine*, December, 1980, p. 110) I knew he had something that even I could handle, a top-phased, top-fed array.

The first article discussed voltage-feeding the antenna, that is, feeding the antenna at the bottom (at a voltage point), which required a tuning network. His second article suggested current feed (at the top at a current point which would be a good match for 52-Ohm coax).

The more I looked at the sketch of his design, the more I wondered why the antenna couldn't be turned upside down so it could be bottom fed. After I looked at it long enough, I decided to do just that. I decided on an antenna for 15 meters which would not use wire for the vertical sections, but tubing, so it would be self-supporting atop the roof. It works better than I expected. See Fig. 1.

I constructed the vertical elements out of 6' lengths of 0.058" wall aluminum tubing (Fig. 2). I used 3/4" o.d. pieces for the three base sections and 5/8" o.d. pieces for the tops. I chose 11'6" as my arbitrary starting point and slipped the smaller diameter tubing inside the larger to a depth of about 6", drilled through one wall of both tubes, and fixed them in place with a sheet-metal screw.

I mounted each of the verticals inside a piece of 3/4" i.d. PVC sprinkler pipe for an insulator and mounted each of those to the top of the house wall (it pays to have a flat roof) so the metal part of the antenna started about 9" above the roof and rose vertically from there. I spaced the three verticals 23' apart (it also pays to have a house 46-feet long on at least one

side). I drilled a hole in each vertical element about 1/2" from the bottom of the aluminum tubing (drill through one wall of the PVC and into one wall of the aluminum). I put a sheet-metal screw into each hole and prepared to attach the coax and the wire phasing lines. Since I made each vertical element 11'6" long and they were 1/4 wavelength long, I doubled the figure to get the half wavelength for spacing.

Since I needed two half-wave phasing lines, I decided to cut a single piece of wire a full wavelength long—46 feet. Each end of the wire attaches to the sheet-metal screws on the two outer verticals. The center conductor of a piece of 52-Ohm coax connects to the sheet-metal screw on the center vertical and the outer shield attaches to the center of the one-wavelength phasing wire. I used another sheet-metal screw through the center vertical PVC to hold the phasing line and ground shield away from the conductor.

Now, remember at this point that I was using the empirical method of antenna construction (cut and try). I knew 11'6" was close to a quarter wave (not taking time to use the formula, length = 243/f(MHz) and to calculate the Q of the tubing). So, for the smoke test I fired up the rig, loaded it up for CW with an swr bridge in the line, and was pleasantly surprised that the vswr was below 1.5 to 1 over the entire 15-meter band.

I tuned around, looking for DX, and I found two countries I had never heard before with the trap vertical I had been using. The two countries were Senegal and the Republic of Volta. Then I heard a lot of South American stations and decided to listen in the phone band. Call areas 4 and 5 sounded the loudest, and since the three verticals run in a line roughly northeast-southwest, I concluded that W8HXR was right, that the antenna radiates broadside the best.

Later that evening, with Steve AA6AA assisting, I found that his signals were about 15 dB stronger on the Bobtail than on the trap vertical using the S-meter on the TS-120S. He reported that my carrier was about 15 dB stronger on the TS-820 when I transmitted with the Bobtail. Two nights later, when 15 meters sounded dead at about 0230 GMT, I heard VU2USA in Bangalore coming through to answer my call (with about 160 Watts dc input to the TS-120S) and I knew the Bobtail curtain was the antenna for me. His longpath signal confirmed that the antenna worked better than I had ever hoped for.

What I didn't count on was making another discovery while trying to improve the signals on 10 and 20 meters on the trap vertical. I reasoned that if a three-element Bobtail works, a two-element Bobtail also must work. So, I decided to set off empirically (again!) in search of a two-element antenna which would use the Hy-Gain 14AVQ as one element and a vertical piece of wire running to a nearby tree as the other. If W8HXR were right and a 20-meter Bobtail would also work on 10 meters, then all I had to do was modify the 20-meter antenna to get two bands for the price of one.

Since the 14AVQ already had a coax feed at the base, I decided to run a half-wavelength radial on 20 meters (33') to a tie point on top of the roof. I mounted the end of the new radial (with an insulator) to a vent pipe. I then took a 16'6" piece of wire, soldered one end to the radial end and installed an insulator on the other. I climbed a nearby tree and pulled the new vertical up and affixed the insulator to a tree branch. The test showed the vswr was okay—not over 2 to 1 on the 10- and 20-meter frequencies that I normally operated. Wow! The thought at the time was that I would install a separate 10-meter Bobtail antenna. (I've never gotten around to it.)

But I did decide to make a change in the original 15-meter Bobtail. I concluded that since the two-element antenna worked well on 10 and 20 meters with four radials for each band, I at least ought to try installing radials on the 15-meter antenna. Since I was already on a streak with the 11'6" measurement, I cut four radials and spaced them 90 degrees apart and attached them to the coax shield at the base of the center vertical. The vswr got even better—no higher than 1.1 to 1 from 21.000 to 21.275 MHz and still below 1.3 to 1 at 21.450 MHz.

What a terrific surprise this whole experiment was. I expected to cut and try various lengths on 15 meters and somehow I lucked out on the first attempt. Then I expected I might run into trouble by adding a Bobtail radiator to the trap vertical—but I didn't. The vswr did go up a little, but nothing unmanageable. And I suspect that if I cut and tried a little harder, I'd be able to solve that, too. So, for an afternoon, a few bucks, and a little inverting of someone else's antenna design, I must say I'm pleased. If you want to write me about the antenna, please include an SASE. ■

The Micro-Generator

—this diminutive device has a price tag as small as its size

An audio generator is a very handy piece of test equipment to have around the shack. I needed one to meet two design criteria; small size and low cost. I decided that the LM566 voltage-controlled oscillator chip would make an excellent building block since it is cheap, readily available, and requires a minimum number of external components to make it a general-purpose oscillator.

Using National Semiconductor data and making a few calculations, I came up with this circuit (see Fig. 1). This unit is continuously tunable from five Hertz through five hundred kilohertz and has selectable square- or triangle-wave output adjustable from 0 to 5 and 0 to 2.5 volts, respectively. Frequency selection is accomplished by selecting the midband frequency with S1 and then tuning in the desired frequency with R1. The choices for the midband frequencies are 10 Hz, 100 Hz, 1 kHz, 10 kHz, and 100 kHz. R1 will vary the chosen midband frequency from one-half to five times its value.

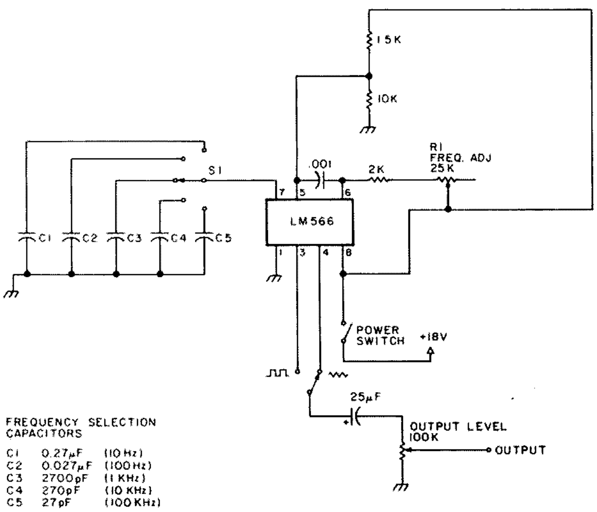

Fig. 1. Schematic for a micro-size audio signal generator.

Construction is not particularly critical. Everything can be bought at Radio Shack, but it is cheaper to shop the *73* ads and use the junk box. Power is supplied by two nine-volt transistor batteries connected in series. The capacitor values should be kept close to the indicated values for frequency readout accuracy. I paralleled junk-box capacitors to obtain the desired values. I labeled R1 as a frequency multiplier control since I wanted to keep the cabinet small. This scheme has accurate frequency readout on all but the high band. If a larger cabinet is used, direct-reading frequency scales for each band will give excellent frequency readout accuracy. Calibration of R1 can be accomplished with a counter or scope. If one is not available, this formula can be used to determine the frequency for a given value of R1: $F_O = 2(Vcc - V_5)/RCVcc$.

Vcc is the supply voltage (18 volts), R is R1 plus 2000 Ohms, C is the capacitor value chosen by S1, V_5 is the voltage from pin five to ground (15.65 volts), and R should be kept between 2k and 20k. Some of the settings for R1 and the corresponding frequencies are: 8k/center frequency, 18k/one-half the center frequency, and 0 Ohms corresponds to five times the center frequency.

I tested my prototype at a University of Maryland lab where I work. The unit had symmetric waveforms and good frequency readout accuracy through the audio range. The 566 is rated to one megahertz, but the waveforms start to become distorted, and frequency does not follow the formula at frequencies much higher than 100 kHz. Overall performance is excellent. The micro-size audio oscillator should make a nice addition to any test bench. ■

SOCIAL EVENTS

Listings in this column are provided free of charge on a space-available basis. The following information should be included in every announcement: sponsor, event, date, time, place, city, state, admission charge (if any), features, talk-in frequencies, and the name of whom to contact for further information. They should be sent directly to Editorial Offices, 73 Magazine, *Pine Street, Peterborough NH 03458, Attn: Social Events.*

MAPLE RIDGE BC CAN
JUL 4-5

The Maple Ridge ARC will hold its Hamfest '81 on July 4-5, 1981, at the Maple Ridge Fairgrounds, located 30 miles east of Vancouver, Maple Ridge BC. Registration for hams is $4.50, a program with a ticket for a drawing is $2.50, and the dinner and dance is $10.00. Registration for non-hams over 12 years old is $2.00; non-hams under 12 will be admitted free. There will be food and camper space (without hookups) available. Features will include prizes, a swap and shop, a bunny hunt, a ladies' program, and much more. Talk-in on 146.34/.94 and 146.19/.79. For more information and advanced registration, contact Bob Haughton VE7BZH, Box 292, Maple Ridge BC V2X 7G2.

OAK CREEK WI
JUL 11

The South Milwaukee Amateur Radio Club, Inc., will hold its annual swapfest on Saturday, July 11, 1981, at the American Legion Post #434, 9327 South Shepard Avenue, Oak Creek WI. Admission is $2.00 and includes a happy hour with free beverages. Prizes include a $100 first prize and a $50 second prize. Activities will begin at 7:30 am and continue until 5:00 pm. Parking, a picnic area, hot and cold sandwiches, as well as liquid refreshments, will be available on the grounds. Overnight camping is also available. Talk-in on 146.94. More details, including a map, may be obtained from The South Milwaukee Amateur Radio Club, PO Box 102, South Milwaukee WI 53172.

STATE COLLEGE PA
JUL 11

The Nittany Amateur Radio Club will hold its annual Mount Nittany Hamfestival on Saturday, July 11, 1981, at the HRB-Singer, Inc., picnic grounds in State College PA. Registration and admission is $2.00 in advance with no charge for spouse and children; $3.00 at the gate. Flea market space is $3.00 in advance; $5.00 on-site. Along with the flea market, features will include an auction, dealer displays and sales, door prizes including a synthesized 2m handheld transceiver, and free parking. Refreshments will be available. The Central Pennsylvania Festival of the Arts will be taking place at Penn State University the same weekend. Talk-in on .16/.76 and .25/.85 from I-80 and major central Pennsylvania routes; talk-in on .52 for local directions. For further information, write Mount Nittany Hamfestival, NARC, Box 614, State College PA 16801, or call Dave Buckwalter N3BBH at (814)-234-0759.

PITTSFIELD MA
JUL 11-12

The Northern Berkshire Amateur Radio Club will hold its annual hamfest on Saturday and Sunday, July 11-12, 1981, at the Cummington Fairgrounds, Cummington MA (off Rte. 9). General admission is $3.00 in advance, and $4.00 at the gate. Family admission is $5.00 in advance and $6.00 at the gate. Dealers are welcome. Talk-in on 146.31/.91. For further information, contact Herb Blake, PO Box 567, North Adams MA 01247.

DUNSEITH ND
JUL 11-12

The 18th annual Peace Garden Hamfest will be held July 11th and 12th on the American side of the International Peace Gardens (which are located 13 miles north of Dunseith ND). Registration will be at the Lodge from noon to 6:00 pm on Saturday and from noon to 3:00 on Sunday. There will be swap tables and other activities on Saturday, followed by the dance at 9:00 pm. There will be breakfast Sunday morning for all those registered, followed by TX hunts and other activities. The general assembly will be Sunday afternoon. For more information, write Ramsey County Amateur Radio Club (WD0FFQ), Box 5, Devils Lake ND 58301.

MOUNT SINAI LI NY
JUL 12

Radio Central ARC will hold its 3rd annual hamfest on Sunday, July 12, 1981, from 9:00 am to 4:00 pm on the grounds of Mount Sinai Elementary School, Rte. 25A, Mount Sinai LI NY. Admission for buyers is $1.50; XYLs and harmonics will be admitted free. Sellers' spaces are $3.00. There will be door prizes, a grand prize drawing at 3:00 pm, a contest, and refreshments. Talk-in on 145.15 (WA2UEC) and 146.52. For more information, contact Lew Franklin at (516)-265-5614.

MCKEESPORT PA
JUL 12

The Two Rivers Amateur Radio Club, Inc., will hold its 17th annual hamfest on Sunday, July 12, 1981, at the Pennsylvania State University McKeesport Campus, McKeesport PA, from 8:00 am to 4:00 pm. The indoor hamfest will be in the Frable Building and the outdoor event will be in the main parking lot. There is no admission charge. Inside setup is $3.00 per table and outside setup is free. Hot food and cold drinks will be available and door prizes will be awarded throughout the day. There are forums and displays planned. Our location at the corner of Eden Park Boulevard and University Drive in the Renziehausen Park Area is easily accessible from most major routes. Talk-in on 146.22/.82.

ALEXANDER NY
JUL 12

The Genesee Radio Amateurs, Inc., will hold the first annual ARRL-approved Batavia Hamfest on Sunday, July 12, 1981, from 7:00 am to 6:00 pm at Alexander Firemen's Grounds, Rte. 98 (nine miles south of Batavia), Alexander NY. Admission is $2.00 in advance, $3.00 at the gate, and $1.00 for the flea market. There will be many prizes, a large exhibit area, programs, YL activities, contests, and plenty of food. Overnight campers are welcome. A boat anchor auction will take place at 4:30 pm. Talk-in on 146.04/.64 (W2RCX), 144.71/5.31, and .52. For more information and advance tickets, send an SASE to GRAM, Inc., Box 572, Batavia NY 14020.

INDIANAPOLIS IN
JUL 12

The Indianapolis Amateur Radio State Convention and Hamfest will be held on Sunday, July 12, 1981, at the Marion County Fairgrounds. For further information, write Indianapolis Amateur Radio Association, Box 11086, Indianapolis IN 46201.

WILKES-BARRE PA
JUL 12

The Broadcasters' Amateur Radio Club will hold its fourth annual hamfest on July 12, 1981, from 9:00 am to 4:00 pm at Pocono Downs Race Track, Rte. 315, 1½ miles north of Wilkes-Barre PA. Admission is $3.00, XYLs and children will be admitted free, and there will be no additional charge for sellers. Gates will open at 8:00 am for setup. There will be unlimited outdoor and indoor space, refreshments, prizes, a free FM clinic, and ac power available. Talk-in on 147.66/.06 and 146.52. For more information, contact Charles Baltimore WA3NUT, BARC, 62 S. Franklin Street, Wilkes-Barre PA 18773, or phone (717)-823-3101.

GLACIER NATIONAL PARK MT
JUL 17-19

The Great Falls Area Amateur Radio Club will sponsor the Glacier-Waterton International Hamfest on July 17-19, 1981, at Three Forks Campground, Highway 2 between East and West Glacier. Features will include forums, technical presentations, exhibits, demonstrations, and ladies' and children's activities, including horseback riding. Until July 7, 1981, preregistration is $6.00; after that, $7.00. Campsites are $5.00 for a full hookup and $4.00 without. For more information, contact Glacier-Waterton Hamfest, Shirley Smith, Secretary, 1822 14th Avenue South, Great Falls MT 59405, or phone (406)-452-1886.

HARBOR SPRINGS MI
JUL 18

The Straits Area Amateur Radio Club will hold its annual hamfest on July 18, 1981, at the Harbor Springs High School, Harbor Springs MI, from 9:00 am to 4:00 pm. Donations are $2.00 at the door and table space is $2.50. Sellers will be admitted at 8:00 am and tables may be reserved in advance. Features include lunch served from 11:00 am to 1:00 pm, one main door prize and several smaller prizes hourly, free overnight parking for self-contained RVs, and refreshments available all day. Talk-in on .52/.52 and 146.07/.67. For more details, contact Mr. Bernie Slotnick KB8RE, 630 Ann Street, Harbor Springs MI 49740, or phone (616)-526-5614.

MANCHESTER NH
JUL 18

The New Hampshire FM Association will hold an electronic flea market on Saturday, July 18, 1981, at the Manchester Municipal Airport, Manchester NH, beginning at 9:00 am. General admission will be 50¢ per person; sellers: $2.00. Sellers should bring their own tables or tailgate. Commercial displays are welcome. Refreshments will be available and door prizes will be awarded. Talk-in on 146.52 FM and 124.9 AM. For further information, contact Dick DesRosiers W1KGZ at (603)-668-8880, or Doug Aiken K1WPM, 30 Meadowglen Drive, Manchester NH 03103, (603)-622-0831.

CHARLESTON SC
JUL 18-19

The Charleston Amateur Radio Society, Inc., will hold its eighth annual Charleston Hamfest on July 18-19, 1981, at the Omar Shrine Temple, 44E Battery Street, Charleston SC. There will be overnight security guards and refreshments available. For more information, contact the Charleston Hamfest Committee, PO Box 30643, Charleston SC 29407, or phone (803)-747-2324/496-3660.

LOUISVILLE OH
JUL 19

The Tusco Amateur Radio Club and the Canton Amateur Radio Club will present the 7th annual Hall of Fame Hamfest on Sunday, July 19, 1981, at the Nimishillen Grange, 6461 Easton Street, Louisville OH. Admission is $2.50 in advance and $3.00 at the gate per person. People under 16 will be admitted free. There will be a flea market, food, XYL activities, forums, contests, distributors, and awards. For qualified dealers of electronic and ham-radio-related products, 30" x 8' tables are available in an indoor display area (with 110-V ac) on a reserved basis at $3.50 each. Talk-in on 146.52/.52, 146.19/.79, and 147.72/.12 (W8ZX or W8AL). For table reservations or tickets, send a check payable to Hall of Fame Hamfest, 10877 Hazelview Avenue, Alliance OH 44601, or phone (216)-821-8794.

BOWLING GREEN OH
JUL 19

The 17th annual Wood County Ham-A-Rama will be held on July 19, 1981, at the Bowling Green Fairgrounds, Bowling Green, Ohio. Gates open at 10:00 am; there will be free admission and parking. Trunk-sale space and food will also be available, as well as prizes. Talk-in on .52 (K8TIH). Tickets are $1.50 in advance and $2.00 at the door. For information, write to: Wood County ARC, Eric Willman, 14118 Bishop Rd., Bowling Green OH 43402. Advance table rental is available to dealers only ($3.00 per table, payable in advance). Saturday setup will be available. Send checks for tables to: Bill Wilkins, 16220 Portage Rd., Bowling Green OH 43402.

WRIGHTSTOWN NJ
JUL 19

The 3rd annual West Jersey Radio Amateurs Hamfest will be held on Sunday, July 19, 1981, from 9:00 am to 4:00 pm at McGuire Air Force Base, Wrightstown NJ. Admission is $2.50 and spouses and children will be admitted free. Tailgate or table space is $2.50 per space; bring your own table. Refreshments and activities, including contests and films, will be available. Door prizes will be awarded continuously. Talk-in on 146.52, 147.15, and 145.47. Advance tickets and information are available from any club member or send an SASE to Bill Luebkemann WB2LCC, 116 Country Farms Road, Box 140, Marlton NJ 08053, (609)-983-8844 (between 6:00 pm and midnight).

OKLAHOMA CITY OK
JUL 24-26

The Central Oklahoma Radio Amateurs will hold the West Gulf Division ARRL Convention and "Ham Holiday" on July 24-26, 1981, at the Myriad Convention Center, Oklahoma City OK. Pre-registration will be $6.00

✓See List of Advertisers on page 114

if received before July 17th; after that, registration will be $7.00. The program will include an ARRL forum, technical talks, a QCWA breakfast, and a Woulf Hong initiation. In addition, a full program is scheduled for the ladies. Other events will be a Saturday evening banquet with speaker Harry Dannals, President of the ARRL, Sunday noon drawings for the Icom 260 preregistration and TS-830S grand prizes, plus others, and an indoor exhibitor and swapfest area. Tables are free to noncommercial registrants. Mail your registration to CORA, PO Box 20118, Oklahoma City OK 73120.

WELLINGTON OH
JUL 25

The Northern Ohio Amateur Radio Society will hold its 4th annual ARRL-approved NOARSfest on Saturday, July 25, 1981, from 7:00 am to 5:00 pm at the Lorain County Fairgrounds, one mile west of Rte. 58 on Rte. 18, Wellington OH. Admission tickets are $2.50 in advance, $3.00 at the gate, and are good for all prize drawings. Tickets for prize drawings only are available by mail or at the gate for $1.00 each. Children under 12 will be admitted free. There will be plenty of food, free parking, a large indoor exhibit hall for dealers, a huge blacktopped midway for flea market and trunk sales, and free camping (no hookups) outside the gates on Friday night. The gates will open at 6:00 am for sellers and dealers. A Ten-Tec Delta transceiver and a Den-Tron GLA-1000B linear amplifier will be among the prizes awarded. For advance registration, information, or tickets, write NOARSfest, PO Box 354, Lorain OH 44052.

OLIVER BC CAN
JUL 25-26

The Okanagan International Hamfest will be held on July 25-26, 1981, at a new location, Oliver Centennial Park, 6th Street, Oliver BC. Registration is Saturday, July 25th, at 9:00 am (PDT). There will be activities from 1:00 pm Saturday to 2:30 pm Sunday. Also on Sunday there will be a potluck luncheon at noon as well as entertainment and bunny hunts. YLs are asked to bring their hobbies for display or sale and also their flea-market items. Talk-in on .34/.94 and .76/.76. For additional information, contact John Juul-Andersen VE7DTX, 8802 Lakeview Drive, Vernon, BC V1B 1W3, or Lota Harvey VE7DKL, 584 Heather Road, Penticton, BC V2A 1W8.

ANDERSON IN
JUL 26

The MCARC Hamfest will be held on Sunday, July 26, 1981, from 8:00 am to 3:30 pm (vendors' setup is at 7:00 am) at the National Guard Armory, N 109 Bypass, Anderson IN. Ample parking and refreshments will be available. Advance tickets are $2.50 each; at the door, $3.50. Spaces with tables are $2.50 each; without tables, $1.75 each. First prize is an Icom IC-2AT. Talk-in on 146.22/.82 and 146.52/.52. For advance tickets and space, send your check to Everett G. Riley, Activities Chairman, RR 4, Box 354, Alexandria IN 46001.

NASHVILLE TN
JUL 26

The Radio Amateur Transmitting Society (RATS) will hold the Nashville Hamfest on Sunday, July 26, 1981, at the National Guard Armory, Sidco Drive, Nashville TN. Doors will open at 8:00 am. Admission is $2.00 and tables are $5.00 each. Refreshments will be available. Talk-in on .90/.30. For more info, contact RATS, PO Box 2892, Nashville TN 37219.

CENTERVILLE MI
JUL 26

The Amateur Radio Public Service Association will hold a swap and shop on July 26, 1981, at the St. Joseph County Fairgrounds, M-86, Centerville MI. Admission at the door is $2.00 and tables are $3.00. Gates will open at 7:00 am. Talk-in on 146.52.

WEST FRIENDSHIP MD
JUL 26

The Baltimore Radio Amateur Television Society (BRATS) will hold its annual Maryland Hamfest on Sunday, July 26, 1981, at the Howard County Fairgrounds, Route 144 at Route 32, adjacent to Interstate 70, about 15 miles west of Baltimore, in West Friendship MD. Tickets are $3 (XYLs and children under 12 will be admitted free), tailgating spaces are $2, and tables are $5 each. For additional information, write BRATS, Box 5915, Baltimore MD 21208, or call Mayer W3GXK at (301)-655-7812.

WEST YELLOWSTONE MT
JUL 31-AUG 2

The WIMU (WY-ID-MT-UT) Hamfest will be held from July 31-August 2, 1981, in West Yellowstone MT. Lodging and campgrounds are available. There will be product displays as well as activities for YLs and harmonics. Talk-in on 146.52, 3.920 or 1.250. For further information, contact "WIMU '81," c/o Les Belyea N7AIK, Box 327, Belgrade MT 59714.

JACKSONVILLE FL
AUG 1-2

The Greater Jacksonville Hamfest Association will hold the ninth annual Jacksonville Hamfest and Northern Florida Section ARRL Convention on August 1-2, 1981, at the Orange Park Kennel Club, located at the intersection of I-295 and US 17 just south of Jacksonville. Advance registration is $3.50 and registration at the door is $4.00. Swap tables are $12.00 per table for both days (no one-day tables). All events will be held indoors and will include a full slate of programs as well as meetings of several statewide and regional organizations. Door prizes will be awarded at both hourly and grand prize drawings. Plenty of free parking will be available. The headquarters hotel is the Best Western First National Inn just across from the hamfest site on US 17. Special hamfest rates will be available. Talk-in on 146.16/.76 and 146.07/.67. For advance registration, hotel rates, or more information, contact Robert J. Cutting W2KGI, 1249 Cape Charles Avenue, Atlantic Beach FL 32233, or Andy Burton, Jr., WA4TUB, 5101 Younis Road, Jacksonville FL 32218. For swap tables, contact WA4TUB at the address listed above.

ESCANABA MI
AUG 1-2

The Delta County Repeater Association will hold the 33rd annual Upper Peninsula hamfest on August 1-2, 1981, at the Flat Rock Township Hall, Escanaba MI. Registration is $2.00. The many activities will include a DX forum, an ARPSC workshop, a satellite-TV seminar, net meetings, and a swap and shop. There will be prizes and a banquet on Saturday evening. For more information, contact Aileen Gagnon WA8DHB, co-chairman of the prize committee, Kipling Loc., Mtd. Rte., Gladstone MI 49837.

ANGOLA IN
AUG 2

The Steuben County Radio Amateurs will hold their 23rd annual FM Picnic and Hamfest on Sunday, August 2, 1981, at Crooked Lake, Angola IN. Admission is $2.50. There will be prizes, picnic-style BBQ chicken, inside tables for exhibitors and vendors, and overnight camping (with a fee charged by the county park). Talk-in on 146.52 and 147.81/.21.

BELVIDERE IL
AUG 2

The annual Big Thunder ARC Hamfest will be held on August 2, 1981, at the Boone County Fairgrounds, Highway 76. Advance tickets are $2.00. Indoor tables are available at a nominal cost and there will be acres of outdoor space available free. Camping is permitted. For advance tickets, send an SASE and check to Bob Anderson K9DCG, 910 W. Locust Street, Belvidere IL 61008.

COLBY KS
AUG 2

The first Northwest Kansas Amateur Radio Swap Meet will be held on Sunday, August 2, 1981, beginning at 9:00 am at the Community Building, Colby KS. Admission is $1.00 and tables are $1.00 each (same for dealers). An auction will be held at 2:00 pm. Other features will include a TVRO demonstration, activities for the ladies, and old-fashioned informal swapping, selling, and visiting. Lunch will be available. Talk-in on 146.22/.82 and .52/.52. For more information, contact WA0GBN or KA0FBQ.

MOBERLY MO
AUG 2

The third annual North Central Missouri Hamfest will be held on Sunday, August 2, 1981, at the air-conditioned Municipal Auditorium, 201 West Rollins, Moberly MO. doors open at 9:00 am. Tickets are $1.50 in advance and $2.00 at the door. Features include commercial dealers, a flea market (no charge for tables), an ARRL display, exhib-

its, prizes, women's programs, a special forum with Bob Hell K9EID on CB-to-10-meter conversions, and a buffet lunch. Drinks and hot dogs will be available all day. Talk-in on 147.69/.09, 146.52, and 3963. For more information, contact Charles Coy WB0ENV, 601 McKinley, Moberly MO 65270.

LEVELLAND TX
AUG 2

The Hockley County Amateur Radio Club and the Northwest Texas Emergency Net will sponsor their 16th annual picnic and swapfest on Sunday, August 2, 1981, beginning at 8:00 am at the city park in Levelland TX. This event is for the entire family. Bring your own picnic basket for lunch at 12:30. A $3.00 registration is requested. There will be swapping all day, with tables provided. Talk-in on .28/.88 (WR5AFX).

BURLINGTON VT
AUG 8-9

The Burlington Amateur Radio Club will hold its annual International Hamfest on August 8-9, 1981, at the Old Lantern Campground, Charlotte VT (14 miles south of Burlington, just off Rte. 7). Admission is $4.00 (US funds). Planned events include a flea market, commercial exhibits, a CW contest, a tower-raising contest, an HT transmitter hunt, and the traditional Canadian-American tug-of-war. Talk-in on .34/.94. For more information, contact Hap Preston W1VSA, PO Box 312, Burlington VT 05402. For campground reservations, call Old Lantern Campground at (802)-425-2120.

WILLOW SPRINGS IL
AUG 9

The Hamfesters Radio Club will hold its 47th annual hamfest on Sunday, August 9, 1981, at Sante Fe Park, 91st and Wolf Road, Willow Springs IL.

MONTGOMERYVILLE PA
AUG 9

The Mid-Atlantic Amateur Radio Club will hold its annual J.B.M. Hamfest on Sunday, August 9, 1981, from 9:00 am to 4:00 pm, rain or shine, at the Budco 309 Drive-In Theatre, ¼ mile north of the intersection of Rtes. 63 and 309, Montgomeryville PA (6 miles north of the Fort Washington interchange of the Pennsylvania Turnpike). Admission is $2.50 with $1.00 additional for the first tailgate space and 75¢ for each additional space. Tailgate setup begins at 8:00 am. Featured will be an Alternate Energy Fair which will include exhibitions of various energy resources, as well as door prizes and a flea market for both the hamfest and the Alternate Energy Fair. Refreshments

HAM HELP

I need a manual or schematic for a Hystar model 100 10-meter transceiver imported from Korea by the Vendetta Corp., Houston TX. This is an AM/SSB rig based on a 40-channel CB unit. I will pay all associated costs.

Bruce Pickering N5CBK
5705 Firewood Dr.
Arlington TX 76016

I recently acquired a Digital model PDP8/E with a teletype model with a paper tape punch and reader. Any help on how to use this or books on it would be appreciated. (Digital seems impractical to try to talk to!)

J.E. Ansley K8ONM
22514 East 9 Mile Road
St. Clair Shores MI 48080

I would like references or info about converting a CB set to 10 meters, a TRC-458 Navaho from Realistic. Any help would be appreciated.

Michael C. Christ XE1MD
Cda Norena 40
Mixcoac D.F. 19
Mexico City, Mexico

I am in need of a schematic and operations manual for a Precision Instruments model PI-2107 seven-channel instrumentation tape recorder. Please call or write if any help is available. I'll pay mailing and reasonable reproduction costs.

John C. Street KA4EPQ
PO Box 275
Niceville FL 32578
(904)-678-5410

I would like to buy, borrow, or copy a manual for the BC-654A. I am willing to pay for postage, Xeroxing, etc. I am also looking for an RS-1 or RS-6 radio.

Gary Cain W8MFL
2464 Hand Rd.
Niles MI 49120

I am looking for a circuit and/or service manual for a Northern Radio Co., Inc., frequency shift converter type 107, model 2, serial no. 1273. Can anyone help?

Lionel L. Sharp VK4NS,
19 Kelso Street
Chermside, Queensland 4032
Australia

I need an operating manual and/or schematic for a Kepco power supply, model #SC-18-1M, range 0-18 V, 1 Amp, fully regulated. I will pay for a copy or will copy and return original. Thank you.

Geoff Chadwick
Box 361
Red Lodge MT 59068

I lost everything—QTH, rigs, logs, QSLs—in a fire on Jan. 9, 1981. I would appreciate dupe QSLs from phone/CW stations worked since Dec. 13, 1979. I also need help to get back on HF.

Art Hadley WA4UDE
PO Box 134
Prince George VA 23875

Help! I need a schematic diagram/owner's manual for a Gonset 2-meter rf power amplifier using a 4X150A tube. I will pay copying and postage fees.

Ruth Valentino KA8GVY
6234 Mentor Pk. Blvd.
Mentor OH 44060

I would like to contact anyone concerning the construction of or conversion of commercially-available converters to 1691 MHz for the reception of WEFAX GOES weather satellites. Thank you for your time and assistance.

Charles T. Huth WB8NLM
146 Schonhardt Street
Tiffin OH 44883

I am in need of a Collins 32S1 transmitter in any condition. Please state condition and price.

Herman F. Schnur
115 Intercept Ave.
North Charleston SC 29405

I am in need of a schematic for a Hallicrafters AM/shortwave receiver (late 40s, early 50s), model number TW-2000. The radio is powered by battery or ac. I would be happy to pay for a copy of such.

Chuck Dicken WD8ICP
1627 Juniper Drive
Bowling Green OH 43402

I need a manual or schematic for a Hammarlund HQ-170A and a Heath VFO-1. I will be glad to pay for copying costs and postage. Thanks.

Richard Smith
214 Wittel Avenue
Opelika AL 36801

I wonder if any readers could tell me what area in Boston sells nuts, bolts, sheet aluminum, and similar items—roughly equivalent to Canal Street in New York.

Neil Johnson W2OLU
Box 585
South Orleans MA 02662

I am in serious need of a Collins mechanical filter number F455B08. I am willing to pay any reasonable price.

Tim Goad KA9AMO
RR 2
Princeton IN 47670

I need a service manual for a Hallicrafters S-120 receiver and a National NCX-3 transceiver. I will pay for copying and postage.

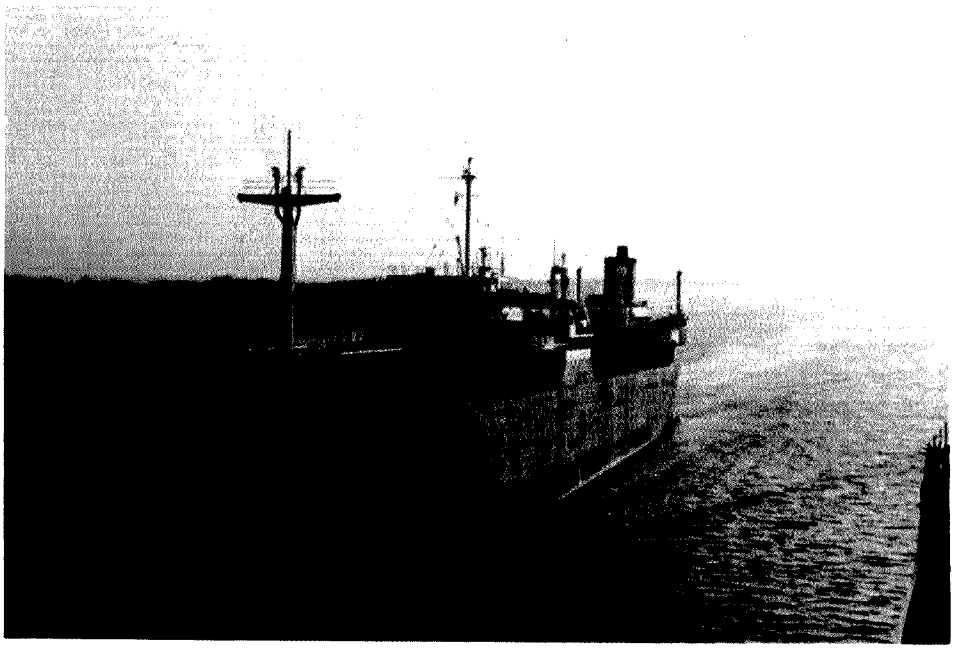
Grandma Packs a Seabag

—lady ham takes to the high seas

When Scottsdale's Lodi Yarbrough AC7V tossed her seabag over the rail of the SS Cove *Communicator* in September, 1980, she sailed as the only lady radio officer in the nation's three major maritime radio unions. And she just might be the only brass-pounding grandma on the high seas.

Lodi is the diminutive YL of Dr. Carl Yarbrough WB7DYC, Scottsdale dermatologist. Her delicate fingers once roamed the keyboard of a Steinway, demonstrating piano technique to hopeful pianists, but now she's known as "Sparkette" on the maritime frequencies.

Lodi's saga in radio began five years ago when she bought Carl a CB radio to brighten his drives from their eagle's-nest home high up on Mummy Mountain to his office in Scottsdale. Fortunately for both Carl and Lodi, there was such a plethora of activity on the CB bands that the good doctor was driven to thinking about ham radio in the hope of establishing a place for himself in that larger sphere. And that's where Lodi got into the act. Early in 1976 she signed up for a Novice radio operator's course in the Scottsdale Educational Enrichment Service.



The American-flag SS Cove Communicator.

"I just had to get involved," Lodi said. "Carl had been a radioman in the Navy in World War II, and I knew when he began talking ham radio with such enthusiasm that there had to be a place in it for me."

Lodi asked Carl to help her learn the code, and he was delighted to do it.

"She was so determined to learn the code that she had me drumming it out with my fingers wherever we might be," Carl said. "Sometimes people around us thought we were a little crazy."

Carl studied Lodi's textbooks, and he and Lodi got their Novice tickets to operate with code in May of 1976. By midsummer, the pair had learned enough

about ham radio to get Advanced licenses, and they began broadcasting with voice from their Mummy Mountain home overlooking Paradise Valley. "That was really great," Lodi said. "We began meeting so many wonderful people on the air."

Lodi and Carl continued studying radio theory, and in September of 1976, Lodi flew to Los Angeles for her amateur Extra license test. There she received her first setback. She laughed about it later. "I was so nervous," Lodi said, "that I couldn't hit the paper with my pencil. I failed the code test."

However, the Scottsdale Radio Club, which Lodi and Carl had joined, showed their faith in Lodi by electing her club president.

"They showed me that it didn't matter that I had failed the test," Lodi said. "That helped."

And then Tom Moore W7FCQ, station manager at Barry Goldwater's Military Affiliate Radio Station, gave Lodi's confidence a further boost by inviting her to become a volunteer operator handling "morale builder" messages for service people in the Pacific. Lodi accepted and donated her time for the next four years.

In November and December of 1976, *73 Magazine* published the "See The World And Get Paid" article by Gerald Hargett, and the idea of doing exactly what the title suggested took root in Lodi's mind. She read and reread the two-part article, carefully stowing away in her mind the methods of getting a radio officer's ticket.

Meanwhile, Lodi kept studying for her amateur Extra license and got it in September of 1977. That's when the Hargett article really began to have an effect. Lodi decided that she had to have an FCC radiotelegraph license, so she began studying for it. The idea of sailing as a radio officer had captivated her imagination.

By 1978, Lodi was getting confident about getting her commercial license, and when she took a Caribbean cruise that summer she took her radio books along so that she could top off her studying. "It was so calm and peaceful at sea that I had a great chance to study radio," Lodi said, "and I did plenty of that."

Several months after the cruise ended, Lodi passed her commercial test. The Federal Communications Commission examiner asked her which ship she was going to sail on.

"None, yet," Lodi told him. "I might just use my license for wallpaper."

But the spirit of sailing and the challenge of maritime radio operating had become Lodi's goal, and it wasn't long before she was checking on maritime unions. "I located not the oldest or the biggest but the best one, and I joined it," Lodi said. "Then the union went to work to find a job for me."

Cove Shipping, Inc., of New York City was the lucky winner of Lodi's radio services. The MEBA/AMO District 2 union (Marine Engineers Beneficial Association/American Maritime Officer) arranged for her to sign onto the tanker *SS Cove Communicator* as apprentice radio officer.

Lodi's whole family caught the spirit of adventure from Lodi, and they supported her going to sea. But when Lodi's November, 1979, departure was imminent, her mother threw out the anchor. Like a good mother-in-law, her visions of Lodi's husband, Carl, without a wife were more than she could bear. "What about poor Carl?" she demanded of Lodi.

"I had signed on for six months," Lodi said, "and

Lodi poses at Krupp navigational radar on bridge of SS Cove Communicator. *The Captain and mates normally operate the radar to keep watch on sea around for other vessels. Lodi checks the circuitry if the Krupp goes out.*

Mother thought I'd be out to sea for the whole time."

Lodi explained to her mother that she would be in and out of port, and once a month she would fly home to visit Carl, or he could catch a flight to wherever she was, and they would be together for the two to four days it would take to load the ship with oil or to unload it. "Mother decided that it would be all right for me to go," Lodi said.

When Lodi boarded the *Cove Communicator* for her first assignment, she found that all of the crew members with the exception of the captain and the radio officer were in their twenties.

"I quickly became Mama to the whole crew," Lodi said. "But before they considered me a full-fledged crew member, they waited to see if I could climb the ship's ladder with a big carton of Coke and other supplies under my arms."

Somehow, Lodi made it up the ladder, and when she reached the top the whole crew cheered and said, "Now, Lodi, you are part of the crew!"

Like Gerald Hargett, Lodi has high praise for the radio officer's job. "It's a better job even than the captain's," Lodi said. She explained that she is on duty from eight to twelve, three to five, and six to eight. All the rest of the time is her own. "I'm off duty in port and can sightsee or do anything I want to do," she said.

Lodi got her six-months' endorsement in June of

1980 and was then qualified to sail as first radio officer. As an officer, she eats at the captain's table, gets her fourteen-by-twenty-foot cabin cleaned and her bed made, and she gets her sheets and towels washed.

"But I still have to do my personal laundry," Lodi said, "and in an old hand-wringer washer at that."

When Lodi goes on duty, her first job is to tune up all of the radio equipment. Then she gets a time check from the National Bureau of Standards radio station, WWV, at Fort Collins, Colorado, and pipes it up to the bridge for the captain. During her watch, Lodi must record one message heard on the 500-kHz frequency every fifteen minutes. She also gets weather reports from coastal stations and listens for three minutes every half hour for emergency signals from ships in distress.

"I've heard two relayed SOSs from stricken ships and one triple-X emergency signal from a burning ship," Lodi said.

Besides her radio duties, Lodi does all of the clerical work for the captain, signs all hands on and off the ship, and makes up the payroll for the thirty-man crew. One of her most appreciated duties is radioing in for the eight to ten movies that the crew gets to watch every month.

"They're usually movies that I've seen ashore," Lodi said, "but the crew enjoys them."

Once when the ship docked at New Orleans, Carl flew in with a new Atlas 210X amateur radio for Lodi to use aboard ship. Lodi asked Captain Dillon, master at the time, if she could install it on the ship so that she could talk to her husband back in Arizona every day. The captain gave his permission, and Lodi and Carl promptly hooked up the Atlas and installed a vertical antenna on the bridge.

"Lodi comes booming into the valley every noon and evening," Carl said, "and I go home every day to talk to her. It sure helps to beat that lonesomeness."

Life at sea does not require Lodi to wear a special uniform as sailors do in the Navy or on pleasure cruisers. "The men wear regular work clothes, and I wear a blouse and slacks because of all the ladders we have to climb," Lodi said. "I take short-sleeve blouses for Florida and the Gulf coasts and long-sleeve blouses for the New England waters. I've got so many winter clothes aboard that you wouldn't believe it. Even thermal underwear."

"We go from the tropics to the freezing north in five days," Lodi said, "but everybody comes prepared, and there are very few illnesses at sea."

Lodi describes the food aboard the tanker as good but nothing fancy. "We have wine on the table only at special times like Christmas," she said.

On her first journey, Lodi found her hair curlers and clothes iron to be superfluous, so she sent them home. "It was impossible with the wind and bad weather to keep my hair set and my clothes pressed, so I wear a scarf over my head and wear my clothes as they come out of the dryer," she said.

A big event on board the ship is "slop chest," according to Lodi. Once a week after fire drill and abandon-ship drill, the captain opens a locker near the radio room and sells cigarettes, candy, and personal things.

"The first time I went to 'slop chest' I stood in line and when I got to the captain I asked for lipstick and perfume," Lodi said. "The captain looked a little shocked and said, 'That's the first time I've had a request for those things.' I told him times were changing, and he'd better get them in!"

Lodi had high hopes that there would be some feminine touches added to the *Cove Communicator*, but when she got back on board for her second assignment in September of 1980, the slop chest still didn't carry a stock of perfume and lipstick.

"I may have to wait for that until we get a woman master on the ship," Lodi said, "and that may not be long in coming." Lodi said that the wife of the owner of the Pointe Shipping Company has offered a $10,000 bonus to the first woman who gets a master's license, and there are several in training for the position now.

Lodi describes her quarters on the *Communicator* as plain but rather large, much roomier than cabins on luxury liners. Besides a table for her ham radio, she has a chair, a sofa, and a cot that is bolted to both the floor and a ship's bulkhead. She found out in a storm off Cape Hatteras why the cot was bolted down.

"We hit force ten winds—near hurricane strength," she said. "They rocked the ship so violently that I was thrown right over backwards with my chair in the radio room." At night, Lodi stacked pillows against the rails on her bed to prevent getting thrown against them. She said the wind blew the windows right out of the bridge on another ship, but the Cove *Communicator* was able to take on seawater ballast and was low enough to weather the storm without damage.

"It always rains at mealtime," Lodi said, "and even going to the mess hall can be a wild experience during a storm." She explained that the radio room is in the center of the ship and the mess hall is a hundred yards away, back by the fantail.

"You have to hang onto anything you can when there's a storm and you want to go to eat," she said.

Lodi keeps a careful log of her sailing experiences. It tells of the time the ship struck something in the Mississippi River and tore a hole in the bow, requiring an eleven-day delay while waiting for repairs.

Probably the most dangerous experience Lodi had was when the hold of the ship filled up with fumes when an exhaust valve failed to work.

"The chief mate went down into the hold with an oxygen mask on, and the others worked on the valve from up above," Lodi said. "The men eventually were able to clear the hold of fumes."

One of Lodi's favorite notes in her log is dated December 25, 1979. She was stuck in port in Port Arthur, Texas, and couldn't get back to Arizona to spend Christmas with Carl.

"I couldn't even contact him on ham radio," Lodi said, "but I luckily hooked up with Tom Hoff WA7MAL in Cheyenne, Wyoming, and he patched me in with Carl. Without that, it would have been a mighty lonely Christmas."

Carl agrees. "We certainly appreciated that phone patch, and do you know," he said, "WA7MAL felt so good about putting us together that he never even sent us a bill for the long distance call."

When Lodi got her six-months' endorsement in June of 1980, she thought of shipping out on one of the Cove Company's supertankers. She thought it would be fun for Carl to go along on a cruise, since each officer can take a spouse along occasionally.

"But I talked to crew members on the supertankers," Lodi said, "And they

told me the crew's quarters are right back by the three big engines that drive the ship, and the vibration is so bad that cups and saucers jump all over the table."

When the time came for Lodi to go out as first radio officer and the call came for her to rejoin the crew of the *Cove Communicator*, Lodi was happy. "It was like going back to an old friend," she said.

Lodi expressed a bit of trepidation about going to sea for the first time as chief radio officer, but her operating experiences and her five years of dedicated study paid off. She handled the usual operating and maintenance duties with no trouble.

"I had to call for a technician a couple of times in port," Lodi said, "but even the old-timers do that. Anyway, I had isolated the problems for the repairmen."

Once, during a hurricane, the VHF antenna broke in two and Lodi had to fix it. "I just grabbed a long extension cord," Lodi said, "and I climbed up and soldered it together again. It worked fine."

Back in Arizona, Carl had decided that he and Lodi wouldn't spend another Christmas apart, so he flew to New Orleans on December 18 and went aboard the *Communicator* as Lodi's guest for a voyage up the eastern seaboard. "The crew accepts Lodi as one of their own," Carl observed, "but the guys still watch their language for 'Sparkette.' "

Carl said that the funniest things that happen to Lodi aboard ship are caused by the responses of shore people who expect the radio officer to be a man. Once when Lodi and Carl were together on the *Communicator*, Captain Hiram Glotfelter greeted a pilot officer in their presence and introduced him to "Radio Officer Yarbrough." The pilot thought the captain meant Carl and turned to shake his hand.

"Oh, no," said the captain to the discomfiture of the pilot, "I mean the lady."

Another time, the captain sent an ITT (International Telephone and Telegraph) inspector to the lounge to look for the radio officer, and he walked right past Lodi. He went back to the bridge and reported to the captain that there was nobody in the lounge but some woman.

"Then you're going to have to go right back to the lounge," said the captain. "That woman is the radio officer."

Another ITT inspector was sent to Lodi's cabin looking for the radio officer and found Lodi drying polish on her nails.

"Oh, pardon me," said the wide-eyed inspector. "I was looking for the radio officer."

"I'm the radio officer," Lodi said, "and if you don't mind waiting until I've dried my nails, I'll talk to you."

"I've waited for a lot of things," said the inspector, smiling, "but this is the first time I've had to wait for that."

Recently, Lodi talked to the radio officer of the SS *Williamsburg*, the ship that rescued the passengers and crew of the *Prinsendom* in the Gulf of Alaska, and the man called Lodi "old man" in customary ham parlance. Lodi quickly informed him that she was a YL. The surprised operator said he didn't know there were any YLs in the big maritime radio unions and asked Lodi to meet him on forty meters for a QSO after going off watch. Lodi agreed, but when it came time for the QSO, her rig wouldn't tune on her trap antenna, and she had to sit and read the mail while the *Williamsburg* operator came on the air and called her and finally hooked up with some other hams and told them about the YL radio officer on the *Cove Communicator*.

Ex-Navy radioman and now Scottsdale dermatologist Dr. Carl Yarbrough hurries home at lunch time to work Lodi when she is out to sea. He says WB7DYC gets mighty lonesome for petite AC7V when she is riding the high seas as a radio officer.

Forms of recreation are scarce on board a tanker, Lodi said. Besides watching movies, the crew reads a lot of good books and shares them with each other. The big social event is off-duty officers getting together in the officers' lounge in the evening to pop popcorn and talk.

"We like so much to eat popcorn out at sea," Lodi said, "that when we come into a port, we sometimes walk for miles to find a store to replenish our stock."

The only time the crew can pick up television programs is when the ship is running north close to the Florida coast, which isn't very often. "Sometimes we're out so far for so long without seeing anything that when a bird comes along, it's a positive delight," Lodi said.

In early January, a banded pigeon came aboard the *Communicator* off the coast of Florida and made three trips from the Gulf ports to New England as the pet of the crew.

"It was really something," said Lodi, "to see those big, burly seamen vying with each other to pluck the pigeon off the fantail and take it into their cabins for the night. They even walked into town from the ports to buy it bird food."

Last year at Christmas time, the *Cove Communica-*

tor was stuck in bad weather at the Staten Island anchorage. The weather was so miserably cold and windy that the motor launches quit running crews to shore or back to their ships. Gales swept the area, and half of the *Communicator's* crew couldn't get back on board for Christmas dinner. But Lodi and Carl were together. Carl had brought Lodi a large case full of radio repair tools, and the ship had been decorated for Christmas.

"They even had a tree in the officers' lounge," Carl said.

While the storm raged around them, Lodi and Carl enjoyed Christmas dinner with those of the crew who had beaten the storm back to the ship. The next day the winds abated, and Carl was able to get ashore and catch a plane back to Phoenix. Lodi, on the *Cove Communicator*, headed for the Hudson River.

"It had been a lousy winter in the East," Lodi said, "so rough and cold. We went up the Hudson all the way to Albany, breaking ice all the way."

Lodi stayed aboard the *Cove Communicator* until late in January, and then she flew home for a four-month vacation in the Arizona sun. When her stay ends and she says goodbye to Carl and her mother and to her children and grandchildren, she'll go back to sea again on a tanker as radio officer, but now she's got her eye on another goal.

"I'd like to get more into troubleshooting," Lodi said. "The time is coming when the radio officer will be the electronics officer and be responsible for all of the electronics equipment on the ship. I'm going to be ready when that time comes."■

AUSTIN TX
AUG 14-16

The Austin Amateur Radio Club and the Austin Repeater Organization will hold the ARRL-approved VHF '81, a combination state convention of the Texas VHF FM Society and the second annual Super Central Texas Swapfest, on August 14-16, 1981, at the Hilton Inn, Austin TX. Registration is $5.00 in advance (August 1st deadline) or $6.00 at the door. Tickets are good for technical sessions, seminars, the swapfest, and more (all indoors and air-conditioned). Other features include the hidden transmitter hunt, the Saturday night boat ride, and the Texas barbecue dinner, prizes, an ARRL forum, and dealers. Talk-in on 146.19/.79. For additional information, contact VHF '81, PO Box 13473, Capitol Station, Austin TX 78711.

OAKLAND NJ
AUG 15

The Ramapo Mountain Amateur Radio Club (WA2SNA) will hold its 5th annual flea market on August 15, 1981, at the American Legion Hall, 65 Oak Street, Oakland NJ, only 20 miles from the GW Bridge. Admission is $1.00; YLs and harmonics will be admitted free. Indoor tables are $6.50 and tailgating is $3.00. Door prizes will be awarded and refreshments will be available. Talk-in on 147.49/146.49 and 146.52. For more information, contact Walt Zierenberg WD2AAI, 344 Union Avenue, Bloomingdale NJ 07403, or phone (201)-838-7565.

TACOMA WA
AUG 15-16

The Radio Club of Tacoma will hold its annual Hamfair on August 15-16, 1981, at Pacific Lutheran University in Tacoma, WA. Featured will be many outstanding technical seminars, games and contests for all members of the family, a large flea market and commercial display area, dinner and after-dinner entertainment, and valuable door prizes. Trailer parking and lodging are available. For more details, contact Eva Anderson WB7QNS, 517 Berkeley Avenue West, Tacoma WA 98466, or phone (206)-564-8347.

MARYSVILLE OH
AUG 22-23

The Union County Amateur Radio Club will hold its fifth annual Hamfest-81 on August 22-23, 1981, at the Union County Fairgrounds, Marysville (near Columbus) OH. Gates open until Sunday at 4:00 pm. Admission is $2.00 in advance and $3.00 at the gate. Children will be admitted free. Featured on Saturday night will be movies, popcorn, round and square dancing to a live band, and overnight camping with hookups, all free. Food will be available all night with a big country breakfast starting at 3:00 am. On Sunday there will be forums, door prizes, and meetings. There will be no extra charge for sellers at the flea market which opens at 4:00 pm on Saturday and 6:00 am on Sunday. Talk-in on 147.99/.39 and .52. For more information, write Union County Amateur Radio Club, 13613 US 36, Marysville OH 43040.

WENTZVILLE MO
AUG 23

The Saint Charles Amateur Radio Club, Inc., will hold Hamfest '81 on August 23, 1981, at the Wentzville Community Center, West Main Street, Wentzville MO. Advance tickets are $1.00 each or 4 for $3.00; at the door tickets are $1.50 each or 4 for $5.00. Parking is $1.00 per car (no camping on hamfest site). Featured will be a reserved flea market for amateurs, a free general flea market area, free bingo, a cake walk, refreshments, and prizes (including a first prize of a Kenwood TS-130S transceiver). Free doughnuts and coffee will be available to the early birds. Talk-in on .07/.67 and .52. For information on motels, tickets, displays, prize lists, camping, etc., write Bill Graham WB0ZEH, 215 Bermuda, O'Fallon MO 63366.

BLUEFIELD WV
AUG 23

The East River Amateur Radio Club, Inc., will hold the Bluefield Hamfest '81 on Sunday, August 23, 1981, at the Brushfork Armory/Civic Center located on US 52, one mile north of Bluefield WV. Admission is $2.00 in advance and $3.00 at the gate, and includes a prize ticket. Tailgaters are $2.00 each and tables are $5.00 each (3 or more are $4.00 each). There will be food, dealers, a flea market, forums, and entertainment. Talk-in on .89/.49 and .52/.52. For more information, write Bluefield Hamfest '81, 2113 Hemlock Hill, Bluefield WV 24701.

TIOGA COUNTY PA
AUG 29

The Tioga County Amateur Radio Club will hold its 5th annual hamfest on Saturday, August 29, 1981, from 8:00 am to 4:00 pm, at the Tioga County Fairgrounds just off Rte. 6, between Wellsboro and Mansfield PA. There will be a free outdoor flea market and inside space will be available. Registration is $3.00. Features will include prizes, demonstrations, and food. Pennsylvania's Grand Canyon is nearby. Talk-in on 146.19/.79 and .52. For more information, write PO Box 56, Mansfield PA 16933.

SEWELL NJ
AUG 30

The Gloucester County Amateur Radio Club will hold the GCARC Hamfest on August 30, 1981, from 8:00 am to 3:00 pm (7:00 am for tailgaters and dealers) at the Gloucester County College, Tanyard Road, Sewell NJ. Admission is $2.00 in advance and $2.50 at the door. Tailgaters' and dealers' charge is $6.00 (which includes one free admission). Refreshments and free parking will be available. Features will include seminars, prizes, contests, and speakers Dale Smith, from the ARRL, and Miles (Brownie) Brown W2PAU, an RCA antenna expert. FCC exams will be given from Tech through Advanced. Talk-in on 146.52 and 147.78/.18. For more information and reservations, send an SASE to GCARC Hamfest Committee, PO Box 370, Pitman NJ 08071, or phone (609)-456-0500 or (609)-338-4841 days or (609)-629-2064 evenings.

LA PORTE IN
AUG 30

The La Porte and Michigan City Amateur Radio Clubs will hold their annual La Porte County Hamfest on Sunday, August 30, 1981, rain or shine, at the County Fairgrounds on Highway 2, west of La Porte IN (50 miles SE of Chicago). There will be an outdoor paved flea market area, indoor tables at $1.00 each, a satellite TV demonstration, and overnight trailer parking for early birds. Advance tickets are $2.00. For reservations or information, send an SASE to PO Box 30, La Porte IN 46350.

GEORGETOWN IL
SEP 5-6

The Illiana Repeater System will hold the 12th annual Danville Area Hamfest on September 5-6, 1981, at the Georgetown Fairgrounds, Georgetown IL. The gates will open at 6:30 am. Tickets are $1.50 in advance and $2.00 at the gate. There will be a flea market, forums, family entertainment, many prizes (including a Santec synthesized hand-held), and free parking. Talk-in on 146.22/.82 and 146.52. For more information or advance tickets, contact Lowell Wells WD9AFG, Hamfest Chairman, RR 3, Box 215, Danville IL 61832, or phone (217)-759-7560.

AUGUSTA NJ
SEP 12

The Sussex County Amateur Radio Club will hold its third annual SCARC '81 hamfest on Saturday, September 12, 1981, from 8:00 am to 3:00 pm at the Sussex County Farm and Horse Show grounds, Plains Road off Rte. 206, Augusta NJ. Pre-registration for outdoor flea-market sellers is $4.00; at the gate, $5.00. Pre-registration for indoor flea-market sellers is $5.00; at the gate, $6.00. Other registration is $2.00. There will be door prizes and plenty of free parking. Talk-in on 147.90/.30 and 146.52. For additional information or pre-registration, write Sussex County Amateur Radio Club, PO Box 11, Newton NJ 07860, or Lloyd Buchholtz WA2LHX, 10 Black Oak Drive, Vernon NJ 07462.

TS-130S *from page 39*

commodate either mono or stereo headphones. Transmit audio was good with the three microphones we tried—a D-104, a Shure 444D, and a Yaesu hand microphone.

Kenwood deserves praise for the quality of the 130S instruction manual. Lots of practical information is provided on installation and use, for mobile as well as fixed operation. As is typical with Kenwood products, no service and alignment procedures are included in the instructions; you'll have to buy a separate service manual for that information. For emergency repairs by those hams brave enough to work on the 130S themselves (see interior photographs), complete schematics and a block diagram are included with the rig.

On the Road!

While the 130S is perfectly at home on the ham shack bench, it really comes into its own when installed in a vehicle. I operated it for several weeks from my car and grew very fond of it in that mode of operation. I sat it on the front seat beside me and ran the power lead directly to the battery. It draws too much current to use with my noise filter, and I was pleasantly surprised when I didn't hear the alternator whine I hear with other rigs that aren't connected through the filter. One feature that I found indispensable in mobile use was the speech processor—it can make a real difference on the other end of the QSO. With the processor on or off, adjusting the mic gain for the proper level using the ALC meter is a simple task. The ballistics of the meter allow sure and fast reading. The mic gain should be readjusted when the processor is turned on or off. The noise blanker did an excellent job of cleaning up ignition noise and I left it on all the time.

A characteristic that I found less than admirable was the limited bandspread of the main vfo knob. Tuning in a signal while jouncing down the road is a challenge—one flick of the knob and you've jumped ten kHz! I eventually learned how to handle the knob with reasonable dexterity, but bandspread is an area in which the 130S could use improvement. Whatever one thinks of the bandspread, it is important to note that frequency stability is not a problem—the rig occasionally became airborne when my driving got, ah, shall we say, over-enthusiastic, but the frequency never drifted.

If the poor bandspread really gets to you, it might help to know that Kenwood offers a nice digital frequency controller that allows tuning of the rig from push-buttons on the microphone.

The real test of the transceiver came on the yearly pilgrimage to the Dayton Hamvention in the infamous *73 Magazine* S-100 van. We installed the 130S on a countertop in the back of the van, connected up a D-104 microphone, and used a Hustler mobile antenna to distribute the rf. The 130S did everything it was supposed to and more, shrugging off a couple of nasty spills onto the floor of the van, a fall of about three feet! A solar disturbance prohibited us from working any DX that weekend, but stations all over the United States were worked, mostly on forty meters.

Conclusions

Considering the price and performance of the 130S, it represents an excellent buy for either fixed or mobile operation. It faces a lot of competition in the small transceiver market, but the current crop of rigs is so varied in concept that each has its own devoted following. If ease of operation, good audio, and a wide range of accessories strike your fancy, the TS-130S might be the rig for you!

For further information, contact *Trio-Kenwood Communications, Inc., 111 West Walnut, Compton CA 90220.* ■

Mark 3CR *from page 46*

Inside, the circuitry has the deceptive aura of simplicity that often accompanies microprocessor-controlled hardware. A couple of glass-epoxy circuit boards take care of all control functions. One handles audio processing such as gating, level adjustments, DTMF decoding, and autopatch phone-line interfacing, and the other is essentially a single-board 6502 computer that performs all the I/O functions for the repeater and any external devices added by the user. A third circuit board contains the front-panel status LEDs and their drivers. The receiver and transmitter boards are housed in separate, fully-shielded cabinets. There is space for an optional receiver on 220 or 440 MHz to be used for control commands to the microprocessor controller.

Selection of Functions

Virtually all commands and functions are selected with a three-digit DTMF code. There are a total of 36 different codes that the controller is programmed to recognize. For security, these codes can be changed instantly by flipping a set of switches inside the repeater. How the controller receives this code is up to its owner. You can use a command receiver, a phone line, or the repeater input for control commands. Using the input frequency is discouraged due to the wild-turkey bonanza this would provide, and is illegal in any case. Flipping the command switch on the front panel removes the ca-

pability of repeater control on the input frequency for all but a select few user commands, such as autopatch access and hangup, and autodial numbers. All other command codes will only be recognized by the controller if they come from the command receiver or the phone line. When a command is received via the control link, it is acknowledged with RRR in Morse the next time the repeater is keyed. This can be a little confusing to users, who inevitably will hear an RRR from time to time in the middle of a conversation.

Basic Features

The basic operating parameters of the Mark 3CR are similar to other repeaters, with some interesting twists. There is a beep at the end of each transmission to let you know when the time-out timer is reset. This timer can be set in 30-second increments from 30 seconds to three minutes via the control link. If a user doesn't wait for the beep before transmitting, he runs the risk of timing out the repeater. If this occurs, the machine will ID and send a CW message such as "beer" or "time" when it comes back on again. There is a timer-reset code that allows users to reset the repeater without waiting for it to recycle.

Any of three preprogrammed CW tail messages can be sent on the repeater tail at the end of each transmission. Oft-chosen messages are Net, 73, and Meet. These messages are enabled and disabled via the control link.

One of the nicest features of the Mark 3CR is its anti-kerchunk system. The controller looks at transmission time and recent repeater activity, and if it decides that there is a pattern of extremely short transmissions, it inhibits the transmitter until a signal remains on for a longer period of time. In practice, this system is extremely effective at discouraging all but the most malicious of kerchunkers, without imposing any inconvenience on other users. It's one of the most effective systems I have seen.

Tones and More Tones!

In a repeater so dependent on DTMF tones, it is important to have a trustworthy decoder. There are two six-pole active filters for high-group and low-group tone conditioning, and the output of these goes to a Mostek MK5102 digital tone decoder. The decoding system is extremely fast and reliable, at the expense of tolerance of improperly-adjusted tone pads. If a user's tone level is set too high, the repeater will not accept his tones. To aid users in adjusting their pads, a clever test sequence is included in the Mark 3CR controller. You send either a row or a column of tones in sequences, and if the level of each tone is correct, the repeater replies with OK in Morse. If the tones are off frequency or incorrect in amplitude, it doesn't do anything. This facilitates adjustment of even the most primitive tone pads.

All the circuitry for autopatch operation is included in the Mark 3CR—just connect the patch to a phone line. It can be configured to operate with either pulse or touchtone™ systems. At present, the patch is not FCC-registered, so if your group is picky about the letter of the law, you'll want to get a Ma Bell approved coupler. Practically speaking, the patch is optically coupled to the phone line, so you're unlikely to encounter any problems with Ma's minions—they can't sense the presence of the patch on the line.

Numbers dialed with the standard autopatch access code can only have seven digits and cannot start with zero or one. A special long-distance access code can be sent via the control link to permit long-distance calls. Five autodial numbers may be preprogrammed, each with its own access code. These autodial numbers may be accessed even when the normal autopatch function is inhibited, allowing emergency access to police, fire, etc., when no control operator is available.

Reverse autopatch is possible, and the procedure is complicated enough to discourage abuse. It would be very difficult for an unauthorized person to "break" the system. It operates like this: When an incoming call is received on the autopatch line, the processor connects the call after about five rings. The caller must enter the reverse autopatch code within five seconds, or the connection will be terminated. If the code is entered correctly, the repeater will transmit a series of Morse Ts. Importantly, the repeater's transmitter will not be activated at all without the correct code. If a user listening to the repeater decides to answer the call, he can enter the usual autopatch code and the call will then proceed as a normal autopatch. It's debatable, of course, but as long as the autopatch phone number and access codes are carefully protected, I'd say that this procedure probably meets the FCC criteria for screening before a reverse patch takes place. The chances of anyone calling your repeater's number and guessing the correct code within five seconds without making a mistake are statistically improbable. Being extremely selective about who gets the code (only hams?) constitutes screening, in my humble opinion. Should someone ever abuse the reverse-autopatch privilege, you can always change the code or disconnect the patch. The FCC may hold a different opinion, however, so you are on your own. If in doubt, don't use the reverse autopatch feature!

The Good Stuff

While the basic operating parameters are almost airtight and very pleasant to have available, things really get exciting when you start using the command and user functions. The Mark 3CR repeater was designed to allow very easy interfacing with external devices. Remember those terminals on the back panel? Here's where they come in!

There are two classes of user functions—those which keep the transmitter on all the time (class I) and those which don't (class II). There are seven class I outputs and four class II outputs. Nominal time-out limits are three minutes for class I and ten minutes for class II outputs. To round out the package, there are three outputs that are enabled and disabled through the control link. How do you use 'em? Simple! Each of the 14 outputs is assigned to a terminal on the rear panel, and each output is enabled by a three-digit DTMF tone. When the controller receives the correct code, the terminal changes state from low to open circuit. The logic outputs are buffered with high-voltage open-collector buffers that can sink up to 30 mA. External pull-up resistors are used to pull the output high. All of you who have suffered long hours with a hot soldering iron and a crate of TTL chips putting together multi-digit tone decoders will understand the value of having the in-

terfaces already in place, ready to go. Link receivers, crossband receivers and transmitters, amplifiers, directional antennas, recordings, all can be added with very little effort and an extremely low external parts count.

An example: Suppose you want to add a tape recording to welcome new users to the repeater. An old eight-track or continuous-loop cassette player takes care of the hardware. Recording the message will be your hardest task! The audio output from the player goes into the auxiliary audio input on the back of the repeater and the control terminal activates a relay to turn the tape drive on and off. Publish the access code for that particular function and you'll be in the "taped-welcome" business! When you grasp the fact that the repeater is capable of supporting fourteen external devices with very little effort involved in interfacing them, you will understand what all the excitement is about.

With all these capabilities, it seems like a terrible waste to put a machine with these capabilities on two meters. I feel like the car buff who is mortified by the Hollywood starlet who uses a Maserati to drive to the supermarket! It would be fitting to put the repeater on 220 or 450 where it could be used in a remote-base configuration with links to 10 FM, a multi-channel 2m rig, and all the other bells and whistles that the spoilers at the FCC won't let us have on two meters. I guess that's one of the benefits of microprocessor technology —products can inexpensively have more flexibility than is really needed for a particular task.

Rf Section

The sophisticated control circuitry of the Mark 3CR threatens to steal the show, but the rf sections of the repeater deserve a fair share of attention. Both receiver and transmitter are conservatively designed, and acquit themselves handsomely at W2NSD/RPT. Special care was given to temperature stability in the transmitter, and immunity to overload and high adjacent-channel rejection in the receiver. Receiver and transmitter boards for 144 and 220 MHz are available. Interface cards to use the Mark 3C controller with GE Masterpro and Motorola Micor repeaters are available for all you old diehards who won't touch anything else.

Power Supply

The 7812 and 7805 regulators used in the power supply ensure that the controller will function correctly under wide ac line-voltage fluctuations. Both sides of the ac line are bypassed to ground with 470-pF, 2 kV caps. The optional 12-volt backup circuitry is highly recommended. Should the ac line voltage fall below an acceptable level, the backup battery is switched in instantly. When the backup supply is in use, a Morse "EP" is sent on the transmitter tail. Should the power ever fail completely with no backup available, a Morse "PF" will be sent on the tail when power is restored. These Morse messages will appear on the tail until removed by a control operator.

Conclusions

No ham product is as uniquely suited to microprocessor control as a repeater, and the flexibility of repeaters like the Mark 3CR is only limited by the imagination of its owners. Best of all, this flexibility is not at the expense of dependability, since the hardware in this controller has a lower parts count than many repeaters that offer only basic features. Its potential for remote-base operation promises to allow that type of setup to enjoy widespread popularity. Whether you use it as a basic local repeater on two or a remote base on 220 MHz, a Mark 3CR should give you or your group years of trouble-free enjoyment.

NCG-15 *from page 42*

midable task. I also had some reservations about hanging my life's savings under the dashboard of my car. After careful consideration, the Hustler antenna was consigned to the yawning void of the hamshack closet. With the NCG now available, all these problems were solved and it looked like I might be doing some mobiling after all!

With a war whoop that brought my faithful hound, Rufus, running, I made for the closet and extricated the Hustler antenna from the forest of aluminum that resides there. Rufus and I grabbed my power drill, some RG-8X, and the NCG, and headed outdoors for the car.

After a quick appraisal of the situation, I concluded that the operation's chances of success were encouraging. I already had a Kenwood TR-7600 2-meter rig screwed to the transmission hump of my Dodge Colt, so I simply placed four squares of 3M double-sided foam tape on top of the Kenwood, and stuck the NCG's bracket to that. If you have never used this tape, you owe it to yourself to try a sample. It has a grip that doesn't quit, yet it rarely leaves any residue when you remove it. I use it to stick radios and accessories together all the time, and even with rambunctious driving on New Hampshire's back roads, it has never come unstuck.

The power connection was a cinch, since I sort of expect this madness to strike from time to time, and I have installed a line from the battery that terminates with a small enclosure inside the car. The enclosure contains a hefty noise filter and a lot of terminal strips to accommodate future expansion of my rolling ham shack.

The antenna was another matter altogether. I suddenly recalled that one of the reasons this particular madness had never struck before was my lack of a mount for the Hustler antenna. Since mounts cost money and money was in short supply, it looked like I would either have to wait until payday or improvise. Rufus was much too excited about the project to put it off until payday, so I decided to improvise.

The rear bumper of the Colt offers a thick flat steel surface that is parallel with the road, and the underside of the surface is accessible. This looked promising! Back in the ham shack, I rifled through my parts drawers, and came up with some thick plastic washers with a raised lip on one side, a couple of lock-washers, a long 3/8-24 bolt, and a female-to-female 3/8-inch threaded collar. I measured the diameter of the washers as I walked back to the car, and promptly blasted a 1/2-inch hole in the bumper. I drilled another, much smaller hole next to the big one to provide a grounding point for the coax.

I used the two plastic

washers to make a sandwich out of the bumper, and then ran the long bolt through a lock-washer to which I attached the center conductor of the coax. The bolt went through the plastic washers and the bumper and the threaded collar was screwed securely onto that. I soldered the shield of the RG-8X to a lug, which was then bolted to the underside of the bumper through the small hole I had previously drilled. All that remained was to screw the antenna itself into the now-complete mount. Once it was in, I stood back and surveyed my work. As it turned out, I'm glad I didn't spring for a commercial ball-type bumper mount—this turned out much better!

I performed the usual series of mundane tests with ohmmeter and swr meter, and finally jumped in the car and grabbed the NCG's microphone with one hand and the vxo knob with the other, intent on some serious operating. W5XX in Mississippi was calling CQ. I called him and he came back immediately, reporting that although my signal strength was weak, the audio quality was good. That's just what I wanted to hear!

For the next several days, I operated whenever I had the chance; I had a lot of rewarding rag-chews, as well as some "59, good-bye" contacts. Some high points included VK4NIC/3X, C5ACA, PV8GG, M1C, and K4EIN/TI4, all with 6 Watts into the antenna, often while rolling down the road! When the DX wasn't rolling in, I had many enjoyable contacts with just about every corner of the US. The NCG provides an extremely high fun-per-Watt and -dollar ratio!

Features and Performance

If you've stuck with me this far, and haven't dropped the magazine in disgust to go fire up your three-kilowatt linear, you might be interested in learning some specifics about the NCG.

The front panel offers the traditional items; volume, squelch, rf gain, mic gain, S-meter, noise-blanker switch, Tx/Rx LEDs, high/low power selector, and an LED digital frequency readout with 5-kHz resolution. Only 5 kHz, you exclaim in dismay? Aye, earthling! The tuning system is unusual for an HF rig, bearing some resemblance to the system found on the Kenwood TR-7400 2-meter transceiver and similar rigs. Rotary switches select the 100-kHz and 10-kHz segments of the band and a push-button adds 5 kHz to the frequency you select. Fine tuning (plus or minus 8 kHz) is facilitated by the vxo knob next to the digital readout. What all this means is that while the radio covers the entire 15 meter band, it is inconvenient to scan from one band edge to the other as you would with a more traditional tuning arrangement. In practice, the tuning system is reasonably workable and you learn to manipulate the controls quickly. There is a sweep control that allows you to scan through the vxo range at a rapid rate but I found that control to be less than useful for my style of operating.

Once you learn to cope with the tuning system, everything else is straightforward. The single-conversion superhet receiver is competent, offering better-than-expected sensitivity, selectivity, and dynamic range for a transceiver in this price range. The agc has a tendency to pump on strong signals, an annoying effect which is easily cured by reducing the setting of the rf gain control. The noise blanker performs as expected, cleaning up a bit of ignition noise without noticeably altering the receiver's performance in any other respect. Audio output is about two Watts and the built-in speaker is perfectly usable, which comes as a pleasant surprise. Only one other rig that I've used in my car has not needed an external speaker for adequate performance!

The transmitter offers no surprises either. There is no provision for ALC metering, but the mic gain control is extremely forgiving, a fact proven to my own satisfaction when I listened at home while someone else operated the NCG from my car. Informal observations by myself and many others indicate that the rig's output is clean and the audio is good. The rig has provision for low-power operation with about three Watts output on voice peaks. Thanks but no thanks—six Watts is enough of a challenge for me! Those of you with monobanders at 70 feet or a penchant for self-abuse may find the low-power position exciting, but I religiously avoid it!

Conclusions

I found the NCG to be a very enjoyable transceiver to work with. For a beginner looking for an inexpensive way of getting on the air, or the mobile or QRP operator, the NCG-15 represents an outstanding value. True, it has a tuning system that only its mother could love, but where else can you get so much rig for so little money? I hope that rigs like this will begin to wean us from the "power trip" so many of us seem to be on. When we use high power to ride over the interference from other hams, rather than to compensate for poor propagation, it's time to rethink our operating habits. See you on 15-meter QRP!

HAM HELP

Does anyone know anything about the technical operation of the ATC/Zenith "SAVVY" instrument? I will pay a finder's fee for the first good information.

Mike Reynolds W0KIE
3826 So. 92 E. Pl.
Tulsa OK 74145

I am in need of operating instructions and especially the schematic for a Royce CB, model I-636. The fine-tune control is causing some FMing when it is used for a swing of more than 4 kHz. Any comments would be welcomed. I will gladly pay for a copy of the operating instructions and schematic. Many thanks.

Herman H. Franke F0FXX
RAMC—AmEmbassy
APO New York 09777

Can anyone provide me with copies of schematics and/or operation manuals for an Elco model 324 signal generator and an Eico model 368 TV-FM sweep generator and marker? I'll pay copying costs and postage. Any info would be appreciated. Thank you.

Gene Smarte WB6TOV
RFD #1, Box 717
Hancock NH 03449

I am looking for instruction books or diagrams for a WRL Multi-Pak Model PSA-63A power supply and a WRL Meteor Model SB-175 transmitter. I will pay for copies or original manuals. Anyone needing Montana for a sked? Can do, on RTTY, CW, or SSB on 80-10 meters. (And thanks, *73*, for this service. I've been helped before and been able to help others.)

Neil Zimmerman W7MAF

The Datong ASP Speech Processor

—will this give you a British accent?

R. Stanley Dicks W8YA
Department of English
Wheeling College
Wheeling WV 26003

Personally, I have never liked speech processors, and my on-the-air friends have tired of hearing me talk about how lousy they sound. I dislike them because almost everyone who uses one turns the gain up too much, thereby causing his signal to become wide and sloppy, and because most operators insist on leaving them on even when they're ragchewing with strong signals, making their audio sound as though it's coming from the bottom of a galvanized garbage can.

I have tried several processors and have never kept any of them. With the alc on my transmitter adjusted properly, processing didn't seem to help much unless the level was turned up so high that I got reports of a spread out, garbled-sounding signal. I resold all of them pretty quickly.

Datong's ASP.

Lately, though, the state of the art in audio processing has improved considerably. The crude diode-clipper-type compressors of years ago have been replaced with sophisticated circuitry using integrated circuits and considerably more filtering than the earlier circuits had. And, I have heard more and more signals on the air from operators who were using processing and whose audio still sounded OK. So, after deciding to give one of the new circuits a try, I went with the Datong ASP.

I chose the Datong unit for several reasons. Datong is a British company which has a somewhat unusual philosophy. In this era of mass-produced, often shoddily-constructed products, Datong believes in turning out quality equipment with some "extra" features. Their receiving audio filters are becoming known among DXers as the best on the market and they introduced a new one at Dayton in 1980 that is incredi-

ble—it's like having a tunable crystal filter. I have used one of their filters for a couple of years and I admired the quality of the components and the workmanship in it. The unit has performed quite well (see the review in the October, 1979, *73*) and it contains some unusually advanced, state-of-the-art circuitry. Because of all of this, the Datong ASP processor seemed to be a logical choice for a try. The results have not been disappointing.

The ASP is an rf clipping device; it has been proven fairly well that rf clipping can provide more average gain with less distortion than audio compression. The disadvantage with most clippers is that they have to be wired internally into the transmitter circuitry. Because they contain filtering circuitry at one of the transmitter's intermediate frequencies, they cannot be interchanged from one rig to another. The ASP unit, however, will work with any transmitter because the rf clipping is all done within the ASP itself.

The unit is hooked up, like audio processors, between the microphone and the mike input of the rig. The audio signal from the microphone goes into the ASP where it is first processed by a special audio processor circuit. The circuit is designed to maintain a constant peak-to-peak speech amplitude no matter how wide the variations in input levels. It also includes a five-second hang time, which means that once the circuit has adjusted itself to a certain input level, the background noise remains constant during speech pauses or loud transients. The circuit thus feeds a controlled, regulated audio signal to the rf clipper and also prevents the clipped, on-again, off-again background rush noise that many processors introduce. The processing in this circuit alone provides considerable enhancement of the audio, and it can be used by itself with no rf clipping simply by pushing a button on the unit's front panel. On-the-air reports indicate that my audio (from an Electrovoice EV-676 mike and a Drake TR-7) is fuller and has more "presence" when the unit is used in this position.

After being processed, the audio is converted into rf through an internal i-f mixer, after which it is fed into another rf stage where it is clipped. The level of clipping is variable in 6-dB increments from 0 dB to 30 dB. After being clipped, the signal is reconverted from rf to af and is then fed directly into the rig's audio input. Because the clipping is all done internally in the ASP, no connections to the transmitter rf circuitry are necessary; you merely plug the mike into the ASP and the ASP into the transmitter.

The ASP comes in an attractive two-tone grey, wrap-around metal cabinet, and shielding seems to be excellent. The only feedback problem I encountered, even while running a full kilowatt, was with a high swr and lots of rf in the shack while operating on 10 meters. The unit requires 6 to 16 V dc at 15 mA; mine is powered, along with several other devices, by a small 12-V dc supply. The front panel contains the mike input connector, push-button controls for on/off and for the clipping level, and three LEDs: one to indicate the unit is on and two to give the operator an indication of how the unit is functioning.

In operation, the unit is switched to the desired clipping level and is immediately operable. There are no gain controls because the unit automatically adjusts in input level from the mike such that just the right amount of af is supplied to the rf clipping section. There is a gain balance adjustment on the back of the unit so that its gain can be matched to the rig in use—this is a one-time, set-it-and-forget-it adjustment. It takes the unit about one second to "learn" the input level from the operator's voice and to adjust to it. Once this learning occurs, the unit "hangs" for about five seconds and keeps itself adjusted during speech pauses. It does this even if the mike push-to-talk button is lifted or the VOX relay drops to receive. If the input voice level is too low, an LED labeled "OK" lights up. If the input is too high, both LEDs light up. A third LED, labeled "SPEECH," follows the operator's voice pattern while speaking. If it stays on during pauses, the background noise is too high and the operator should move closer to the mike or should reposition the mike. I have been amazed at how accurately the three LEDs indicate what is going on with the unit; they tell the operator so much that a meter is hardly necessary.

The ASP has a couple more interesting features. There is a switch on the front panel which allows instant changing from low- to high-impedance microphone inputs, thus allowing for rapid comparison of various mikes. Also, the unit has a push-button labeled "TONE." When this button is depressed, a 700-Hz sine wave is fed into the rig, allowing for rig audio adjustment and even tune-up of the tank circuit.

All of these features add up to a unit that is extremely easy to operate. Usually, using the unit requires merely the pushing of one button and the operator can then forget about it. The operation of the unit is excellent also. On-the-air tests with friends indicate that the audio sounds beautiful in the 6-dB and 12-dB positions and that it then begins to get a little "fuzzy" in moving from 18 dB to 30 dB. Even at 30 dB, however, the signal does not broaden and distortion products are not generated in the transmitter. Compare this to most processors, where setting them at 30 dB, if they will even go that high, produces audio so distorted that it sounds like a tape recording of Custer's Last Stand.

When rag-chewing, I generally leave the unit in the 6-dB position, as my buddies say that they actually prefer it to my normal, unprocessed audio! When trying to bust through a pile-up or work weak stations, I switch to the 18-dB or 24-dB positions. From what I can tell, the unit gets me through pile-ups much faster than with unprocessed audio. I have never had a single report or complaint of "dirty" audio, no matter what setting the ASP has been in. I have to confess it—the ASP has converted me from an anti-processor person into one who will tolerate processing and even use it himself.

The Datong ASP is a top-quality af and rf speech processing device with many extra features. It is probably the fanciest unit on the market today and is also the most expensive ($229.95). It is certainly not meant for the casual operator. However, for serious DXers, weak-signal VHFers, contesters, or avid traffic handlers, the ASP is a unit which can provide a great many benefits.

The ASP is imported and marketed in the states by *AR Technical Products, Post Office Box 62, Birmingham MI 48012; (313)-644-5698*. Reader Service number 476.■

W2NSD/1 NEVER SAY DIE

editorial by Wayne Green

from page 18

donned my regulator, tank, mask, fins, depth gauge, and my new Casio skin-diving watch... good to 100 meters. I'd picked that up in Tokyo for about $25. Not bad compared to the old Rolex I used to use, which now costs about $500. Spa-loosh, and I was over the side in about 50 feet of water. It was beautiful and worth all the trouble. I headed for the bottom and the coral-encrusted drop-off nearby... where the head wall dropped beyond sight.

I swam around taking pictures of the fish, the three other divers, the coral... having a fantastic time. I've been scuba diving for at least 25 years... all over the world... so this was blissful for me.

My depth gauge went to 75 feet... then to 85 feet. My watch was doing great at 75 feet... and was out of commission by 85 feet. Hey, Casio! What's this baloney? Without a watch one has a problem. With about 50 minutes of air one likes to keep track of time. It is very difficult when you run out of air at 85 feet and have to work back toward the surface trying to suck the tank through the regulator. And one really has no way to keep track of time under water without a watch. Your sense of time is lost in this slow-motion environment where you are weightless and can go anywhere in three dimensions at will. It's like flying.

With everything but the co-pilot seat filled, I got that choice seat. The hat was to keep my brains from frying in the sun... which is very hot down there.

Despite the rumor of hordes offering special prayers for disaster from somewhere in central Connecticut, all went well. I got a lot of fine pictures and emerged in euphoria.

Sherry was still a bright green. Chuck had been snorkeling (he hadn't been checked out for scuba yet). We headed back to the Inn... a long, long trip over a very bounding main.

Once ashore, Sherry recovered quickly and was ready for lunch when it was served a few minutes later. Hamburgers.

In the afternoon, Jeff made the mistake of going to the bathroom and I grabbed the rig, whipping off about a hundred contacts before he was able to wrest the mike from me again.

I was surprised and pleased to find that an old friend of mine had moved to Provo and was living there. Bob Cooper, the king of the satellite TV game, was there with his family, a big dish, and TV service for the island. Bob and his wife came over to the hotel and we had dinner with them, talking over old times. It was about 25 years ago I first visited him In California as K6EDX.

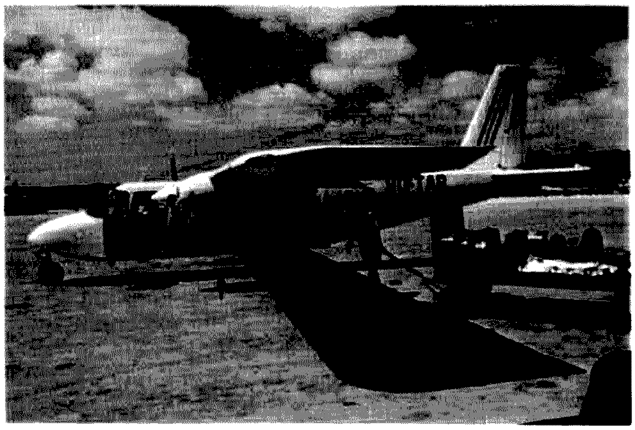
We arrived at Provo on Thursday evening... got our bags Friday evening. I went scuba diving Saturday and Sunday mornings... and got in about a thousand contest contacts from Chuck's station in his hotel room. This was about a couple hundred yards from the Third Turtle Inn... at the Latitude 22 (hotel). He had a wonderful location there, with lots of room for his traveling dipole antenna.

On Sunday afternoon we all (except Jeff, who was contesting) visited Bob's television setup. Formidable. He picks up the signals from the satellites, sends them on channel 7 to the only real hill on the island, and rebroadcasts them from there on channel 4, with a repeater station wich is entirely sun-powered. This provides TV for the island... which has a population of perhaps a thousand. Bob eventually will be charging for this service at around $12 per month/per user, which should keep him in the chips. That's one of the better aspects of a small island government system... it is flexible enough to be practical.

Jeff and Tim did very well in the contest. Jeff was operating at the last minutes and got a scare when his rig blew up just as the contest ended. He was just starting to get some scores from the others when a curl of smoke brought the news... and the rig gasped. The problem is that the rig was not designed for wide variations in power voltage... and a sudden surge wiped out the filter capacitors.

I've found that there are few smaller countries where the power does not go through unbelievable gyrations. I would strongly suggest that anyone going on a DXpedition put in higher voltage filter capacitors... ones which will withstand fast surges to 150 or more

This is the Piper which brought us to Provo from Grand Turk. Chuck brought his guitar... he's getting awfully good at bluegrass these days.



Turks and Caicos National Airlines is about to add our luggage to that of the other passengers... and the commercial cargo... and mail. They just barely were able to squeeze it all in.

line volts. Your rig should also perk at 95 volts, because that is all you're going to get at times. Tim swiped the filters from a second set (which went west during the contest, too, but not with filter troubles), and they were back on the air again... after a couple of hours. The next morning (Monday) Chuck and I went for a swim not far from the Inn, where we found some coral and I took more pictures. Then we had to pack and catch the TCNA plane from Provo (they had room this time, but just barely). By the time they had packed all of our rigs (Tim and Jeff were with us this trip), Chuck's guitar and rig, my suitcases of cameras, skin-diving gear, and other toys, the plane was so loaded the pilot was not sure it would be able to lift off.

We made the takeoff...and eventually got to Grand Turk, where we boarded an Air Florida plane. We stopped off at the Dominican Republic for a half hour...and then were off to Miami, flying up the Bahama chain. We eventually got back to Boston at about 1 am. It was a fun trip and well worth all the troubles...and perhaps even the expense.

CAVEAT EMPTOR

It's bad enough to read a serious review about an antenna which is a hoax, even if the manufacturer doesn't know enough about antennas to know it, but worse things are out there to waste your money on if you are not damned careful. That review came complete with an ad for the silly antenna. I have not permitted that antenna to be advertised in *73*.

Will that same magazine start running ads for a "new" firm which recently turned up? I sure hope not, but apparently ethics are not a primary problem with all of our publications, so buyer beware...*beware!*

It wasn't long ago that a ham firm sort of disappeared after accepting orders, I am told, from about 5,000 people. They'd been at a lot of hamfests, selling their products, so no one suspected what was coming. It is estimated that hams and experimenters were ripped off for about $750,000 and suppliers for another $200,000 or so...damned near $1 million...tax-free, apparently.

One ham mentioned to me that he'd been at a hamfest and seen the owner of the business pocket some $30,000 in cash. Was this going into the company later on? No, apparently not. In one case, I understand that the cash was converted into a cashier's check, which later went into a personal bank account and then was used as a down payment for a very expensive home. Mind you, this chap and his wife were taking home about $100,000 in declared income.

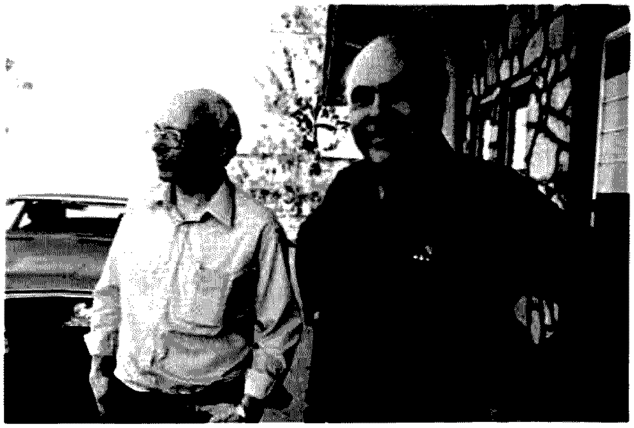
In another case, he paid someone helping him with his booth out of the roll in his pocket, pointing out that this was all tax-free. Well, if people want to steal money from their company, I suppose that would normally be a problem for the government to worry about... but when the hams get it in the neck and someone walks away free and clear, then I *do* take an interest in scuttlebutt. There are a lot of totally innocent people being hassled and even convicted by our government, so I really hate to see someone using amateur radio to clean up...and get away with it.

Other magazines may make a big deal about protecting their readers, but I still see them taking ads from firms which I won't accept. I assure you that this reincarnated firm will have to advertise elsewhere.

Speaking of refusing ads, I ran into Jim Penny at the March San Francisco computer show. He used to run Dycomm and said he didn't need ads in *73* to stay in business. I refused to run his ads because his 2m amplifiers would not meet published specs. So he advertised in *QST* ...and went out of business. He's now living in Egypt, selling air-conditioning equipment.

I do my best to keep the crooks out of *73*, as well as those firms which are so shaky that they may be going under, those whose equipment I think is poor, or firms which I have a reason to believe may not be giving good service. I reserve the right to refuse ads for any reason...or without any reason. I'm not perfect in protecting you, but I think I'm the best you've got.

If you have any problems with any ham firm, please let me know about it right away. I want to know about anything crooked you see going on...bum service support and so on.



Chuck and me. Most of the time I'm taking the pictures, so I don't get into a lot of them. I mostly use a Nikon FE, with a Nikonos IV for underwater shots.

Sherry, our Vice President (someone has to do the work!). She's wearing a Casio C-80 watch. I had mine on when I was swept up in the current while trying to cross a canal. It got dunked to about six feet but didn't suffer. My Casio skin diving watch flooded at 85 feet. We've recently switched to the new Casio CA-90, much the same as the C-80, except they have an alarm and an hourly beeper.

CLIPPING SERVICE

This is my way of thanks to all of the readers who have been taking the time to clip newspaper and magazine items which they think might interest me. They do...and I really appreciate the thought. I'm particularly interested in anything about amateur radio, WWII submarines, microcomputers, radar detectors, etc.

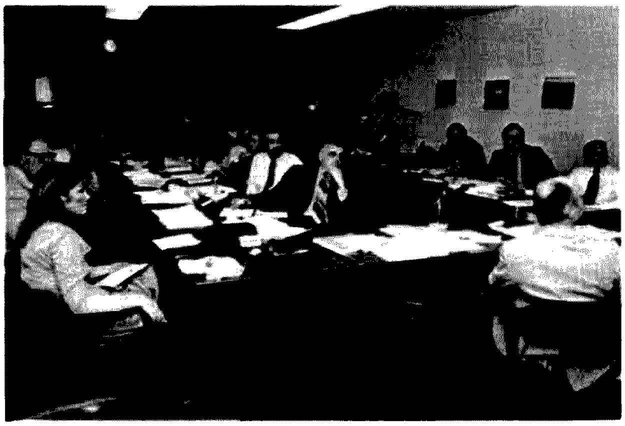
NIAC

A couple of years ago, I was surprised to find myself recommended as a member of the FCC advisory committee on amateur radio emergency measures. This is the National Industry Advisory Committee (NIAC). Well, I'm game to do anything which looks as if it might benefit amateur radio...despite rumors coming from my good friends to the south that I'm out to destroy amateur radio (and, presumably, my magazine). I also perceived the position as one of honor, so my ego puffed up slightly.

Now, with a couple of NIAC meetings under my belt, I think it might be time to throw the light of day on this group. I suspect that not one ham in a hundred even knows that NIAC exists... I know that I was only vaguely aware of it before the knock on the door. When you consider that this is the *only* amateur radio group with an input to the Commission, you perhaps can understand why it *could* have some benefits for us.

The committee used to be run 100% by the ARRL, with the chairmanship passed down from friend to friend without even a vote by the committee.

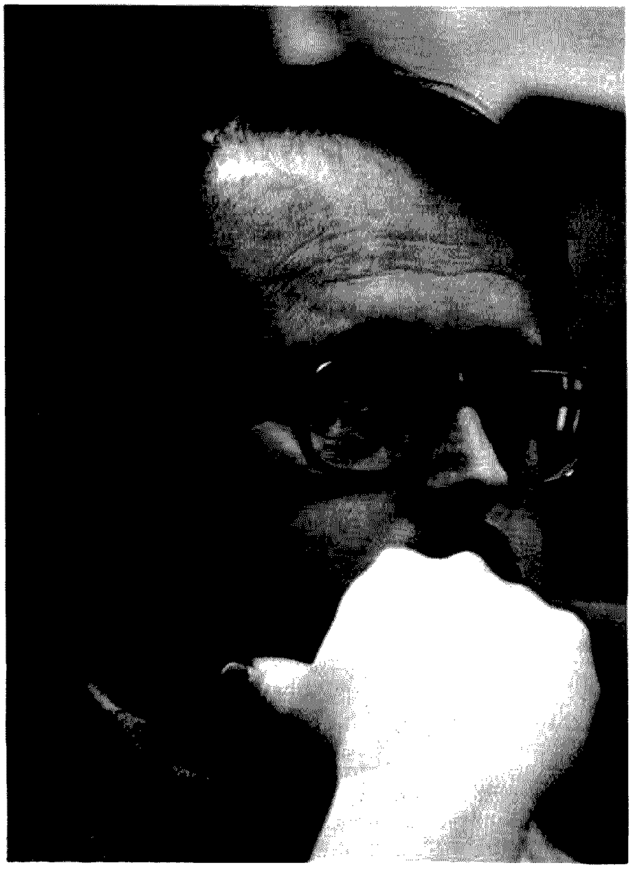
Chris Payne seems a bit disappointed over the chairman problem. He seems very anxious for NIAC to get in there and tackle the problems of the day and get the committee to take some initiative.



The March, 1981, meeting of NIAC. On the left we see Charlie Dunn K7RMG, an FCC secretary to take the minutes, and Chris Imlay N3AKD. At the end of the table is Sherry, with Tony Curtis K3RXX of Tab Books, then Chris Payne W3IRC of NAB, Alan Dorhoffer W2EEK of CQ, and Hal Todd W7ZXM with the red jacket. On the right, from the back, are Rafael Estevez WA4ZZG, Mike Renfro (FCC), and Herb Newman (FCC). The chap in front with his back to us is John Obradavich W3IS, the chairman.

The committee also has an unblemished record of doing virtually nothing. When I was in high school I belonged to an "honor" society like this. It was called the Book Club and I got to be a member by virtue of having been a member of the St. Paul's Choristers (St. Paul's Church was nearby). Well, it provided a private room and a freedom from going to study hall, so who could complain? Yes, I was a choirboy before my voice changed...and a good one, too.

The makeup of NIAC has been changing in recent years. There are about 17 members, of which about 60% manage to get to the meetings. Recent new members, other than me, have been Tony Curtis of TAB Books and Alan Dorhoffer of *CQ Magazine*, neither particularly rubber-stamp-type hams.



Tony Curtis managed to stay awake... just barely... through a long film on Three Mile Island. No one was sure why the film was shown.

There was a good deal of irritation among the more enthusiastic members over the abrupt cancellation of the meeting scheduled for last October. I don't know about the others, but I had gone to a lot of trouble to work my schedule so I could attend that meeting. I felt there were some urgent matters which should be considered by the group. Then, with little warning, the chairman of the committee sent a note saying that he had cancelled the meeting. Hell, he hadn't even come to the previous one in May, 1980!

When asked at the March, 1981, meeting why he had cancelled the October meeting, he said that he had looked over the agenda and decided that there was really nothing important. Without consulting the members of the committee, he sent out the cancellation letters. This triggered an attempt spearheaded by Chris Payne (NAB) to get him replaced as chairman. This was deftly sidestepped and Mr. Obradavich is still sitting in The Chair.

While the cancellation was irritating, particularly since it was so heavy-handed, I really didn't think that a change of chairman was called for. Besides, there was always that lurking fear that I would be asked to take the spot. What does one say to that? There is no way that I could do the job that should be done... it would be impossible. I won't bore you with the burdens I've taken on, but they are more than full time as it is and there is just so much of me to spread around. If I'd been sure that it might go to Payne or one of the others, I would have been more enthusiastic.

One of the limitations of the committee has to do with being involved only with ham emergency matters. As such, the committee has been grinding very small matters into dust rather than taking advantage of its position as a group with the ear of the Commission. To get around that little drawback I pointed out to the committee that any emergency communications system is going to be useless unless it is in regular daily use by amateurs. No special emergency system can be relied upon to work if it isn't in common use. That's the way things go.

With this proviso, we could start discussing special amateur radio satellite communications systems, special modes of communications, and all of the developments which are so desperately needed by amateur radio these days. Further, without some sort of spark to get amateur radio growing again, we may not have an emergency service available.

The "plain language" rules came in for some serious discussion. It had not escaped everyone that the new rules have done away with *all* of the reasons for amateur radio to ex-

Alan Dorhoffer played it cool, letting the others fight.

Hal Todd came a long way for the meeting.

ist. Under the new rules amateur radio comes out looking incredibly like another Citizens Band service. There were so many changes of the rules built into the rewrite that it was difficult to do anything but recommend that the whole project be scrapped. No real plusses were found, and the negatives were legion.

Another NIAC meeting is scheduled for this fall. Other than getting rid of that stupid 10m linear rule, what moves do you think the FCC could make which would improve amateur radio?...with particular emphasis on emergency communications? Is there anything the Commission might do which you think might get amateur radio started growing again?

I did make a stereo tape of the whole meeting, if anyone or any club is interested in hearing several hours of an FCC advisory committee at work. There are about four hours of tapes, so send $10 for the lot.

BEEFS

A reader mentioned he had read some beefs about *73* not being at hamfests these days. Well, we can't get to 'em all, of course, but we do get to as many as we can. Actually, it is rare that someone from our staff doesn't get to the larger hamfests.

At Orlando we had both Bob Lyons and Jim Gray. Bob went from there to the Charlotte hamfest. Just about everyone from our place went to Boxboro last fall, though I was in Tokyo at the time, getting together with the Tokyo International Amateur Radio Association... and visiting the Trio-Kenwood people.

Those of you who went to Dayton this year had your chance to see and hear me.

The microcomputer aspect of my publishing has put a big strain on me, and much of my travel has been involved with that, but I've had to cut down on computer shows, too...such as the recent one in Dallas. I did get to the CES in Vegas in January, the West Coast Computer Faire in April, and NCC in April. Ooops, I almost forgot the NIAC trip to Washington in March...a strictly ham event.

MILLER HASSLE

The storm is still raging over the firing of Don Miller as ARRL director. The Indiana hams seem to be extremely upset over this and most resistant to the HQ-named replacement: Metzger.

Though I was away from the *73* booth at Dayton at the time, one of the *73* team (we had nine people there) reported that some chap claiming to be Metzger's lawyer came by and yelled about the pro-Miller letters we published, threatening to sue over it. There was a general agreement that this chap was loud and obnoxious.

Hear this, Metzger: Threats of lawsuits are not going to keep us from printing the facts. They never have.

Several years ago I had a run-in with another Don Miller, who I understand is now in prison in California for trying to have his wife killed. This chap was DXpeditioning and I exposed his game of claiming to be one place while in reality being elsewhere. He sued for $650,000. He never got a dime from me.

Then Ma Bell sued because I ran some articles showing circuits the phone company wanted kept secret. Only $100,000 that time. I paid them nothing.

The CCAT crowd sued because I ran 2-GHz receiver circuits...and lost the case. Now we're counter-suing to get the legal costs back. They lost double because before they brought the suit they had been able to scare people into not selling receivers on threat of a suit. Now, with that loss on the

Here's a photo of me talking to the TIARA group...and thanks to JK1UFW for sending in the photo. Note the buffet, which was first rate. Yes, I'll fly 10,000 miles for a good meal.

This is the top brass of Kenwood (note Anniversary issue of 73), posing with Sherry and me. Also note those boxes on the right...a complete TR-2400 system. If you're active on 2m, you'll hear me using it when I get to your town...and I do get around a lot.

record, they have little with which to threaten people.

I'm currently being sued for $3,000,000 by a firm because I won't let them advertise. Isn't that ridiculous?

I really hate lawsuits, but I damned well don't back off from them when someone tries to use the threat of one to stop me from printing something I think you should have.

Getting back to the Miller case...it sure looks as if he was shafted by the ARRL because he asked too many questions. I hope they enjoy Metzger.

WIND JAMMERS

A recent talk with some FCC people brought out that the Commission is getting record numbers of complaints of the jamming of ham communications...by hams. To say that this is counterproductive for us is a great understatement. Add this to the other frustrations and you perhaps can understand why many of us were not surprised at the degradation of the amateur "service" which turned up in the proposed "plain language rules."

To understand what is going on you have to look at things from the viewpoint of the FCC, not from *your* position. First, the Carter commissioners came into office at a bad time from our standpoint. They were faced with a serious problem brought on by the illegal use of amplifiers by CBers and HFers. Previous actions by the Commission had put the manufacturers of well-designed "clean" linears out of business, leaving the field to unscrupulous underground firms which spewed out cheap, cruddy amplifiers which were virtual TVI factories.

Rather than tackle the real problem, the FCC went the typical governmental route and chose to stop the manufacture of ham amplifiers which might be used on the Citizens Band. I note that the number of TVI complaints is up substantially for 1980, despite the linear ban and a large drop in CB activity.

We could have prevented this ridiculously futile exercise if the ham industry and the ARRL had worked together and proposed some reasonable solutions for the FCC's problems. What happened was one of the worst debacles in ham history...second only to the 1963 proposed license changes which stopped amateur radio growth for over ten years.

With all of these other problems, one of the things we need the least is to continually frustrate the FCC with complaints that we are no longer able to be self-policing. For many years amateurs had proudly pointed out that they were the least bothersome service due to our ability to do our own policing. Amateurs apparently have just about given up on even trying to be self-policing.

Frankly, I think it is about time that we again assume responsibility for our own hobby...or "service" as the FCC prefers to consider it. Now, I do not question for one minute that our service nets are of great value, but if they are going to continue to get us in trouble with the FCC through their inability to handle their own problems, then perhaps it is time for reevaluation of their worth to us. This going crying to the FCC over jamming is intolerable. The same thing holds for repeater jamming.

It is time that we took the business of being self-policing seriously. I'm open to any articles for *73* which will tackle this problem. I'm open for ideas on why we are having these jamming problems. Some of it is brought on by officious control operators. Many is the time that I have called into a net or in on a repeater only to be met with arrogance and an infuriating attitude. My first reaction is to get even with the damned bastards. That's when I turn off the big switch and walk away from my rig and do something which is more fun. When hamming stops being fun, I stop hamming.

During my recent stint from VP5, I found my signals being jammed every now and then. It was malicious, there was no question about that. On the one hand I was pleased that this happened so infrequently, but on the other I felt this was a problem that needs to be tackled. The jammer(s) were trying to spoil my fun...and the enjoyment of the hundreds of operators who were trying to get through for a contact. There was no way that my fun could be spoiled, for if hamming got to be a pain in the ass, there was always scuba diving, lying in the sun ruining my skin and prematurely aging me, reading (Hey, have I got a good book I'm reading! Grab it if you see it...paperback, but not a pocket-sized book, called *Human Scale*. You'll love it.), talking with Coop about satellite television, etc.

Let's see what we can do to work out solutions to our jamming problems. It may take some cooperation of ham clubs and some direction-finding...if so, let's see articles on this. It may take some psychology. We may just be dealing with insanity, which seems to be a problem predominantly centered in the L.A. area, but which may be leaking out. I feel that since there are more of us who are interested in bettering amateur radio than in destroying it, the good guys can win if they gang together and swap ideas.

If you...or your club...decide to actually do anything to help amateur radio in this time of distress, please feel that *73* is your means of communications with others similarly interested.

PROJECTS

If we are going to get amateur radio moving again, I think we should do all we can to tackle some of the technical projects which seem worthy of experimentation. This holds even more in the light of the recent FCC thaw on Special Temporary Authority (STA) permits for experimentation. I assure you that *73* will do all it can to provide the communications that intensive amateur experimentation needs...so if you are doing any serious experimental work, be sure to report on your progress in *73*.

Some of the projects which show promise for amateurs are: (1) automatic identification of all transmissions...probably via ASCII using subaudible tones; (2) stereo double sideband, which may permit us to get ten to thirty times the number of stations in a given band without serious interference; (3) SSB repeaters for our VHF bands, which may allow us to squeeze in at least three times as many channels in the band as we have at present (just what we needed ...more 2m repeaters); (4) packet transmissions; (5) high-speed message-handling and perhaps the development of automatic forwarding of messages; (6) SSTV transmission of single pictures, probably using a ROM for the picture storage as an inexpensive method of sending along a photo of the operator or the ham station; and (7) the development of amateur use of commercial satellites as an emergency measure...but which will have to be in everyday use to be ready for the emergencies.

With digital electronics moving ahead rapidly, it is up to us to not only keep up with technical developments, but also to be the ones to push the frontiers ahead. *73* is ready to help...if *you* will grab the ball.

HAM HELP

I need a copy of the operating manual and schematic for a Hallicrafters SX-122 receiver. I will be glad to pay copying costs and postage.

WORLD OF DXING AND CONTESTING

Welcome to this new column. When I was asked to write the DX column, I felt that there was perhaps a need to have something more: a touch of contesting; most of the magazines have DX columns *and* contest columns. I agree with the *NCJ (National Contest Journal)* that contesting is growing and the amount of space devoted to contesting in the magazines is shrinking. Most of them have only a contest calendar and results or rules for the contests that they sponsor.

DXing and contesting are very close because they have one thing in common: competition. Contesting requires quite a bit of work and effort and generally is confined to 48 hours or less. DXing is more relaxed; there is more time available and deficiencies in the equipment can be "covered up" by persistence.

Contesters often are the better operators, and when they go on a DXpedition, things run more smoothly. DXers enjoy picking at the rare stuff during the contests and provide some precious points and multipliers.

In this column, I would like to report on the past activities from the rare and not-so-rare DX countries, list QSL information, elaborate on some pressing issues of DXing and contesting, and report on what is new and interesting that would help us to improve our equipment and skills.

Due to the lead time required to publish the magazine, it is virtually impossible to write about most of the upcoming DXpeditions. Those hard-core DXers interested in timely DX activity will have to rely on the variety of weekly or biweekly bulletins or DX information nets.

To those planning DXpeditions or Contestpeditions, please let me know in advance (about 3 months) and we will publish the information here. We also solicit your input—especially pictures (color and black and white) and slides.

"You have to keep trying new things. Sometimes you'll succeed and sometimes you'll fail but you have to continue to meet the challenges. That's how you grow!"—Mary Tyler Moore

I like this quotation and I think this is what drives many people on their path towards excellence. Amateur radio is a very special hobby or sport (DXing and contesting) and those who started experimenting way back in the pioneering days of radio have done a lot to get us where we are today.

The question is: "Do we want to sit around with our crystal sets, or do we want to operate today's marvels of technology with all the bells and whistles?" The competitive part of ham radio was there almost from the beginning, when the first transatlantic contact was made. Our fathers wanted some kind of indicator to evaluate their achievements: number of different stations worked, countries, distances spanned, etc.—DX and contests were born.

Being fortunate to be involved in ham radio for a while, I have had the opportunity to get my feet wet in almost all aspects of our hobby: equipment building, communicating, DXing, satellite communication, computers, antenna design, propagation studies, and contesting.

There usually occurs at a certain point in time a situation in which we reach a plateau, or are close to it. Then the interest can start to fade away. One of the most beautiful things about ham radio is the fact that it is always changing and remains challenging.

Let me make one thing clear: I am not against any aspect of our hobby. I went through most of them and I love them all. My longest-lasting "obsession" is contesting. Why? I think it is because with each contest there is always a new challenge. You are starting from scratch at 0000 GMT and it is a new competition for the next 48 hours. It doesn't matter how long you have been licensed or if you were around when Clipperton was activated. It is up to you and your station as to how you'll perform in that short time frame.

What many DXers find after a while is this: After you get all (or almost all) of them, you start asking yourself, "What now?" Many will continue collecting a variety of awards, building, or experimenting with circuits. Some will get involved with contesting. Some of the really hard-core DXers who reach that magic 318 mark become just statistics on the Honor Roll, and you never hear them on the air anymore.

Contesting means that as things get more competitive, you have to dig deeper to get that extra dB out of your antenna installation, improve your equipment, better your operating skills. It is a lot harder to show up in the top six world high listings or beat the old record in the contest. Only few of many that are competing can get there. This is why I think contesting presents more of a challenge.

In the world of DXing, things are a little bit more relaxed. If you get that new one an hour later, that's OK. The contest station has to go further. One more dB of gain from your antenna might bring you another 500 contacts with "little guys"—more points. The competition is getting fierce—one almost can't afford to go to the washroom. Everyone is on his own, as it used to be back in the old days of DXing when there were no repeaters, nets, lists, and bulletins. You had to hunt, and your DXCC total meant something.

But, DXing *is* getting more popular; newcomers get the bug and want to show up on the Honor Roll as soon as possible. This is natural and is to be expected. All you need is to work them all and, most importantly, *get that QSL card*. And here is where quite often it is believed that the end justifies the means. *Anything* to get that QSL! What starts happening? Some "clever" things get invented: lists, nets, repeaters, bulletins, etc.

Let's have a look at lists. I believe that there is room for them. Especially when some poor, unsuspecting brand-new ham becomes "wanted" because he happens to be in Burma, and after his first CQ, the whole "animal farm" descends on him. He wouldn't know that it is not his receiver oscillating, but that the whole DX world is calling him. So then someone will "undertake" the list and things will somehow get rolling. If the new DX baby is born, let's help him to start walking, give him a hand. But let's not keep him in his walker. Let's help him to get on his own feet and eventually teach him to run. Or, do we want to end up as a bunch of handicapped crawlers, being carried over the finish line on a stretcher?

There is a breed of professional list undertakers. They are just waiting for something juicy to show up on the band. They are ready to take the list and get things "organized." When we were on St. Paul Island (the XJ3ZZ/1 DXpedition), we had about four list undertakers come on our frequency and ask us to work the list they had collected. This was usually at the time when we were working the world on our own, at up to 6 stations a minute! How many can you work on the list? Looks like there are quite a few undertakers on this ego trip. You have to get on your knees to get on the list and then wait, sometimes a day or two, to work that rare one. Fun? Sure, just like shooting animals in the zoo.

This is where contesting helps. By operating in a contest you can learn how to manage the pileups and learn to walk by yourself and eventually run. Wasn't that refreshing to hear LU3ZY work the stuff in the contest one after another, rather than sitting like a duck on a string on all those lists? Is it a big challenge to work the stuff on the list? Does it make you or the "lister" grow?

Do you want to grow? If yes, you have to work at it. Nothing

comes easy. You can always make up for the deficiencies in the area of equipment—just use your brain and skills! I am sure that you will be a lot happier that way, rather than being carried over the Honor Roll finish line on the stretcher of lists and nets!

DX NEWS

Bahrain—A9XCE is active on CW. Could be found between 14020 and 14050 kHz daily from 0100Z to set up skeds for your 5BDXCC. QSL to PO Box 5750, Bahrain.

Benin—K4YT operated from TYA11 (incorrectly-issued callsign) until April 25. QSL for this operation to W2TK. Another operator, ON5NT, operated the same station until May 2, strictly CW. QSL via ON5NT home address.

Glorioso was to be on by FR7AI/G until May 11, time permitting. QSL to FR7AI *Callbook* address.

Kingman Reef—A change in the schedule brought this one on before the Palmyra operation. AD0S/KH5K and KB7NW/KH5K were active on all bands with a good signal. The next stop was supposed to be on Palmyra, with calls AD0S/KH5 and KB7NW/KH5. QSL via AD0S.

Saipan is active on 10m near 28580 kHz on weekends from 2100Z; call is KH0AC. QSL to Box 66, Capitol Hill, Saipan, CM 96950. Also look for brand-new AH0AA on high bands. QSL via bureau.

Heard Island—VK9NS (P29JS) writes about his try for Heard Island DXpedition: The transportation was off due to the short weather window. He will be renewing his VK0JS license and he is still hoping for an operation this coming autumn. Jim had 256 donations to the Heard Island DX Association and they were acknowledged by receipt. He says other small ($1) contributions were received which have not been acknowledged, for obvious reasons. Jim VK9NS has opened a number of doors for future operations, and be they by him or someone else, he will be trying.

1A0KM—K3ZJ found the following: The Sovereign Military Order of Malta is an extraterritorial area of Rome. I0MXM, chairman of International Committee of Radio Amateurs for UNICEF, applied to the ARRL for its separate status for DXCC. The following is the endorsement for the validity of the application: The *National Geographic Atlas* recognizes SMOM as the smallest country in the world. The SMOM has been in continuous existence since 1100 AD, making it the oldest diplomatically-recognized state in the world. The courts of Italy recognize their lack of jurisdiction over SMOM territory. Full diplomatic relations were maintained in 1980 with at least 45 countries on all continents. The SMOM has a complete functioning government structure, its passports are recognized by all countries, it issues its own stamps and currency, and the Prince-Grand Master, as head of SMOM, is ceremonially accorded full Head-of-State status when on official visits outside of the SMOM. (Tnx LIDXB)

CE0Z—Dr. Dave Gardner K6LPL opened from Juan Fernandez as planned on March 11 on all bands 80-10 SSB and CW. He was making the trip alone with the second "passenger" being two transceivers, which he had to buy the tickets for. The limit per passenger was 22 pounds, so the linear was left behind. Excellent operation as usual. Dave was supposed to leave the antenna on the island for the next expedition by the Chilean RC. Dave made about 10,000 QSOs in four days of operating. (TDXB)

VK9NYG Cocos—Quite active on 10m around 28540 at 12-1300Z, running 40 W and dipole. Usually calls the stations on CQ. Quite a pleasant surprise call to many during the ARRL Phone contest. QSL via VK6NE.

GU3HFN Guernsey—Operated in the ARRL CW, made about 3000 QSOs, with operators N6RA, GU3MBS, and GU4CHY. QSL via GARS, Box 100, Guernsey, Channel Islands.

A51PN—Pradhan is using "business" rig. He is looking for donation of the rig to ensure the continuation of his operation. Anyone interested should contact W5GAI. (TDXB)

OJ0AM Market Reef—Wayne W6EUF will be accompanying the Helsinki DX gang, with OH1BR and OH2BAD, during the operation from July 6 through 14. The reef will be taken over by the military in the fall so it may become rare. (SCDXC)

5N0DOG—Terminated operation from Nigeria. Dave handed out many contacts and multipliers in the contests. Excellent operation appreciated by many DXers and contesters.

DX AWARDS CONTROL BOOK

Today's mail brought one of the finest operating aids I have seen in a long time. Sponsored by the Susquehanna Amateur Radio Society (SARS), the *DX Awards Control Book* is a must buy for any serious DXer. Wouldn't you know it, my pal and yours, Hal Dennin AC3Q, is the driving force behind it!

With this well-published manual, you may organize and document your contacts with a single entry. Thirty-three legal-size pages itemize all the DX countries and their prefixes as you would expect to find them. The book comes spiral-bound at the top for easy access and is personalized with your callsign on the cover.

Using the *DX Awards Control Book* is relatively simple. First log the call worked in the appropriate band column. Note the date and mode of operation. When marking the mode, it is suggested it be color-coded for quick identification. Finally you check the award(s) you wish to apply this contact to. Four common awards are listed: DXCC, WAC, WAZ, and ITU. One of the nice features of the format is that space is provided for up to three calls worked per band. Also included is a block for indicating QSLs sent and received.

The cost of the *DX ~~Award~~ Control Book* is $7.00 to an address within the 50 US states and any territorial possession. Foreign stations must enclose $8.00 in US funds.

The sponsors are so confident in the acceptance of their new operating aid that they will provide a 10-day money-back guarantee that you'll be satisfied with your purchase.

Send your remittance, name, call, and address to SARS, PO Box 326, Montoursville PA 17754.

BEGONIA AWARD

Today I received a very nice letter from Maurie Batt, representing the Ballarat Amateur Radio Group of Victoria, Australia. Maurie enclosed the details about two very challenging awards.

To earn the Begonia Award, operators in VK-land must contact 10 Ballarat stations, while all DX outside Australia must contact a minimum of 5 amateur stations in Ballarat. There are no restrictions as to band or mode.

The following stations qualify as Ballarat contacts: VK3DS, VK3GM, VK3GR, VK3HW, VK3IV, VK3KU, VK3KY, VK3LJ, VK3NU, VK3PH, VK3SE, VK3VU, VK3ZL, VK3AAG, VK3ABI, VK3ADT, VK3AGL, VK3AJR, VK3ALM, VK3AMH, VK3ANH, VK3AQM, VK3ARS, VK3AXH, VK3AGY, VK3AZE, VK3BMH, VK3BML, VK3BNC, VK3BNT, VK3BPK, VK3BQE, VK3BSC, VK3BTX, VK3BWC, VK3NBN, VK3NCU, VK3NGL, VK3NGY, VK3NHN, VK3NHT, VK3NIH, VK3NLH, VK3NLY, VK3NLZ, VK3NRS, VK3NTG, VK3NUI, VK3NUC, VK3NUY, VK3NVC, VK3NVF, VK3NVJ, VK3NVZ, VK3NWN, VK3NWV, VK3NWS, VK3VEE, VK3VEZ, VK3VEI, VK3VOM, VK3VON, VK3VMO, VK3VQA, VK3VQQ, and VK3VSE.

To apply for the Begonia Award, send your list of contacts and $2.00 (Australian) or equivalent to: Maurie Batt, R.S.D. Rokewood Junction, Victoria 3351, Australia.

THE WASHINGTON TOTEM AWARD

The Western Washington DX Club, the northwest's largest and most active DX group, takes pleasure in issuing the first major W7 award. This award is issued to any licensed radio amateur who submits proof of two-way contact with the state of Washington.

Applicants must submit proof of QSOs with 100 different Washington stations. Twenty (20) of these must be confirmed contacts with different Western Washington DX Club members. DX stations need only confirm 25 Washington stations including 10 WWDXC members.

GCR apply. Submission of QSL cards is not required. DX stations may submit log data in lieu of QSL card confirmation. All contacts must be dated January 1, 1973, or after. Certified lists must be sent in alphabetical order with date and time in GMT.

The Washington Totem Award is free to all stations outside the United States. Stations within the US must enclose $1.00 to defray the cost of processing and mailing your award.

If a special endorsement is required, merely forward supporting documentation or information to substantiate your claim.

If you wish a WWDXC

DX AWARDS GUIDE

Contrary to popular belief, neither I nor *73 Magazine* are in any way affiliated with the publication, *The DX Awards Guide*, which I might add consists of numerous volumes. To clear the air about this very popular "guide" and to answer the flood of letters I've been getting about it, I highly endorse the contents. To date, it represents the most composite set of awards information I have received since beginning this column over 2½ years ago.

The price of *The DX Awards Guide* is $6.95 per volume with the exception of Volume C, which is only $4.95. Guides mailed within North America are sent prepaid. All other addresses require additional monies be sent to cover 10 oz. postage per volume. Any extra will be refunded promptly.

Many letters have asked about the contents of each volume, so I will attempt to list the awards as best I can. I apologize to *The DX Awards Guide* publisher and to my readers for any mistakes that may appear.

One of the nice features of this *DX Awards Guide* series is that the publisher, Chuck Ellis, has made every effort to provide a full and complete application blank for each award listed. In most cases, the entire form and the required columns are formatted into a very impressive presentation.

For further information about these guides or to order one or more of the series, address your correspondence to: Chuck Ellis, PO Box 1136 Welch Station, Ames IA 50010. Be sure to tell Chuck you read about his guide in *73 Magazine*!

GRANDE RONDE AWARD

Grande Ronde Radio Amateurs in Union County, Oregon, now offer an award to amateur operators, domestic or foreign, who submit evidence of having contacted three (3) stations located in the Grande Ronde Valley.

Contacts may be on any band or mode. Do not send QSL cards. Have your list of contacts verified by at least two amateurs or the secretary of a radio club. The fee for this award is $1.00 or 3 IRCs. Applications should be sent to: Matt Sirrine WB7PMG, 803 14th Street, La Grande OR 97850.

To assist interested amateurs, the following list of club members will qualify as "good contacts" for this award: KA7BAK, KA7BBE, KA7EIM, KA7EIP, KA7EJB, KA7EJC, KA7EJS, KA7EJT, KA7EPS, W7IES, W7KVV, W7ULC, WB7FBG, WB7FBH, WB7FDB, WB7FFC, WB7PKX, WB7PME, WB7PMF, WB7PMG, WB7RVO, WB7RVP, WB7RVQ, and WB7WJR.

AMATEUR RADIO STATION CERTIFICATION

While we are discussing the award incentives being sponsored by the Susquehanna Amateur Radio Society, one cannot go without mentioning their very handsome Amateur Radio Station Certificate.

Display this unique certificate on the wall of your shack, den, or family room for all visitors to see. Jet black olde English lettering on expensive tinted parchment gives this certificate the elegance any amateur would

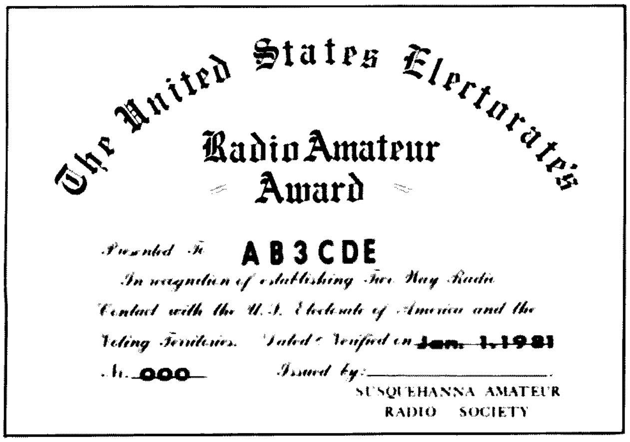
be proud of. Even the XYL will be impressed!

Forward $5.00 for postpaid delivery of this certificate to your door. As with all awards sponsored by SARS, your satisfaction is guaranteed 100% or your money back within 10 days. Along with the US funds, include your name, callsign, address, and any awards you may wish to itemize at the bottom of the certificate.

Send your request to: SARS, PO Box 326, Montoursville PA 17754.



U.S. ELECTORATE'S AWARD

This award is printed on expensive parchment-like paper stock with jet black olde English lettering highlighting the diploma. This unique combination adds a richness not found in a lot of other awards being offered today. Measuring 11" × 14" the certificate is ready for framing.

The award is sponsored by the Susquehanna Amateur Radio Society. To qualify for this award, the applicant must work all (50) fifty states plus the following voting territories: KG6 (Guam), KG6S, T (Marianas), KP4 (Puerto Rico), KS6 (American Samoa), KV4 (Virgin Islands), or KZ5 (Canal Zone).

Applicants are asked not to send QSL cards! You may have your contacts verified by a local radio club secretary or by two licensed amateurs. As a last resort if no amateurs are available in your area, a notary public may countersign your claim.

Forward your verified list along with $4.00 USC or 12 IRCs in a self-addressed envelope to SARS, PO Box 326, Montoursville PA 17754.

EURD AWARD

The DARC announces their new EURD Award to promote RTTY activities. It is available to all amateur and club stations holding the required RTTY contacts. It is based on 2-way contact with different European countries and their prefixes.

Class III requires written confirmation (QSL) from at least 20 different countries (regardless of band) and a minimum of 100 prefix points. The WAE European prefix counts for 1 prefix point per band.

Class II requires at least 30 different countries and a minimum of 150 points.

Class I requires at least 40 different countries and a minimum of 200 points.

The EURD Trophy requires at least 50 countries and a minimum of 250 prefix points.

All amateur bands may be used including VHF; QSLs must confirm 2-way RTTY and shall be dated after January 1, 1965, to be valid.

Contacts made during the European DX Contest, WAEDC, RTTY portion may be used for EURD endorsements, provided the log of the requesting station has also been received. Should this be the case, claims for the EURD Award should not be made until after the contest results have been published.

The fee for each certificate is DM 10 or 15 IRCs. Send a list which has been verified by a local radio club official and the fee to: Klaus Zielski DF7FB, PO Box 1147, D-6455 Erlensee, West Germany.

The following WAE List of DX Countries applies: C31, CT1, CT2, DL, EA, EA6, EI, F, FC, G, GC, GD, GI, GJ, GM, GM (Shetland), GW, GU, HA, HB9, HB0, HV, I, IS, IT, JW, JW (Baer), JX, LA, LX, LZ, M1, OE, OH, OH0,

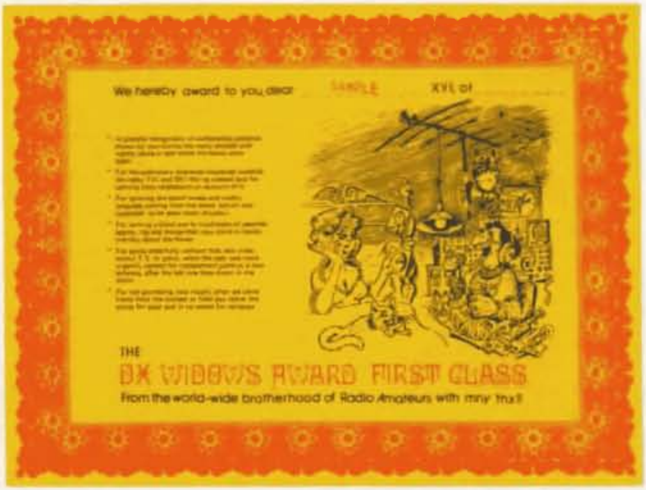
OJØ, OK, ON, OY, OZ, PA, SM, SP, SV, SV (Crete), SV (Rhodes), SV (Athos), TA1, TF, UA1, 3, 4, 5, 6, UA2, UA (Franz), UB5, UC2, UO5, UN1, UP2, UQ2, UR2, YO, YU, Y2, ZA, ZB2, 3A, 4U, and 9H1.

THE FIRST CLASS DX WIDOWS AWARD

This award is also sponsored by the Ballarat Amateur Radio Group of Australia. I am proud to announce that once and for all there is an award celebrating the misgivings of the many XYLs who are married to dedicated DX husbands. Rightly given the title of The First Class DX Widows Award, this certificate requires practically nothing more than your utmost patience as a XYL.

"Wives, for your outstanding patience shown by you during the many endless cold nights alone in bed while the bands were open . . . for the exemplary tolerance displayed towards the nasty TVI and RFI the rig created and for calming the irate neighborhood on account of it . . . for ignoring the weird noises and kooky language coming from the shack (which was supposed to be your room, anyway) . . . for turning a blind eye to truckloads of assorted spares, rigs, and things-that-may-come-in-handy-one-day about the house . . . for going cheerfully without the new dress, color TV, or perm when the cash was more urgently needed for replacement parts or a new antenna, after the last one blew down in the storm . . . or for not grumbling (too much) when we came home from the contest or field day rather the worse for wear and in no mood for romance . . . this certificate of recognition is only for the deserving—the XYL in waiting!"

If you are an XYL, or husbands, if this sounds like something your own XYL deserved long ago, perhaps the least you could do is enclose $2.00 and request this award by sending your remittance direct to: Maurie Batt, R.S.D. Rokewood Junction, Victoria 3351, Australia.



MOUNTAIN STATE AWARD

The Logan County ARC will hold its first annual Mountain State Award expedition from 1600 UTC August 22 until 1600 UTC August 23, 1981. Operations will take place on a West Virginia mountaintop in Logan County, which is located in the heart of southern West Virginia's billion-dollar coal fields.

Phone operating frequencies will be approximately 25 kHz from the low end of the General phone bands as propagation allows. Novice-band frequencies of 3725 and 7125 should be checked each hour from 1600 UTC August 22 to 0400 UTC August 23.

The callsign WD8KWC will be used. A handsome 8" × 10" certificate will be awarded to all contacts submitting a QSL and legal-size SASE to Basil Napier WD8KWC, RFD 1, Box 198, Chapmanville WV 25508.

TIMBER CARNIVAL

The Mid-Willamette ARC will be operating from the World Championship Timber Carnival in Albany, Oregon, 1900 UTC, Friday, July 3, until 2300 UTC, Sunday, July 5. Look for W7SO on 3.975, 7.275, 14.285, 21.375, and 28.575 MHz, and for club members operating their own stations on various other frequencies. A special certificate will be sent to each station sending a QSL card and an 8½" × 11" SASE to Mid-Willamette ARC, PO Box 1226, Albany OR 97321.

THREE MILE ISLAND DXPEDITION

The Central PA DX Club will hold a TMI Fun DXpedition on August 22-23, 1981, from 1200Z Saturday until 2100Z Sunday. Tentative frequencies on phone are 3900, 7240, 14260, 14290, 21325, 21375, 28625, and 146.58. Tentative CW frequencies are 21125 and 7125. The callsign used will be WB3DNA/portable TMI. A QSL card will be sent to all contacts upon receipt of an SASE or IRCs. QSL to CPDXC, c/o WB3DNA, T. Fanus, 6140 Chambers Hill Road, Harrisburg PA 17111 USA.

KAHANER REPORT

Larry Kahaner WB2NEL
PO Box 39103
Washington DC 20016

REACH OUT AND CRUSH SOMEONE

You wouldn't think that the world's largest corporation, one with a $6 billion net income, needed a boost, a little help to compete in the marketplace. Well, think again. In its ruling on cellular radio—a new mobile telephone service that promises a dial tone in every Dodge—the FCC handed AT&T a competitive edge so sharp that others wanting to enter the field may never get a chance to try. First, some background.

It all began about 12 years ago when the FCC and others realized that the then state-of-the-art mobile phone service was heading for disaster. Channels were crowded, voice quality was poor, and waiting lists swelled with those who needed phones in their cars. Things didn't get better and, indeed, couldn't get better because the system just couldn't support high numbers of users. Each city had one mobile operator who had one transmitter and about a dozen frequencies for thousands of users. You waited your turn to get through while someone calling home tied up the frequency all over town. Now, enter the cellular radio concept.

It didn't rely on one transmitter—it relied on many, each in a different section of the city, each called a "cell." They're low power as are the car telephones, so many conversations take place at the same time without bothering someone else in a neighboring cell. As you drive from cell to adjacent cell, you are handed off without interruption. As customers increase, you just divide cells into smaller cells—a sort of electronic mitosis.

AT&T asked for FCC permission to test cellular radio in Chicago, and about two years ago it began. The full-scale experiment involved 2,000 people, mostly businessmen. Things worked splendidly. Voice quality rivaled that of regular landline telephones, and blocking (how often you couldn't get a dial tone) checked in at about 2 in 100 times. Satisfied mobile dialers deluged the Commission with fan mail, saying: "We need this and we need it now."

In Washington, meanwhile, Motorola started its own test in conjunction with a local radio common carrier. That system, compatible with Bell, also worked great, although it still had some minor kinks.

Anyway, everyone agreed cellular radio worked, that it was time to wave the green flag so we could all dial while we drove.

As with all Commission matters, cellular radio traveled through legal mazes until it finally surfaced at the beginning of April with a hearing that ended with a proposed rulemaking, the final step before law. At that

meeting, the FCC decided all sorts of technical and economic issues such as where the service will operate (800 MHz), who can manufacture equipment (anyone), and whether it is indeed in the public interest (of course—what are you, crazy?).

But the most controversial part was the number and kind of common carriers in each market. Two kinds of common carriers exist: wireline and wireless, also called radio common carriers. Wireline common carriers serve the public with copper wires, e.g., telephone companies. Non-wireline common carriers use airwaves, e.g., paging companies.

The FCC decided that each market would host a maximum of two cellular operators, one wireline and one wireless (even though the cellular systems are identical). Each would receive a 20-MHz spectrum chunk. The Commission also said that in each market the wireline allotment would be held for five years. No one else could touch it. Now, the good part.

Since wireline carriers are guaranteed a slot, and AT&T is the dominant wireline carrier (the only wireline carrier in many regions), AT&T is virtually ensured a hook into any market it chooses. And while radio common carriers remain locked in comparative hearings amongst themselves for their 20-MHz piece of the pie, AT&T would have sucked up prime sections of prime markets for themselves. Reach out and crush someone, Ma Bell.

The Commission justified the 2-slot method by saying it's the best way to get cellular radio to the public quickly. They said AT&T might not invest in a market unless it was ensured a clear shot. Also, it deserved special consideration because it did most of the experimental work.

The Justice Department called the split method "blatantly anti-competitive" in a reply it filed last July during FCC procedures. Travis Marshal, Motorola's vice president handling cellular matters, said FCC actions amounted to giving AT&T a lock on the market while everyone else "scrambles for the remains."

One small radio common carrier, Millicom, filed suit in the US Court of Appeals for the District of Columbia, asking the court to overrule the FCC. They said markets should be open to competition no matter who you are or what kind of carrier you are. If AT&T wins, so be it; but let's have free competition, they said. More lawsuits are expected.

All the FCC's general counsel said publicly on the subject was: " The position is defensible in court."

Why the FCC believed it had to give the world's largest corporation a leg up on a system it could dominate very easily on its own in unknown. However, one thing is clear: In its belief that helping AT&T would move things along, the FCC may have inadvertently shifted cellular mobile radio into reverse.

ALL I GET IS BILLS

The FCC would get authority to set minimum interference standards for TV sets and other home entertainment devices under a bill introduced into the Senate by Barry Goldwater. We've seen this sort of thing before—in fact, several times before.

Bill S-929, titled "Amateur Radio Service and Private Land Mobile and Fixed Services Act of 1981," differs from past bills in that it increases amateur license terms from five to 10 years and allows hams and CBers to act as volunteer monitors for the FCC.

Perhaps the most important provision gives the FCC power to regulate or prohibit delivery of transmitters to unlicensed persons. This means you can't buy a rig until your license arrives. Manufacturers and retailers are certain to put up a fuss over that section.

FCC UNHAPPY WITH JUSTICE DEPT OVER ANTI-CASTRO BROADCASTER

The FCC's enforcement teams are bitter over the Justice Department's refusal to prosecute a Miami radio pirate caught broadcasting anti-Castro propaganda in the 40m band. Commission officials say they spent more time on that case than on any other unlicensed operator enforcement matter in recent years. Staffers are particularly miffed because they believe Justice dropped the case for political rather than legal reasons.

The incident involved Jose Gonzalez, charged with unlicensed operation after his transmissions showed up on neighbors' TV sets. Hams all over the world complained of interference, too. The Miami and Fort Lauderdale monitoring stations tracked Gonzalez's clandestine activities from December, 1979, to April, 1981, logging more than 1,000 man-hours. The FCC presented the case to the Justice Department but, on April 14, US Attorney Atlee Wampler dropped the charges on the condition that Gonzalez cease operation from his home. The Justice Department still retains the right to prosecute Gonzalez if he transmits from another site.

Former chief of investigations Jeff Young said that in his personal opinion, because Gonzalez was popular in the Cuban community, Justice decided to drop the case rather than stir up resentment in a neighborhood suffering severe racial problems. Fort Lauderdale engineer-in-charge James Feagles gave us similar thoughts. "We were frustrated... It wasn't our decision, of course; it was Justice's and we have to believe that [politics] was the case in their decision." He said that without Justice's support, illegal operations will continue. "I'm concerned that the Cuban community in Miami might perceive this as a victory. It might lead to increased activity," said Feagles.

Atlee Wamper said politics played no part in his decision. "It's simply not true. Those accusations are blatantly false." He added that with all the criminal cases he must handle, dropping this case seemed justified. "With all the crime perpetrated by Cuban criminals from Castro's jails, prosecuting one 60-year-old man without a criminal record seemed ridiculous," he noted.

He has a point. So does the FCC staff.

LOOKING WEST

Bill Pasternak WA6ITF
c/o The Westlink Radio Network
Suite 718
7046 Hollywood Blvd.
Hollywood CA 90028

One question often asked of this reporter is why we delay in reporting actions by the FCC and other agencies regarding malicious interference. There is a very sound reason for this, which has to do with the Constitutional guarantee that states that a person is presumed to be innocent of a crime until found guilty. While it is very tempting to any reporter to "cash in" as it were on hot news items, especially those which involve the current wave of jamming sweeping over our amateur bands, I always have taken the view that the guarantees afforded to an individual under our Constitution are far more important than any story I might write. Hence, while a matter is under litigation, as was the case in the item you are about to read, I refrained from commenting on it.

Only after a decision has been reached by the powers that be will I go into detail about such matters.

What you are about to read is an actual story about a license revocation in the Amateur Service. This in itself is nothing new. Amateurs have lost their licenses for various reasons, usually some form of major violation to Part 97. Again, this was the case here. But the reasoning behind the license revocation issued against K6EOA is possibly a first on the part of the Commission. It could have far-reaching effects on the eligibility of anyone to hold an amateur license.

The following report was written by Alan Kaul K6RCL, who assists me in the preparation of the weekly Westlink newscasts. It was the lead story in Westlink "QST" number 167 which aired the week of April 11th, 1981. It was prepared from the actual FCC Report and Order dated March 24, 1981, which ordered that the amateur license of John W. Munson, Jr. K6EOA be re-

voked. Here is that report.

"This story centers on an FCC license revocation, but it may be a milestone case because an administrative law judge has decided that mental incompetence is grounds for license denial. The judge also said that when an individual applies for an amateur license, he or she must abide by federal radio regulations, and thus as a licensee does give up certain First Amendment rights.

"The case involves K6EOA, John W. Munson, Jr., of Los Angeles. On October 2, 1979, Munson was alleged to have transmitted an A0 emission on 147.435 MHz, jamming transmissions on a Los Angeles repeater. FCC engineers Lawrence Guy and James Zoulek of the Long Beach, California, FCC office were nearby monitoring the transmission in a van equipped with direction-finding equipment. They recorded the transmission, then knocked on Munson's door. They showed their identification and attempted to inspect his station, log, and license.

"But Engineer Guy said later in his official report that they were not permitted entry and that Munson refused to show them his license or the records of his station. They returned to their monitoring vehicle and again started their tape recorder. This time they not only recorded more A0 emissions, but also threats on their lives if they attempted to inspect the amateur station again. And, as Guy testified later, a threat to kill another amateur as well.

"As a result of the threats against the lives of two federal officers, Guy went to the US Attorney and a complaint was issued which included a warrant to search the premises of Munson's home. Technically, a search warrant wasn't needed because the engineers had witnessed an infraction of federal law, and under Part 97 an amateur who is observed violating the law with his radio transmissions must open his station, log and license to inspection.

"Three days later, on October 5, 1979, Munson showed up at the FCC Office in Long Beach and was arrested. [Note: At the time of the arrest, he had voluntarily gone to the FCC office to give to them an official written apology for his actions.] Guy also served him with the search warrant and entered the ham shack of K6EOA. A stolen portable receiver, a loaded rifle, marijuana plants, and transmitting equipment were seized. On March 19, 1980, a federal grand jury in Los Angeles returned an indictment against Munson for violation of federal radio law and for threatening the lives of FCC enforcement officers.

"But, two months later, the indictments were dismissed when a court-appointed psychiatrist found that Munson was legally insane; he lacked the mental capacity to discern the unlawful nature of his actions.

"In September, 1980, state charges were filed against Munson, and in what is called by lawyers a four-count "criminal information" he was accused of threatening bodily harm. In November, Munson entered a guilty plea to one of the state counts and in January of this year the judge ordered him to pay a $500 fine, not to use his amateur equipment, and to undergo psychotherapy. He was also placed on three years probation.

"At this point one would think this would have been the end of the Munson case, but it wasn't. The FCC reentered the act and ordered a hearing on licensing before the Chief Administrative FCC Law Judge, Lenore Ehrig of Washington DC. [Note: The actual hearing was held in a Federal Building here in Los Angeles.]

"In her findings, Judge Ehrig held that since Munson was not mentally competent to discern right from wrong in his Federal prosecution, he was not mentally competent to operate a lawful amateur radio station, that operating such a station would require adherence to the law.

"The Judge also held that when one applies for an amateur license under Part 97, one also implies consent to certain federal regulations. One doesn't give up his right to free speech, but at the same time, some lawyers would argue that a ham license doesn't entitle you to exercise your right of free speech on amateur radio. As an analogy, you can play music at home, in your car, or just about anywhere else you want except on the amateur bands using your amateur transmitter.

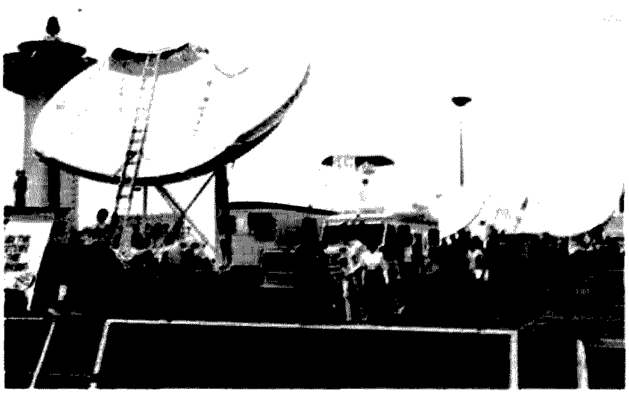
"We might be a bit premature in calling these precedents and findings as landmark decisions, but the actions of the FCC Administrative Law Judge in this case have affirmed the right of the Commission to make laws and to enforce them."

Commentary:

If space had permitted, I would have published the entire 11-page FCC finding in this case. I do have it, but please do not request copies. I have neither the time nor the funds. If you need a copy, I can only suggest that you contact the FCC in Washington and request it. There will probably be a charge for the transcript, though I have no idea as to the exact costs. For those interested, there are a number of news services that supply such information. "FCC Observer Services" you might call them. They're expensive, but if you are an FCC watcher, they're worth their weight in gold.

As to the Munson case itself, I think that I should explain that there is a definite reason for my not writing directly on the matter until now. There are actually several reasons, not the least of which was that I was one of probably hundreds listening the evening that the now proven violation occurred. As you know from my past writings in this column and elsewhere, I am strongly opposed to permitting wanton regulatory violations to continue. I honestly felt that after listening to things first hand, I could not be objective in my reporting. Nor did I want to see John Munson or anyone else "tried and convicted in the press." I do not know the man personally. I had spoken with him on two meters prior to the episode which cost him his license. I had also talked with him on the phone. While our views were not in accord and probably never can be, I still felt a strong obligation to both him and the Commission to permit them to solve things themselves. I told this to John and the local FCC people at the outset, and at that point I removed myself from handling the matter in this column or on Westlink.

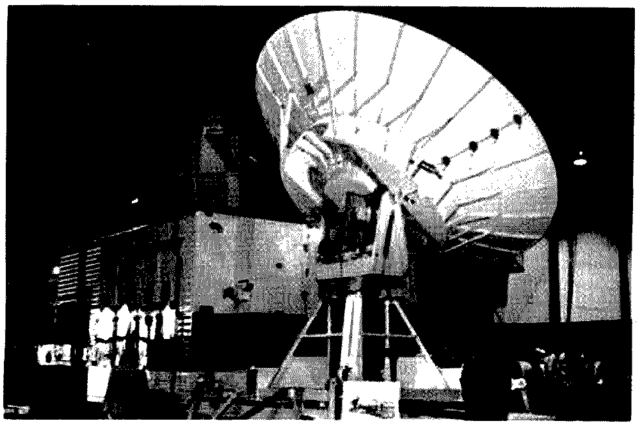
Those of you who heard about John Munson's problems either on Westlink or in *H.R. Report* should be made aware that those were from official reports, court news releases, and other such sources. To paraphrase a well-known expression from the long-expired television program, "Dragnet," it was a case of having one of my coproducers provide "the facts m'am... simply the facts." Maybe you could call this my own personal fairness doctrine, but having Alan write what now appears to be the final chapter in this story was in keeping with what I felt obligated to do. Not being an "earwitness" to the initial happening afforded him a certain objectivity I might not have been able to achieve.



Satellite communication is definitely the wave of the future, as this parking lot full of ground stations will attest.

NAB-IT DEPARTMENT

The initials NAB stand for the National Association of Broadcasters, and each year this august body, which represents every aspect of today's broadcast technology, holds an annual get-together. This year it was the city of Las Vegas that played host to the NAB Convention on the weekend of April 12th, and I had the opportunity to get to NAB '81 thanks to Rupe Good-



This is a complete mobile television studio capable of directly feeding a satellite from any location.

Named by the Dayton Amateur Radio Association to receive the 1981 Specific Achievement Award are (left) Bill Pasternak WA6ITF and Bill Orenstein KH6IAG, for their work in producing the weekly Westlink news bulletins.

speed WA6QLE and Western Airlines; the former going up and the latter for the return trip.

My reasons for attending NAB were purely business, having nothing whatever to do with amateur radio, but nonetheless, I did have the foresight to bring along my Wilson hand-held. I soon found that I was not the only one who had thought of this. As you are probably aware, many people in the broadcast industry have their roots in amateur radio, and 146.52 simplex was very much alive as the unofficial intercom channel. In my 30 short hours I heard someone from every US prefix district, including such well-known people as Jean Shepard K2ORS come onto the channel. By the way, the VoCom gain antenna seemed to garner a lot of attention each time I found it necessary to utilize its efficiency for communication with someone who was marginal on the rubber-duckie. Again, that antenna has come in quite handy, and I can again say for the record that its performance meets its claims.

Probably the most interesting exhibit was in the parking lot adjoining the main exhibit hall. Never before have I seen so many dishes in one place at the same time. I didn't have a wide enough lens to catch everything aimed skyward.

Other equipment shown included the latest in mini-cameras and portable recorders for use in electronic news gathering. Each year the size of field-production equipment seems to shrink, with the old 40-pound cameras giving way to the new lightweight varieties. I was very impressed by one from a company you probably never heard of unless you are involved in television production. The company is called Ikegami, and for many years they have been the trendsetters in portable field-production camera equipment. Many cameramen consider their HL-79 series the state of the art standard. Having used the HL-79 myself, I can see why. They have a new smaller camera called the HL-83. It's a professional 3-tube prism beamsplitter camera that weighs less than most home cameras, with an electronics package that will make your mouth water. It even has provision for attachment on one of the new mini-VCRs directly to it making a one-man ENG operation possible. The only drawback for you and me is the price: many kilobucks.

If equipment was of use to any part of the broadcast industry, it could be found someplace on the convention floor. I spent many hours ogling some of the new production audio recorders shown; wishing I had the kilobucks to buy them for Westlink. Alas, like many other things in life, this is but a dream.

While NAB is not the kind of show that the average amateur will ever attend, it is an interesting experience if only from the standpoint that what one sees at NAB will, in a simpler, less complex form, find its way into the average American home. Today, we take owning a VCR for granted. Five years ago they were found only in television stations, educational institutions, and similar environments. What happens at "that" end of the media stream eventually affects us all. It's nice to see it first-hand and even nicer to be able to share a bit of it with you.

A QUICK THANK-YOU

On behalf of Bill Orenstein KH6IAF, Alan Kaul W6RCL, Burt Hicks WB6MQV, Jim Davis KA6IUH, and everyone else who make up Westlink Radio Network operation, I wish to express my humble and sincere gratitude to the Dayton Amateur Radio Association for selecting the Westlink operation to receive the 1981 Specific Achievement Award. Though the award names Westlink, Bill Orenstein, and myself as recipients, it is something we all share collectively. For the honor you have bestowed upon us, we say thank you for the recognition. It is an honor we will hold dear all of our lives.

FCC

APPLICANTS FOR SPECIAL TEMPORARY AUTHORIZATIONS MUST FOLLOW THESE PROCEDURES

The FCC has announced that requests for Special Temporary Authorizations (STAs) in all Private Radio Services, except Private Operational Fixed Microwave, must be sent to a new address: Federal Communications Commission, Consumer Assistance Branch, Box 441, Gettysburg, Pennsylvania 17325.

STA requests for Private Operational Fixed Microwave (POFM) should continue to be sent to the Federal Communications Commission, Washington, D.C. 20554.

All information must be submitted, in writing, to the FCC preferably on business or company letterhead. Requests should reach the FCC at least ten (10) days before the proposed date of operation.

In an extreme emergency, FCC rules allow a request to be filed by telegram or telephone. Such a request, however, must be followed by a written signed request within ten (10) working days of the telegram or telephone call. If the written request is not received within that time, the FCC will rescind the STA.

General questions concerning STAs and other licensing activities will be answered by the Consumer Assistance Staff in Gettysburg, Pennsylvania. Call (717)-334-9167 or 334-7631.

EXTERNAL RADIO POWER AMPLIFIER TYPE-ACCEPTANCE REQUIREMENTS EXTENDED INDEFINITELY (DOCKET NO. 21117)

The Commission has adopted a rule change extending indefinitely its type-acceptance requirements for external radio frequency power amplifiers.

The requirements apply to all amplifiers and amplifier kits capable of operation below 144

MHz. They cover most amplifiers used in the Amateur Radio Service. Type acceptance requires submission of a sample of each model amplifier, together with technical information, to the FCC for approval before it can be manufactured and marketed. Only 10 prototype units may be built in preparation for model submission for type acceptance.

The Commission on December 18 instructed its staff to draft an order that would extend the type-acceptance and related technical requirements indefinitely. The requirements were adopted in 1978, effective for three years, to cope with the problems created by the large number of amplifiers being marketed and promoted for use in and around the CB frequencies. External power amplifiers of the sort used to amplify CB signals illegally can cause serious interference to TV and radio reception.

The effectiveness of type acceptance in halting promotion of amplifiers for illegal applications indicates that it should be maintained, the Commission said then. Numerous manufacturers and distributors of amplifiers designed or promoted for illegal operation have ceased manufacture or marketing since type acceptance was imposed.

The rule change took effect April 28.

Action by the Commission March 23, 1981, by Second Report and Order (FCC 81-118). Commissioners Lee (Acting Chairman), Quello, Washburn, and Fogarty, with Chairman Ferris not participating. For further information, contact John Reed at (202)-653-6288.

FCC REFUSES TO CONSIDER ELIMINATION OF NEW AMATEUR RADIO SERVICE CLUB LICENSES (DOCKET NO. 21135)

The Commission has denied the petition of the Capitol Hill Amateur Radio Society (Capitol Hill) for reconsideration of its action in discontinuing the issuance of new Amateur Radio Service club licenses.

In June, 1980, the Commission determined that no new licenses would be issued for club, military recreation, and Radio Amateur Civil Emergency Stations, except for modification or renewal of licenses.

Capitol Hill claimed that the Commission was deficient procedurally in discontinuing new club licenses, in that it did not consider the alternative of continuing the system of issuing club station callsigns from the regular format calls. The Commission said it had considered the option of continuing such licensing and rejected it.

Capitol Hill also contended that the amended rules are not in the public interest because they do not foster amateur growth to serve the public in times of emergency. It also maintained that eliminating future club station licenses lessens the likelihood of such emergency preparedness.

The Commission said that operations now conducted by club stations may, in the future, be conducted either by club members operating portable stations or acting as control operators of another member's station. The Commission said it does not believe eliminating club licenses will result in a disinclination of the public to form amateur radio clubs or in failure of educational institutions to fund amateur radio clubs.

Action by the Commission March 26, 1981, by Memorandum Opinion and Order (FCC 81-123). Commissioners Lee (Acting Chairman), Quello, Washburn, Fogarty, and Jones, with Chairman Ferris not participating. For additional information, please contact John Borkowski at (202)-632-7597.

There are hams who have been at it for decades, people who have devoted their best efforts to one or another phase of the hobby with great dedication. In other fields of human endeavor there are tangible rewards to be gained. If you were to dedicate all the energy that is expended by the average ham into, say, the study of some musical instrument, chances are that you would eventually become so accomplished that you could earn a great deal of money. If you devoted yourself with equal persistence to university studies, you could earn an advanced degree. If you displayed as much ingenuity and tenacity in the position you now hold, you might be in your company's top echelon of management.

People find it hard to understand why we amateurs become so deeply involved in such activity, one from which relatively few tangible rewards can be gained. To many ordinary laymen, hams seem like a company of superannuated fools who play with childish toys. Even the families of some amateurs display a degree of vague embarrassment when the subject arises; they would feel much more comfortable if Dad were a yachtsman, a golfer, a fisherman, a photographer, or even a bird-watcher. Such activities are regarded as normal, but for some unfathomable reason, ham radio makes little or no sense at all. You explain that you communicate with others all over the globe, and they view it as something akin to what they did when they were kids and cultivated "pen pals" whom they wrote to during their summer vacations. You tell them that you handle traffic during emergencies, and they tell you about the time some CB oaf on the next block interfered with their TV reception. You show them your RTTY equipment, and they ask you if you can receive police calls or the daily stock quotations.

The most frequently asked question of all is, "What do you get out of all this?" They are unable to fathom any other motivating factor. To them, unless something tangible can be gained, there's no sense in devoting time, energy, and money to such activities. They cannot relate any accomplishment, however worthy, to success unless there is some sort of a payoff.

Like as not, if you were to assemble a group of amateurs and ask each to give his motivation, his purpose in being a ham, you would be likely to get a different answer from each of them. But I doubt that even those who actually work in allied fields would cite material reasons. Sure! There are hams whose careers opened as a direct result of their participation in ham radio, but if you ask them, you will learn that they never regarded the hobby as a mere means to the end.

For at bottom, practically all of us are hams because of one single word—*enjoyment*. I don't care what your bag is. . . handling traffic, slow scan TV, CW, DX, RTTY, satellite, QRP operation, designing and construction, mobile hamming, antenna development, digital techniques, antique wireless, county hunting, public service nets, or just plain garden-variety rag-

NO-CODE POLL RESULTS

The response to the no-code license question that appeared in the April Leaky Lines was rather one-sided: 94% said to keep the code! The remainder indicated that they thought the code requirement should be dropped. However, some of those wanting to keep the code said that they thought the code speed requirement should be reduced for a variety of reasons.

What we found particularly interesting was that the Fun! column poll in the March issue had a larger number of hams respond to it than to the no-code poll, although without the vehemence. Well, there certainly is no accounting for taste.

We would like to thank all who responded, and particularly those who included a comment or two along with their votes.

chewing...I know that I must have omitted at least a dozen more. The essential reward we derive is enjoyment. Not the enjoyment of the sudden flush of an easy victory such as one might feel when winning at cards...not the sort that comes from a sudden stroke of luck. But the sort of enjoyment one feels from honest accomplishment based upon dedicated work and an understanding of problems and obstacles to be overcome. There's a great difference.

I think it is significant that this column, which began as a polemic against the sick public preoccupation with materialistic goals, one of the distressing manifestations of our era, has automatically turned toward another direction. It has become a declaration of pride in the world's greatest hobby—amateur radio. It is the queen of hobbies. To be sure, there are faults to be found; nothing is perfect. But the faults are enormously outweighed by the positive values. And we do tend to focus on the bad rather than the good.

But, for the most part, we hams are chauvinists, in a way; we don't run down other people's preferences, but we are quite firmly convinced that when it comes to hobbies, ours is unquestionably the best.

Well, I'm sure that anglers, philatelists, and photographers must feel the same way. But there is an enormous and most significant difference; ours is a hobby whose entire progress and history is characterized by contributions to the society of mankind. Others have contributed, too...amateur astronomers have produced significant discoveries; amateur explorers have accomplished feats of importance. But there is no avocation which has so consistently broken new ground in the art and science of communications in ways that have so positively affected the lives of those who inhabit the planet.

Radio amateurs have made so many contributions which are now taken for granted, continue to do so to this very day, and will do so in the future. But, as always, whenever you have a record of accomplishment, you must guard it vigorously against those who would seek to exploit it for undue advantage or personal gain. There are those, unfortunately, who are forever scheming toward such ends, and there must be constant vigilance on the part of thoughtful amateurs.

One of the unmistakable hallmarks of the bonanza seekers is their constant emphasis on the growth of numbers rather than increased quality. I must declare that if all the current agitation in favor of the code-free, entry-level amateur license was originating among hams themselves, I would view it with far less apprehension. Whenever there is a cry raised for proposed changes that would increase our numbers through the elimination or lowering of standards, you don't have to search very far to find out where it's coming from. It is inspired by those who don't give a tinker's damn about the future of amateur radio, except in terms of the money that it represents.

They view that huge, untapped ocean of potential customers who will be in the market for equipment, and the saliva oozes from the corners of their slavering mouths!

I honestly and sincerely believe that this is the true origin of each and every proposal of this sort. And I also believe that those among us who have been led to endorse such plans, although they fail to grasp the fact, are simply being used as unwitting pawns. And because I have stated this, there are those who have said of me that "he has an axe to grind."

I wonder...does anyone have a bigger axe to grind than those who seek to sacrifice the integrity and quality of amateur radio on the altar of financial profit? And what about those Judas goats who aid and abet them?

I leave the answer to you. Do you seriously believe that, if I were to deliberately set out to harm the League (although I can't see how my opposition to a code-free license could possibly hurt it), it could be as great a threat as certain people's willingness to do anything for money? Do you think that my interest in promoting increased subscriptions and newsstand sales of this magazine are as great a threat as our failure to organize immediate, vigorous opposition to any FCC proposal that would deleteriously affect amateur radio? What is this mysterious "axe" that I have to grind?

I have been a loyal member of the ARRL for many years. I support it in every possible way. But that support includes an obligation to oppose paths which I consider harmful. And I do not think that the League has to run a referendum or take a poll in order to learn that the huge majority of its members strenuously oppose code-free licensing. I don't care who proposes it—the FCC, the manufacturers of electronic equipment, or goodness knows which of the several lobbies which represent special interest groups. The League should respond to such proposals immediately, with vigor and in no uncertain terms. It should never give the impression as to the slightest doubt about where its overwhelming majority stands by delaying its response pending further study or discussion. Opposition should come immediately and automatically.

This was the point of my piece in the April issue. it had come to my attention that when the FCC first floated this code-free idea, vigorous League opposition did not ensue immediately. It was delayed, and I suspect that the delay was inspired by a certain tendency toward slavishness on the part of a few people who feel that we must kowtow to the Commission, hat in hand. Well, diplomacy is wonderful, but it doesn't do much good in a life-threatening situation. You can't reason with a guy who has a knife poised at your throat!

If K2AGZ has any axe to grind at all, it is simply that he believes we need to develop some militancy in our dealings with the FCC and with those in positions of power who are or may be in the hip pockets of forces which don't have the future of amateur radio in mind. That's my "axe," and I intend to keep right on grinding it!

NEW PRODUCTS

MACROTRONICS' MAILBOX RTTY SYSTEM

Macrotronics, Inc., has announced the development of a disk-based "mailbox" RTTY system into a sophisticated RTTY communications terminal. The system has been designed for simplicity yet contains many new features. Some of these are:

- Disk-based WRU with "mailbox" storage and retrieval of messages.
- Disk-based programmable messages.
- Disk-based storage and replay of received text.
- Transmission and reception of BASIC programs, assembly source listings, object code, and data files in INTEL Hex format with error-checking and direct-save on disk in executable form.
- Auto 10-minute ID timer.
- User-programmable end-of-file sequence.
- Word mode editing.
- On-line buffered ASCII printer-driver.
- Communications through the Macrotronics interface or the Radio Shack RS232C interface board.

it is expected that the system will particularly appeal to:

- Repeaters: Set up in the WRU mode, it lets repeater users leave or play back messages. Special announcements, W1AW bulletins, propagation forecasts, DX bulletins, etc., can be made available. These may be created from the keyboard, created "offline" using the "Electric Pencil" (a registered trademark of Michael Shrayer Software) or "SCRIPSIT" (a registered trademark of Tandy Corporation) or saved off the air (and edited later with the "Electric Pencil" or "SCRIPSIT" if desired).
- MARS/Traffic handlers: The operator can save a message off the air to disk, replay it anytime on command, transfer it to another station's "mailbox," and let him call it up later. With the "Electric Pencil" or "SCRIPSIT" disk program, he can edit the

received text to correct "hits," insert "misses," add new text, rearrange paragraphs, etc. If his net requires a special end-of-line character sequence, he can program his own. Traffic can be originated by using either keyboard entry or the word processing capabilities of the "Electric Pencil" or "SCRIPSIT" disk program to create text and save it to disk. It can be transmitted at any time under keyboard control or transferred to a mailbox for automatic call-up by the destination station. For hard copy of all traffic, the operator simply has to turn on a parallel ASCII printer connected to the Radio Shack parallel printer port, and all received as well as transmitted text is output to both video and the printer.

• Program swappers: Programs and/or data files can be exchanged direct, disk to disk. This includes BASIC, assembly source, and object code. Using INTEL Hex format, the user can communicate in either the Baudot or ASCII modes. A checksum gives automatic error-detection. Programs received in this way are directly executable from disk.

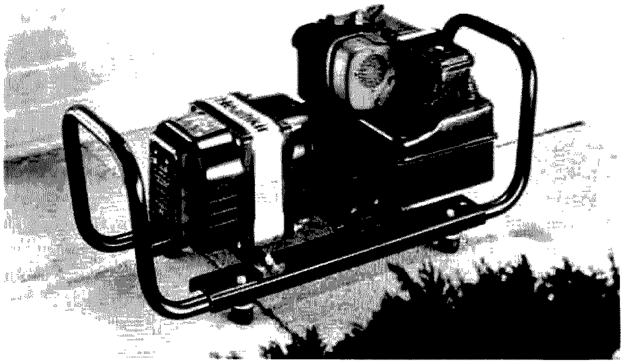
• High-speed ASCII buffs: The system allows communication through the Radio Shack RS232C interface board. The user can attach a conventional telephone modem and communicate over the air (or telephone) using Bell 103 tones and 300 baud. The system will communicate through the RS232C board at baud rates from 50 to 1200.

The M8000 disk-based RTTY system requires the Model I TRS-80 with at least 32K RAM and one Radio Shack disk drive, plus a Macrotronics ham interface (models M80, CM80, or TM80).

The M8300 disk-based system requires the Model III TRS-80 with at least 32K RAM and one Radio Shack disk drive, plus a Macrotronics ham interface (models M83, CM83, or TM83).

Both systems come complete with customized program on disk, extensive User Guide in three-ring binder, quick reference card, and conversion module.

For further information, contact Macrotronics, Inc., 1125 N. Golden State Blvd., Turlock CA 95380; (209)-667-2888. Reader Service number 480.



Heath's GU-1820 portable power system.

HEATH GU-1820 PORTABLE GENERATOR

Heath Company has announced its entry into the emergency/auxiliary/portable power market with the Heathkit GU-1820 portable power system. This lightweight alternator can produce up to 2200 Watts of 120-V ac, 60-Hz power—enough to operate a ham station, an electric chain saw, or a refrigerator-freezer during a blackout.

The GU-1820 is designed for ham radio clubs, home owners, civil defense, and police and fire departments. It can also provide on-location power for construction and logging crews, campers, hunters, woodcutters, and others.

Voltage is regulated to within ±5% and frequency variation is limited to ±4 Hz, from no load to full load at 3600 revolutions per minute (rpm). Radio-frequency interference is eliminated by a resistive spark plug. The 5-horsepower Briggs and Stratton gas engine can run up to 1¾ hours at half load on a tankful of regular gas, or gasohol. Noise is controlled by a low-tone muffler; to reduce sparking to a minimum, the optional GUA-1820-1 spark-arresting muffler (required in California) is available.

For more information on the GU-1820 portable power system, contact *Heath Company, Dept. 350-035, Benton Harbor MI 49022.* (In Canada, write *Heath Company, 1480 Dundas Street East, Mississauga, Ontario L4X 2R7.*) Reader Service number 478.

NEW PRODUCTS FROM TRAC

TRAC Electronics, Inc., has announced the introduction of two unique products for the CW enthusiast.

The TRAC*ONE CW Processor, Model TE-424, is an advanced CW audio processor which receives the audio from any rig, passes it through a phased-locked-loop tone decoder (removing all QRN and QRM), and reproduces a fully adjustable CW audio signal. Front-panel controls allow full adjustment of frequency, tone, delay, and gain. The frequency control is adjustable from 300 Hz to 2500 Hz, a match for any rig. While the CW signal is being decoded, a front-panel LED flashes in sync with the signal, establishing that the unit is locked onto the audio from the rig. The TRAC*ONE contains a built-in speaker, a headphone jack on the rear panel, and is operated on a 9-V dc battery or with an ac adapter. In the bypass position, the Model TE-424 may be left in line and the rig audio is passed through to the speaker.

The TRAC*ONE + Deluxe CMOS Keyer, Model TE-464, combines the full-featured TRAC*ONE with a deluxe state-of-the-art CMOS electronic keyer. The keyer contains self-completing dots and dashes, dot and dash memory, iambic keying with any squeeze paddle, 5-50 wpm, speed, volume, tune, and weight controls, sidetone and speaker, rear-panel switch for use with a bug or straight key, and quarter-inch jacks for keying and output. The Model TE-464 keys both grid-block and solid-state rigs and operates on one 9-V dc battery or a 9-V dc ac adapter.

For further information, contact *TRAC Electronics, 1106 Rand Bldg., Buffalo NY 14203.* Reader Service number 481.

New products from TRAC.

AMATEUR RADIO PROFILES

A new publication is now available to the amateur ranks in the form of a quarterly technical journal. *Amateur Radio Profiles*, a worldwide publication, contains factual reviews on amateur equipment performance, quality, and service. It is written by amateurs who have used, tested, and compared—and will "tell it like it is."

Equipment evaluations not only include the typical bench-test specifications, but the important on-the-air appraisal and how it compares to present state-of-the-art units. It's written in plain, easy-to-understand language by amateur enthusiasts who have actually done the testing, comparing, and rating.

Both old and new market introductions are evaluated, and *ARP* is designed so that it can

be retained and stored for future reference.

A unique feature of *ARP* is the "GBBU Equipment Ratings," in which the good, better, best, and ultimate dollar values versus performance are listed for study and comparison.

Amateur Radio Profiles, a new introduction for 1981, has already reviewed over 100 amateur products, including 61 HF and VHF antenna systems. Popular transceivers, receivers, amplifiers, and hand-held products have also been reviewed and rated!

With its unique style of equipment reporting, *ARP* should prove invaluable for the amateur as a source for product study.

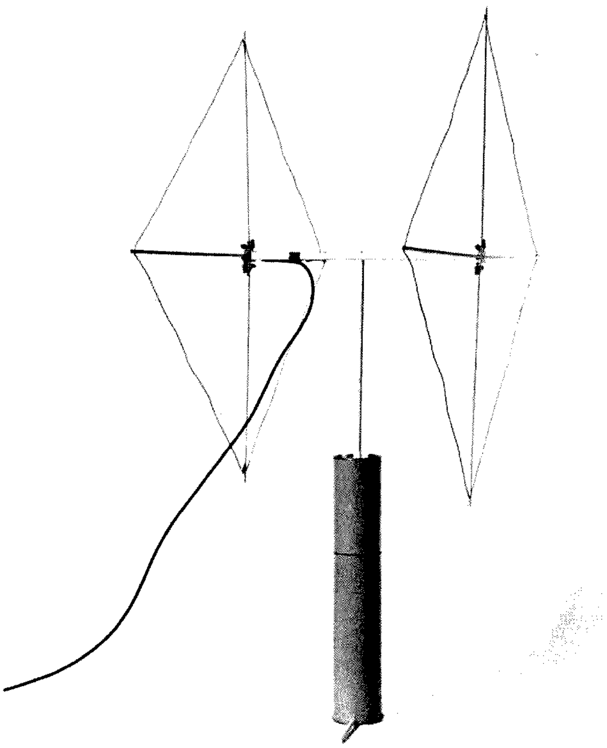
For further information, contact Amateur Radio Profiles, *Box 164, Cataula GA 31804.*

PORTABLE TWO-METER QUAD

A new collapsible antenna has been introduced by Palomar Engineers. It extends the range of low-power two-meter transceivers by providing the gain and front-to-back discrimination of a two-element quad. It is ideal for boating, backpacking, mountaintopping, and other portable applications since it gives the gain of a linear amplifier but does not require additional battery power.

The entire beam assembly is housed in an 18" carrying case hat will fit in a suitcase. For use, it unfolds to form a two element full-size quad complete ith stabilized mounting stand.

For further information, conact *Palomar Engineers, 1520-G ndustrial Avenue, Escondido A 92025.*



Palomar Engineers' portable two-meter quad.

BENJAMIN MICHAEL INDUSTRIES' MODEL 273 CLOCK

Benjamin Michael Industries, nc., has announced the addiion of the Model 273 to its line of 24-hour military-time-format clocks. The 273 is housed in a standard three-inch aircraft instrument case and is designed for mounting in the aircraft panel. The large, highly visible, LCD-type display provides the pilot with a direct readout of MT time and eliminates the need to convert from local time. The highly efficient four-digit liquid-crystal display remains visible in bright sunlight and internal, push-button-activated backlighting is provided for night viewing (though cabin or post lighting is usually sufficient).

Installation of the 273 is facilitated by the fact that the unit is powered entirely by an internal battery; connection to aircraft power is not required. The clock will operate for well over a year on a single 1.5-volt battery and the unit need not be removed for battery replacement. An identical 12-hour clock with AM and PM indicators is also available as the Model 272.

For further information, contact *Benjamin Michael Industries, Inc., 65 E. Palatine Road, Prospect Heights IL 60070.* Reader Service number 488.

Benjamin Michael Industries' Model 273 clock.

CATALOG ON TADIRAN LITHIUM BATTERIES PUBLISHED BY PLAINVIEW ELECTRONICS

Tadiran lithium thionyl chloride (inorganic electrolyte) batteries are prized for their high cell voltage, safety, long life, high energy density, and wide operating temperature, and are used as power sources for CMOS circuits, memories, and in high-reliability instrumentation. The new Plainview Electronics catalog describes 4 popular sizes—½AA, AA, C, and D—including complete operating specifications and applications hints. Each cell's nominal working voltage is 3.4 volts. At room temperature, shelf-life is greater than 10 years.

For further information, contact *Plainview Electronics Corp., 28 Cain Drive, Plainview NY 11803.* Reader Service number 479.

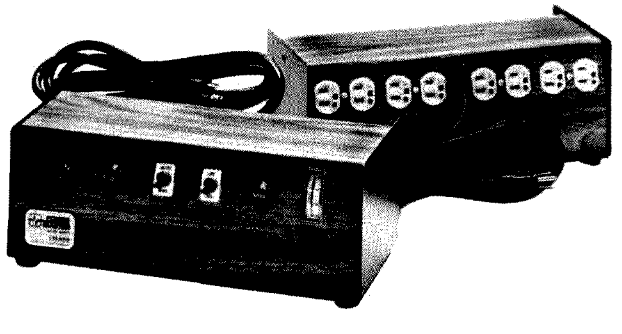
TRANS COM 401 TUNABLE CTCSS ENCODER

Trans Com, Inc., has introduced a new subaudible tone encoder. Measuring only 1.0" × .6" × .3", the 401 can be installed in radios in which similar encoders will not fit. Operating voltage is anywhere from 7 to 20 volts dc, with an average current consumption of only 4 mA. Tuning range is from 67 to 251 Hz, and frequency stability over a broad temperature range is claimed. Tone level is adjustable from 0 to 2 V p-p, with THD less than 1%. For more information, contact *Trans Com, Inc., 1104A Ridge Avenue, Lombard IL 60148.* Reader Service number 482.

OMNI-GAIN MOBILE ANTENNA

The "Omni-Gain" mobile antenna has been introduced by Valor Enterprises, Inc. The unique construction of the "Omni-Gain" omits the copper coil by combining a 17-7 stainless steel whip, a 6061-T6 electroplated aluminum coaxial matching section, and a chrome-plated brass 3/8-24 ferrule.

The "Omni-Gain" is rated at 200 Watts with 5/8-wavelength and 3-dB gain. It is field-tunable to a typical vswr of less than



SGL Waber Electric's Power Master™ line monitor power conditioner.

1.5:1 at resonance. The mobile antenna is available for the 2-meter and 220-MHz amateur bands.

For further information, contact *Valor Enterprises, Inc., West Milton OH 45383.* Reader Service number 485.

ECONO-PAK GL-25 RESISTOR KIT

The GL-25 resistor kit consists of a specially designed resistor organizer and 840 ¼-Watt 5% carbon film resistors. 20 each of 42 different values are supplied. Immediate delivery is available from *Century Electronics Corporation, 3511 North Cicero Avenue, Chicago IL 60641.* Reader Service number 483.

POWER MASTER™ LINE MONITOR POWER CONDITIONERS

SGL Waber Electric, a division of SGL Industries, Inc., has just introduced its new Power Master line monitor power conditioners. These power conditioners reduce "electrical pollution" coming through electrical power lines and branch circuits to solid-state electronic equipment which is sensitive to voltage spikes and electrical noise. A recent study showed that the average incident rate of harmful power line disturbances is over 128 times per month. Major causes of electrical pollution are the switching on and off of electrical motors; energizing transformers, relays and solenoids; power line overvoltages and undervoltages; lightning; fluorescent lights; radio frequency interferences; electromagnetic interferences; and electromagnetic pulses; and improper grounding of equipment.

Electrical pollution can have devastating effects and even destroy sensitive semiconductors in modern equipment. Noise interference can be interpreted as actual signals by microcomputer chips to produce false data input or output. The result can be equipment breakdown or the wiping out of valuable data or programs stored in the memory. Power Master line monitor power conditioners will safely and simply alleviate these problems.

Equipment protected by Power Master power conditioners includes minicomputers, word processors, electronic instruments, photocopiers, cash registers, personal computers, automatic bank tellers—any electronic equipment with semiconductors, all of which are sensitive to voltage spikes and electrical noise.

The product line consists of eight power conditioner models which vary in complexity from a wall plug-in unit to a very sophisticated console or rack-mounted unit. The simplest models contain varistors to clamp or reduce voltage spikes. The more sophisticated units include a multi-stage filter network which has spike suppression capability, transverse and common mode electrical noise filtration, as well as an undervoltage warning system, with indicator lights which are activated when the incoming electrical line voltage drops below a safe level. In addition, an ac voltmeter allows the operator to inspect the incoming ac power.

For further information, contact *SGL Waber Electric, 300 Harvard Avenue, Westville NJ 08093; (609)-456-5400.* Reader Service number 487.

ADJUSTABLE DUAL POWER SUPPLY KIT

Recently announced by Jameco Electronics is the Model JE215 adjustable dual power supply kit. The supply provides independently adjustable positive and negative output voltages from 5 to 15 V dc regulated. Separate adjustment for each supply allows the user unlimited applications for integrated circuit requirements. Power output for each supply ranges from 5 V dc @ 500 mA to 15 V dc @ 175 mA; an onboard LED indicates power-on condition.

For further information, contact *Jameco Electronics, 1355 Shoreway Road, Belmont CA 94002.* Reader Service number 486.

ELECTRONIC AND RADIO THEORY

Okay, gang, time to shape up! So far we've been coddling you with puzzles on purely social and operating matters. Now we start the tough stuff—technical material. Remember technical material, all that funny junk the FCC asked you about on that test you took? Oh, you do remember. And you hated it? Well, no matter, everything can't be as much fun as repeater operating.

ELEMENT 1—CROSSWORD PUZZLE
(Illustration 1)

Across

1) A conveyance of electrical energy
9) Revolutions per minute (abbr.)
10) Oscillator type (abbr.)
11) Portable memory unit (abbr.)
12) Neon's symbol (abbr.)
14) The amateur's curse (abbr.)
15) The frequency synthesizer's friend (abbr.)
16) Engineering society (abbr.)
18) Query in Morse
19) Two parts of Ohm's Law
20) Millifarad (abbr.)
21) Crystal cut
23) A lie
25) Worldwide radio rulemakers (abbr.)
26) Connected circuit branches
27) Director, for instance (abbr.)
28) Input/output (abbr.)
29) Rural Electrification Administration (abbr.)
32) Absence of
33) Indefinitely long time
34) Symbol: pair of grid voltages
36) Charged electron or molecule
37) Opposite of off
38) Symbol: output resistance
39) Memory register (abbr.)
40) Alerting signal
41) Semiconductor devices (2 words)

Down

1) Propagation type (abbr.)
2) Symbol: plate resistance
3) Class A, B, C
4) Not a genuine emission
5) Metric ton (abbr.)
6) Process of 36 across
7) QRN or QRM
8) Din eradicator (2 words)
13) Degree suffix
17) Force and current (abbr.)
22) Elec______
24) D'Arsonval or 160
30) Symbol: output voltage
32) NOT-ORs (abbr.)
35) Silicone grease
36) Intermodulation distortion (abbr.)

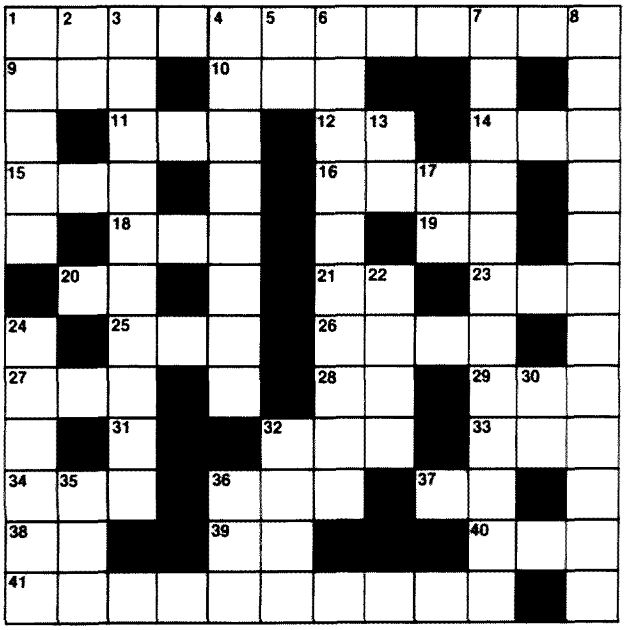

Illustration 1.

ELEMENT 2—ALPHABET GAME

Complete the nine words below by placing letters of the alphabet on every dash. Use each letter only once.

A B C D E F G H I J K L M
N O P Q R S T U V W X Y Z

1) _E_E_
2) _RE___EN_Y
3) _U_ERRE_ENER_TIVE
4) PERM_A_ILIT_
5) _I_O_AT_
6) SC_E_AT_C
7) _IP_LE
8) _O_
9) _OULE

ELEMENT 3—NAME THE EQUATION

Here are some common equations used in radio and electronics—name them.

1) $I = \frac{E}{R}$

2) $X_C = \frac{1}{2\pi fc}$

3) $P = EI$

4) $L(\mu H) = \frac{a^2 n^2}{9a + 10b}$

5) $\text{length} = \frac{492}{f}$

6) $\text{frequency observed} = \left(\frac{V + W - Vo}{V + W - Vs}\right)\left(\text{frequency of source}\right)$

7) $F = \frac{Q_1 Q_2}{d^2}$

8) $n = \sqrt{Zp/Zs}$

9) $X_L = 2\pi fL$

10) $Q = \frac{R}{X}$

ELEMENT 4—FILL IN THE BLANK

1) SSB receivers must use a __________ detector.
2) The more elements on a beam antenna, the greater its __________.
3) The two RTTY tones are called _______ and space.
4) A voltmeter should have _______ internal resistance.
5) Propagation ducts often form in the __________.
6) A "Clapp" is a type of __________.
7) "Hertzian waves" is the old term for __________ waves.
8) __________ is an alloy used in electronics to join metallic surfaces.
9) Electrical noise on a CRT is often called _______.
10) "Capture" is the term for a strong signal eliminating a weak signal in the _____ mode.

11) A two-element tube is a ________.
12) A ________ chart is a polar chart using circles to show resistance and reactance.
13) The process of adding known impurities to a semiconductor is called ________.
14) A V beam is ____-directional.
15) The unit of electrical charge is the ________.
16) Most long-distance (HF) radio communication is accomplished by reflecting signals off the ____-layer.
17) A device which passes or rejects a certain frequency while rejecting or passing others is known as a ________.
18) The siemens used to be the _____.
19) A valuable metal with low rf resistance is _______.
20) A "No. 47" is a common ________ light.

ELEMENT 5—MATCH THE TRANSISTOR

Match the transistor types listed below with the schematic symbols in Illustration 2.

1) Dual-gate MOSFET
2) Unijunction
3) MOSFET
4) Junction FET
5) Bipolar

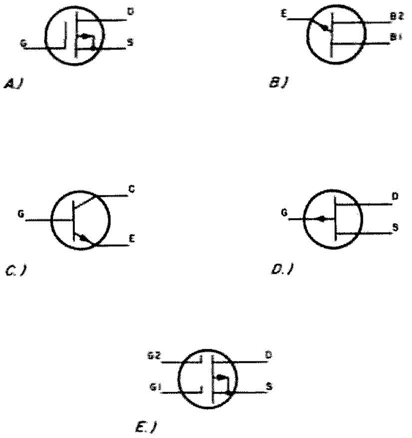

Illustration 2.

THE ANSWERS

Element 1:
See illustration 1A.

Element 2:
1—ZENER, 2—FREQUENCY, 3—SUPERREGENERATIVE, 4—PERMEABILITY, 5—KILOWATT, 6—SCHEMATIC, 7—DIPOLE, 8—VOX, 9—JOULE.

Element 3:
1—Ohm's Law, 2—Capacitive reactance, 3—Power formula, 4—Coil inductance, 5—Half-wave dipole length, 6—Doppler effect, 7—Coulomb's Law, 8—Impedance matching, 9—Inductive reactance, 10—Q of a parallel circuit.

Element 4:
1—product, 2—directivity, 3—mark, 4—high, 5—troposphere, 6—oscillator, 7—electromagnetic, 8—Solder, 9—snow, 10—FM, 11—diode, 12—Smith, 13—doping, 14—bi, 15—coulomb, 16—F, 17—filter, 18—mho, 19—gold, 20—pilot.

Element 5:
1—E, 2—B, 3—A, 4—D, 5—C.

SCORING

Element 1:
Twenty points for the completed puzzle, or 1/2 point for each question correctly answered.

Element 2:
Two points for each word deciphered. Two bonus points if you get all nine.

Element 3:
Two points for each equation named.

Element 4:
One point for each blank filled.

Element 5:
Four points for each transistor matched.

Rate yourself:
1-20 points—CBer
21-40 points—A passing interest in electronics
41-60 points—Junior Engineer
61-80 points—Engineer
81-100+ points—Senior Engineer

FUN! MAILBOX

Each month, as space permits, we'll try to print interesting letters from readers.

I've just gone through my February *73* and feel compelled to comment on your FUN! column. Specifically on Element 3, question 8 (I am an Advanced class ham so I am qualified to comment on Element 3—hi). The correct answer should be FALSE; KP2 is not THE new prefix for KV4 but A new prefix for KV4. NP2 and WP2 are also new, and issued, prefixes for KV4 (and people accuse the FCC of tricky exams).

Jim Lommen NP2AE
St. Croix, U.S. Virgin Islands

Pardon my article.—JE

Your interest in the ham fraternity is admirable. Too bad the guys at the ARRL don't have the same curiosity.

What we need is a second fraternity organization to formally represent ham radio. I will be a charter member.

Jim Owens W5JQE
Pottsboro TX

Thanks for the nice words, but I was never one for frats—the hazings are too rough.—JE

CORRECTIONS

Some changes have been made which affect my article, "Operating Overseas" (February, 1981), and I would like to bring things up to date. At the time I submitted the story, there were no guest licenses available in South Africa. In the meantime, new procedures were introduced and quite a few have since been issued.

The first one was issued by the Telecommunications Department in Pretoria to a visitor from the USA. Bob W2TK/ZS was the first amateur with a guest license: GL1. Bob visited the clubhouse of the Johannesburg Branch of the South African Radio League. Guest licenses have been issued also to two visitors from Japan.

I hope the introduction of guest licenses will get more amateurs to bring their rigs to South Africa or to operate the various club stations available. Regrettably, some visitors fail to understand that it is illegal for a person without a license to operate an amateur station. We have no third-party facilities in South Africa.

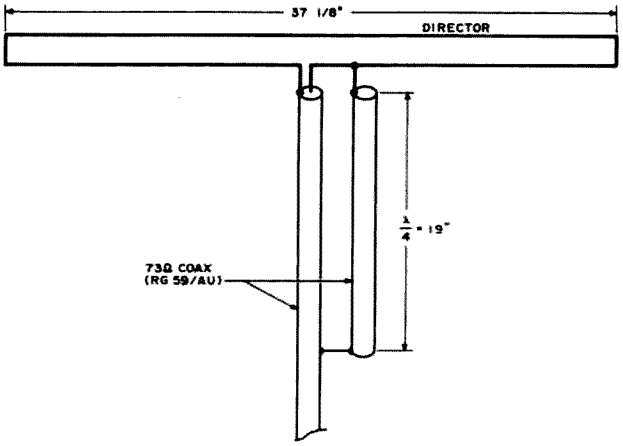
I hope this will clear any doubts.

Peter Strauss A2CPS
Gaborone, Botswana

In "The Earth Mover," on page 48 of the May, 1981, issue, in Fig. 2, (a) and (b) are reversed. The pattern at the top is that with the reflector open and the antenna 1/2 wavelength above ground. The one at the bottom is the pattern with the antenna 1/4 wavelength above the reflector.

In (a) the reflector is removed and in (b) the reflector is 1/4 wavelength below the dipole.

Jerrold A. Swank W8HXR
Washington Court House OH



Revised Fig. 3. Dimensions given for the 1-to-1 balun are for 146.5 MHz. For other frequencies, balun length in inches is calculated from 2942 × .95 ÷ MHz.

In my article, "The ZL/DF Special" (March, p. 40), I made an error in calculating the balun length; the velocity factor should have been .95. The revised Fig. 3 and caption are shown here.

My sincere apologies to *73* and its readers, and my thanks to W9PJF for bringing the mistake to my attention.

Reprinted from the Federal Register

Radio Service; Amendment of the Commission's Rules To Establish Procedures To Minimize Potential Interference to Radio Astronomy Operations

AGENCY: Federal Communications Commission.

ACTION: Final rule.

A. Part 95 of Chapter I of Title 47 of the Code of Federal Regulations is amended, as follows:

In § 95.17, a new paragraph (g) is added, as follows:

§ 95.17 Filing of applications.

* * * * *

(g) In order to minimize possible harmful interference at the National Radio Astronomy Observatory site located at Green Bank, Pocahontas County, West Virginia, and at the Naval Research Laboratory site at Sugar Grove, Pendleton County, West Virginia, any applicant for a license (other than mobile, temporary base, or temporary fixed) for a new station or for modification of an existing station in a manner which would change either the frequency, power, antenna height or directivity, or location of such a station within the area bounded by 39° 15' N. on the north, 78° 30' W. on the east, 37° 30' N. on the south, and 80° 30' W. on the west shall, at the time of filing such application with the Commission, simultaneously notify the Director, National Radio Astronomy Observatory, P.O. Box No. 2, Green Bank, West Virginia, 24944, in writing, of the technical particulars of the proposed station. Such notification shall include the geographical coordinates of the antenna, antenna height, antenna directivity, if any, proposed frequency, type of emission, and power. In addition, the applicant shall indicate in his application to the Commission the date notification was made to the Observatory. If an objection to the proposed operation is received, within 20 days of the receipt of the application, from the National Radio Astronomy Observatory for itself or on behalf of the Naval Research Laboratory, the Commission will consider all aspects of the problem and take whatever action is deemed appropriate.

B. Part 97 of Chapter I of Title 47 of the Code of Federal Regulations is amended, as follows:

In § 97.85, a new paragraph (f) is added, as follows:

§ 97.85 Repeater operation.

* * * * *

(f) The licensee of an amateur radio station, before modifying an existing station in repeater operation in the National Radio Quiet Zone, or before placing his/her amateur station in repeater operation in the National Radio Quiet Zone, shall, after May 13, 1981, give written notification thereof to the Director, National Radio Astronomy Observatory, P.O. Box No. 2, Green Bank, West Virginia, 24944. Station modification is any change in frequency; power; antenna height or directivity; or the location of the station.

(1) The notification shall include the geographical coordinates of the antenna, antenna height, antenna directivity, if any, proposed frequency, type of emission, and power.

(2) The National Radio Quiet Zone is the area bounded by 39° 15' N. on the north, 78° 30' W. on the east, 37° 30' N. on the south, and 80° 30' W. on the west.

(3) If an objection to the proposed operation is received by the Commission from the National Radio Astronomy Observatory at Green Bank, Pocahontas County, West Virginia, for itself or on behalf of the Naval Research Laboratory at Sugar Grove, Pendleton County, West Virginia, within 20 days from the date of notification, the Commission will consider all aspects of the problem and take whatever action is deemed appropriate.

HAM HELP

I have been trying for several months to get in touch with a manufacturer of paging systems. I would like to communicate with a couple of them as soon as possible.

I need to supply a base system and about 100 units for use by volunteer firemen.

The specifics are: operation on 220/240 volts, coverage of a large area, and units which are nonselective.

Any help in this area would be greatly appreciated.

James E. Kowing
Serra E Mar
Apartado #167
Portimao, Algarue
Portugal

I need a manual on a Johnson Valiant transmitter and also instructions for converting it to single sideband operation.

I will be glad to pay a reasonable price for a copy of either or both sets of information or will copy and return if permissible.

W. E. George W4LHJ
1731 Country Club Drive
Tullahoma TN 37388

I am looking for any kind of SSTV monitoring equipment, used or brand new. I would appreciate any help.

RTTY LOOP

Marc I. Leavey, M.D. WA3AJR
4006 Winlee Road
Randallstown MD 21133

It seems as though every July I have covered the topic of computer-based, or assisted, RTTY. Not wanting to trample on any traditions, this month will be no exception.

Most longtime readers are aware that my preference in computer systems is the 6800. While this stems from my years of experience(!) in owning and programming one, it is boosted by the many letters I receive from other 6800 owners who enjoy the ease with which such a system can be put on RTTY.

In the past, I have presented simple schemes to receive or transmit RTTY, using software timing and a PIA (parallel port) for interfacing. Several readers have expressed an interest in RS232 interfacing, and a general curiosity about the MP-C control interface exists, since it is a PIA used for serial interfacing with the MIKBUG ™ monitor.

Fig. 1 is a diagram of the MP-C interface. As can be seen, several input and output devices are tied to the PIA I/O lines. While MIKBUG requires a specific configuration of bit patterns in order to use the port, nothing prevents us from writing a software driver to accommodate ourselves. In doing so, we gain several things: We get to use a board that many of us have relegated to a back drawer, onboard RS232 or current-loop operation is possible, and since the MP-C is unbuffered, unlike the MP-LA, we can program individual PIA lines for input or output, if we need to.

For example, a 1 written to bit 0, the least-significant bit, of the A side (PA0) will output a mark level on both the RS232 and TTY outputs. Similarly, a 0 will output a space. Note that this is a bit different than with the MP-LA, where a 1 is output as a high state, which is space in RS232 and mark on TTY. Using the MP-C board interfacing greatly simplifies things.

With this in mind, look at Program 1. This is not a whole program, but an I/O driver segment and initialization routine. The initialization, of course, would be called once, at the beginning of the program. The assumption is made that the output routine is called with the character to be sent in the A accumulator, in five-level code, similarly to the programs presented here before. That is, the Baudot/Murray data is left justified within the eight-bit character. For this demonstration, Letters or Figures is not considered. Thus, an S, which is 1-0-1-0-0 in Baudot/Murray, would be represented as 10100000 in eight-level code. By the way, this is *not* ASCII, even though it is eight bits. ASCII defines a specific code, covered here several months ago, and just because a character is seven or eight bits long makes it no more ASCII than a frog.

The output routine works similarly to a straight PIA routine, but the output, taken from the appropriate MP-C output, is true RS232 or TTY level. Try it!

Along these lines comes a letter from Gary Fender W6SZX in Santee, California, who is looking for ways to interface his 6800 system with a 60-mA loop. Gary is using an old TT/L-2 terminal unit and is having problems interfacing it to the computer. You might try isolating the optoisolator normally used for 20-mA TTY output from the computer power supply and placing that in the loop. Alternatively, using the output of the MP-C board to drive another optoisolator may solve your problem. Let me know how it goes.

Interest in full programs to receive and/or transmit RTTY continues unabated. Leon Howe AH2AG, on Guam, is looking for the program we published some time back to transmit RTTY from the computer to the transmitter. Another request for the transmit and receive programs comes from Kurt Wenger, in Steinhausen, Switzerland. Copies of the programs are on their way to both and remain available for $1.00 each to cover expenses.

A 6800-based system that has received little coverage is the Heathkit ET-3400 trainer. Mike Clare WB3ILM, in Wyoming, Delaware, has an ET-3400 and a HAL ST-5000 demodulator. He wonders if it is possible to put the ET-3400 on RTTY. While I have little information about the ET-3400, I see no obvious reason why any 6800 system having one parallel line in and one line out could not be used on RTTY. The programs mentioned above do not use any features truly unique to SWTPC systems. The system clock frequency would have to be taken into consideration when setting up timing loops, but it should be a doable project. Any readers now using the ET-3400 on RTTY or who know of any problems with doing so are invited to write us with the details.

Along the lines of more established systems, Charles Plaisted WA1ZDA, of Rockland, Maine, has a problem. Charles has acquired bits and pieces of a 6800 system and is trying to assemble them into a workable system. He states that he has the MP-A2 CPU board, two MP-M 4K memory boards, and two MP-8M 8K memory boards. He is not sure what the monitor chip is and wants help in getting his bits and pieces assembled into a computer.

To begin with, you will need at least two more items to start on your way: a mother board and a power supply. Suitable mother boards for the SS-50 bus are available from a number of sources, including Thomas Instrumentation, 168 Eighth Street, Avalon NJ 08202, and GIMIX, Inc., 1337 West 37th Place, Chicago IL 60609. The mother-board configuration for the SS-50 bus includes 50-pin connectors for CPU, memory, and accessory cards, and 30-pin connectors for I/O cards. The power supply needs to supply +8 V dc, + 12 V dc, and − 12 V dc at enough current to supply all operating boards.

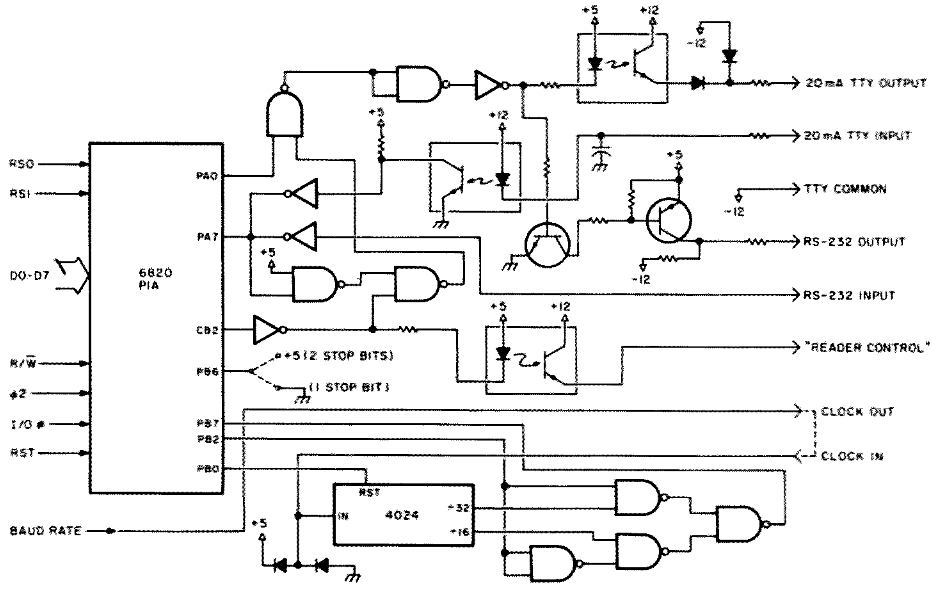

Fig. 1. Partial schematic of MP-C interface.

Now, about that monitor chip. If the top of the chip reads "MCM6830P8," then it is MIKBUG. The later monitor sold by Southwest Technical Products Corp., SWTBUG™, had the "SWTBUG" and version number on the top.

Input and output may be provided by an MP-C, such as diagrammed here, or by an ACIA board, available from the above sources. Another source of information is the series written on 6800 computers by Pete Stark, and others, carried in our sister publication, *Kilobaud Microcomputing*. Good luck, and let me know how you make out.

Interested in a full RTTY program for the 6800? So are many others. Ron Cohen K3ZKO, of Cheltenham, Pennsylvania, is putting his system up and looking for a program. So is Bob Wilson K8MPV, of Milford, Michigan. The 6809 evokes its share of interest with both of the above gentlemen, as well as Bob Sayler KB8DR and others mentioning the new Radio Shack 6809-based Color Computer. Well, to all of you, watch the pages of *73* carefully for a full transceive program for the 6800, which should be convertible to a 6809 with a minimum of effort.

Other items to watch out for, by the way, include a newly revised edition of *73*'s *RTTY Handbook*, including material published since the last revision in 1977. New material on video RTTY and computers will also be included. We are also hoping to bring out a compilation of RTTY Loop covering the first few years of this column, for those of you who came in late. Watch for the announcement in the *73* Radio Bookshop section. While you're in the neighborhood, by the way, take a look at many of the fine offerings presented there. Some mighty fine material, don't 'cha know!

Speaking of reading material, next month will feature something to read and something to write! Interested? Don't miss next month's RTTY Loop.

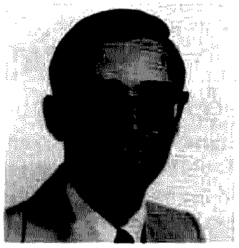
CONTESTS



Robert Baker WB2GFE
15 Windsor Dr.
Atco NJ 08004

COLOMBIAN INDEPENDENCE DAY CONTEST

Starts: 1800 GMT July 18
Ends: 1800 GMT July 19

Entry classes include: A) single operator/single band; B) single operator/multi-band; C) multi-operator/multi-band/one rig; D) multi-operator/multi-band/multi-transmitter. Use all bands, 160 through 10 meters, on SSB and/or CW. Contest call is "CQ HK TEST." Only one contact per band with the same station. No crossband or crossmode contacts are allowed.

EXCHANGE:

Non-HK stations send RS(T) and three-digit serial number starting with 001. HK stations will send RS(T) and 171. The number 171 represents the years of commemorated independence.

SCORING:

QSO points for non-HK stations are as follows: 10 points for each HK station, 3 points per DX QSO, and 1 point for QSO with stations in the same country. QSO points for HK stations are 5 points for each DX QSO and 1 point for each HK station worked. In all cases, the multiplier is the number of DXCC countries worked on each band. Multiply the total QSO points by the sum of multipliers per band for the final score.

AWARDS:

Silver cup and plaques for world winner and first and second places in each operating category for both HK and non-HK stations. A minimum of 100 QSOs must be shown when applying for any award.

ENTRIES:

Keep a separate log sheet for each band. Enter the country only the first time worked. Show all times in GMT. Each entry must be accompanied by a summary sheet indicating scoring information. The logs not summarized according to the above mentioned instructions will be used only as check logs. Normal disqualification rules apply. Entries must be postmarked no later than August 30th and must be received before December 30th to be eligible for awards. Send all entries to: LCRA, Contest and Awards Manager, Apartado 584, Bogota, Colombia, South America.

SWOT QSO PARTY

Starts: 0000 GMT July 17
Ends: 2359 GMT July 23

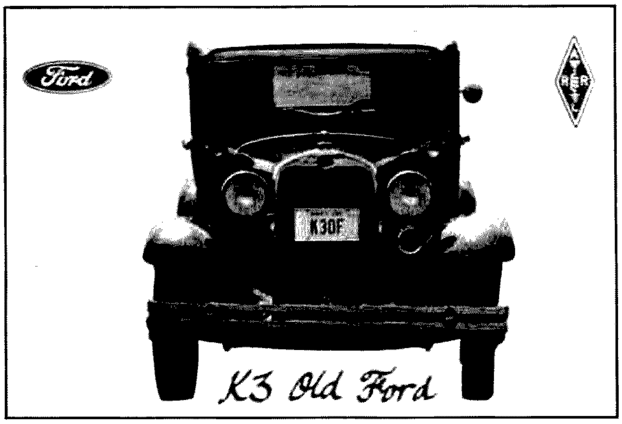
There are no restrictions on the number of hours devoted to the contest during the one-week contest period. All licensed amateurs with operating privileges on two meters are eligible to participate. All contacts must be made using CW or SSB only. Any station may be worked once on each mode for QSO score. Contacts must be made direct without the aid of satellites, repeaters, or retransmission of any kind. EME contacts may be counted if they meet all requirements. All contacts must be made from one geographic location. Portables or mobile stations operating in more than one geographic location may submit from the location where they obtained the highest score.

EXCHANGE:

To qualify for contact credit the following information must be exchanged: callsigns, geographic location (county and state, territory, or equivalent), SWOT numbers for SWOT members.

SCORING:

The SWOT member credit equals the total number of SWOT member QSOs times the number of geographic locations times two. The non-SWOT member credit equals the total number of non-SWOT QSOs multiplied by the number of geographic locations. The final score equals the sum of the above two totals.



QSL OF THE MONTH

Our QSL of the Month Contest's first winner is W.C. Cloninger, Jr., K3OF of Rockville, Maryland. Mr. Cloninger works for the Ford Motor Company and is a member of the Ford Amateur Radio League (also known as the Tin Lizzie Club). The vehicle pictured on his QSL is his unrestored 1930 Model A Town Sedan.

If you would like to enter the contest, put your QSL *in an envelope* and mail it along with your choice of a book from *73*'s Radio Bookshop to *73 Magazine*, Pine Street, Peterborough NH 03458, Attention: QSL of the Month. Entries which do not use an envelope (the Postal Service does *occasionally* damage cards) and do not specify book choice will not be considered. Sorry.

W5WG	148	105	40	26,160
WA1FCN	82	155	43	23,908

AWARDS:

The highest final score will receive the 1981 SWOT trophy. Certificates will be awarded to the highest scorer in each ARRL section in which more than one entry is received. In the event of ties, the entry with the earliest postmark will be the winner. Winners will be announced in the *SWOT Bulletin* at the earliest possible date.

ENTRIES:

Logs should not be submitted unless requested. Send a summary postmarked not later than August 21st to: Dean Figgins WA7EPU, PO Box 1141, Carefree AZ 85377. Include your name, callsign, address (with county and ARRL section), SWOT number (if member), and all necessary scoring information.

CW COUNTY HUNTERS CONTEST

Starts: 0000 GMT July 25
Ends: 0200 GMT July 27

The CW County Hunters Net invites all amateurs to participate in this year's contest. All mobile and portable operation in less active counties is welcomed and encouraged. Stations may be worked once on each band and again if the station has changed counties. Portable or mobile stations changing counties during the contest may repeat contacts for QSO points.

EXCHANGE:

QSO number; category (P for portable, M for mobile); RST; state, province, or country; and US county. Stations on county lines give and receive only one QSO number, but each county is valid for a multiplier.

FREQUENCIES:

3575, 7055, 14070, 21070, and 28070. It is strongly requested that only P or M category stations call CQ or QRZ on 40 meters below 7055 and on 20 meters below 14070, with all other stations spreading out above those frequencies.

SCORING:

QSOs with fixed stations are 1 point; QSOs with portable or mobile stations are 3 points. Multiply the number of QSO points times the number of US counties worked. Mobiles and portables calculate with their score on the basis of total contacts within a state for the state certificate, and calculate their score on all operation if they operated from more than one state in competition for the High Portable or High Mobile Trophy.

AWARDS:

Certificates will be awarded in three categories:

1) Highest fixed or fixed portable station in each state, province, and country with 1,000 or more points.

2) Highest station in each state operating portable from a county which is not his normal point of operation with 1,000 or more points.

3) Highest station in each state operating mobile from 3 or more counties with a minimum of 10 QSOs in at least each of 3 counties.

Trophies will be awarded to the highest single-operator station in the US in categories P and M. The Awards Committee will issue additional awards where deemed appropriate.

ENTRIES:

Logs must show category, date/time in GMT, station worked, band, exchanges, QSO points, location, and claimed score. All entries with 100 or more QSOs *must include a check sheet of counties worked or be disqualified from receiving awards.* Enclose a large SASE if results are desired. Logs must be postmarked by September 1st and sent to: CW County Hunters Net, c/o Jeffrey P. Bechner W9MSE, 673 Bruce Street, Fond du Lac WI 54935.

EUROPEAN DX CONTEST—CW

Starts: 0000 GMT August 8
Ends: 2400 GMT August 9

Sponsored by the Deutscher Amateur Radio Club (DARC). Only 36 hours of operation out of the 48-hour period are permitted for single-operator stations. The 12 hours of non-operation may be taken in one but not more than three periods at any time during the contest. Operating classes include single-operator, allband and multi-operator, single transmitter. Multi-operator, single-transmitter stations are only allowed to change band one time within a 15-minute period, except for making a new multiplier. Use all amateur bands from 3.5 through 28 MHz. A contest QSO can only be established between a non-European and a European station. Each station can be worked only once per band.

EXCHANGE:

Exchange the usual six-digit number consisting of RST and progressive QSO number starting with 001.

SCORING:

Each QSO counts 1 point. Each QTC (given or received) counts 1 point. The multiplier for non-European stations is determined by the number of European countries worked on each band. Europeans will use the last ARRL countries list. In addition, each call area in the following countries will be considered a multiplier: JA, PY, VE, VO, VK, W/K, ZL, ZS, and UA9/UAØ. The multiplier on 3.5 MHz may be multiplied by 4, on 7 MHz by 3, and on 14 through 28 MHz by 2. The final score is the total QSO points plus QTC points multiplied by the sum total multipliers.

QTC TRAFFIC:

Additional point credit can be realized by making use of the QTC traffic feature. A QTC is a report of a confirmed QSO that has taken place earlier in the contest and later sent back to a European station. It can only be sent from a non-European station to a European station. The general idea is that after a number of European stations have been worked, a list of these stations can be reported back during a QSO with another station. An additional 1 point credit can be claimed for each station reported.

A QTC contains the time, call, and QSO number of the station being reported, i.e., 1300/DA1AA/134. This means that at 1300 GMT you worked DA1AA and received number 134. A QSO can be reported only once and not back to the originating station. Only a maximum of 10 QTCs to a station are permitted. You may work that same station several times to complete this quota, but only the original contact has QSO point value. Keep a uniform list of QTCs sent. QTC 3/7 indicates that this is the 3rd series of QTCs sent and that 7 QSOs are reported. Europeans may keep the list of the received QTCs on a separate sheet if they clearly indicate the station who sent the QTCs.

AWARDS:

Certificates to the highest scorer in each classification in each country, reasonable score provided. Continental leaders will be honored with plaques. Certificates will also be given to stations with at least half the score of the continental leader or with at least 250,000 points. The minimum requirements for a certificate or a trophy are 100 QSOs or 10,000 points.

ENTRIES:

Violation of the rules, unsportsmanlike conduct, or taking credit for excessive duplicate contacts will be deemed sufficient cause for disqualification. The decisions of the Contest Committee are final. It is suggested that the log sheets of the DARC or equivalent be used. Send a large SASE to get the wanted number of logs and summary sheets (40 QSOs or QTCs per sheet). SWLs apply the rules accordingly. Entries should be sent no later than September 15th. North American residents may send their applications and logs to: Hartwin E. Weiss W3OG, PO Box 440, Halifax PA 17032 USA.

EUROPEAN COUNTRY LIST:

C31, CT1, CT2, DL, DM, EA, EA6, EI, F, FC, G, GC (Guer), GC (Jer), GD, GI, GM, GM (Shetland), GW, HA, HB9, HBØ, HV, I, IS, IT, JW (Bear), JW, JX, LA, LX, LZ, M1, OE, OH, OHØ, OJØ, OK, ON, OY, OZ, PA, SM, S, SV, SV (Crete), SV (Rhodes), SV (Athos), TA1, UA1346, UA2, UB5, UC2, UN1, UO5, UP2, UQ2, UR2, UA Franz Josef Land, YO, YU, ZA, AB2, 3A, 4U1, 9H1.

HAM HELP

I have acquired a DuMont model 208-B oscilloscope, serial number 10237, for which I am looking for information, schematic, manual, etc. Willing to pay for copying or will copy and return original.

H. L. Church WØKXP/9
309 W. St. Louis St.
Lebanon IL 62254
(618)-537-4498 or 537-6666

I acquired an old radio some time ago. I do not have any idea as to what tube it requires or what voltage is necessary to operate same.

The radio was manufactured in 1925, by Kutzen Radio Mfg. Co., Racine WI. It is serial #019690, Model #SM-1. On the top lid of the radio there is another ID plate with "Radio Receiver #1371, build by W. F. Main Radio Co., Cedar Rapids, Iowa." I believe this to be the case manufacturer.

I would appreciate any and all information anyone can supply about this unit.

Edmund L. Ogle
109 Sumac St.
Greybull WY 82426

I need schematics, manuals, or any available information on the following items: Ray Jefferson model 914 transceiver; T-195(B)/GRC-19 transmitter; MI² model 101 TWX Data Unit; CV-278/GR FSK demodulator; MD-203/GR FSK modulator; and a set of manuals for my 33ASR.

I would like to hear from anyone who has converted an RT-594/ARC38A SSB transceiver for normal ham service—also need manual or diagram. I will gladly pay all postage and other costs. Thanks.

Tommy Norris KA4RKT
Route #1, Box 412
Auburn KY 42206
(502)-542-6343, after 0000UTC

I need a schematic for a 10-Ampere power supply, filtered, highly stable, variable, and regulated. On hand I have the following parts, which I hope to use in the supply:

- Transformer—117-ac input, 19-ac output under no load
- Full-wave bridge rectifier rated at 25 Amperes
- 25000 uF filter capacitor rated at 100 volts dc
- PNP power transistor no. 2N1653
- Motorola regulator no. LM317K
- Heat sink to mount the power transistor and regulator on

Can anyone help?

Clinton E. Pratt WB4MXI
3509 Ballylinn Ct.
Virginia Beach VA 23464

I will pay for technical help on a part-time basis. I need help in designing oscillators, multipliers and amplifiers up through UHF—all solid-state breadboarding.

D. W. Straham
9625 Catlett
La Porte TX 77571
(713)-479-1614

LETTERS

RE NO CLICKEE

In regard to J. Olsen's "A New Proposal" letter and Wayne's reply, May, 1981, "Olsen...no clickee, no tickee" seems a hard-line reply as Olsen's ideas were interesting and may have some merit.

My own objection would be that people like my XYM, with his first-class commercial ticket and a ham ticket sans code (as Olsen proposes), could not legally operate commercially-available equipment they may have already purchased. My XYM also has found the code difficult to corral and would welcome a ticket sans code. But not with restrictions as spelled out by Olsen, because we do own "store-bought" rigs which I then could operate and he could not (even though we would then *both* have our ham tickets).

E. Nadine Hardy KA5GRH
Tijeras NM

PLENTY OF SPACE

Perhaps my previous letter (December, 1980) was not clear and Wayne's comment at the end seemed to lend flavor to the fact that I was for a "code-free, theory-free" license. This is far from the truth.

I have never advocated a code-free license nor do I advocate a theory-free test. What I am against is the necessity of the depth of the theory involved. The FCC should place greater emphasis on rules of the road and proper operating procedure. Basic understanding of some electronics is necessary but do we have to know "What speed characteristics does TTL have as compared to 4000 CMOS?" or "Determine the Boolean equation for the circuit shown"? Who cares? Does knowing this make anyone a better or worse ham? I think not. These are just a few of the absurd questions on the test.

If we are going to go this far, why don't we just make it a requirement to have a degree in electronic engineering. Then we can really have an elitist group. Just how far do you want to go?

We, as a group, need a greater influx of hams to have a greater voice in Congress and with the FCC. Stop worrying about overcrowding on the bands. There is plenty of space available. Maybe if we had a few fewer contests and nets (I like both) there would be more space. Do we really need so many contests and nets, though?

For those who wrote and called in support of me—thank you. For those that indulge in hate letters—you call yourselves hams? Ha! Constructive dialogue is what is needed. Bickering and name calling only serves to divide, and we all lose.

Alan G. Davis KB7HM
Salt Lake City UT

INSPIRATION

In reference to the letter from J. Olsen in the May issue, I find I must reply. If Mr. Olsen wanted an amateur license, he could get one anytime. After all, "code recognition" is not that hard. My nine-year-old son learned the letters of the alphabet in one week.

Mr. Olsen is 31 years old. So what? I was 28 when I got my Novice ticket and I got my Extra last year. A friend of mine (WB5IIR) was 67 when he got his Novice. He is also an Extra now.

Mr. Olsen's attitude is like a six-year-old saying, "I don't want to learn to read. So why should everyone else have to?" I really don't think Mr. Olsen *can* learn the code, at least not as long as he persists in not wanting to. I hope this letter inspires him to get off his lazy tail and get to work. I'm sure some ham in his area would be glad to help him.

Mike Kilgore KG5F
Richardson TX

MAYDAY

I really enjoyed listening to an emergency net going on 27.425—that's right 27.425. From what I can figure out, a boat left Antigua for someplace or another. Well, this fellow, Whiskey Jack 6605, got into trouble and .425 was in an uproar. (Let me say before I go on that this fellow had his marine radio out for repairs and his compass also was on the fritz.)

Ok, on with the story. Poor 6605 is out there floating around and the frequency lights up with help. You name it, sandbaggers, Whiskey Jacks, HF Charlies, April club, and Whiskey Whiskeys come flying out of the woodwork to help. All I could get from all this was mass confusion and one station telling another station to get off the Mayday channel.

At one point, somebody asked if poor 6605 had tried to get in touch with an amateur station since he did have a ham rig. "Oh, no," came the answer. "You know how those hams are. They just sit and listen but wouldn't answer anybody but one of their own."

Now the Coast Guard is said to be waiting for a call from anybody who could tell them where soggy 6605 may be; call collect, of course. Oh, oh! The phone number given out is the wrong number says someone, that number is the Puerto Rican Coast Guard, not the Martinique one. Now we're back on the track; numbers squared away and we're off with flares.

One fine gent comes up with the idea of shooting off flares every 30 minutes. Old soggy (by now) 6605 was to shoot one and all the islands were to shoot one, a different color for each island. Well, the response was overwhelming. Texas got a couple off, Canada for luck, and Florida, being that they where pretty close. At 2325 UTC, i was in the frenzy of the search. What am I to do—no flare gun?

Wait! A road flare thrown from the top of my tower might do the trick. What the hell. If the Coast Guard, Navy, and the whole of 10½ meters couldn't help old soggy bottom, I'm going to try. But what do you think happened? A lavender flare lights up the sky from Dover, New Jersey—skunked again.

Poor 6605 is still out there floating around and I'm going to sit and see what happens. I'll let you know what happens soon. Can the Whiskey Jacks pull off the 10½ meter rescue before the Coast Guard or the Navy ruins their chance to make the pages of *QST*? Stay tuned for the next installment.

Name withheld by request

TRIBUTE

You are the only one getting this letter from me. I am spending my last few hours with my beloved Heath SB-102, which is probably the best transceiver that company ever made. For several years, I have thrilled over the way it could pull a signal from the back of the band and put it front and center for a rock-solid QSO. For several years, I have enjoyed compliments from the other end on how clean my signal was.

I paid for the rig, like all of us, with income left over from family expenses, food, rent, etc.

For several years now I have felt great pride every time I tuned up and logged in. Tomorrow that ends. I'm selling my rig tomorrow so that I can pay my income tax. It's the only way. My 1980 income is the same as 1979 income. My 1980 deductions were higher than in '79. In '79, I got a forty-dollar refund from the IRS. This year I have to pay, pay, pay. I'm sick of paying those creeps in Washington who sleep with lobbyists, pay off criminals, and lie to the rest of us.

I don't want any sympathy from the world. I want concern. I bet I'm not the only one in this country selling a prized possession so the bums in Washington can continue their screwball activities. Thank God I didn't have to sell my car. Thank God I have health and love and ditto for my family.

This country doesn't need sugar, pomp, or rampant liberalism. We need hell raised and hell to be paid.

Larry Myers KA2DDX
E. Amherst NY

THE ONLY GAME

I appreciate your printing of my communication on the "ARRL swindle."

However, I am *not* the Secretary/Treasurer of the Indiana Radio Club Council. This fine organization is made up of various radio clubs around the state. I am a member of the Indianapolis Repeater Association.

We all would like to be members of the ARRL, but we

want them to clean up their act.

As Wayne says, "it's the only game in town." It could use competition.

T. James Barnes K9TFI
Greenwood IN

TS-830 REVISITED

In his review of the new Kenwood TS-830 transceiver, WB8BTH didn't give the TS-830 credit for all its capabilities, and didn't recognize its heritage.

He stated that the TS-830 maintains the dual-conversion scheme of the TS-820. The TS-820 is a single-conversion rig, and with the exception of the i-f shift, there is no similarity between the TS-830 receiver and the TS-820 receiver. The TS-830 receiver is very similar to the R-820 receiver sans the 50-kHz third i-f.

Points of interest missed by the author of the TS-830 review include:

1) The crystal filter in the 8.83-mHz i-f and the ceramic filter in the 455-kHz i-f combine to give the rig a shape factor of 1.5 (−6-dB and −60-dB points), and ultimate rejection matched by few other rigs.

2) The combined shape factor of the two i-fs is degraded when the VBT is used to narrow the passband, but nevertheless, the impact on QRM is incredible.

3) Kenwood has provided an incredible array of CW filter options that should make this rig the dream of most CW operators. (Unfortunately, QSK operation was not included.) The filter options boil down to the following (in order of increasing performance and cost): a) Use rig without additional CW filters. Combined shape factor just over 5 (i.e., about 500 Hz wide at −6 dB and about 2550 Hz wide at −60 dB). b) Install 500-Hz optional filter in 8.83-MHz i-f; shape factor of 3. c) Install 500-Hz optional filter in 455-kHz i-f; shape factor of 1.6. d) Install 270-Hz optional filter in 8.83-MHz i-f; shape factor of 4. e) Install 250-Hz optional filter in 455-kHz i-f; shape factor of 2. f) Install 500-Hz optional filters in both i-fs; combined shape factor is about 1.3 with VBT not in use. g) Install 270-Hz optional filter in 8.83-MHz i-f and 250-Hz optional filter in 455-kHz i-f. Combined shape factor is about 1.3 with VBT not in use.

The VBT circuit is useful with whatever combination of filters is installed, but really performs magic only if matched filters are installed in both i-fs (i.e., a pair of 500-Hz filters or the 250- and 270-Hz filters).

The author erroneously indicates that the rf clipper has two stages, one in the VBT circuit and one in the i-f circuit. Actually, there are three stages, all in the 455-kHz i-f. The quality of the TS-830 audio even under heavy clipping is largely due to the fact that the 455-kHz ceramic filter precedes the clipper, and the 8.83-MHz crystal filter follows the clipper.

Harrison Clark KA2R
Clifton Park NY

Thanks to KA2R for his corrections and additions to my review of the TS-830S. Based on his comments, I am eager to install CW filters in our 830.

By the way, the equipment reviews in 73 are purposely kept less technical and more subjective than the reviews found in some other publications. We find that parameters such as shape factor and 3rd-order IMD simply do not mean very much to the average ham. Since these technical aspects are well covered in other magazines, we tend toward reviews which emphasize actual on-the-air impressions.—WB8BTH.

COMPARISON TESTS

Hats off to Bob Glorioso W1IS for his surprising and highly informative article (May, 1981) on 2-meter antennas! Bob's comparison test provided this amateur with plenty of concrete detail on how to improve his 2-meter station, especially as I look up at the 5/8-wave ground plane presently on my roof.

More direct comparisons in *73* would be much more appreciated than the typical reports on individual products. Maybe W1IS will start such a trend?

Bill Dryer WB2CQP
Rutherford NJ

PACKET'S PROGRESS

The Vancouver Amateur Digital Communications Group (VADCG) is devoted to creating a packet switching network via amateur radio, and is experimenting with high-speed HDLC protocol transmissions. Current efforts include a smart terminal node controller board which interfaces any parallel or asynchronous serial device to the network, an S-100 card to provide the centralized station node network control, and a 1200-baud modem card for mike-jack connection to VHF transceivers. Some public domain software is available and more will be provided as it is developed. A practical continent-wide network protocol is under development and geosynch satellite experiments will probably begin this year. Our newsletter subscription is $10.

D.A. Oliver VE7AOG
Secretary-Treasurer, VADCG
818 Rondeau St.
Coquitlam BC, Canada
V3J 5Z3

NETS

Anyone who worked anywhere at any time at a land-based tributary or relay station (government, military, commercial, or whatever) that handled message traffic by means of cable, wire, wireless, or radio, using a hand key or teleprinter or cable or wireless perforator, IBM Radiotype, radioteletype, or any other device, please send dates, locations, office calls, callsigns, and routing indicators, to me.

I am compiling histories of the old War Department Radio Net, the Alaskan Communications System, and the Army Airways Communications System that existed before World War II. I also am compiling histories of the same and for all other networks (wherever) that were in existence during World War II.

I ask that you send me a stamped envelope with your return address printed legibly on it. For this, you will receive a copy of these histories. Those who send significant contributions will be mentioned. Those who send material and wish to have it sent back to them please say so.

Arnold J. Madlol
436 Orchard Ave.
Grand Haven MI

FIRST?

Thank you for the December, 1980, article, "Who Really Invented Radio" and the related letter from Mr. Troy Cory Stubblefield printed in the April, 1981, issue of *73*.

Agreement may never be reached about who actually "invented radio" but it is most certainly possible to credit the men who first transmitted their voices electromagnetically, without the use of connecting wires.

This honor goes to Mr. Alexander Graham Bell and his laboratory assistant, Mr. Sumner Tainter, whose voice was transmitted over a beam of modulated sunlight in early 1880, more than 101 years ago.

This marvelous event was reported in *Scientific American* (see "50 and 100 Years Ago" in the October, 1980, issue) and in the excellent book, *Light Beam Communications* by Forest M. Mims III, Howard W. Sams and Company, Indianapolis, 1975.

I hope you find this information as interesting as it has been for me.

John N. Henning
Miami FL

HAM HELP

Wanted: schematic and/or manual for a Lafayette KT-340 general-coverage shortwave receiver. Usual offer for copies. Thank you.

OSCAR ORBITS

Courtesy of AMSAT

The OSCAR satellites are subject to atmospheric drag, of course, and the present period of intense solar activity has accentuated the problem. During this period, our sun has been expelling huge numbers of charged particles, some of which find their way into the Earth's upper atmosphere, increasing the density (and thus the drag) there. It is through this region that the OSCARs must pass. OSCAR 8, in a lower orbit than OSCAR 7, is the more seriously affected of the two.

If the drag factor is not considered when OSCAR calculations are performed, long-range orbital projections will be in error. For example, by the end of 1979, OSCAR 8 was more than 20 minutes ahead of some published schedules. The nature of orbital mechanics is such that extra drag on a satellite causes it to move into a lower orbit, resulting in a shorter orbital period. Thus, the satellite arrives above a given Earthbound location earlier than predicted.

Using data supplied to us by Dr. Thomas A. Clark W3IWI of AMSAT, the equatorial crossing tables shown here were generated with the aid of a TRS-80™ microcomputer. The tables take into account the effects of atmospheric drag and should be in error by a few seconds at most.

The listed data tells you the time and place that OSCAR 7 and OSCAR 8 cross the equator in an ascending orbit for the first time each day. To calculate successive OSCAR 7 orbits, make a list of the first orbit number and the next twelve orbits for that day. List the time of the first orbit. Each successive orbit is 115 minutes later (two hours less five minutes). The chart gives the longitude of the day's first ascending (northbound) equatorial crossing. Add 29° for each succeeding orbit. When OSCAR is ascending on the other side of the world from you, it will descend over you. To find the equatorial descending longitude, subtract 166° from the ascending longitude. To find the time OSCAR 7 passes the North Pole, add 29 minutes to the time it passes the equator. You should be able to hear OSCAR 7 when it is within 45 degrees of you. The easiest way to determine if OSCAR is above the horizon (and thus within range) at your location is to take a globe and draw a circle with a radius of 2450 miles (4000 kilometers) from your QTH. If OSCAR passes above that circle, you should be able to hear it. If it passes right overhead, you should hear it for about 24 minutes total. OSCAR 7 will pass an imaginary line drawn from San Francisco to Norfolk about 12 minutes after passing the equator. Add about a minute for each 200 miles that you live north of this line. If OSCAR passes 15° east or west of you, add another minute; at 30°, three minutes; at 45°, ten minutes. Mode A: 145.85-.95 MHz uplink, 29.4-29.5 MHz downlink, beacon at 29.502 MHz. Mode B: 432.125-.175 MHz uplink, 145.975-.925 MHz downlink, beacon at 145.972 MHz.

At press time, OSCAR 7 was scheduled to be in Mode A on odd numbered days of the year and in Mode B on even numbered days. Monday is QRP day on OSCAR 7, while Wednesdays are set aside for experiments and are not available for use.

OSCAR 8 calculations are similar to those for OSCAR 7, with some important exceptions. Instead of making 13 orbits each day, OSCAR 8 makes 14 orbits during each 24-hour period. The orbital period of OSCAR 8 is therefore somewhat shorter: 103 minutes.

To calculate successive OSCAR 8 orbits, make a list of the first orbit number (from the OSCAR 8 chart) and the next thirteen orbits for that day. List the time of the first orbit. Each successive orbit is then 103 minutes later. The chart gives the longitude of the day's first ascending equatorial crossing. Add 26° for each succeeding orbit. To find the time OSCAR 8 passes the North Pole, add 26 minutes to the time it crosses the equator. OSCAR 8 will cross the imaginary San Francisco-to-Norfolk line about 11 minutes after crossing the equator. Mode A: 145.85-.95 MHz uplink, 29.4-29.50 MHz downlink, beacon at 29.40 MHz. Mode J: 145.90-146.00 MHz uplink, 435.20-435.10 MHz downlink, beacon on 435.090 MHz.

OSCAR 8 is in Mode A on Mondays and Thursdays, Mode J on Saturdays and Sundays, and both modes simultaneously on Tuesdays and Fridays. As with OSCAR 7, Wednesdays are reserved for experiments.

DEALER DIRECTORY

Phoenix AZ

The Southwest's most progressive communications company stocking Kenwood, Icom, Yaesu MFJ, B&W, Astron, Larsen, Cushcraft, Hy-Gain, Bearcat, and more. Would like to serve you! **Power Communications Corp., 1640 West Camelback Rd., Phoenix AZ 85015, 241-Watt.**

Culver City CA

Jun's Electronics, 3919 Sepulveda Blvd., Culver City CA 90230, 390-8003. Trades 463-1886 San Diego. Call us for a low quote.

Fontana CA

Complete lines Icom, DenTron, Ten-Tec, Mirage, Cubic, Lunar, over 4000 electronic products for hobbyist, technician, experimenter. Also CB radio, landmobile. **Fontana Electronics, 8628 Sierra Ave., Fontana CA 92335, 822-7710.**

San Jose CA
SAN FRANCISCO BAY AREA

Homebrewers' haven; tons of new and used Ham/Computer gear and components. Serving Hams since 1958. We specialize in Icom, KLM, Mirage, Comptronix. We ship worldwide. **Tele-Com Electronics, 15460 Union Avenue, San Jose CA 95124, 377-4479.**

San Jose CA

Bay area's newest Amateur Radio store. New & used Amateur Radio sales & service. We feature Kenwood, ICOM, Azden, Yaesu, Ten-Tec, Santec & many more. **Shaver Radio, Inc., 1378 So. Basoom Ave., San Jose CA 95128, 998-1103.**

Aurora CO

Electronic parts, surplus, used ham gear and test equipment, catering to radio amateurs, electronic hobbyists and small manufacturers. Low prices, growing selection. Come see us! **Electronic Bits 'n Pieces, Inc., 9717 E. Colfax, Aurora CO 80010, 361-6530.**

Denver CO

Experimenter's paradise! Electronic and mechanical components for computer people, audio people, hams, robot builders, experimenters. Open six days a week. **Gateway Electronics Corp., 2839 W. 44th Ave., Denver CO 80211, 458-5444.**

Columbus GA

KENWOOD—YAESU—DRAKE

The world's most fantastic amateur showroom! You gotta see it to believe it! **Radio Wholesale, 2012 Auburn Avenue, Columbus GA 31906, 561-7000.**

Smyrna GA

For your Kenwood, Yaesu, Icom, Drake and other amateur needs, come to see us. **Britt's Two-Way Radio, 2506 N. Atlanta Rd., Smyrna GA 30080, 432-8006.**

Preston ID

Ross WB7BYZ, has the Largest Stock of Amateur Gear in the Intermountain West and the Best Prices. Call me for all your ham needs. **Ross Distributing, 78 So. State, Preston ID 83263, 852-0830.**

Terre Haute IN

Your ham headquarters located in the heart of the midwest. **Hoosier Electronics, Inc., #9 Meadows Center, P.O. Box 3300, Terre Haute IN 478003, 238-1456.**

Littleton MA

The ham store of N.E. you can rely on. Kenwood, ICOM, Wilson, Yaesu, DenTron, KLM amps, B&W switches & wattmeters, Whistler radar detectors, Bearcat, Regency, antennas by Larsen, Wilson, Hustler, GAM. **TEL-COM Inc. Communications & Electronics, 675 Great Rd., Rt. 119, Littleton MA 01460, 486-3040.**

Medford MA

New England's Distributor and Authorized Service Center for all Major Amateur Lines. Located Just North of Boston at Exit 5 on I-93. **Tufts Radio Electronics, Inc., 206 Mystic Ave., Medford MA 02155, 391-3200.**

St. Louis MO

Experimenter's paradise! Electronic and mechanical components for computer people, audio people, hams, robot builders, experimenters. Open six days a week. **Gateway Electronics Corp., 8123-25 Page Blvd., St. Louis MO 63130, 427-6116.**

Phila. PA/Camden NJ

Waveguide & coaxial microwave components & equipment. Laboratory grade test instruments, power supplies. Buy, sell & trade all popular makes, HP, GR, FXR, ESI, Sorensen, Singer, etc. **Lectronic Research Labs., 1423 Ferry Ave., Camden NJ 08104, 541-4200.**

Amsterdam NY
UPSTATE NEW YORK

Kenwood, Icom, Drake, plus many other lines. Amateur Dealer for over 35 years. **Adirondack Radio Supply, Inc., 185 West Main Street, Amsterdam NY 12010, 842-8350.**

Syracuse–Rome–Utica NY

Featuring: Kenwood, Yaesu, ICOM, Drake, Ten-Tec, Swan, DenTron, Alpha, Robot, MFJ, Tempo, Astron, KLM, Hy Gain, Mosley, Larsen, Cushcraft, Hustler, Mini Products. You won't be disappointed with equipment/service. **Radio World, Oneida County Airport-Terminal Building, Oriskany NY 13424, 337-0203.**

Winston-Salem NC
AMATEUR RADIO REPAIR

Professional service; reasonable rates, all brands. USA KDK repair center. **Amateur Radio Repair Center, 1020 Brookstown Ave., Winston-Salem, NC 27101, 725-7500.**

Columbus OH

All major brands featured in the biggest and best ham store for miles around. Come in and twist the knobs before you buy. **Universal Amateur Radio, Inc., 1280 Aida Dr., Reynoldsburg (Columbus) OH 43068, 866-4267.**

ROCHESTER HAMFEST CLOSED DOWN BY TAX OFFICIALS

New York tax officials descended on the Rochester Hamfest and closed down the ARRL booth, threatening president Harry Dannals with an arrest warrant if he continued to hawk his books and magazines. It was at the height of the hamfest just before noon on Saturday, with an estimated 3,000 people milling around the flea market and the handful of exhibitor booths, when the tax officials and police arrived.

The police cars drove up and down the aisles of the flea market, demanding that everyone pack up and leave immediately. Inside the exhibits building, the tax officials demanded proof of a tax certificate, which few exhibitors could produce. The exhibits were then forced to close down. The *73* booth was permitted to continue without interruption, though the *QST* booth was closed.

This all got started about two years ago when several ham dealers collected the New York state taxes on sales, but then did not turn them into the tax department. Out-of-state ham dealers who just ignored the tax did not cause problems, but the collecting of the tax without the payment of it was too much. A New York ham dealer complained through his state congressman and the heat was on.

Last year, a tax official turned up to investigate and made it clear that this sort of thing would have to stop. He told all exhibitors to be sure to get state tax certificates, collect the tax, and pay it. Again, some of the dealers collected the tax. . . and didn't pay it. The New York ham dealer, feeling that this gave his competitors an undue advantage. . . the tax collections being pure profit. . . complained again through his congressman.

When the tax people and the police showed up at the peak of the hamfest, the committee went into hiding and offered no help or advice. The only statement, issued hours later, was to the effect that the committee had no position on the tax one way or the other. The situation was one of total confusion.

The media got the word, and television teams soon arrived, causing a fast exit by the police and tax people. The threats of arrest warrants were apparently just scare tactics. . . and of questionable legality. Exhibitors would have done best, it turned out, to just keep on selling. Losses in sales have been estimated at about a quarter of a million dollars.

Just to make things even worse, security at Rochester was poor and many exhibitors found themselves made miserable by thieves. Some were working in teams to distract dealers while an accomplice grabbed equipment. One dealer lost three HTs. . . from the *back* of his exhibit booth!

PLAIN LANGUAGE DEADLINE EXTENDED

A last-minute effort by *73 Magazine*, the ARRL, and others has resulted in a 60-day extension of the deadline for filing comments on the Plain Language Rules docket. You now have until August 21 to contribute your thoughts about PR 80-729.

We urge every club and repeater association to take a close look at the docket and then submit specific, constructive comments. If you would like to be a formal participant in the comment process, file an original and five copies. If you file an original and 11 copies, every Commissioner will see your remarks. Of course, the FCC will consider all comments, regardless of the number of copies submitted. The important thing is to speak out before the August 21 deadline.

Until October 21, the FCC permits you to file *replies* to comments received by August 21. The difficulty lies in obtaining copies of the many comments the Commission has received. One good way to obtain these comments is to contact the individuals who filed them. For more details about the FCC's activities, call the Office of Consumer Assistance at (202)-632-7000.

MILLER HASSLE WON'T QUIT

The dumping of Miller as a director of the ARRL and the naming of his opponent, Metzger, without the benefit of even counting the votes, has upset hams in Indiana considerably. We published some letters on the subject and I'm told by some of the *73* team which was at Dayton (nine of us were there) that a chap claiming to be a lawyer for Metzger came by the booth yelling and threatening to sue us over the letters. He apparently came across loud and obnoxious.

If this chap is representative of Metzger, the division is in for a most interesting time. I don't envy them. More information has been promised on the details, but from everything I've heard it is a clear-cut case of the ARRL wanting to get rid of a director who was asking too many questions. The smear of Miller is continuing. Insignificant things are being blown up out of all proportion to try to justify the character assassination of Miller. Pity.

DAMNED GOVERNMENT

Many of us expect to see the federal government react about the same as the states to a reduction in funds: Cut the most important and visible services first, protecting the bureaucrats to the last. It is nice that Reagan has put out a call for the public to blow the whistle on government waste, bad management practices, and fraud. If you've run into any such, you might send word to Howard Messner, Office of Management and Budget, Room 10208, New Executive Office Building, Washington DC 20503.

It appears as if there is going to be a try at getting the government out of the large-scale printing business, too. That'll be a relief.

PETERBOROUGH DAYS

"Our Town," as Peterborough is called as a result of being used as the role model for the play of that name many years ago, is having an all-out bash on August 6-7-8th, and you're invited.

To do our part in the celebration, we're going to have a wide selection of back issues of *73* available for the taking. . . plus ham gear and parts collected by me over the last 40 years. We have to make room for a new magazine and that means I've lost my ham equipment storage rights. Pick 'em over and watch my stifled sobs as you walk off with my treasures.

The town will be having a lot of special events, including a circus on the 6th, a muster on the 8th, a relatively short marathon race, sports tournaments in tennis, swimming, softball, and volleyball, a book sale, square dancing, a bluegrass band, kite flying, an antique show. . . there's no end to it.

Add to this your chance to visit (and perhaps operate from) the W2NSD ham shack, the growing *73* publishing offices, Instant Software, etc. You may not believe what resources and people it takes to bring you this magazine every month.

Our Town is one of the most beautiful in New England and it is situated in one of the most remarkable little valleys in the country. One visit and you'll see why New Hampshire is one of the fastest growing states in the country. Remember that we have no sales taxes, so when you shop you pay the actual retail price for everything.

If you can arrange for a few days in New Hampshire, you should include a visit to the White Mountains, about 100 miles north of Peterborough. You may want to stop off in Warren and see the Morse Museum. From there you are a short drive to Franconia Notch and the amazing Flume, the Foot Basin, and the first North American tramway on Cannon Mountain.

If you have some time and like to climb around, you might want to visit Lost River, right near Franconia Notch. Or you might want to join the multitudes who have climbed Mt. Washington. . . or at least take the cog railway to the top. The last time I climbed the mountain I took the train back down.

So, if you and your family are within driving distance of lower New Hampshire, you might plan on getting up here in early August to see us. . . and to get in on some of the fun of Peterborough Days. We monitor 147.54 when you're in the area.

This is a mecca for famous writers and artists, so you may be bumping elbows with people who stay at our MacDowell colony, such as Leonard Bernstein, or some of the well-known local residents, such as Ed Land. You never know who you are going to see in the A&P.

One of the highest mountains in southern New Hampshire is in Peterborough, complete with a road to the top. Bring a good HT or mobile rig and see how many repeaters you can kerchunk from there. I've often gotten up there in the early mornings and made contacts all the way down to Washington DC. Long Island is a snap. This is where the big-effort VHF contesters gather.

Well. . . I Can Dream, Can't I?

by Bandel Linn K4PP

"Honey, I know you're talking to DX. . . I've put dinner on hold. . . just tell me when you're ready to eat!"

Wild Turkeys 1, FBI 0

—another foul-up from the feds

Editor's Note: Some portions of the FBI reports in this article may appear to our readers to be confusing, incomplete, and/or disjointed. They appear that way to us, too.

Photo A. The jamming transmitter in the sagebrush, enclosed in a black-painted first-aid box. Wires lead to the plastic-wrapped, buried batteries.

J. J. Howard WA7UDO

Boise ID 83703

What do the FCC, FBI, jamming transmitters, and coyote hunters have to do with each other? Read on and you will soon come to know.

On December 2, 1979, a low-power jamming transmitter (less than 0.1 Watt) was placed in a remote area near Boise, Idaho. The transmitter consisted of a VHF Engineering transmitter strip with a quarter-wave antenna attached to sagebrush. The transmitter was located in such a way that detection in the Boise Valley was made difficult.

The transmitter output was set on the input of our local club repeater (146.22-146.82) located on a high mountain peak just north of Boise. Since the repeater was located around other commercial radio and TV transmitters, I assumed, as others did, that a birdie was locking the repeater up and timing it out, rendering it useless.

Since I am a pilot, I thought one way to locate a signal on the input to the club repeater would be to jump into the airplane and do some looking with han-

During the period from December 6, 1979, through January 11, 1980, a survey was conducted by Special Agents of the Federal Bureau of Investigation at all known outlets in the Boise, Idaho, area, in an effort to determine if any purchase was made of a radio crystal operating on the frequency of 146.82 megacycles with negative results. A similar survey was conducted at all known outlets in the Boise, Idaho, area of Ray-O-Vac multiple ignition batteries to détermine if the identities of any persons purchasing such batteries during the pertinent period could be identified. This survey also met with negative results.

The evidence obtained from the Blacks Creek Summit, including the first-aid kit housing the transmitter, along with the batteries, wire, wire antennas and plastic sheet protecting the battery, were submitted to the Federal Bureau of Investigation Laboratory by communication dated January 8, 1980.

By communication dated June 13, 1980, the Latent Fingerprint Section of the Federal Bureau of Investigation, Identification Division, advised that there were no latent prints of value present or developed on any of the specimens submitted. On the same date, the Federal Bureau of Investigation Laboratory report advised that tool mark examinations on the submitted items bore very limited tool marks, which were not sufficiently characteristic to determine the tool type and were of no value for identification purposes.

By Federal Bureau of Investigation Laboratory report dated April 11, 1980, the Federal Bureau of Investigation Laboratory advised that the ends of the white nylon string attached to the transmitter submitted to the Federal Bureau of Investigation Laboratory for examination were not suitable for matching purposes. The report also stated that the black paint utilized to cover the JOHNSON AND JOHNSON first-aid kit housing the transmitter could not be specifically identified with a particular source.

By Federal Bureau of Investigation Laboratory report dated May 21, 1980, the Federal Bureau of Investigation Laboratory advised that the transmitter submitted to the Federal Bureau of Investigation Laboratory for examination was apparently a factory made circuit board and various electronic components, which function as a transmitter. The device appeared to have been modified to some extent before being installed in a JOHNSON AND JOHNSON first-aid kit with a bare wire antenna and COAX wire power cord. When the transmitter was connected to the two Ray-O-Vac multiple ignition batteries in series, the transmitter transmitted a frequency of approximately 146.22 megahertz. The report went on to advise that the crystal in the transmitter was marked in part "146.22" and bore the manufacturer's name, "ICOM." No type or Serial Number were noted on the crystal, circuit board or other components of the device. The Federal Bureau of Investigation Laboratory advised that ICOM was believed to be the name of a Japanese manufacturer, whose parts are carried by many dealers.

The Federal Bureau of Investigation Laboratory report went on to advise that the two six volt multiple ignition batteries were both tested to be functioning and applied adequate voltage to operate the transmitter.

On June 25, 1980, the facts of this case were discussed with Assistant U. S. Attorney [redacted] District of Idaho, Boise, Idaho, and he advised that this matter was not suitable for prosecution in U. S. District Court. He stated that the violation was at best a technical violation, and the statute to be applied to this violation was designed to protect the Civil Defense Communications Network from acts of espionage to subvert their defense capabilities, and since this matter appeared to have involved a dispute between two different amateur radio clubs and particular individuals, he did not feel this matter was suitable for prosecution in U. S. District Court. For this reason, he recommended that this violation be referred to the Federal Communications System for whatever administrative action they would deem appropriate.

Fig. 1. Summary report of FBI actions.

FEDERAL BUREAU OF INVESTIGATION

- 1 - Date of transcription 1/24/80

SA [redacted] accompanied [redacted] JIM HOWARD, and [redacted] to the vicinity of Blacks Creek Summit in Ada County, Idaho. The purpose of the trip was to attempt to locate the transmitting device jamming the receiver operated by the Boise County Amateur Radio Club, of which [redacted] HOWARD, and [redacted] were members. The trip was made to a parking lot located near the Summit of the Blacks Creek Road in a four-wheel drive vehicle owned [redacted] b7c

From there, utilizing a hand-held direction finder and two snowmobiles, the transmitting signal was traced from the parking lot to an area located near the Arrow Rock Dam Access Road. This access road is located down the hill a short distance from the Summit on the north side of the Summit. The access road to the Arrow Rock Dam leaves the Blacks Creek Road in a westerly direction. From there, it winds around through the sagebrush hills and according to a sign just off the Blacks Creek Road, this access road dead ends at the Arrow Rock Dam.

Utilizing the snowmobiles, the group traveled to a high point on the road where the direction finder pointed to an area on a knoll from which a strong radio signal was originating. Subsequent examination of that area located a transmitter tied to a sagebrush and attached by a wire to two Ray-O-Vac six-volt multiple ignition batteries buried in the ground. The transmitter was housed in a Johnson and Johnson auto travel first aid kit box, which was painted black and sealed from the weather. The Ray-O-Vac six-volt batteries were protected by a piece of plastic and covered with dirt.

At the time this transmitter was located, JIM HOWARD had in his possession a walkie-talkie radio set at the frequency for the jammed transmitter. When the batteries were removed from the transmitter, the receiver immediately came on the air.

The transmitter, the antenna, the string used to hang the transmitter, the wire attached to the batteries, and the batteries, were secured as evidence and removed from the hill.

Investigation on 12/5/79 at Boise, Idaho File # BT #52-5826

by b6 SA [redacted] b7c Date dictated 12/10/79

This document contains neither recommendations nor conclusions of the FBI. It is the property of the FBI and is loaned to your agency; it and its contents are not to be distributed outside your agency.

Fig. 2. Special Agent's investigation report of actions on December 5.

die-talkies. So, on December 4, another radio amateur and I departed Boise in search of the signal which was locking up our club repeater. I was confident that the signal was emanating from the hill where the repeater was located—probably among those commercial transmitters with thousands of Watts of power.

Wrong. The signal increased as we flew in a southeasterly direction, reaching its full strength about 20 air miles southeast of the repeater site.

That evening, in darkness, I and two other members of the club returned to the site and made a ground search with just a handie-talkie. The lack of passable roads, snow, and darkness made our efforts in locating the transmitter unsuccessful, but the following evening, with the aid of snowmobiles, better DF equipment, and with others, including a local agent of the FBI, we returned to the site. Within about 20 minutes the transmitter was located, and it was taken off the air by the FBI agent. He said the transmitter and batteries would be sent to Washington DC for a thorough evaluation.

Unknown to us, the FBI staked the site out the following day and apprehended two local radio amateurs apparently returning from the site where the transmitter had been hidden. It was reported by the agents that their tracks led directly to the sagebrush in which the transmitter was hung. The two hams denied having any knowledge of the hidden transmitter and said they were only coyote hunting.

The wheels of bureaucracy began to turn. We waited and waited for reports from the FBI on materials sent to the lab. The FBI was unable to link the evidence recovered to those persons apprehended at the site.

On June 25, 1980, the FBI discussed the case with the Assistant US Attorney, District of Idaho. He recommended that this violation be referred to the Federal Communications Commission for whatever administrative action that they deemed appropriate. After we heard this news, I made an attempt to obtain a copy of the FBI report under the Freedom of Information Act. After the exchange of several letters and a long wait, I got copies of FBI reports on September 15, 1980. The entire matter was now in the hands of the real Paper Tiger—the Federal

Fig. 3. Special Agents' report of actions on December 6.

FEDERAL BUREAU OF INVESTIGATION

- 1 - Date of transcription 1/25/80

SAs [redacted] and [redacted] established an observation point near a knoll a short distance from the Blacks Creek Summit where the radio transmitter had been located on the previous day. The purpose of this observation was to determine if the individuals who were responsible for placing this transmitter device would return to that location when the radio discontinued transmitting on December 5, 1979. b7c

This observation was maintained from 8:00 a.m., until 3:00 p.m., on December 6, 1979. The site of the observation point enabled the Agents to observe the north slope of Blacks Creek Summit and any vehicle traffic passing over that Summit could be readily observed.

At approximately 11:00 a.m., an older model pickup was observed traveling down the icy Summit Road in a northerly direction. The vehicle continued on out of sight and was not again observed until approximately 1:00 p.m. This was the only vehicle observed in the area during the time of the observation and the observation was discontinued at 3:00 p.m., in order for the Agents to return to their vehicle at the Summit of Blacks Creek Road and continue the observation.

Both Agents walked from the observation point down the access road to the Arrow Rock Dam to the Blacks Creek Road. While walking up the north slope of the Blacks Creek Road toward the Summit, a GMC pickup with a camper was observed traveling down the slope toward the Agents. The time of the observation was 3:30 p.m. Observed on the vehicle was Idaho License [redacted] which was designated as an amateur radio license. The vehicle was occupied by two white males. b7c

The driver of the vehicle, who was wearing a beard, stopped the vehicle and asked the interviewing Agents if they needed assistance. They were informed that the Agents' vehicle was at the top of the Summit and no assistance was required.

Investigation on 12/6/79 at Ada County, Idaho File # BT #52-5826

by SA [redacted] SA [redacted] b7c Date dictated 12/10/79

The Agents immediately returned to their vehicle and proceeded down the slope to the junction of the Black Creeks Road and the access road to the Arrow Rock Reservoir. Observed parked approximately 140 feet in front of this access road was the vehicle earlier observed. Observation of that area located two sets of footprints in the snow that went directly from the pickup to the gate to the access road to the Arrow Rock Dam.

The Agents followed these tracks up the path on the access road to a point where the tracks were lost. Due to the time involved in realizing that the two individuals had probably already reached the site where the transmitter had been recovered, the Agents returned down the path to where the tracks had earlier been lost and determined that the two individuals had taken a shortcut over the top of a knoll.

The interviewing Agents then continued down the access road and positioned themselves at a point approximately 100 yards from where the access road joined the Blacks Creek Road. While waiting for the two individuals to return, the Agents heard the engine in the pickup truck start and heard the truck drive away. The Agents immediately returned to their vehicle and upon examining the tracks left by the vehicle, it was determined it had proceeded on north down the Blacks Creek Road toward the area of Prairie, Idaho. The Agents followed these tracks and at approximately 4:35 p.m., the pickup truck was observed and stopped by the Agents. At that time, the occupants of the vehicle were identified. The driver of the vehicle presented his Idaho driver's license and identified himself as [redacted], Idaho. The description obtained from his driver's license is as follows:

Race	White
Sex	Male
Date of Birth	[redacted]
Height	5' 11"
Weight	155 pounds
Hair	Brown
Eyes	Brown
Social Security Account	[redacted]
Driver's License	[redacted]

b7c

The occupant of the vehicle was identified by driver's license and by oral statements as [redacted], Boise, Idaho. His driver's license described him as follows:

Race	White
Sex	Male
Height	6'
Weight	185 pounds
Hair	Brown
Eyes	Brown
Date of Birth	[redacted]
Selective Service Number and Idaho Driver's License Number	[redacted]

b7c

The driver of the vehicle, [redacted], acknowledged that the vehicle belonged to him and he gave both Agents permission to look in the cab of the pickup and in the camper ~~area of the~~ pickup. At that time it was determined that MEISSNER had a radio in his pickup which was set at the frequency of 6.820 megacycles. b7c

NAME NOT Omitted

Observed in the camper area of the pickup was a Super 48 Preco wet battery, which had been installed on a battery charger and was in the process of being charged.

After the identification was made, the Agents returned to the scene where the pickup had been parked and at that time the footprints were back tracked from the pickup to a point north of where the vehicle had been parked over a large bank and up the hill toward the sight where the transmitter had been located on the previous day. The Agents followed these tracks which were the only tracks observed in the snow in that area. The tracks went together for a short period and separated. One pair of tracks was north of the other and went over several deep slopes and continued on to the exact location where

the transmitter had been located on the previous day. The other set of tracks were followed to a point where they joined the access road to the Arrow Rock Dam and continued on where they met the other pair of tracks and continued to the spot where the transmitter had been located.

Both of these pairs of tracks made a distinct pattern in the snow and in the mud, making them easy to follow. A rough sketch was made of the track design, which matched the design on the soles of the boots worn by [redacted] and [redacted] at the time they were identified. b7c

Copies of the sketches of the two footprints are attached.

Communications Commission.

I called the Portland Office of the FCC and they said there wasn't much they could do with this case. I was told that if I wasn't satisfied with their actions I should contact my Congressman or the head of the FCC Investigations Division in Washington DC. After many, many calls to the FCC in Washington, they finally informed me that the evidence that was presented to them in FBI reports was extremely weighty but circumstantial. A staff member of the Investigations Division informed me that the FBI probably had apprehended those individuals responsible for the act.

In essence, the FCC suggested that they could not take actions against the individuals since it was not illegal to be apprehended at the site of the jamming transmitter. I asked what circumstances might enable them to prosecute. They informed me that if the individuals had picked up the transmitter, that would have been sufficient evidence. In other words, had the FBI left the transmitter and the individuals had picked it up, then that might have been sufficient evidence.

I wonder.

Had those individuals

BT #52-5826 - 5 -

allegations. It was determined that [redacted] b7c selling this equipment purchased at surplus properties for a profit. Once the allegations had been confirmed, the organization was completely disbanded by the Governor. [redacted] had no idea the Governor would take such drastic action, but assumed that he would only stop members from that organization from buying this surplus property and selling it at a profit. At the time this club was disbanded by the Governor, he was severely criticized by the membership and did make several enemies at that time.

[redacted] explained the jamming of their repeater being experienced at this time as follows: b7c

On December 2, 1979, the repeater located on Chaeffer Butte stopped functioning at approximately 11:00 a.m. At that time he was listening to his radio and heard the signal come on and run three minutes. After three minutes, the signal dropped off because that was the time of the setting of the timeout timer. [redacted] that this meant the repeater was either stuck or was being jammed. b7c

On Monday, December 3, 1979, he went up to Deer Point with three other members of his club, [redacted] and [redacted] On arrival at the site, he reset the timer and the signal came back on the repeater. The signal stayed on for three minutes and again timed out. [redacted] that meant there was a signal input into the receiver and lacking a directional finder to locate this signal input, he returned to Boise, Idaho. b7

The following day, December 4, 1979, at approximately 2:00 p.m., he and JIM HOWARD rented a plane at GEN AIRLINES and flew over the site with a direction finder and found the transmitting signal was coming from Blacks Creek Summit, approximately 17 miles from the transmitter. They over flew the Summit and the meter on the receiver pinned straight down, confirming the general location of the transmitter on the Summit. From the air, he could see snowmobile tracks in the area.

BT #52-5826 - 6 -

Later that night, he returned to the area of the Blacks Creek Summit with [redacted] and JIM HOWARD. They walked to the Summit with a direction finder and again located the general site of the transmitter, which was north by east of the Blacks Creek Summit. They were receiving ten signal strength units on their direction finder, which was the maximum reading indicating a very strong signal. This direction finder and the strength of the signal would place the proximity of the transmitter very close. b7

[redacted] stated that from the strength of the signal, it would indicate to him that the transmitter should have a large storage battery. He also believed the transmitter would have an 11-foot beam antenna. b7c

[redacted] said that their radio equipment transmitted at 146.82 megacycles and received at 146.82 megacycles. b

[redacted] also explained that if he and JIM HOWARD had not rented the aircraft to try to locate the transmitting device, he did not believe the equipment they had available to them would have allowed them to find the location because of the lack of access to any of the land between where the transmitter was located by the aircraft and the location of the repeater. It would have involved an almost impossible task of walking through the area between Blacks Creek Summit and the site of the receiver with a direction finder, a distance of 17 miles. For this reason, he did not believe that the persons who installed the transmitter believed that it could ever be found. b7

He also said that the transmitter was placed in a location where it could not be detected from the Boise Valley because the signal was originating from an area over a hill, which blocked out the possibility of it being transmitted into the valley. For this reason, the frequency utilized by their club was blocked out without any detectable signal coming in on the radio. It was only after they went up over Blacks Creek Summit that they were able to pick up any signal on that frequency and under normal circumstances, and without the use of the airplane, they would have assumed the transmitting device jamming their receiver would have been located somewhere near Chaeffer Butte.

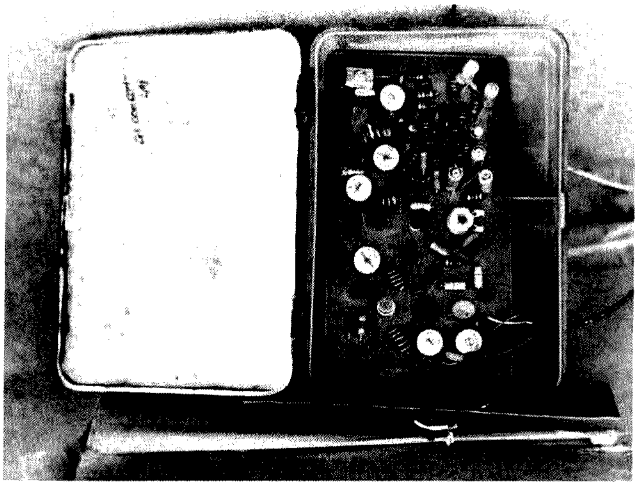

Photo B. The transmitter in the first-aid box.

FEDERAL BUREAU OF INVESTIGATION

- 1 - Date of transcription 1/25/80

[redacted], driver of a GMC pickup bearing Idaho license [redacted] who was stopped by the interviewing Agents on the Blacks Creek Road, was advised of the identity of the interviewing Agents and the nature of the inquiry. b7c

[redacted] furnished the following information: b7c

He advised that he was in that area with [redacted] to look for a place to hunt. When asked what sort of game he was interested in, he stated that they were going coyote hunting. b7c

[redacted] denied having any knowledge at all about an illegal transmitting device that had been placed on a hill near the Blacks Creek Summit and in explanation for the reason why he was observed on a hill at the exact location where this illegal transmitter had been removed on the previous day, he commented that he was just following a lot of tracks, and he wanted to see what had been going on. He continued to say that he knew nothing about the illegal transmitter. b7c

[redacted] stated that the GMC pickup and camper driven by him was owned by him and the Idaho State motor vehicle license, [redacted], were his call letters since he was a licensed amateur radio operator. b7c

[redacted] gave the interviewing Agents permission to look into the cab of his truck and into the camper area and when the Agents found a Super 48 Preco battery in the camper area of his truck, he stated that he had always carried the battery in a cabinet area of the camper and it needed charging. b7c

At the conclusion of the interview, [redacted] was asked his destination, and he stated that he planned to go on to Prairie, Idaho, area and back through Mountain Home. b7c

[redacted] was also asked to display the soles of his boots and upon observation of the design on the sole, it appeared to be the same design on the tracks earlier observed by the interviewing Agents, along the access road to the Arrow Rock Dam. b7c

Fig. 4. Report on FBI interview with first coyote hunter.

been apprehended with the transmitter in hand at the site, the story could have been very, very similar: "We were only coyote hunting and found this device tied to the sagebrush." And as the scenario unfolded, I could perhaps have expected a similar reply from the Federal Communications Commission: "It is not unlawful to be apprehended at the site of a jamming transmitter while coyote hunting and stumbling across a device of unknown nature."

In conclusion, I believe that the Federal Communications Commission, in another classic case, has shown its unwillingness to do its job. After a year of investigation and several hundred dollars spent by local radio amateurs, and probably thousands of dollars spent by the government (FBI, FCC, etc.), the efforts of many were brought to an end by the FCC and their do-nothing attitude.

All reports and observations should end with a

recommendation, and I have mine. In light of what I have seen as inaction and a do-nothing attitude on the part of the FCC, and to join with the efforts of many to bring about a streamlining of our government to reduce its overall cost, I summarily advocate Congressional action to eliminate the Federal Communications Commission from among the many branches of our government. If not, then at least the elimination of the enforcement division within that agency because, by its own admission, it prosecutes very, very few of the cases brought before it.■

Ridgway PA 15853

Sailplanes on Six

—these thermal-hunting hams have an edge on the competition

What, besides a hamfest, would get a ham out of bed at the crack of dawn to drive a hundred miles to stand around in dew-soaked grass with eighty or ninety other people? An R/C (radio control) sailplane contest, that's what! One contest in particular draws a very large turnout of these types to Faustown Park just outside York, Pennsylvania. It's the Lancaster Area Soaring Society's annual two-day meet which is held the first weekend after the Fourth of July.

The pilots' meeting begins at nine sharp as the Contest Director outlines the flying task for the day. The "task" is the routine which each contestant and his plane will perform. This day, they will launch, drop the towline, and then fly the plane for exactly ten minutes before landing it inside a twenty-five-foot-diameter circle, right-side up and with no parts shed. Sound easy?

The aircraft are separated into four classes. Scale ships are miniature replicas of full-size planes, right down to the pilot figure and instrument panel. Planes of less than 100-inch wingspan have two classes, one for ships with just rudder and elevator controls and the other for ships using spoilers—which are like air brakes. The fourth group is called "Unlimited" because any plane with any number of controls and a wingspan of over 100 inches may compete in it.

After the pilots' meeting, the contestants break up and return to their planes to check them over before being called up to fly. Usually, a group of hams will gather to chat about the weather conditions, which repeater they used while driving to the Park, or the new FM R/C radio that one of them will be using. Hams usually make up about ten percent of all of the contestants, yet they manage to wind up near the top of the heap when the scores are

Jeff Carr WB3CXC launches his Pierce Paragon sailplane at the 1980 League of Silent Flight Regionals. At age 16 his score was second highest overall and tops in Junior class. (The tow line is too fine to see.)

With the US Air Force Museum in the background, Peter Carr WB3BQO holds his 12-foot-wingspan Craftaire Sailaire sailplane at the 1980 A.M.A. Nationals Contest.

Bill Melske, a ham who hails from the New York area, launches his Craftaire Viking of 3-meter wingspan.

Don Goodwin WA2FRO puts his 100-inch-span Aquila on the tow line. The plane carries a Thermic Sniffler and is guided by an R/C rig on 53.3 MHz.

counted. This is because they are better prepared.

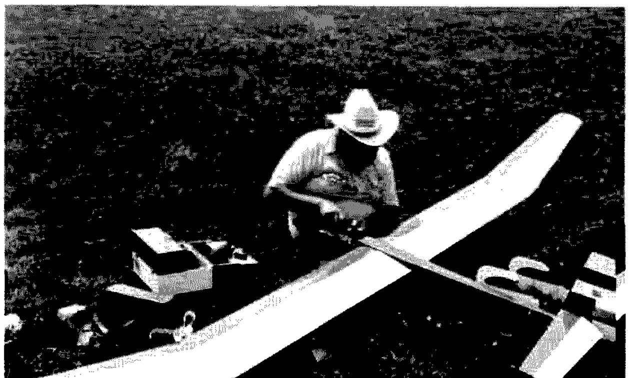
As each ham is called to the launch area to fly, he collects his transmitter from the Impound Table. (All transmitters remain impounded except when in use in the contest, avoiding jamming through accidental use.) It carries two colored streamers on its antenna; one color is black, denoting a six-meter operating band, and the other color shows which frequency it uses in that band. Also, most hams use a Thermic Sniffler, a telemetry system which senses temperature changes (indicating thermal currents) and radios them to the pilot. This rig operates in the low end of the two-meter band. The use of the six-meter uplink and two-meter downlink is restricted to hams with a Technician or higher-class license.

At the launch area, the ham connects his plane to the towline by a hook mounted on the bottom of the fuselage. He then moves up to the winch unit and steps on a foot switch. This engages a motor and drum assembly which winds in the towline and tows the plane into the air. At "top of the launch," about five- to six-hundred feet up, the line is dropped by radio command and the line falls to earth for the next launch. Meanwhile, the plane banks away to begin its search for lift.

Without finding a thermal, most sailplanes will fly no longer than about three and a half minutes. Finding these thermals is the basis of the contest, and the pilot's ability to locate and gain maximum height from each thermal is what the game is all about. A thermal is an invisible column of rising air which originates just above the earth.

A dark area such as a parking lot, farm field, highway, or the roof of a building absorbs more heat than its surroundings. This heat is passed to the air just above it and the air begins to rise. As this bubble of warm air rises, cooler air is drawn in to replace it and to

Joe Bertin WD8PRG operates a winch-line retrieval system which returns the towline to the launch area for another launch.



Dave Burt of Indiana, Pennsylvania, adjusts the controls of his original design "Penn-Fli" 12-foot-span sailplane.

be heated itself. This results in a column of air which leans over and drifts downwind while going up.

Since all this is invisible, the only way a pilot can tell if his plane is near one is to watch its movements. A sudden change of direction or wobbling of the wings means that the plane has entered the turbulent air around the thermal. If the plane is some distance from the pilot, identifying and staying with the thermal can be difficult. Hams have a better way. Their Thermic-Sniffler rigs send an audio tone of about 850 Hz, which indicates steady flight. When the plane enters a thermal, the tone rises—at a rate determined by the degree of the change in altitude. All else being equal, the higher the tone, the faster the plane will go up. If the plane hits a downdraft (colder air), a much lower tone alerts the pilot to steer away toward better air. By listening to the tone, the pilot can find a thermal, center the plane in it, and keep it centered as the thermal drifts downwind. This is obviously far more efficient than guessing from a thousand yards away.

Having worked the thermal for the required time, the sailplane is then flown back to the landing area. This part of the flight is very important and can add ten to fifteen percent to the pilot's total score. The landing circle has a length of tape nailed down at its center point, and scores are marked on it from 100 in the center to zero at the end. The plane must land as close to the center of the circle as possible, and the score is read where the tape touches the plane's nose.

Each pilot will fly four flights like this during the day. Because there are only seven R/C frequencies for non-hams, there is a long wait between rounds for those without an amateur ticket. Hams, on the other hand, have five R/C frequencies in the top of the six-meter band, and since there are fewer hams, this makes the wait between rounds much shorter for them. As the best lifts occur between 10:00 am and 2:00 pm, being able to choose when to fly is an added advantage for the ham.

At a large contest such as the one at York, the flying isn't completed until late afternoon, at which time the awards and trophies are passed out. It should be no surprise that hams take home a large share of the hardware. By using their electrical and mechanical skills to prepare the aircraft and their license privileges to operate them with confidence in the uplink control and efficiently through telemetry, they are well prepared, and scores show it. They also have the satisfaction of knowing all about their radios as well as their aircraft; they haven't just assembled store-bought items and made them work together in harmony.

The road home is made shorter by the chatter on the area repeater about missed landings, new model designs, better radios, and the feeling that win or lose, you have enjoyed the companionship of a great bunch of people. ■

Gene Shelkey from Scottdale, Pennsylvania, gets some help to launch his scale-model Schweitzer sailplane. It is an 11-foot span, 6½-pound flying weight craft complete with pilot figure and full interior.

The Supernova Station Organizer

—in this project, four into one will go!

F.T. Marcellino W3BYM
13806 Parkland Drive
Rockville MD 20853

It was on Roanoke Island, located near the Outer Banks of North Carolina, where I first met Dick Schultes WB2PEF from Cherry Valley, New York. Dick had brought his HW-8 plus tuner and bridge with a box of coaxial cable and antennas for a week of ham camping on the island.

Being thoroughly satisfied with the simplicity of operating the HW-8, I purchased one for my own camping usage. However, instead of WB2PEF's multiple-box station, I wanted just one additional box having as many conveniences as possible.

Thus, the Supernova was created. This device has four functions which enhance the operation of my QRP station. It contains an ac power supply, keyer, transmatch, and swr bridge.

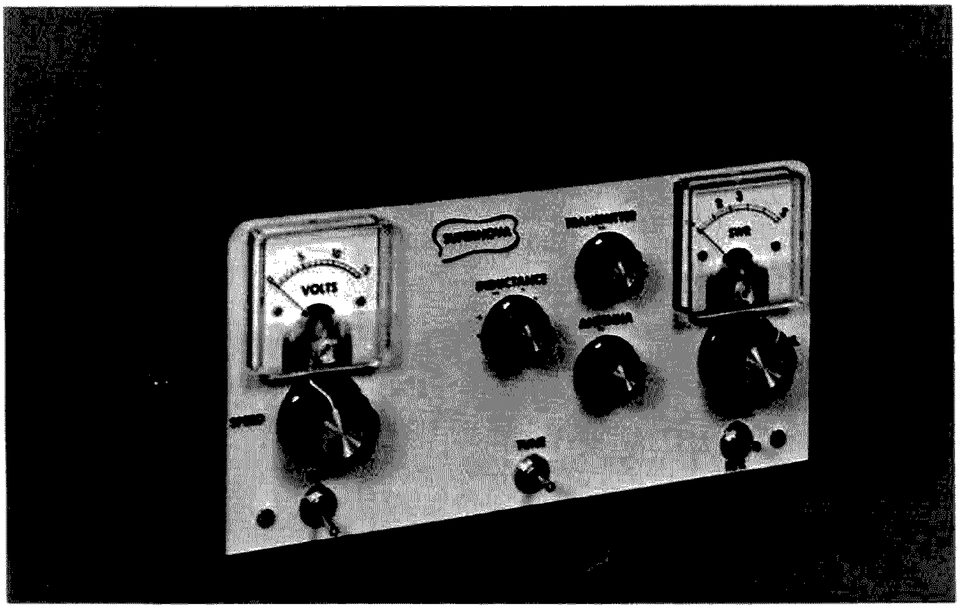

Photo A. The completed Supernova.

The keyer circuit uses the Curtis 8044 chip which is suitable for portable operation and readily adapts to a set of paddles.

The rf department was planned for use with a 40-meter half-wave dipole, center-fed with 50-Ohm coaxial cable. Multiband operation on 20 and 15 meters is aided by a built-in transmatch combined with a unique swr bridge.

Front-panel controls include a speed control for the keyer and a spring-return toggle switch for keying the rig during tune up. The FWD and REV selector and sensitivity controls are located under the swr indicator. The opposite side of the panel contains the voltmeter and power ON control, giving a well-balanced professional appearance to the panel.

The cabinet for the project was retrieved from my junk box and measures 8" × 4-1/2" × 4". The front panel and inner chassis were fabricated from scrap sheet aluminum. The transmatch and swr bridge were

shielded within a 3" × 4" × 5" minibox provided with a removable top section. The bottom section attaches to the inner chassis using sheet-metal screws. Rf input and output connectors plus a wing-nut ground terminal are mounted to the side of the bottom section. This bottom half of the minibox was modified by removing the front side to provide panel clearance for the transmatch and swr components.

The inner chassis was constructed with a rear-apron dimension of 7/8", which is sufficient to accommodate the various rear-mounted parts. These included: two 1/4" phone jacks for the keyer input and output, a twisted pair of #16 AWG wires 24" long with battery clips, fed through a 3/8" grommet for storage-battery operation, a DPDT toggle switch wired in parallel for selecting either battery or ac operation, and another twisted pair of the same size and length terminated with the HW-8 power connector. Next in line are the two fuses, one for protecting the battery circuit and the other the ac circuit. Finally, the input ac wires enter the apron through another 3/8" grommet. It was a tight fit, but I felt that all of these inputs and outputs plus other components were important to maintain complete control and flexibility from my QRP station.

For travel purposes, the three power cords can be coiled and stuffed into the back of the unit between rf box and the power transformer. In addition, the XYL contributed to the effort with a set of custom-made covers using some old towels. A close color match to the HW-8 was obtained by spraying the cabinet with #204 Ford-green engine enamel and the front panel with DS-GM #283 pastel green. These

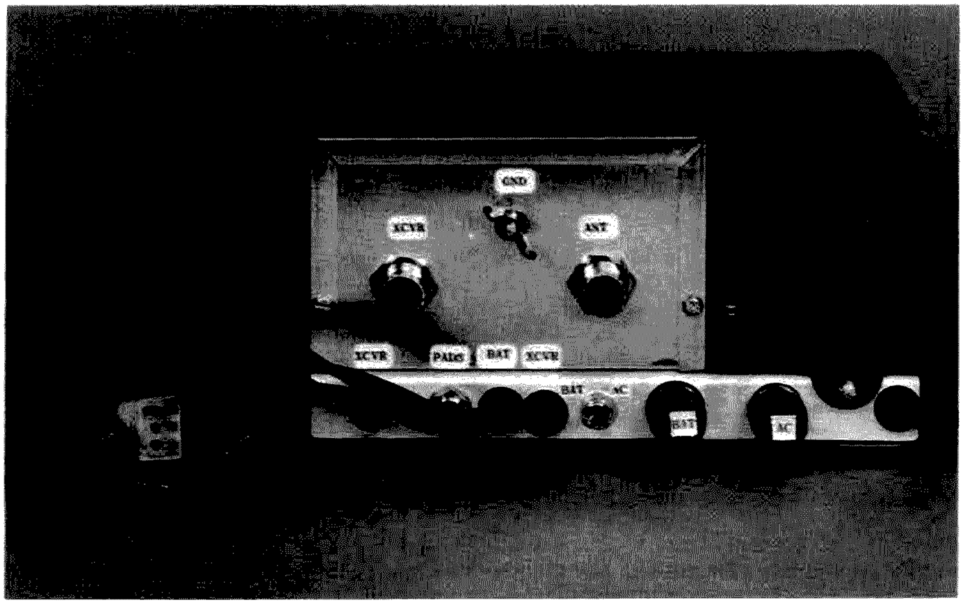

Photo B. Rear view of the Supernova.

paints are available from your local automotive-parts outlet.

Power Supply

The ac power supply is a standard circuit using a 12.6-V ac at 1.5-A transformer and a full-wave rectifier. With the capacitor-input filter, the input voltage to the LM340-15 regulator is about 17.6 V dc, giving a voltage differential of 2.5 V dc across the regulator. During keying periods, the voltmeter shows a steady indication very near 15 V dc. For good regulation and minimum ripple, a large amount of capacity was required, as shown in the circuit diagram.

The plus 15-V dc regulated voltage is connected to the rear-panel selector switch. Notice that the voltmeter is wired to the arm of the switch. This allows monitoring of either the ac-supplied 15 V dc or the storage-battery voltage.

Keyer

I'm accustomed to using a set of paddles in my shack, so I made this a requirement for my QRP rig. I chose the Curtis 8044 chip because of its compactness and low operating power. See Fig. 1.

Since the HW-8 has its own sidetone generator, there was no need to use the 8044's generator circuit. Therefore, pins 11, 12, and 13 were not used. The supplied data sheet showed Vdd max to be 10 V dc. This presented a small problem since I would be using either 12 or 15 V dc. A one-Watt, 8.2-V dc zener and a series resistor provided a simple solution.

The output of the 8044

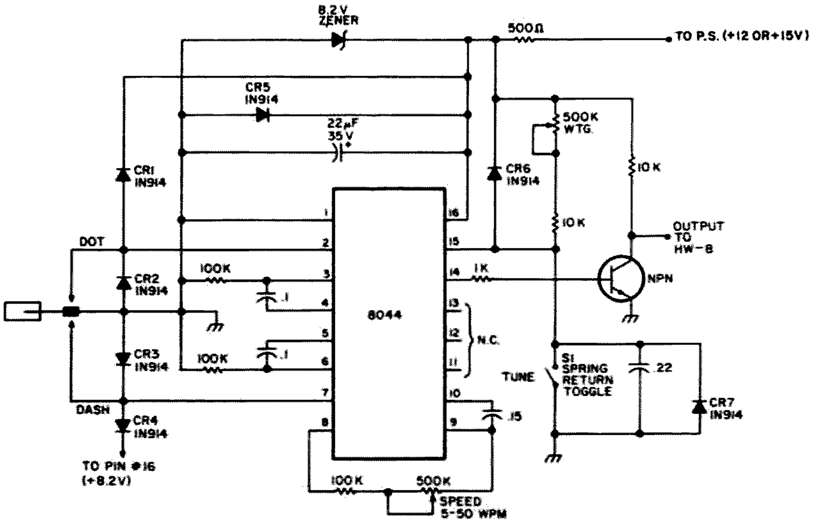

Fig. 1. Keyer circuit.

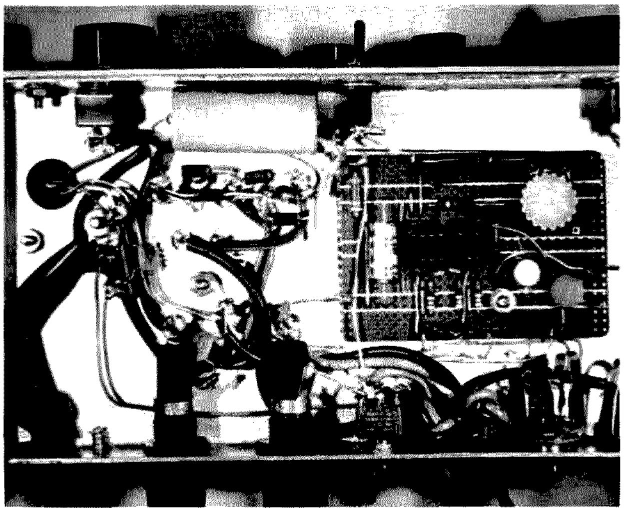

Photo C. This bottom view of Supernova shows the power supply components on the left and the keyer parts on the right. Across the bottom are the various inputs and outputs.

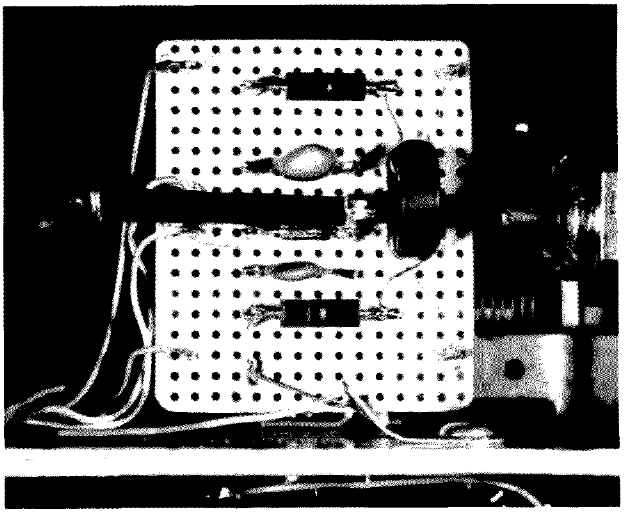

Photo D. This view of the swr bridge shows the main rf wire covered with black insulation. Notice the wire reversal on the lower winding.

drives an ordinary NPN transistor on the keying line. When either the dot or dash paddle is active, the collector of this transistor will transfer from 8.2 V dc to near ground potential thereby turning on the transmitter. Notice that only one keying wire is required to the HW-8. The other connection is supplied by the power ground wire.

The circuit for the keyer shows several diodes. *Do not* omit these diodes—they have a definite purpose. As stated in the Curtis data sheet,[1] this chip uses CMOS technology; and although not stated in the data sheet, the device could be susceptible to electrostatic discharge (ESD). Admittedly, the level of zapping voltage may be higher than for an unprotected MOS device, but you nevertheless should exercise caution during handling.

I recommend that the entire keyer circuit be fabricated using all the diodes called for, and with all wiring to jacks and power supply completed, prior to inserting the 8044 into its socket. Photo C shows the parts layout which I used. The weight control is board-mounted and adjustable through a hole in the case bottom.

When you are ready to install the chip, place the palms of both hands on the chassis. This will discharge any accumulated body charge and place you at the same potential as the chassis. Remember that after removing the chip from its black conductive foam, it becomes vulnerable to ESD damage.

Next, grasp the chip on its bare sides (*never* the lead sides) and install it into the socket. These are relatively simple precautions that could save your device from damage. Personally, I'd rather use a little caution than mail another sixteen bucks to Curtis Electro.

Swr Bridge

The swr-bridge circuitry is a modification of a circuit which I've used in the past on some CB equipment.[2] All components are attached to a piece of perfboard mounted in the rf box. The main rf conductor, a #12 AWG wire, is secured to the board and serves as the board mount when soldered into the rf connector. See Photo D for details.

This circuit requires two 3-turn windings on a toroid core to form a transformer with the main rf conductor. Once the windings are phased properly, a SPDT toggle is used to transfer the indicator circuit from FWD to REV. Both windings are wound on the core in the same direction using #28 enamel-covered wire.

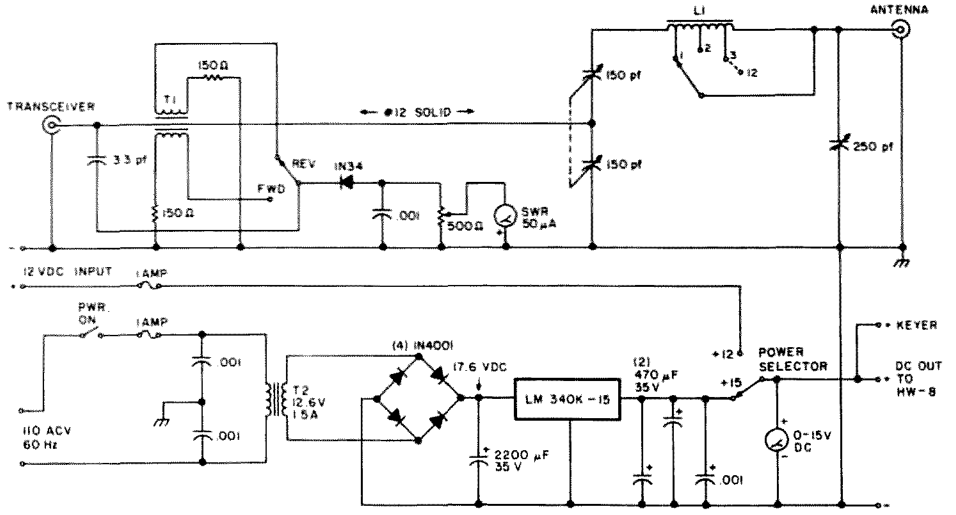

Fig. 2. Power supply, swr bridge, and transmatch. T1 uses two three-turn windings of #28 enamel on a Fair-Rite Products #638MT-L core. Windings are laid on in the same direction. L1 consists of 30 turns of #18 enamel on an Amidon #T-106-2 core.

Phasing is done by reversing the two wires for the REV winding. The bridge components were arranged in an orderly fashion with no great concern given to bridge symmetry. The bridge has been checked against my commercial swr bridge with no difference detected at QRP levels.

Transmatch

This circuit is a basic transmatch configuration[3] using a broadcast transistor transistor-radio dual capacitor, a standard single-gang capacitor, and a core inductor. See Fig. 2. The inductor was constructed using 30 turns of #18 enamel-covered wire with 12 taps, spaced about every two turns. An air inductor could be used, but it would occupy considerably more space. The diameter of the completed core inductor approximated the size of the ceramic wafer on the rotary switch. This proved to be beneficial because after bending the switch solder lugs parallel with the wafer, wires from the 12 taps slipped into the lugs. See (Photo E) for details.

Operation

The Supernova is simple to operate and, when combined with the HW-8, the two units become inseparable. Whether in my home shack or in some remote location, I have experienced a satisfaction that only a QRP operator could appreciate.

When placing my station on the air, I have found that time is saved by first tuning up the HW-8 into a dummy load on the band of my choice. With the swr bridge set to read reflected power, adjust the transmatch for a minimum indication. Use the sensitivity control to maintain meter deflection near midscale for these initial adjustments. For maximum transfer of rf power, use the least amount of inductance while tuning for a 1:1 match.

When you have obtained the best possible match, switch to FWD and set the meter to full scale. While the transmitter is still keyed readjust the loading control on the HW-8. The power meter on the rig will peak, with simultaneous peaking of the swr meter, indicating proper rf coupling to the antenna. The sensitivity control may now have to be reduced somewhat to maintain the full-scale reading. The correct swr ratio can now be read when the switch is placed in the REV position.

The Supernova has performed better then expected. The transmatch loads the 40-meter dipole with near 1:1 ratios on 40, 20, and 15 meters. In the evenings when 20 and 15 are open, I can work from coast-to-coast with respectable signal reports. I have operated the two units from my 12-V dc storage battery or commercial power. The ability to transfer between power sources proved very convenient during unscheduled power outages.

I designed the Supernova to enhance my HW-8 while keeping component cost at a minimum and operation simple. I believe these goals were satisfied, and hope I've contributed in a small way to the big thrill of QRP communication. ■

Kenwood's TR-9000

—the multi-mode 2-meter rig that's making SSBers out of VHFers

If we had to choose one word to describe Kenwood's TR-9000, a multimode two-meter transceiver, that word would be *flexible*. In two months of use, we have put this rig to the test as an FM station at home, made it a mobile traveling companion, and used it to enjoy the fun of SSB mountaintopping. All this flexibility comes in a box that is no bigger than most conventional FM-only units.

Tuning, Scanning, And Searching

Each TR-9000 user will discover a favorite way to select operating frequencies. You can use the main tuning dial, stepping across the band in 100-Hz, 5-kHz, or 10-kHz steps. The same thing can be accomplished with the up and down switches on the microphone. If operating is confined to a handful of frequencies, then the memory channels may be preferred. There is even a special oddball channel that allows you to use nonstandard repeater splits.

Three types of searching and scanning can be used. "Autoscan" is an FM-only means of scanning the entire band. If a signal is present, the scanning stops and then restarts when the signal drops. Pushing either the hold switch or the PTT switch returns the rig to normal operation. The second kind of scanning is "free scan," in which the band is swept without stopping. Another version of free scan gives the user "search" capability in the SSB and CW modes. A 10-kHz segment is repeatedly searched in 100-Hz steps. That way you will be aware if there is any activity on what might otherwise be a dead band.

The ten front-panel controls devoted to frequency selection take some getting used to, but the remaining seven knobs are self-explanatory. They give you RIT, volume control, squelch, etc.

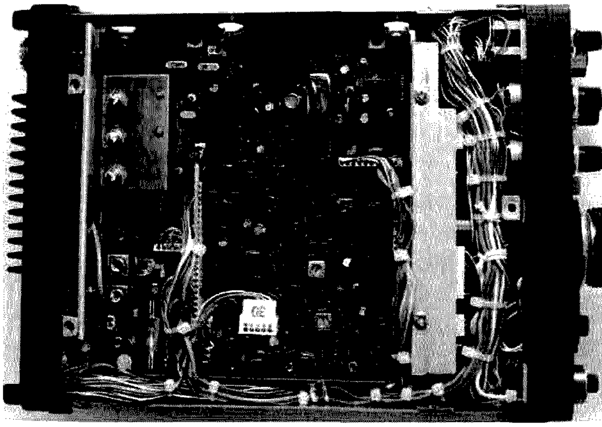
Looking Inside

Before giving the details of what we liked and disliked about the TR-9000, it might be worthwhile to look at the rig's innards. There are eight circuit boards, filling almost every available square inch of space. The frequency selection and control blocks fill three of the boards. The majority of the remaining circuitry is found on the transmitter and receiver cards. Three smaller boards hold the transmitter power amplifier, carrier oscillator for SSB/CW, and sidetone oscillator.

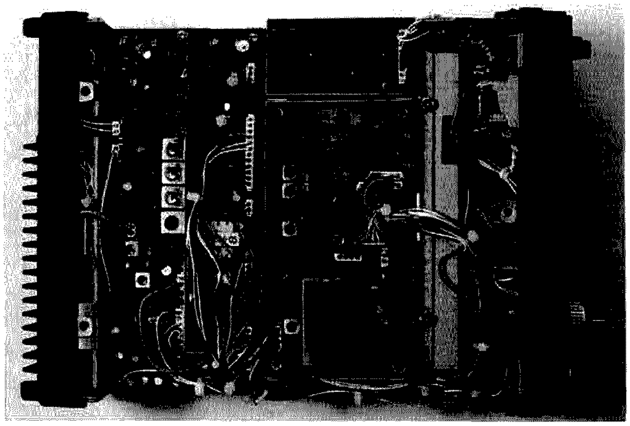
The TR-9000's flexible frequency selection stems from the use of a 6500-based microprocessor system. The magic takes place in one chip that contains the memory, central processor, and much of the support circuitry. The microprocessor has sixteen data lines that drive the phase-locked-loop unit where the frequency synthesis takes place.

The contents of the microprocessor's memory are lost if the power is disconnected, requiring the user to reprogram his favorite frequencies. If the rig is

Kenwood's TR-9000.



Bottom view of the TR-9000.



Top view of the TR-9000.

connected directly to a battery, the TR-9000's computer will keep operating even if the power switch is in the off position. This backup function consumes about 2.5 mA, so the rig can be left in the car for several weeks without causing appreciable battery drain. Since the computer is always on, it is important that the radio be disconnected before the vehicle is jump-started or an external battery charger is used.

A close examination of the TR-9000's schematic revealed that cost-cutting measures had been held to a minimum when the rig was designed. Unlike some of the earlier all-mode two-meter rigs, Kenwood's latest whiz-bang box has separate filters for SSB and FM. The dual-conversion receiver for FM offers one level of selectivity, while the single conversion SSB/CW circuit has a narrower bandwidth. This allows you to have your cake and eat it, too.

CW operation is enhanced by a "fast" agc that automatically returns to a slow constant when the rig is switched to SSB. A noise blanker is available for SSB or CW receiving and helps to reduce the plague of impulse ignition noise. Another SSB/CW-only feature is the RIT, which offers as much as 1 kHz of plus and minus offset. Transmitting on CW can be awkward since the T-R switching must be done with the microphone's push-to-talk switch or with a "standby" switch of your own devising. Accommodations for full or semi-break-in CW operation are not to be found.

The TR-9000's transmitter circuitry features a preset microphone gain for SSB operation. The alc and mike gain circuits are factory aligned for a "normal" voice and may need some tweaking by the operator who whispers or shouts into the microphone. Unfortunately, the instruction manual only shows where the controls are located—not how to adjust them. A rear-panel connector is provided for FM operators who desire to use a touchtone™ pad. An 8-volt supply is available at this connector when the rig is in the FM mode.

The TR-9000's final power transistors provide 10 Watts of output in the high-power FM and CW modes and approximately 10 Watts PEP out for SSB. The energy-saving low-power position reduces the output to slightly more than a Watt. Our tests showed these power levels to be consistent from 143.3 to 148.7 MHz, allowing MARS and CAP coverage.

Like other radios using solid-state finals, the TR-9000 employs a protective circuit that reduces the transmitter's output power when the antenna is something other than a nominal 50-Ohm load. Our tests showed that no appreciable power reduction occurred until the swr exceeded 2:1.

The instruction manual that accompanies the TR-9000 is in keeping with the tradition of providing basic operational instructions and little else. The six methods of frequency selection and searching are described with moderate clarity, but it takes several minutes of study and experimenting to get the hang of things. The manual's text is supported by a number of drawings that show the do's and don'ts of installing the rig. Information about servicing is nonexistent except for warnings not to play with the radio's insides. A service manual is available, however.

We previously noted that operating the TR-9000 involves some compromises, especially in the SSB and CW modes. Perhaps an explanation is in order. Until recently, multi-mode two-meter rigs were scarce and expensive. VHF diehards relied on receiver and transmitter converters. This meant tying up an HF station and dealing with cabling and switching hassles. The benefits of this approach include a more sophisticated receiver and the opportunity to have VOX, variable mike gain, and similar goodies. Which approach is better? That depends on your needs.

For *73 Magazine* staffers who have a drive-up mountain ten minutes away, the all-mode radio was the answer. Most of the time it resides in a mobile setup, being used on the local repeaters. When the two-meter SSB bug hits, we toss a small beam into the car and head for the mountain. In no time flat, we are having a blast talking to SSB ops up and down the eastern seaboard. Future plans call for the TR-9000 to be pressed into service as part of an OSCAR satellite station. We can't vouch for the rig's applications in weak-signal work like moonbounce or scatter, but it does do a good job of meeting our FM and mountaintopping needs.

Odds and Ends

Several matching accessories can accompany your TR-9000. The PS-20 is a 12-volt power supply, good for 4.5 Amperes. A matching external speaker, the SP-120, is a nice addition for fixed station operation, as is the system base, B0-9. It has a memory backup power

Butternut's HF5V-III Vertical

— this one really does work equally well in all directions

The trap vertical antenna is an oft-maligned radiator of rf, but, in truth, it has a few things going for it. It is ideal for the beginner who wants to sample the activity on all the bands without making his backyard look like the high-wire act at the circus or spending a lot of money. Properly installed, the vertical can even be reasonably effective! Truly, the trap vertical is not just for beginners. A roof-mounted vertical is often the only answer for hams with a shortage of real estate who crave 160-, 80-, and 40-meter operation. The low angle of radiation of a vertical has better DX-catching potential than a dipole, and contesters have found the vertical to be excellent for checking activity off the back and sides of a directional array. Many a long-path DX opening has been missed because a station did not do this sort of checking! I frequently use a vertical to make sure that my beam is headed in the right direction. Flip back and forth between the beam and the vertical—if the other station is stronger on the vertical, you are pointing the beam in the wrong direction.

The Butternut HF5V-III vertical antenna.

Once you have a vertical, you'll think of lots of ways to use it. As the sunspot cycle plunges 10 meters into oblivion, you might want to consider taking down that tribander, replacing it with four- or five-element monobanders for 15 and 20 meters. On the rare occasion when 10 is open in the bottom of the sunspot cycle, the vertical will allow you to sample the action. Meanwhile, you'll be enjoying the superior characteristics of the large monobanders on 15 and 20, assured that you aren't missing much on torpid ten!

Some time ago, I installed Butternut HF5V-III vertical antennas in two separate locations—one roof-mounted at the *73 Magazine* ham shack for contest spotting and Novice use and the other ground-mounted at home to serve as my main antenna system until I amass the fortune necessary for a tower and beam.

Why the Butternut?

I chose the Butternut antenna for two reasons. Trap vertical antennas have relatively narrow bandwidth on 80 and 40 meters and must be set for lowest swr in the most often used portion of the band. This is a reasonable compromise, unless you operate in both CW and phone bands, as I do. With many verticals, retuning for different portions of the band is annoying at

The Meterless Ohmmeter

—an audible continuity tester

The subject of this article is an audible low-voltage, low-current, and low-cost continuity tester. The tester is also small enough to put in your shirt pocket because it uses a 35mm film container for an enclosure. Originally I had a need for such a tester during a project that was wire-wrapped and I needed to check a lot of connections in as short a time as possible. The tester will give you an audible indication of resistance up to around 2000 Ohms. You can test semiconductor junctions with it and the tester will let you tell the difference between just a few Ohms of resistance because different tones will be heard when testing different values of resistance. Since this continuity tester will let you measure small values of resistance, it is nice for testing any sort of wiring or semiconductor components.

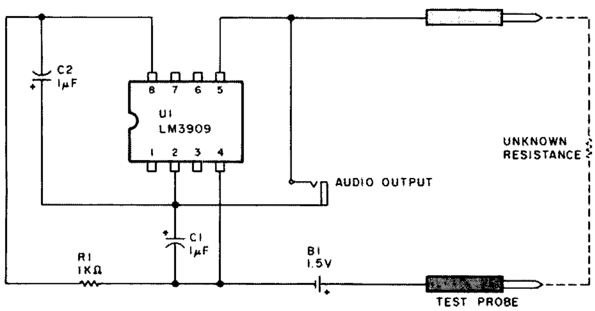

Fig. 1. Continuity tester schematic.

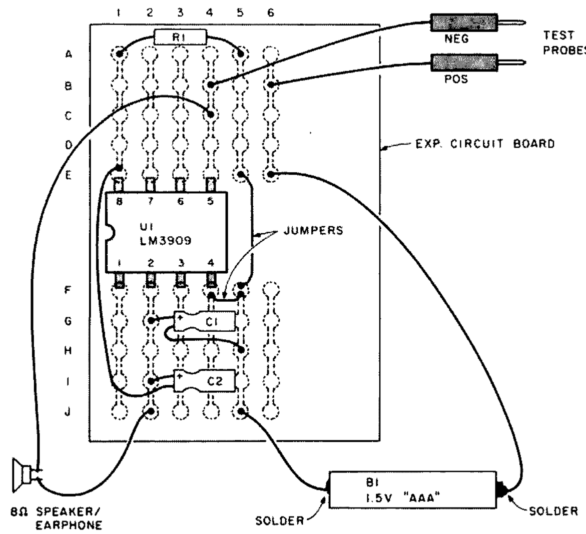

Fig. 2. View from top of circuit board.

The LM3909 used in this tester is almost indestructible provided it isn't fed with more than 1.5 volts. I use an AAA-size 1.5-volt battery in my tester and it has lasted almost a year now. The tester provides enough voltage to turn on transistor and diode junctions and it does so at low current levels. Maximum current levels are obtained when the component being measured has close to zero Ohms of resistance. If you use a 1000-Ohm earphone with the tester, the current will be approximately 2 mA. If you use an 8-Ohm speaker, the current will be around 13 mA. If you're not measuring zero Ohms, the current through the component or wire being tested will be in fractions of a milliampere. The enclosure used for my continuity tester was an empty film container and it is just the right size to put in your pocket and get ahold of when you need it. If you don't have a 35mm camera, ask one of your friends that does to give you an empty film container.

Construction of this continuity tester will only take an hour or so if you have all the parts ready. You can buy all the parts at a Radio Shack store. Depending upon what you have in spare parts and your junk box, the total cost will be from five to ten bucks.

The electrical design of the continuity tester is shown in Fig. 1. If you look at Fig. 2, you can see how the parts are placed on the piece of experimenter circuit board. A completed continuity tester is shown in Fig. 3. Looking at Fig. 1, you should notice that the earphone or speaker has to be connected for the tester to operate. If you don't use an earphone and jack as I did, you might want to install an on-off switch to turn the tester off in case the test

Fig. 3.

leads touch together while it is waiting to be used.

Before you solder the parts in place on the circuit board, trim it down enough to fit into the film case. Then drill two holes in the lid of the film case and pass the test leads through it. Fig. 5 is an example of my trimmed down circuit board. The capacitors used in my tester were electrolytics rated at 50 volts, but any rating small enough to fit on the circuit board and into the film case would work just as well. The voltage rating needs to be only a few volts, so tantalum capacitors would work nicely, too. After you have soldered the components to the circuit board, drill a hole in the center of the film container top for the earphone jack (if you use one) and install it. Finally, solder the leads going to the battery and touch the test leads together. You should hear a tone coming from the earphone or speaker, depending on which you used. At this point, your continuity tester should look like Fig. 4.

If you have some low values of resistance handy, try the tester on them and listen to the different tones generated by different values of resistance. When you're sure that the tester is working correctly and all the wires are soldered, wrap the circuit board and the battery with electrical tape to prevent things from shorting out once you put everything into the film case. Take a look at Fig. 6—you can see what my tester looks like before stuffing everything into the film case. Now that you've got the audible continuity tester put together, you can use it to check wires and semiconductors. By connecting it to a telegraph key, you've got a code practice oscillator. If you replace the earphone or speaker with the correct value of resistor (between 10 and 2000 Ohms) and take an output from across it, you have an audio signal generator, the output frequency depending upon the resistance that you use. ■

QRM-Free Antenna Tuning

—with this inexpensive noise bridge

One definition of the word "relaxed" is "being at rest or at ease." The way to achieve that state when working with antenna tuning problems is definitely to use a noise bridge. Compared to the anxiety and frustration which usually develop when feeding power into a tuning system for protracted periods, you can experiment for hours

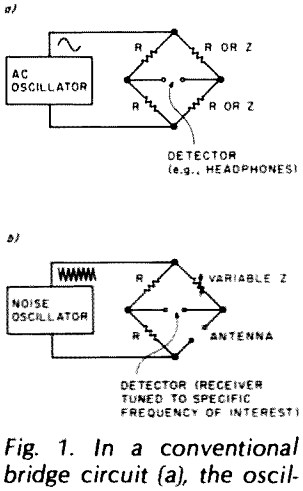

Fig. 1. In a conventional bridge circuit (a), the oscillator generates a specific frequency which is detected for a null when the bridge is balanced. In a noise bridge (b), multiple frequencies are generated and the detector provides selectivity so the bridge can be balanced for a null at the frequency of interest.

using a noise bridge and not worry about components heating up or having to vary the power level back and forth to get an swr meter to read properly as tuning conditions change.

Besides, you also do the rest of the amateur fraternity a favor by not radiating a lot of needless QRM. Any amateur who does not have such a permanently established antenna and antenna tuning system that operation is merely a matter of always presetting tuning controls on each band might well consider the noise-bridge idea.

The noise bridge is a versatile device and can be used for various functions involving impedance measurement as well as antenna tuning. However, it is probably most useful for antenna tuning work, so just that aspect of its application will be emphasized. The basic idea of the noise bridge is just like that of most bridges. That is, as shown in simplified form in Fig. 1(a), when the arms of the bridge are balanced, the detector will not have any output.

Usually, the detector used is not frequency selective: The ac oscillator used, be it in the af or rf range, generates a specific frequency and the detector is a broadband device (like a pair of headphones) which responds to any oscillator frequency being used. As shown in Fig. 1(b), the noise-bridge idea just exchanges this scheme—the oscillator becomes a broadband frequency-generating device, and a frequency-selective detector is used.

In the noise-bridge scheme, the noise generator generates rf noise (a voltage which is a random function of time) over the HF range and a communications receiver tuned to the frequency of interest becomes the detector. When the arm marked "variable Z" in Fig. 1(b) has the same value as that connected to the terminals marked "antenna" at a specific frequency, the noise level (as heard in a receiver tuned to the same frequency) would theoretically be zero. In reality, because of leakage and imperfect components, the received noise is not zero, but it dips to a distinct null as the "variable Z" arm is varied in value around that of the impedance connected to the "antenna" terminals.

The circuit of the noise bridge is shown in Fig. 2. A 6.3-volt zener is used as a noise source and its noise output is amplified by a simple three-stage amplifier. There is nothing particularly critical about the components used. The only item that requires a bit of care in construction, although it is hardly difficult to do, is the output transformer. Care must be taken to obtain good balance between the windings.

The transformer is wound on an Indiana General CF 102, 3/8" ferrite core or on an Amidon T-50-2 core. These items were formerly a bit difficult to obtain but are now readily available from a number of mail-order sources. In fact, Amidon will sell direct and accepts small orders (Amidon Associates, 12033 Otsego Street, North Hollywood CA 91607).

A slightly larger or smaller core also can be used as long as the core is made of a ferrite "mix" intended for the HF range. Four 5" lengths of #28 enameled wire (or any near gauge) are first twisted together along their entire length. One neat way to do this is to insert each wire in a hole on perforated board stock

leaving just enough wire exposed to grip the ends. Then, twist the board and gradually pull the wires back out of the board.

It doesn't cost much to practice this technique a few times and extremely neat results will be obtained. The "quadrifilar" winding on the core is then produced by simply taking the twisted wire bunch and winding it on the core to produce 4 to 5 turns. Space the turns evenly around the core and hold them in place with a bit of clear glue or coil dope. The ends can be marked before winding the transformer or located after using an ohmmeter.

Connect any two windings together to form the primary and the other two together to form the secondary. Take care, of course, to get the windings polarized correctly as shown by the dots next to the windings in Fig. 2.

The circuitry can be assembled on any small PC board using point-to-point or isolated-pad-type wiring. I assembled the circuity on a 2-1/4" × 1-1/2" board. My usual technique in assembling a circuit of this sort where short lead lengths are desired and where really no complex circuitry is involved is just to follow the schematic during construction. That is, components are soldered in place one by one as compactly as they can be placed following the schematic from left to right.

A PC board larger than required is used and, after assembly is finished, the PC board is trimmed to size with a fine handsaw. I also mounted a small trimmer-type capacitor and potentiometer on the board. This was only done for test purposes. In practice, you would normally want to have these components (the 100-Ohm potentiometer and series 140-pF capacitor shown in Fig. 2 which constitute the variable impedance arm of the bridge) as panel-mounted controls.

The circuitry can be mounted in any small enclosure which can contain the circuitry, a battery, and two coaxial connectors for the antenna and receiver terminals. A shielded one is preferable but not absolutely necessary.

The panel-mounted variable capacitor and potentiometer deserve a word of mention. If an air-variable capacitor is available it can be used, but experience has shown that even the cheap transistor radio variables are quite satisfactory and very inexpensive. The same is true of the potentiometer which has to be a linear-taper, carbon-composition type.

An unshielded type is desirable to avoid stray capacitance. In some cases, the metal back cover on a potentiometer can be removed. One can find PC-mount trim potentiometers which are completely unshielded and which can be turned into a panel control by means of a nylon extension shaft. They are very inexpensive but ideal for this type of application.

If you want to use the noise bridge as a calibrated instrument, first connect a 50-Ohm composition resistor to the "antenna" terminals and use a communications receiver tuned to 10 or 15 meters as a detector. As the capacitor and potentiometer are varied, a noise null should occur around the midpoint of their shaft rotations.

Different value resistors above and below 50 Ohms can then be used to calibrate the resistance potentiometer. Various value capacitors below 68 pF and in series with a 50-Ohm resistor are used to calibrate the capacitor rotation. The capacitor rotation on one side of its noise null (as es-

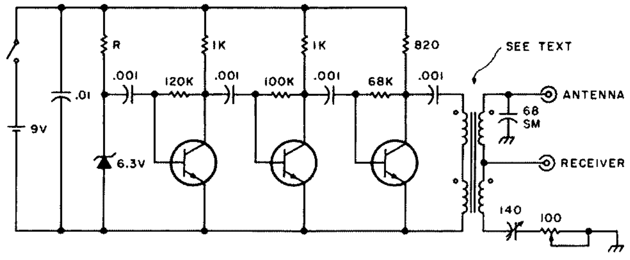

Fig. 2. Complete basic noise bridge. The resistor, R, is chosen for maximum noise output using any given 6.3 volt zener. Start with a value of about 1K Ohm. If the variable RC components on the output have their rotation calibrated, the bridge can be used to directly measure complex impedances over the range of 160-6 meters. Transistors are 2N5129 or HEP or Radio Shack equivalents.

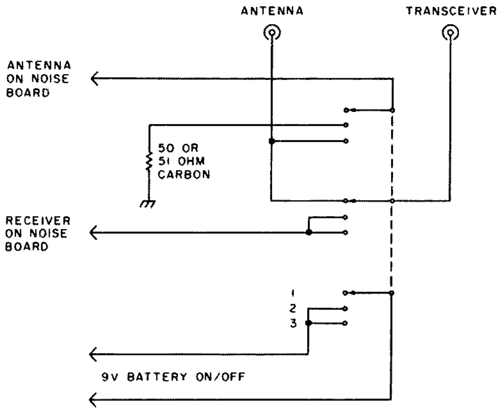

Fig. 3. Some additional switching circuitry makes the noise bridge more versatile and easier to use if you are primarily interested in only 50-Ohm load adjustments. Switch positions are: 1—off (bypass); 2—test (calibrate); 3—on (operate).

tablished with just a 50-Ohm resistor as a load) will indicate capacitive reactance while the other side will indicate inductive reactance.

Using various value capacitors and calculating X_C for each value capacitor (using the frequency the receiver is tuned to) calibrates the X_C side. You could calibrate the X_L side using various value inductors but it is generally accurate enough to just mark the X_L side as a mirror image of the X_C side.

Following the above procedure, you can develop a nicely calibrated test instrument to measure complex impedances. I have had such an instrument in use for several years with very good results. However, most amateurs really don't measure complex impedances very often.

The main advantage to a noise bridge for most amateurs is that it allows the leisurely setting of antenna tuners or other matching devices to provide a 50-Ohm load to a transceiver. In such cases, by adding an extra switch and resistor to the basic noise bridge one can develop a simple, self-calibrating noise bridge. The switching arrangement shown in Fig. 3 allows the noise bridge to be bypassed (with the battery switched off), switched to a 50-Ohm "calibrate" position, or switched into operation.

I assembled my 50-Ohm noise bridge in a 4" × 2" × 1-1/2" enclosure.

The PC board is just held in place by stiff wiring to the side-mounted variable capacitor and potentiometer. The battery is held in place by back-to-back adhesive tape, although a proper holder is recommended. The 3P3T switch is at the top of the enclosure between the two coaxial connectors.

Rather than using two SO-239 female connectors, one connector was made from a UHF-type male connector. So, this arrangement saves having to use an adapter when inserting the bridge.

The male connector is mounted by means of a reducing adapter (for either RG-58 or RG-59) which fits the UHF male connector. A lock washer is threaded on the adapter which is too small to pass over the end flange of the adapter. The hole in the enclosure is made just large enough to pass the threaded diameter of the adapter. With the adapter inserted from the inside of the enclosure, the male connector is screwed on to it from the outside.

In operation, the noise bridge is first calibrated by switching to the 50-Ohm "test" (calibrate) position and adjusting the side controls (which are unmarked) for a noise null. Then you can switch to the "on" (operate) position for hours of leisurely testing (well, at least up to 7 or 8 before the battery will give up).

The side controls are, of course, not touched, and whatever device is being tested or adjusted is varied until the same noise null is obtained as with the 50-Ohm calibrating resistor. The "off"—or bypass—position is useful when you want to apply power to check that a 50-Ohm load has indeed been achieved for a transceiver.■

IC-2A Accessories the Cheap Way

—build 'em yourself and save!

The Icom IC-2A has been on the market only a short period of time, yet it is already starting to look like it is going to be one of the most popular handie-talkies to hit the market. This article details a few easily built or acquired accessories which will further enhance the flexibility of this fine rig.

Remote Microphone

For mobile and belt-carrying use, an external microphone is a real nicety. You can easily fabricate a lightweight microphone with push-to-talk that fits the hand perfectly. First, accumulate the following parts:

- A single-conductor shielded guitar cord, coiled, available from Radio Shack (RS 42-978), which sells for $5. There's easily enough cord for two microphones, so split this with a friend.
- An electret condenser microphone element available from either Radio Shack ($3.00) or Bullet Electronics ($2.00).
- An SPST momentary contact miniature push-button switch. Radio Shack sells 5 for $2.50.
- A 24k-Ohm ¼-Watt resistor.
- A Polaroid "Print Coater" case. This is the small plastic case that the print-coating applicator supplied with Polaroid film comes in.

First, clean out the Print Coater case with soap and water. You can throw away the cap, as this won't be used. Now, punch a hole in the bottom of the case to take the coil cord, and cut a slot in the side of the case one inch long which has a width equal to the diameter of the shank of the push-button switch you are using. Don't mount the switch at this time. Pull one end of the coil cord through the Print Coater case and wire the coil cord, switch, resistor, and microphone element as shown in Fig. 1.

Note that only the power and shield connections to the microphone element are used. The audio output center conductor is taped up and not connected to anything. The audio feeds into the IC-2A through the power line of the condenser element.

With everything wired up, slide the push-button switch down the slot and fix in place with its locknut. Push the microphone element into the end of the case and secure in place with Silastic compound

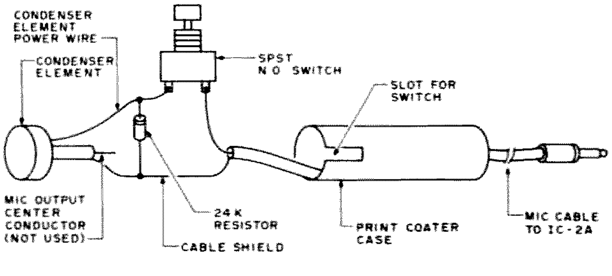

Fig. 1. PTT microphone details.

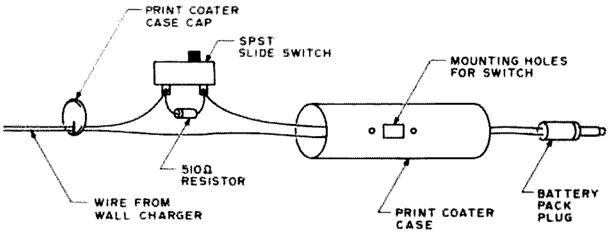

Fig. 2. Wall charger trickle adapter.

(available at any hardware or drug store). Also, fill in any extra gap in the case with the Silastic compound.

Finally, mount the subminiature microphone connector supplied with the IC-2A on the free end of the guitar cable. Voila! You now have a great remote microphone. Pushing the PTT switch both completes the microphone circuit and causes the IC-2A to switch to transmit. This is accomplished by a clever bias circuit within the IC-2A which permits a remote microphone with push-to-talk using just a center conductor and ground. This remote microphone sure makes mobile operation easier and the price is right!

Trickle Charger

The wall charger that comes with your IC-2A charges the batteries at a 50-milliamp/hour rate. However, like any nicad battery, battery damage can occur if you overcharge the batteries. The recommended charge time is 16 hours for a completely discharged battery. It is also recommended that you discharge the batteries completely each time since nicads can develop a memory based on less than full discharges. Since minor things like work and sleep sometimes keep me from being around at the end of a 16-hour period, I felt that it would be beneficial to be able to trickle-charge the batteries during these times. Since trickle-charging will not harm a nicad, you can leave an extra battery pack on a constant trickle-charge to ensure a fully-charged battery pack when you need it. The recommended trickle-charging rate is approximately one percent of the battery Ampere-hour capacity. For the standard 250 mAh IC-2A nicad pack, this will be 2.5 milliamps. Your IC-2A wall charger can be converted to a switchable trickle/normal charger for less than one dollar. You will need the following: one 510-Ohm ¼- or ½-Watt resistor, a miniature SPST slide switch (Radio Shack sells two for 79 cents), and a Polaroid Print Coater case (remember this?).

First, wash out the Print Coater case with soap and water. Next, cut a cross in the bottom of the case and push through the wall charger connecter. Pull about a foot or so of cord through the case. Now notch the case cap so as to pass the cord. The mounting holes for the miniature slide switch are now cut in the side of the Print Coater case. The switch will mount from the inside of the case, but don't mount it yet. First cut one of the wires of the charging cable. Now wire the 510-Ohm resistor, SPST switch, and charging cable as shown in Fig. 2. Slide the SPST switch into the Print Coater case and snap the case cap in place. The SPST switch now either shorts out the 510-Ohm resistor for normal charging or permits the 510-Ohm resistor to stay in the line for a 3-milliamp trickle-charge rate. The LED charging indicator in the 250-mAh battery pack will not light with the 3-milliamp trickle-charge rate, so I use the status of this indicator to tell me if the charge switch is set to the normal or trickle state. I think that you will find this to be a very worthwhile modification to the wall charger. The total time required for this modification is less than ½ hour.

12 V dc Power Cord

An inexpensive 12 V dc charging cord which includes a cigarette lighter plug on one end and the same plug which mates with the IC-2A battery pack on the other end is available from Radio Shack. It is an RS 270-1533 and sells for $2.99. A useful addition to this cord is the trickle/normal switch modification just described. This permits you to keep a battery pack trickle-charging in the car all the time.

K-Mart Karrying Kase

Finally, I found an Instamatic camera carrying case at K-Mart which fits the IC-2A almost perfectly. The only size problem had to do with the camera case being three-fourths of an inch too long. I compensated for this with a ¾-inch wood spacer. The beauty of this is that the IC-BP4 450-mAh battery pack will extend the length of the IC-2A by exactly ¾" permitting this case to be used with either battery pack. A little care with an X-acto® knife over a period of about one hour will leave you with a very professional looking case complete with all cutouts. In addition, I also sewed a couple of leather loops to the side of the case to hold both the flex antenna and a collapsible 19-inch antenna purchased separately. The PTT switch is easily pressed by squeezing the case. Incidentally, the price of this case was $3.67!

I've described several inexpensive accessories for the IC-2A. I am sure that you can continue along this line with others. For example, a real speaker/mike complete with touch-tone™ pad built into an old CB microphone is in the planning stages. I'm also working on an inexpensive remote speaker/amplifier box for mobile operation. I'll have more on these at a later date. I think that you will find that with a little work, you can easily build many of the desired accessories for your IC-2A. ■

Solar-Powered Alignment Tool

—using Old Sol to find true North

Two common methods of calibrating the direction of a beam antenna with respect to true north (or south) are: to align the boom in the direction of the polestar, or to apply the variation correction to the magnetic north (or south) reading of a compass. Unfortunately, there is no accommodating star at the south celestial pole for observers in the Southern Hemisphere. The variation correction depends upon one's latitude and longitude.

The method I shall describe here is simpler; it is based upon the sun's meridian passage at any locality in the world. All one needs to know is one's approximate longitude obtained from a world map and the local mean time (LMT) of the sun's meridian transit. At this moment, the sun is at its maximum altitude and is on a north-south line. Table 1 lists the LMT of the sun's meridian passage on the first, tenth, and twentieth of each month. These values do not vary by more than about one minute from year to year.

Since our clocks are based on standard or zone time and not on local time, it is necessary to apply a longitude correction, converted to time units. Table 2 allows this, to the nearest standard meridian. The standard meridians theoretically are spaced 15° apart to the east or west of the Greenwich prime meridian. If the station longitude is east of the standard meridian, subtract the difference in longitude in time units between your station and the nearest standard meridian from the LMT; if the station longitude is west of the standard meridian, add the longitude difference in time units to the LMT. Thus, standard or zone time = LMT plus or minus the difference. Because the time zones have ragged boundaries, it may be necessary to add or subtract one hour, and, in some instances, one-half hour, as the custom dictates.

To demonstrate the simplicity of the solar method, two examples are chosen.

(1) What is the standard time of meridian passage of the sun at longitude 114° 20′ W on October 15? From Table 1 we interpolate a value of 1145 LMT. The nearest standard meridian is 120° W. The difference in longitude between the station and the nearest standard meridian is 5° 40′. From Table 2, this amounts to 23 minutes. Since the station is *east* of the standard meridian, the Pacific standard time of the sun's meridian passage is 1145 − 0023 = 1122 PST.

(2) What is the standard time of meridian passage of the sun at longitude 25° 40′ E on March 25? From Table 1, LMT = 1205. The difference in longitude between the station and the nearest standard meridian of 30° E is 4° 20′, which from Table 2 is equivalent to 17 minutes. Since the station is *west* of the standard meridian, the standard time of the sun's meridian passage is 1205 + 0017 = 1222.

At the standard time the sun is on the meridian, that is, due north or south, depending on your latitude, line up the antenna boom with the sun or parallel to any shadow cast by a vertical structure (pole, tower, etc.). An error of 4 minutes in time amounts to a change in the direction of the sun of only 1°. Set the direction indicator of your rotator to 0°. Make certain that the radiating element of the antenna is on the correct side of the boom—otherwise you could be 180° off. That's all there is to it! ■

The DX Primer

—low power plus low antennas plus good technique equals 300 countries

One of the things that many amateurs look forward to the most when they upgrade is the prospect of being able to work some DX with their new privileges. Novices especially look forward to being able to operate on better DX frequencies and on 20 meters. However, many of these would-be DXers are discouraged right from the start.

Because they have heard that 20 is the best DX band, they listen to the stations in the "kilowatt alley" on that band from about 14.200-250 MHz. These stations all seem to be running a full kilowatt (at least) and a four- or five-element beam at about 70 feet or more. They are always giving out 59+20-dB reports to DX stations which the newcomer can't even hear with his modest transceiver and dipole at 25 feet. The newcomer listens for awhile, decides that DXing is a game for wealthy fanatics, and heads for two meters or for a rag-chew on 75 SSB.

He has been too hasty, though, for it is quite easy to work DX with that 100-Watt transceiver and a low-slung dipole. It takes some patience and some special techniques, but it can be done. I worked my first 100 countries with 20- and 15-meter dipoles 10 feet high and a barefoot transceiver. I worked 262 countries before I got an amplifier and worked 310 countries before any of my antennas were higher than 29 feet.

In many European countries, amateurs are limited to about 200 Watts of power, and yet stations from those countries constantly show up on the honor roll. So, it is possible.

Equipment

Before discussing some of the techniques for low-power DX chasing, at least a little should be said about equipment and antennas. The most important parts of your station when it comes to working DX are, in order: antenna, receiver, transmitter. The antenna is by far the most important factor in determining how successful you will be at DXing. It does not matter how expensive or marvelous your receiver is, it can't receive signals that aren't fed into it, and it is the job of the antenna to pick those signals up and to send them to the receiver. Likewise, it doesn't matter how much power your transmitter runs and how clean and pure your signal is; if your antenna won't radiate that signal out of your backyard, then you aren't going to work any DX.

So, you should put up the best antenna you possibly can. We are already assuming here that you cannot get an antenna up very high. If that is so, then what antenna is best? There is no single answer to that question, and this is not meant to be an article on antennas. I do have some general advice, however. If at all possible,

put up a gain antenna, and put it up as high as you possibly can. I worked my first 310 countries on dipoles and a three-element 20m yagi that I bought for $27 and put up on a TV tower at 29 feet. Look through the antenna books and the magazines and find articles on gain antennas you can construct. If necessary, use a fixed wire antenna, but get some gain if you can. For 10, you can pick up "retired" CB antennas for a song and recut them so they'll work on 10. In most cases, that involves cutting a few inches off the elements until you get the antenna resonant on 28 MHz.

Many old-timers will tell you that if you can't get an antenna up high, you should use a vertical because it has a lower angle of radiation and is, therefore, better for DX work. While this may hold true on 40 and on 80, where a dipole a half-wavelength high has to be 60 or 120 feet, respectively, it is not true on 20, 15, and 10. On 10, a dipole one-half wavelength high has to be only about 15 feet up. I had a good friend in Texas who worked the world on 10 with a little four-element yagi eight feet off the ground. My advice for the "higher" bands is that you put up a gain antenna if at all possible, and if not, put up a dipole as high and as clear as you can. Verticals will work fine on these bands for DX, sometimes better than a dipole, but they have two main disadvantages: 1) they are susceptible to QRM from all directions, and 2) they are considerably more susceptible to man-made noise—line noise, auto ignition, your neighbor's hair dryer, etc. I like verticals for 160, 80, and 40, but on the higher bands, dipoles seem to do the job as well or better.

Regardless of what type of antenna you put up, it should be carefully tuned so that it is resonant on the frequency you will be using most often. Also, it should be put together carefully. Wire connections and coax connectors should be soldered, tubing and pipes should be scraped and bonded together, etc. In short, anywhere where metal joins metal, the connection should be clean and solid. If you are going to use an antenna at a low height, you must ensure that it radiates and receives every Watt possible, rather than losing that precious power in bad connections, leaks to ground, faulty coax, etc.

Once you have your antennas in good shape outside, you should then concentrate on the gear you have inside. Even the most modest equipment is capable of working DX, but not if it is out of alignment or full of "soft" tubes. Unless you are sure that your gear, especially the receiver, is in perfect alignment, realign it yourself (the manual should tell you how), have a friend do it, or return it to the factory.

If you have tube-type equipment, replace at least the most critical tubes for receiving: the rf amplifier tube and the i-f stage tubes. Even though your receiver may sound like it's working OK, you might be surprised at how much "hotter" it becomes with new tubes. Save the old ones for spares.

Make sure that all of the contacts and interconnections in your shack are clean and well-soldered, especially those having to do with antenna and ground connections. An oxidized antenna connector might let rf through when you transmit and, thus, not show up on your swr meter, but it can seriously degrade receiver sensitivity, especially with weak DX signals.

There are several station accessories that you should consider if you want to chase DX. One is a good pair of headphones. Not only will they help ensure domestic tranquility, they will also help you hear weak signals under poor conditions better than you can through a speaker. You can get a good pair of 8-Ohm stereo headphones fairly inexpensively these days.

If you hear a lot of hum and hiss when you plug them into your receiver, you probably have an impedance mismatch. Many receivers have headphone jacks with impedances in the 500-2000-Ohm range. To match these to 8-Ohm headphones, you can buy an audio transformer at Radio Shack for a buck or two. Put it in the audio line so the 8-Ohm side goes to the phones and the higher impedance side goes into your headphone jack (you can even wire the transformer internally onto the jack). This should eliminate the mismatch-induced noise and will make headphone reception much more pleasant.

While we're on the subject of audio, you should also consider an audio filter for reception. Audio filters are available for as low as $30, and they can greatly improve the performance of a receiver, especially an inexpensive or moderately priced one. If you contemplate using mostly CW, you can get one of the CW-only filters; if you're going to work SSB, too, then you should consider one of the continuously variable filters. An audio filter will help improve your receiver's selectivity and will allow you to notch out QRM and to pull through those weak ones.

Yet another valuable accessory is an automatic keyer. Most DX pileups on CW are conducted at high speed (don't let that worry you; all you have to send and receive is your callsign and report). It is tough to send 20-30 wpm with a straight key for an hour or two in a pileup, and a keyer makes it much easier.

Finally, you might consider a speech processor of some kind. If you are running barefoot, the processing will give you several dBs of average gain, and this will definitely help under weak-signal conditions and in pileups. However, do not adjust the processing level too high (as most people do). It is tempting, but you will create splatter on adjacent frequencies, rob your audio of intelligibility, and possibly damage your transmitter.

Techniques

Now, you've got your antennas and your equipment ready. How do you work the DX? There are three main variables you need to consider: What mode will you operate? What band will you operate on? What time of day should you operate?

In general, the beginning DXer or the low-power DXer will do much better on CW than on SSB. There are two major reasons why this is true. First, CW is the better mode under weak-signal conditions, and it tends to be something of an equalizer under good conditions. On bands that are only marginally open, you can often make CW contacts when SSB contacts are virtually impossible. And, because of variations in the receiving station's frequency and pitch, your chances of getting through on CW when conditions are good will be better. Second, there is less competition on CW. There are fewer people tuning the band looking for DX than on SSB, and, thus, your chances are much greater of finding a rare one without anyone else calling. And the pileups are generally smaller and much easier

to get through. So, at least to begin with, you are probably going to do better on CW than on SSB.

Which band do you work? A good rule of thumb is to operate on the highest band that is open at any given time. The higher you get in frequency the less trouble there is with QRN, solar absorption, man-made noise, and harmonic broadcast interference. Right now, near the peak of the sunspot cycle, 10 and 15 are the best bands for low-power, low-antenna DXers. For one thing, your low antennas are going to perform better on those bands.

To be of optimum effectiveness, a gain antenna usually needs to be one wavelength high. This is 66 feet on 20, but it is only about 33 feet on 10. You are going to have a lower angle of radiation on 10 and 15 than on 20, and, therefore, you are going to work DX better. There is less competition on 10 and 15 than on 20, and these bands tend to be "equalizers." For some reason, the difference between a kW and a barefoot exciter is often almost negligible on 10.

So, each time you get on to chase DX, check 10 and 15 first; if they're open, stay there. These bands tend to be best in the wintertime; conditions slack off a little in the summer. Also, they are primarily daytime bands, especially 10. You will rarely work DX on 10 and 15 before sunrise or for very long after sunset, although it does happen occasionally, especially on 15. For a year or two at the sunspot maximum (where we are now), these bands are often open all night.

Year in and year out, sunspot cycle in and out, 20 is the best all-around band for DX. It is open to somewhere in the world almost 24 hours a day. Because of this, it is probably the most crowded amateur band, and the competition for DX is often fierce. Nonetheless, you can work DX on 20. Your best bet is to work CW and to do so early in the morning (about 5:00 to 8:00 am local time) or late at night, when there aren't so many stateside stations on. At these times, depending on the time of year and the sunspot cycle, the band is often open to several parts of the world and the competition isn't too severe.

The worst time to work 20 is from 4:00 to 7:00 pm, local time. This is when everyone rushes home from work and turns on the rig; the band is very crowded and very chaotic, although it's not as bad on CW as it is on SSB.

You will not do very well on 40 and 80 with low power and low antennas. Because of heavy broadcast QRM, most of the DX work on 40 is done on CW below 7025, so you need an Extra class license. And on 80, most of the DX work on SSB is below 3800 and the CW below 3525, again requiring an Extra. These bands are highly seasonal; in the summer months heavy static makes DXing very difficult, so winter is the time to listen. If you have up good antennas for these bands, you should listen occasionally; DX contacts are possible with low power, especially right at sunrise and at sunset.

Obviously, the time of day you are going to operate depends on many variables: the band you want to use, the time of year, your work schedule, your spouse's sleeping habits, etc. In general, though, your best bet is to pick times when the bands you want to work are open and the competition isn't too tough. Usually, this means late at night and early in the morning.

Another thing to remember about times is that there is the least competition on a band when it is just opening. When 15 opens in the morning, you can often hear many DX stations calling CQ and not getting answers; a couple of hours later, when the crowd has gotten up and discovered that the band is open, the competition becomes fiercer.

Try finding a time period that you can operate every day. That way you will learn the bands that are open at that time, the areas they are open to, the severity of the competition, which band you do best on, etc.

The best operating advice to the low-power DXer can be given in one word: Listen! You are not going to get many answers to your "CQ DX"s; they are usually a waste of time and spectrum. When you first get on a band, tune across it slowly. Write down the calls and frequencies of the DX you hear. You can then learn whether the band is open, and, if so, to what direction.

Keep tuning across the band until you hear a station you need or want to work. If the band is open to an area where you need several countries, don't get involved in a rag chew with a country you don't need (unless rag chewing with DX is your main interest). While you are telling a G3 about the great weather you've been having, an LX1 or a C31 might be calling CQ 5 kHz away.

When you hear one you need calling CQ or finishing a QSO, you should call him on his own frequency, unless he designates otherwise. If no one else is calling him, you need only give his callsign once (he knows what it is) and your own two or three times. It is generally better to give short, frequent calls than to make long ones, unless that's the only way to get through.

Once you have worked your first 50-100 countries, you will find that it becomes increasingly difficult to work new ones without getting into pileups. So, like it or not, you'll need to develop some pileup strategies. Most of the time, you are not going to bust through a pileup with sheer force (you don't have enough). You should try it a couple of times, nonetheless; sometimes selective propagation will put you over the top even with your low power.

There are several tactics that might help you get through faster. One is to wait until the pileup subsides before sending your call. See if you can sneak it into a lull in the pileup. You aren't going to get through if you give your callsign two or three times right after the DX station stands by—everyone else is doing the same thing.

Another tactic is to try calling off frequency a little, even on SSB. If a station is listening off of his own frequency, call him on the fringes of the pileup. If he is listening, say, from 14.025 to 14.030, call him at .030 or .031; you probably aren't going to make it at .027.

Though a dangerous one, tail-ending is another tactic. Here you send your callsign quickly just as the station working the DX signs his call or just afterwards. If the pileup is small and the DX station doesn't seem to mind, tail-ending is OK. Otherwise, don't do it.

Another technique which sometimes works on SSB is to say something besides your callsigns; a station who is saying something else often stands out. You might try things like "W8YA in West Virginia" (works well from rare states), "W8YA for a new one," or "W8YA running low power." Even if the DX station doesn't hear you, some of the big guns in the pileup who hear you might mention to the DX station that there is a low-power station or a "W8 who needs you for

a new one."

Incidentally, use standard phonetics when calling DX. Most DX ops know the standard English phonetics, but they won't understand "Walrus Dionysus Two Long Yellow Underwear." Another tactic, though sometimes questionable, is to ask for help. If you have a friend nearby or you know someone in the pileup who is likely to get through, ask him to pass along your call. This shouldn't be done when the DX is rare, but for common and semi-rare DX it's OK. The best advice in a pileup is to listen and send carefully. Timing will be all important for you because you won't make it on sheer force. Always follow the DX station's requests.

Other than calling stations you tune across and calling in pileups, there are a couple more methods for DXing. One is "piggybacking." Here, the guy across town who runs 5 kW to a 32-element beam at 1000 feet calls CQ DX or calls a specific DX station with you (who have carefully cultivated his friendship) standing by. After he exchanges reports with the DX, he calls you into the QSO and you become part of the roundtable. This is definitely OK unless there is a big pileup or an extremely rare DX station, in which case you will probably get clobbered.

Another method is to check into DX nets. There are several on the bands, mostly on 20 and 15, and once you check in you will be allowed to call whatever DX is on frequency without QRM. One good net to try is the YL International SSB Net at around 14.330. This is a very friendly group of people who are willing to help out low-power stations trying to work their DX check-ins. Because they often have a large number of check-ins, you might have to wait awhile before you get to call.

An increasingly popular and controversial DX method is the list. Here, a strong stateside or foreign "emcee" takes a list of stateside calls and passes them on to the DX station, who then calls the stations one by one. This is fine, as long as the DX station has not had the list forced on him. If you need the country, get on the list if you can. Personally, I have never derived much satisfaction from working DX via a list, but if it's the only way to work a new one, I will do it.

One final way to work DX with low power is through satellites. This, of course, requires some VHF gear and some specialized antennas. The best time to try for DX on the satellites is just at acquisition time as they come over the horizon. In the near future, constant orbit satellites will be sent up and will make it possible to work DX consistently for many hours a day with a few Watts and a small VHF antenna.

Using the preceding techniques and methods, and a few of your own that you will acquire through experience, it is quite possible to work DX, lots of it, with low power and low antennas. It is, in many ways, more challenging and more rewarding than it is to the high-power, big-antenna boys who become somewhat blasé about DX after awhile. The main things you need to remember are patience, listening, and timing. If you work on those three things, you can work a logbook full of DX. Spend most of your time on CW on 10 and 15, and on 20 when those bands are not open. Good luck! ■

A Flier's Guide to the Airwaves

—off we go into the wild blue yonder

How many hams can claim to have carried on a 5-state simultaneous QSO on 2 meters, without repeaters, mobile, where two of the stations were 400 miles apart? It's easy—all you have to do is get your antenna 12,000 feet in the air! A difficult task, you say? Not at all, if you go *aeronautical mobile*.

I'm not going to get into a discussion of the old "handie-talkie in an airliner" trick, except to say that no airline captain or airline radio shop people in their right minds are going to give you permission to play with your toy while their ten-million-dollar jet is boring holes in the sky 5 miles up. If you somehow sneak your hand-held on board without permission, you risk a $10,000 fine and 5 years in stony lonesomeness, loss of license, and the chance of putting 120 people plus yourself into the side of a vertical granite runway.

No, I much prefer to hook my radio onto a small general-aviation type of airplane. Here, the only permission you need to operate your rig is a nod of the head from the guy flying the left front seat.

By now, 95% of you may have one, two, or three misconceptions about aeronautical mobile:

1. It is against FCC amateur rules to operate aeronautical mobile.
2. It is against FAA rules to operate an amateur station in an airplane.
3. No pilot is going to take me joyriding just so I

Photo A. Connecting the antenna onto the mount and running the coaxial cable down the trailing edge of the strut.

Photo B. Installing a temporary antenna mount onto the tie-down ring.

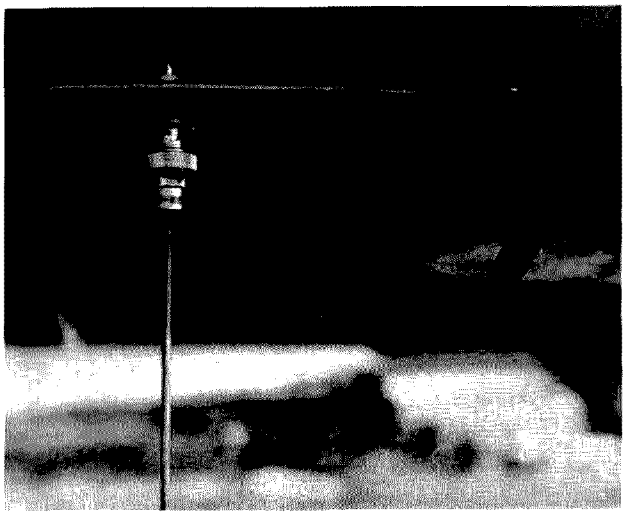

Photo C. Detail of the antenna mount and tiedown ring. The antenna is a 48-cm length of brass brazing rod.

Photo D. The author enjoying a Saturday afternoon aeronautical mobile (at rest) QSO.

can get my antenna 2 miles up.

Now let's pop these bubbles in order.

1. "It is against FCC amateur rules to operate aeronautical mobile." Rubbish. FCC rules (part 97) allow the amateur to operate mobile. Period. They do not restrict you to automobile, boat, snowmobile, submarine, or airplane. You may operate aeronautical mobile under exactly the same rules as if you were operating your automobile station in the same area.

2. "It is against FAA rules to operate an amateur station in an airplane." I wish I had a nickel for every time I've heard this ridiculous statement. FAA rule 91.19 *clearly* states that any electronic device that the pilot feels will not interfere with the safe operation of the flight is authorized for use. As a matter of fact, there was so much confusion over this rule that the FAA went out of its way to issue a clarification of the rule to permit not only hand-held rigs but also permanently-mounted amateur sets for the ham pilot. More about this later.

3. "No pilot is going to take me joyriding . . ." Would you turn down a phone-patch request from one of your neighbors? Wouldn't you give of your time and equipment to someone who wanted to become a ham? Pilots are pretty much the same. Generally, they are quite happy to show off their hobby (or profession) to an interested neighbor. Nor is flying all that expensive. An hour's fuel goes for about $6; if the pilot has to rent the plane, figure on $20 an hour, tops.

One good way of getting to know a pilot is to offer him (or her) a few phone patches to relatives, or invite him over for an afternoon of 20-meter DX work. Gradually lead into the subject of aeronautical mobile, an I'll bet that within the week you'll have your rig in the airplane.

Where do you hang the antenna? Well, if the airplane isn't yours, you're probably going to have to stick to the 2-meter and above bands. I've done my fair share of aeronautical mobile, and I can almost guarantee that an indoor whip or rubber duckie will produce poor results, if any. Even near a window, you are still inside an almost completely enclosed, metallic "screen room," and "getting out" will be difficult, if not impossible.

This situation dictates an outside antenna of some sort, but hanging a whip out in the breeze will also present a fairly difficult mechanical problem. Yes, mechanical—not electrical. Forget the 3-dB-gain long whips, the longwires, and the arrays. A good old quarter-wave whip is more than adequate for aeronautical work. Now the problem will be getting a quarter-wave wire outside the plane, and this is *not* an easily solved problem.

You see, drilling a mounting hole in an airplane requires a tinker's license from Uncle Sammy, and most airplane owners take a dim view of someone punching unnecessary holes in their birds. Also, that wire will have 120 mph winds buffeting it all the time you are airborne, and the last thing you want to do is drop a metal object onto someone's head below. I mean, that kind of thing could ruin his whole day! And for those of you thinking of using a magnetic mount, forget it. That bird's skin is aluminum and besides, the pilot's compass is more than happy to lock onto the antenna base magnet rather than the North Pole, and there are better ways than this of getting lost.

About the only good place for an antenna on OPA (other people's airplanes) is the trunk-lip mount base attached to the baggage (or cargo) door opening. Remember to put in a rubber shim so that the airplane paint job doesn't get marred. If the airplane doesn't have a cargo door, the passenger door may be used, being careful to damage the weather stripping as little as possible.

Another good idea (on high-wing aircraft) is to remove the bolt that attaches the tiedown ring (non-structural) to the strut, insert a home-made whip mounting plate, and reinsert the bolt. Run the coax from this plate into the cabin via the strut, and lace it in place with nylon lacing tie, plastic tie-wraps, or (as a last resort) heavy duct tape. (Photos A, B, and C show construction and installation details of a tiedown-ring mount on the author's Cessna 172.)

If you own the airplane, things are a little easier. I will pass on to you a trick that lets you hang the antenna on the best spot on the airplane—the belly; yet, if and when you decide to sell the airplane, you can remove the antenna mount with no sign of it ever hav-

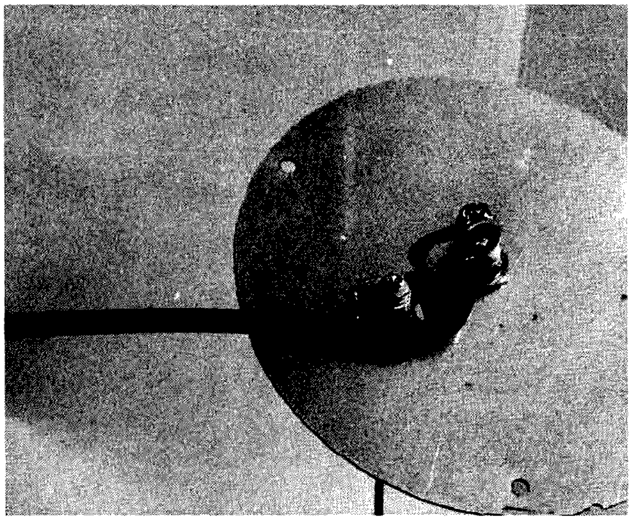

Photo E. Mounting the BNC connector to a spare belly inspection plate. Note that the cable is securely clamped.

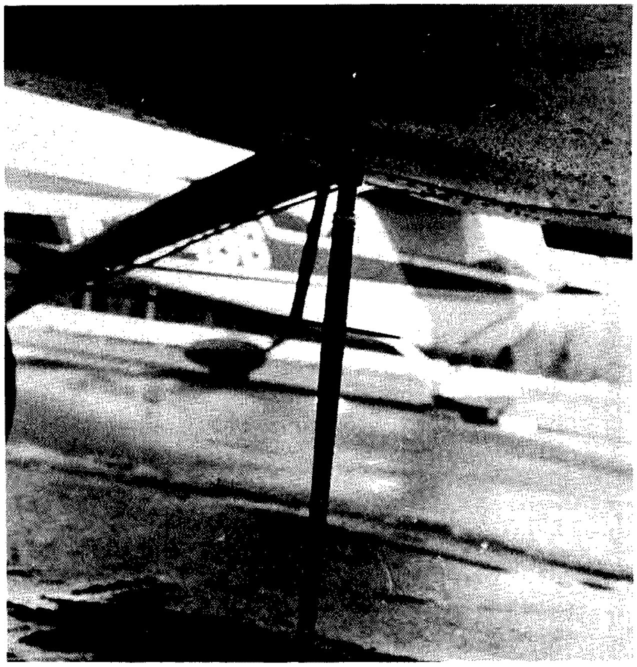

Photo F. The inspection plate mounted on the belly with a 10-meter band rubber duckie antenna attached.

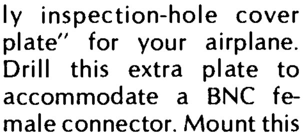
ing been on the airplane. Not only that, you will be able to operate any band you wish simply by using plug-in antennas for the various bands.

The trick is this: Go to your friendly airplane parts store and buy an extra "belly inspection-hole cover plate" for your airplane. Drill this extra plate to accommodate a BNC female connector. Mount this connector onto the plate with the female connector portion on the *outside* of the plate. Remove your present belly inspection plate and store it in a safe place, because you will need it if you ever want to take the ham antenna connector off. Connect your coax cable to the inside of the connector, and string the coax up to where the rig is going to be installed. (This last step really should be inspected by a licensed airframe mechanic.) Now bolt on the new plate and connector where you removed the old plate. Cut an antenna for the band of your choice using the quarter-wave formulas from the *Handbook*. Attach it to a BNC male connector, making sure that you fill the connector body with epoxy to keep the antenna rod mechanically attached to the connector. Connect this antenna to the belly plate, fire up the rig, and you are on the air.



3-TERMINAL VOLTAGE REGULATOR IS NATIONAL SEMICONDUCTOR LM317 FOR CURRENTS UP TO 1.5AMPS, AND LM350 FOR CURRENTS UP TO 3.0 AMPS

Fig. 1. Schematic of 24-to-12-volt converter.

Before flight, though, have your airframe mechanic make a logbook entry in accordance with Advisory Circular 20-98, "Auxiliary Two-Way Airborne Radio System Installations." In some cases, you may have to get a copy of this AC from your general aviation district office and give it to the mechanic, as most of them have never seen this document. I highly recommend that you tell the mechanic exactly *why* and *how* you plan on installing your antenna—before you start. Hell hath no fury like a ticked-off inspector, and one sure way to torque his jaws is to do your work without telling him, and then ask him to "sign off" your brainchild. (See Photos E, F, and G for a detailed view of this belly-plate antenna installation.)

We now come to the subject of power, because you sure don't want to run from nicads all the time. Well, I have good news and bad news. Ninety-five percent of all light aircraft have 12-volt battery systems identical to an automobile battery supply. With these aircraft, you can plug directly into the cigarette lighter, or have your mechanic put in a separate circuit breaker or fuse (not expensive) just to run your ham rig. If you choose to have the breaker installed, I strongly suggest that you have a molex type of pigtail connector installed in both the airplane and on the rig. Aircraft vibration is a mortal enemy, and "Jones," "octal," and "ribbon" connectors have a nasty tendency to vibrate apart. You might also check your local auto parts store for polarized "bullet" connectors which are also relatively vibration-proof.

Now for the bad news. Since 1978, Cessna and a few others have been using 28-volt electrical sytems, but they still use the *same size* cigarette lighter plug and the *same size* circuit breakers and fuses. There is no more sickening smell in this world than $300 worth of French-fried silicon. The answer, of course, is to ask the pilot beforehand what kind of electrical system he has in his airplane—and if he doesn't know, then he is not the kind of pilot I especially like to fly with! At any rate, if the aircraft you are using has a 28-volt electrical system, I recommend that you use one of the new 3-terminal regulators to drop the 28 volts down to 12. Remember during transmit, your rig will be drawing about 2 or 3 Amps. That means that your regulator will be dissipating up to 50 Watts, as a good heat sink is mandatory. Fig. 1 shows an easy-to-make 12-volt regulator for use with 28-volt aircraft.

Well, I've told you how to get the power in and how to get the power out. The only thing left for me to do is pass along a few tips I've found useful in some hun-

dreds of hours of aeronautical mobile.

● Flying is hours and hours of fun punctuated by moments of stark terror. If the pilot motions for you to "cool it"—*shut up*. Do *not* make one more transmission to pass along 73s. A curt "QRT—Stand by" is preferable to lousing up approach control's message about the coverging 707. You always can pick up the conversation after the "aluminum overcast" misses you.

● Remember that at altitude, 10 Watts will travel up to 300 miles, and when you hit the button on .34/.94 over Vermont, you will bring up every machine from Maine to New York, including some that may not be too happy about it. Remember that you have fantastic range at this altitude, so work simplex where possible.

● Working 80 through 10 is possible—but not easy. Unless you own the airplane and are willing to make your ADF sense antenna double in brass for a very short whip (matched, of course, with an antenna tuner), then I suggest you do your aeronautical mobile on a band that requries a short antenna.

● Spikes on the 12-volt aircraft supply are not unknown, especially when the flaps, landing gear, landing lights, or other high-current draw items are switched on and off. A 16-volt zener or "transzorb"-style spike suppressor inside the radio will go a long way towards keeping your radio out of the auto-destruct mode.

● DO NOT take this article as license to string wires and cable hither and yon about the airframe without the advice of a pro. The few bucks (or a case of beer) you may have to pay a licensed expert to check your installation is cheap insurance when it comes to betting your fanny.

● And last, but not least, QSL if asked. Some hams go their whole careers without one single /AM on their walls. Above all, have fun. Aeronautical mobile is the least used yet most rewarding mode of operation. I hope to meet you someday in my *first* AM/AM QSO. ■

Cybernet Ten-Meter Offset

—If you've gone CB to 10, why not go all the way? Add the repeater offset, too!

The CB to 10 FM conversion in the January, 1980, *73*[1] has reheated many cold soldering pencils in the past few months. Some of us were lucky enough to find new or working units in the corner of "Ye Olde CB Shoppe" while others either purchased circuit boards from one of the surplus houses[2] or one of the 10 FM transceiver kits available.[3] This growth in activity has led to an increase in the use of both remote bases and repeaters.

What is described here is a simple way to add a repeater offset to any conversion utilizing the Cybernet board (PTBM033, 036, 039AOX) for not much more than the price of the offset crystal required.

The method used incorporates diode switching of the reference crystal oscillator when transmitting. The theory of operation is basic. There are two points on the motherboard that alternate voltages when switching from transmit to receive. When in the receive mode, TP11 produces 7 volts, while TP14 carries 8.5 volts on transmit. By switching these voltages to the proper offset crystal, either simplex or repeater operation can be selected.

The first consideration must be the selection of the proper reference crystal. If the 11.8066-MHz crystal were replaced by one cut for 12.65167 MHz, as discussed in the *73* conversion article, an offset crystal for 12.61833 MHz must be obtained. Some conversions, however, utilized a crystal for 12.57166 MHz, allowing 29.500 through 29.700 to fall between channels 20 through 40. For these, a crystal for 12.53833 MHz is required to provide for the 100-kHz shift.

The entire circuit shown in Fig. 1(a) can be mounted on a piece of Vectorboard® approximately ½" × 1" as illustrated in Fig. 1(b).

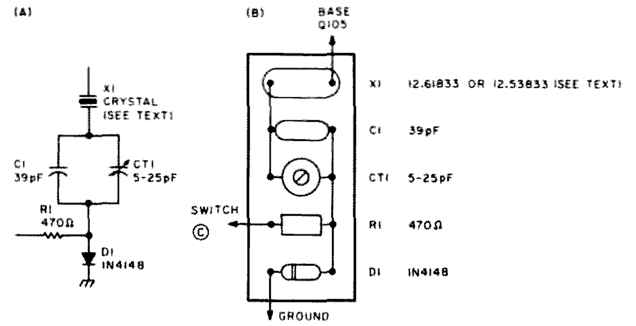

Fig. 1. (a) Repeater offset switching schematic. (b) Component arrangement.

Motherboard Preparation

Complete the following steps:

1) The circuit board track must be cut to separate where C118 (39 pF) and trimmer CT101 connect to ground, as diagrammed in Fig. 2.

2) To maintain continuity around the severed track, a ground jumper must be added near the edge of the board as indicated.

3) On the foil side of the board, insert a 1N4148 switching diode from the isolated area to the ground track.

4) On the component side of the board, insert a 470-Ohm resistor at the

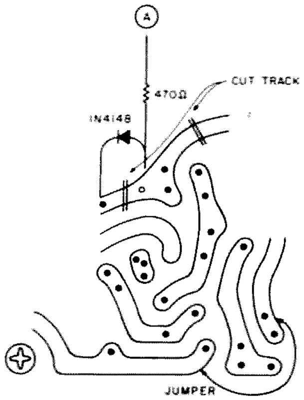

Fig. 2. A 1N4148 diode mounts on the foil side, while the 470-Ohm resistor mounts on component side next to J103.

cold end of this diode. This can be done by inserting one end of the resistor in the hole found between jumper J103 and R108 (1500 Ohms). Mount this resistor vertically from the board.

5) Locate TP11 near the 10.695-MHz crystal oscillator, and mount a 1N4148 diode vertically with the cold end down to the board.

6) Locate TP14 (near TP11) and mount another 1N4148 diode in the same manner (cold end down).

7) Connect the hot end of the diode at TP14 to the common position of a SPDT switch (see Fig. 3).

8) Connect the hot end of the diode at TP11 to the open side of the 470-Ohm resistor mounted vertically on the main board and continue this connection to the SPDT switch at the simplex terminal.

Mounting the Crystal Board

To mount the crystal board, complete the following steps:

1) Run a short length of wire (1″) from the crystal output end of the crystal board to the base of transistor Q105. It is usually best to solder this directly to the lead of the transistor. (Go easy on the heat. They're durable, but don't push it.)

2) For ease of mounting, solder the hot end of the diode on the crystal board to the top of transformer T101. This will not only serve as a good ground connection, but will elevate the crystal board approximately ½″ above the main board.

3) Connect the open end of the 470-Ohm resistor on the crystal board to the offset terminal of the SPDT switch.

Now, all that remains to be done is to adjust the offset crystal to frequency using your favorite counter and you're ready to work into those machines that you've been hearing.

If you or your club are interested, information on items such as receiver conversion kits and direct replacement 6-kHz NBFM i-f filters are available from me by sending an SASE.

See you on 29.6 FM. ■

A Stout Heart for a Simplex Autopatch

—put your KIM-1 to work

Steven C. Erdei WD8CHH
16005 Ramage Avenue
Maple Heights OH 44137

A simplex autopatch is an automatic phone patch which requires only one frequency for both transmitting and receiving. The simplex autopatch is a time-division type of phone patch; a phone patch whose transmitter is turned off for brief periods of time and whose receiver is turned on, letting the radio user access the phone line. A good discussion of the various types of phone patches has been published in *73 Magazine*.*

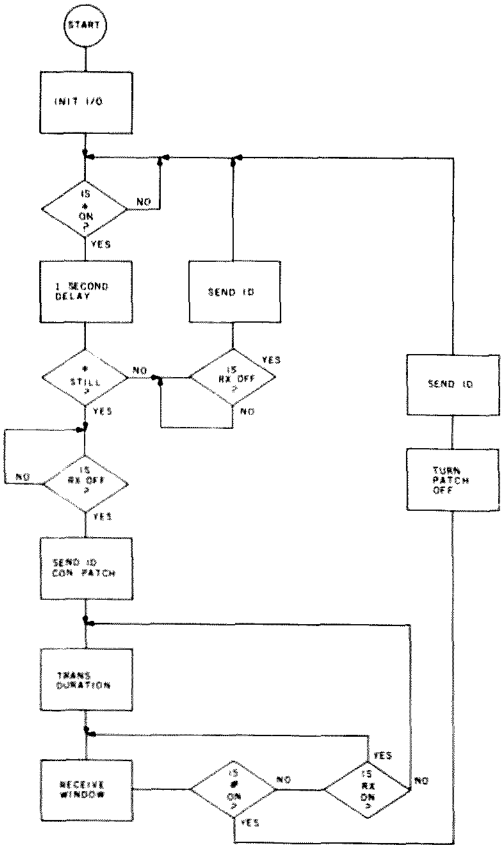

Fig. 1.

The only hardware needed to build this simplex autopatch is a VHF transceiver, three touchtone™ decoders, a phone patch, a touchtone phone line, and a MOS Technology KIM-1 microcomputer.

The KIM-1 computer is the heart of this simplex autopatch since it controls both the transceiver and the phone patch. The VHF transceiver must have a carrier-operated switch connected to the receiver section. This line should be a logic 1 with no signal present and a logic 0 when a signal is being received.

The touchtone decoders that I used are the 567, phase-locked loop type. (This circuitry is not shown since there have been many articles on these decoders in *73 Magazine*.)

The phone patch itself can be any method of coupling audio to and from the phone line. To be able to dial calls directly, the phone line you connect to this system must be able to recognize touchtone digits.

*"Phone Patching '76," *73 Magazine*, June, 1976.

This program uses less than .5K of memory on the KIM-1. The program's starting location is 0300. When started, the program first initializes the I/O ports. PA0-7 and PB0 are assigned as outputs. PB1-7 are assigned as inputs. Next, the program waits until it receives an access command. This command consists of a received signal and the * digit being decoded. After the initial access command has been decoded, the program will wait for about 1 second and check for the access command again. If the access command is not present, as soon as the received signal goes away, a CW ID will be sent.

If the access command is still being decoded, this is interpreted as a request for a phone patch. As soon as the received signal goes away, a CW ID will be sent, the phone patch connected, and a dial tone broadcast. The program then continues on into the transmit delay section. This is where all audio from the phone line is transmitted.

After the transmit delay, the transmitter is turned off and the receiver is turned on. The receiver is then polled for a signal or command. If no signal is received, the transmitter and

Table 1. ID code table.

autopatch audio are turned back on and the transmit delay repeated. The receiver on-time (or window) is on for only short periods of time, so the audio from the phone is degraded only slightly.

The transmitter delay time can be changed by altering the value in location 0363. The receive window time can be changed by altering locations 0371 and 0376. If a # digit is decoded (the disconnect command) during the receive window, the patch is immediately disconnected and an ID sent. The ID program is located at 0200 and is called as a subroutine. The ID data table starts at location 0068 and can be programmed using the data in Table 1. A flowchart of the autopatch program is shown in Fig. 1.

Table 2 gives a complete list of all connections to and from the KIM-1. All outputs are a logic 1 when on; all inputs are a logic 0 when on. All input connections should be logic levels and connected to the input pins. The touchtone decoders can be tuned to the proper tones as listed in Table 2, or to other frequencies if you want your system to respond to other digits.

The interfacing of the output lines is left up to the reader because of the differences in the devices that you must control. The best way to interface these control lines is to bring them out to a 7406 hex inverter and have the inverter control relays. You would need to do this for the transmitter keying line, the patch connect line, and the patch

transmit/receive line, if this line is used. If you want to interface these lines in another manner, remember not to draw more than 1 mA from an output pin.

Inputs	Outputs
PB1— 941-Hz decoder output	PA2—Transmitter keying
PB2—1477-Hz decoder output	PA4—Patch connect
PB3—1209-Hz decoder output	PA5—Patch send/receive switch
PB5—Receiver carrier-operated switch	PB0—CW ID audio output

Table 2. KIM-1 I/O connections.

The simplex autopatch is compatible with normal simplex use on the same frequency. Only transmissions with an access digit are responded to; all other signals are ignored. The following describes how to use the autopatch.

First, to see if you are in range of the autopatch, key your transmitter and momentarily press the * on the touchtone pad. When you release your mike, you should hear the autopatch ID. Second, if you want to use the patch, follow the above procedure, but hold the * down for a couple of seconds. This time, you will hear an ID followed by a dial tone. You can now use the patch just like an autopatch connected to a repeater, with one exception: You must wait about a second before you dial or talk so that your first digit or word isn't missed.

When using the simplex patch, you will notice ticking sounds in the patch audio. This ticking is the receive window that lets you control the patch. When you are finished with your call, send a # and the patch will disconnect and send a final ID.

If you have a problem with the receive window interfering with the quality of the audio from the phone line, the squelch tail on your receiver is probably too long. You can eliminate this problem by removing the electrolytic capacitor following the diodes in your receiver's noise amp. This cured the problem in my system. For what would seem to be a difficult project, the use of the KIM-1 microcomputer turned this autopatch into a relatively easy task. If you have any difficulties in getting your system on the air, feel free to contact me.■

The Bearcat 350 Programmable Scanner

—a first-class act from Electra

It's hard to believe that only four years have gone by since Electra released their first keyboard-entry programmable scanner, the venerable BC-210. This eminently-usable little scanner was followed in rapid succession by a flurry of new products: the BCs 250, 220, 211, 300, 160—and now, the BC-350.

This new entry from Electra sports one radical innovation: a fully-alphanumeric display. No longer does the listener have to remember that 155.505 is his local police frequency or the 147.045 is the Robbinsville repeater. He can use the keyboard to write in "Police," "Fire," or "RVL RPTR." Up to 8 characters, alpha or numeric, may be entered for display on any channel. Readout is a brilliant fluorescent display.

The alphanumeric function is not in lieu of a frequency entry; either display may be called up alternately by toggling the A/N key.

Another feature which will be well-received is the faster scan/search rate—20 channels per second (10 on slow speed).

The Bearcat 350 programmable scanner.

Frequency ranges covered are typical of the new Bearcats: 30-50, 118-136, 144-174, and 421-512 MHz. Electra chooses to break these ranges into seven subbands for advertising purposes. It is significant to note that low-band coverage is now advertised as full 30-50 MHz rather than 32-50 MHz as in previous products. Although the earlier units went down to 30 MHz, performance and parameters were not always repeatable.

The 350 is not tiny; in fact, in spite of the photo, it is the largest unit yet produced by Electra: 12" W × 4" H × 9" D. It was definitely not produced with the mobile listener in mind! However, the BC-350 does have a 12-volt input for those with room.

Sensitivity and selectivity are excellent. 0.4 uV on low and high bands and 0.8 uV on UHF are typical. −60 dB rejection ±25 kHz discriminates against adjacent channel interference.

As with some previous models, 50 channels of memory are allocated to 10 bands, allowing selective call-up of various frequency clusters programmed by the user.

For noisy environments such as those encountered in industrial or mobile installations, a 2-Watt audio amplifier provides plenty of sound from the internal speaker. A rear-apron jack is provided for an external speaker or de-scrambler.

Selective scan delay (an Electra patent) allows for immediate resumption of scan or search after the carrier goes off the air, or it may be toggled to wait 2 seconds for responses on that channel.

A priority feature allows sampling of channel one every two seconds if desired to be sure not to miss a call on that channel. An auxiliary function can be used to activate a remote recorder. A count memory permits the user to determine the number of times a channel has been active, even if you have not been there to hear it. A lockout key allows you to temporarily exclude any channels you wish during scan.

The display is divided into two readouts. The left-hand window provides call-

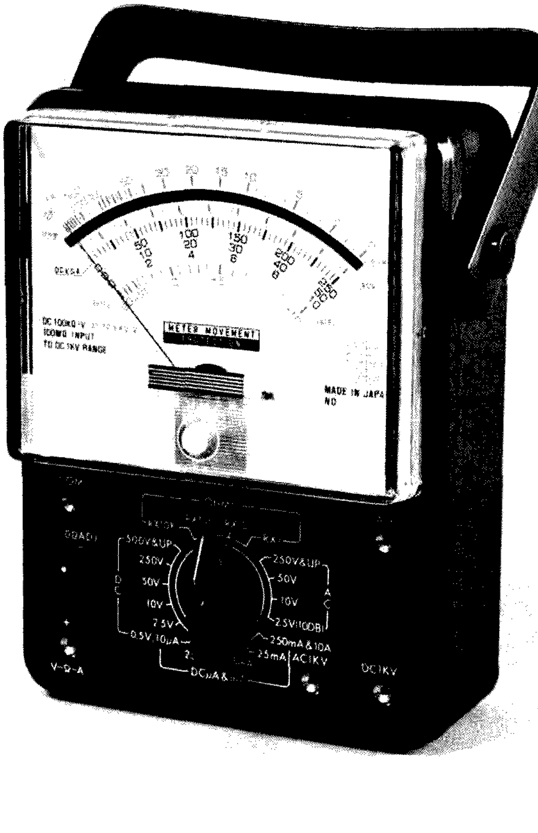
The Calectro Multi-Tester

—a full-size, lab-type multimeter for fans of analog operation

The most common items of test equipment needed in the ham shack or home electronics workshop are rf and af signal generators, oscilloscopes, frequency counters, dummy load/wattmeters, grid-dip oscillators, and—perhaps the *primary* instrument—the multi-tester or multimeter.

Little need be said about the utility of the multimeter on the bench or in the home workshop. This versatile instrument allows one to make basic current, voltage, and resistance readings (as a minimum), and for this reason it is indispensable for even the non-technical amateur or SWL—if for no other purpose than to be able to detect open and short circuits or to check one's ac line voltage. For the home-brewer, experimenter, and kit-builder, the multimeter is invaluable in circuit design and development as well as in troubleshooting applications.



The Calectro 20-205 multimeter.

The basic multimeter, or VOM, is an analog device that has four, five, or more scales, each representing a different type of measurement, such as ac, dc, Ohms, decibels (dBs), and possibly other parameters. The input arrangement and number of ranges depends on the degree of sophistication and cost of the unit. A primary "driver" of quality and cost (they go together, of course!) is the meter's internal resistance—the higher the better, since units with relatively high internal circuit resistance (20,000 Ohms-per-volt or greater) will tend not to unduly distort readings as a result of loading of the circuit under test by the meter itself.

There is little question that the industry is moving toward the digital-readout multimeter. Frankly, this type of tester can enable a greater degree of over*all* accuracy for the average user, just as the digital watch can permit more precise timekeeping than can the two-hands type. For example, a good digital multimeter's accuracy may be on the order of 0.1 to 0.5% of basic dc scale, whereas good analog meters boast precisions of but 2-5%, not to mention such additional problems as interpolation and parallax errors.

Despite the superior accuracy of the digital instrument, there's still a good deal of room for the analog multimeter for general-purpose electronic usage. The better grade instruments are still a good deal less expensive than equivalent digitals. In addition, for general troubleshooting, the smooth analog meter action is often much preferred over trying to interpret running, flashing digits when working with highly dynamic or unstable circuits. Too, movement trends of the parameter being measured are much more clearly discerned on the analog meter.

There's no shortage of analog multimeters in the marketplace. However, one of the better meters I have encountered is the new Calectro (GC Electronics) model 20-205, formerly known as the H3-361. This high quality, "lab-type" instrument is a multi-purpose multimeter that's a good example of what a better analog model can do. The 100,000 Ohms-per-volt dc internal resistance ensures that most circuits under test will be unaffected by

the meter's presence. I found it to be a very rugged, reliable all-purpose measuring device capable of handling a wide range of ac and dc voltages, resistances, dc currents, and dBs.

The Calectro instrument has a large (4") clear plastic-front meter with a two-color mirrored scale for good visibility and ease of interpolation. The 18-position range switch, when coupled with the four front-panel input jacks, enables selection of 22 ranges. Dc voltage ranges run from 0-500 millivolts to 0-1000 volts. Ac measurements of from 0-2.5 volts to 0-1000 volts are available; VUs are measurable in five ranges from −20 to +62 dB; dc resistance scales run from 0-2000 Ohms to 0-20 megohms; dc current scales run from 0-10 microamperes to 0-10 Amperes. Batteries are required only for the Ohms function (two AA-size 1.5-volt penlight cells will do the trick—use alkaline cells for long life), which incidentally in the R×1 range has a center-scale position of 16 Ohms. This enables convenient and accurate resistance measurements down to a mere fraction of an Ohm.

Meter protection is a particularly important feature of any item of test gear. The Calectro unit is well protected by dual silicon diodes. The protection circuit worked well for me, since through operator error I managed to goof in checking out the unit by making several gross mistakes in range switch selection, including inadvertently placing raw 120-V ac line current across the meter when using one of the low Ohms ranges. No damage was experienced.

The unit's accuracy seemed adequate for most in-shack uses and appeared to be better than the rated dc ±3% and ac ±5% (of full scale) accuracy. The double-jeweled ± 2% meter and temperature-stabilized resistors in the innards undoubtedly contributed to the tester's overall excellent accuracy.

The Calectro device is a large instrument as far as multimeters go, being 7¼" H × 6" W × 2¾" D. It comes with standard color-coded test leads and prods and is list priced at $59.95. There are no accessories advertised for use with it.

While one may easily purchase a much less expensive, miniature multimeter, one will likely find the latter to be but a mere toy beside a higher-quality instrument such as the lab-grade unit I've highlighted here. A good analog instrument can be made to do yeoman duty for a multitude of tasks, including battery testing, transistor or diode checking, and field-strength measuring (when used in conjunction with a diode or rf probe). It can even be used as an S-meter for an older receiver. An rf probe, or a set of extra-long coiled test cables with easy-grip clips, would also represent money well spent.

Sure, I know that the future is digital, but analog has its rightful place, and that place just may lie in your workshop. It certainly does in mine!

The 20-205 is sold primarily through general electronic supply houses. This Japanese-made import is distributed by GC Electronics, 400 South Wyman St., Rockford IL 61101. Reader Service number 479. ■

How To Defend Yourself Against Radar

How To Defend Yourself Against Radar by Bruce Bogner and James Bodnar. The Brehn Corporation, 1980.

When it comes to police radar, it seems like the public can't win. In one camp there are the police, backed by the radar manufacturers. On the other side you'll find the people that sell radar detectors and the high-speed buffs that buy them. The information that these two groups provide usually consists of a few facts mixed with a liberal dose of misinformation. The result is a very confused public. The myths, exaggerated claims, and outright lies that are associated with radar are laid to rest in a book called *How To Defend Yourself Against Radar.*

Published by the Brehn Corporation, *How To Defend Yourself Against Radar* is authored by Bruce Bogner, an engineer, and James Bodnar, an attorney. Their combined efforts result in a book that allows you to understand radar without having an engineering degree. Nor will you always need a lawyer to successfully defend yourself against a radar charge.

Most of this 100-page softbound book is devoted to the details of how radar works. You will find out what pitfalls make radar questionable and how a police officer can inadvertently arrest a non-speeder. By the time you digest the first five chapters, you'll probably know more about the subject than most policemen or judges.

The last three chapters outline how to defend yourself against a speeding ticket. You must make painstaking observations at the time of apprehension and careful measures must be used to obtain testimony from the arresting officer. Even if you are not up to defending yourself, this information will be helpful to your lawyer.

No book can guarantee that you will beat a radar rap, but the $6.95 cost for *How To Defend Yourself Against Radar* is a small price to pay compared to a fine and higher insurance rates. *How To Defend Yourself Against Radar* is available from *73*'s Radio Bookshop, Peterborough NH 03458. ■

Guide to RTTY Frequencies

Guide to RTTY Frequencies, *by Oliver P. Ferrell. 1st Edition, 1980. 96 pages, 6" × 9", paperback, $8.95. Gilfer Associates (PO Box 239, 52 Park Avenue, Park Ridge NJ 07656).*

If you are a ham or SWL, you're probably familiar with the well-known book, *Confidential Frequency List.* The *CFL*, by Oliver P. Ferrell, lists a plethora of "utility" stations (nearly everything except hams and broadcast) from 4001 to 25,590 kHz. It covers AM, SSB, ISB, CW, and facsimile modes of transmission.

Mr. Ferrell has compiled a new book, dedicated to radio-teletypewriter (RTTY) stations. The *Guide to RTTY Frequencies* is similar to the *CFL*, but is exclusively about RTTY. Stations are listed in ascending order of frequency from 4003 to 26,860 kHz. Listed, in most cases, are the frequency, callsign, location, type of service, shift, speed, power, and useful remarks (such as language).

Many of the book's entries are positively tantalizing. Nearly every country is represented with news services, military, aeronautical, marine, or point-to-point stations. This could be a fun way to practice your foreign-language skills! It's also a good way to see "what's goin' on" in distant lands. For that matter, it is interesting to see just what's going on in our *own* land—with USCG, USN, FBI, FCC, MARS, and UPI.

As fascinating (and as useful) as the station listings is the book's "Introduction to RTTY Identification" by Webb Linzmayer. Explained, in detail, are the various types of RTTY signals encountered in the high-frequency spectrum. If you've ever used a "multi-speed any-shift" RTTY receiving setup, you've probably wondered about the RTTY signals that you *couldn't* copy. Mr. Linzmayer explains it all. He describes the various teleprinter codes and multiplex systems in use. Mentioned, too, are various privacy measures designed to frustrate the unauthorized receiver (or printer)! While truly encrypted transmissions probably will not be decoded on the basis of this book's information, it's probable that computer buffs will be able to crack the bit-inversion and bit-transposition privacy schemes. Of course, if you are an amateur cryptographer, RTTY will supply you with endless encrypted material. If you should happen to find a way to decode any U.S. military encrypted material, you might call an intelligence officer and mention the fact!

The *Guide to RTTY Frequencies* should be a valuable addition to any RTTY shack or computerized shortwave station.

Hey, look. . . there's Interpol talking about my brother again! ■

The History of Ham Radio

—part XVII

Reprinted from QCC *News*, a publication of the Chicago Area Chapter of the QCWA.

EARLY ACTION ON DILL RADIO BILL EXPECTED

Measure Would Create Independent Commission to Operate Broadcasting

WASHINGTON, April 29.(AP)—The Dill radio bill, which set up an independent commission with complete power over broadcasting, was approved today by the senate interstate commerce commission with indications pointing to an early favorable report to the senate.

Taken in the face of repeated warnings from President Coolidge against establishment of any more separate government agencies, the action had the effect of sidetracking the White bill, backed by the administration, providing for an advisory committee to work with the commerce department in controlling the industry. This bill has passed the house.

Meanwhile Secretary Hoover, whose department recently lost in the federal courts the right to assign wave length to radio stations, took exception to statements recently made in congress to the effect that he was attempting to become "dictator" of the radio world.

"It's the last responsibility I want," he asserted.

He reiterated his opposition to any plan leaving to any one official the responsibility of determining who shall broadcast and on what wave lengths, because of the expense and bureaucracy tendencies involved.

These duties, he said, should be placed in a semijudicial board of commission as provided in the White bill, and the administrative or enforcement end left to an existing government department.

A news story published on April 29, 1926.

From 1912, as wireless was just emerging from its cocoon and Congress first enacted a radio law, until 1927, developments in radio were nurtured by the Department of Commerce under the guidance of then-Secretary Herbert Hoover. Radio was destined to go through many convulsions during those fifteen years . . . the task of prescribing wavelengths . . . issuing licenses . . . specifying power and time on the air . . . legislating. For some 700 applicants, the privilege to broadcast proved chaotic. With the passage of the compromised White-Dill radio bill signed by President Calvin Coolidge on February 23, 1927, the first meaningful legislation on radio control in the United States was accomplished.

Industry Problems

Toward the end of 1926, because of the mounting problems which constantly arose in the broadcast field, the President was compelled to sign into law an emergency measure. Congressional Joint Resolution 125 became effective December 16, 1926. The law required that any applicant for a new or renewal radio broadcast license "waive any right of claim of right as against the United States to any wavelength, or to the use of the ether in radio transmission because of previous license to use the same or because of the use thereof."

The Radio Commission, after a visit with President Coolidge. Left to right, H. A. Bellows of Minnesota, J. F. Dillon of California, E. O. Sykes of Mississippi, and O. H. Caldwell of New York.

The New Law

Sections 2 and 3 of "An Act For the regulation of radio communications, and for other purposes" specified that:

1) The United States be divided into five zones;

2) A Commission be created consisting of five commissioners appointed by the President, each commissioner a resident of the zone represented; and

3) The members of the Commission have terms of two, three, four, five, and six years, respectively, and shall meet from time to time as required by public convenience, interest, and necessity.

Section 4 authorized the Commission to:

1) Classify radio stations;

2) Prescribe the nature of the services to be rendered;

3) Assign bands of frequencies for each individual station;

4) Determine the power and the time on the air;

5) Determine the location, and regulate the kind of apparatus used to prevent excessive interference;

6) Have authority to establish areas to be served and make special regulations applicable to radio stations engaged in chain broadcasting; and

7) Have authority to make general rules and regulations requiring stations to keep such records of progress, transmission of energy, communications, or signals as it may deem desirable. (Radio amateurs to keep a log.)

Commissioners Initiate Course of Action

As early as March, 1927, the following steps were taken by the Commission in General Order #1: Broadcast stations were given authorized channels with even 10-kilocycles separation, original assigned frequencies to Canadian stations were cleared of interfering United States stations, and all amateur and ship station licenses were extended indefinitely as of March 15th.

Time-sharing for all broadcast stations was a major problem. Stations which had deliberately jammed power and had deviated from previously assigned wavelengths came under greatest criticism and penalty.

The Commission immediately set about to reallocate stations in the interest of the listener. By June, 1927, local stations within a given locality were assigned frequencies 50 kilocycles apart. Other stations, especially the higher powered ones, were given assigned frequencies depending on location, public service, and previous time on the air so as to minimize heterodyne interference. In many instances, actual experience and cooperation between stations served as a guide.

The law as enacted applied to all radio stations—ship, land, experimental, amateur, coastal, etc.—with the exception of those operated by the United States Government. Even with the ether lanes crowded, there were over 250 applicants for broadcast-transmitting-station licenses pending at the State Department prior to the effective date of the 1927 Act.

Section 5 of the Act specified that from and after one year after the first meeting of the Commissioners, "all powers and authority vested in the Commission, except as to revocation of license, shall be vested in and exercised by the Secretary of Commerce. The Secretary is to designate call letters of all stations."

Section 9 provided for granting licenses by the Secretary and renewals for three-year periods for broadcast stations, and up to five-year periods for other classes of stations.

Radio Amateur Rulings

The secretary of Commerce extended amateur operators' licenses by issuing the following order on March 16, 1927: "All radio operator licenses valid at the passage of the Radio Act of 1927 are hereby extended for the unexpired period of such licenses."

As these new regulations were issued, the amateur first-grade license was changed to "radio operator Extra Class," and the amateur second grade changed to "Temporary Amateur License." The amateur Extra First, Experimental, and Instruction Grades were eliminated.

On March 26, 1927, the Commission ordered all supervisors in the various regions to issue temporary amateur station licenses pending the review and issuance of new amateur regulations.

To obtain an amateur operator's license, the applicant was requried to pass a code test in sending and receiving Continental Morse code at a speed of at least ten words per minute. Also required was successful completion of a written examination in the theory, construction, and operation of radio equipment.

At the time of renewal, the applicant was required to report satisfactory activity during the last six months of the license term in lieu of taking another examination.

With the passage of the Radio Act of 1927, all concerned with radio prepared for the forthcoming convention of all nations to the International Radio Telegraphic Conference scheduled to take place in Washington, DC, in October, 1927.■

THE NEW RADIO LAW as of FEBRUARY 23,1927

[Public—No. 632 69th Congress]
[H. R. 9971]

An Act For the regulation of radio communications, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act is intended to regulate all forms of interstate and foreign radio transmissions and communications within the United States, its Territories and possessions; to maintain the control of the United States over all the channels of interstate and foreign radio transmission; and to provide for the use of such channels, but not the ownership thereof, by individuals, firms, or corporations, for limited periods of time, under licenses granted by Federal authority, and no such license shall be construed to create any right, beyond the terms, conditions, and periods of the license. That no person, firm, company, or corporation shall use or operate any apparatus for the transmission of energy or communications or signals by radio (a) from one place in any Territory or possession of the United States or in the District of Columbia to another place in the same Territory, possession, or District; or (b) from any State, Territory, or possession of the United States, or from the District of Columbia to any other State, Territory, or possession of the United States; or (c) from any place in any State, Territory, or possession of the United States, or in the District of Columbia, to any place in any foreign country or to any vessel; or (d) within any State when the effects of such use extend beyond the borders of said State, or when interference is caused by such use or operation with the transmission of such energy, communications, or signals from within said State to any place beyond its borders, or from any place beyond its borders to any place within said State, or with the transmission or reception of such energy, communications, or signals from and/or to places beyond the borders of said State; or (e) upon any vessel of the United States; or (f) upon any aircraft or other mobile stations within the United States, except under and in accordance with this Act and with a license in that behalf granted under the provisions of this Act.

Sec. 2. For the purposes of this Act, the United States is divided into five zones, as follows: The first zone shall embrace the St
Maine, New Hampshire, Vermont, Massachusetts
Rhode Island, New York, New Jersey, Del
District of Columbia, Porto Rico, and
zone shall embrace the State or any right
Virginia, Ohio, Mich ommenced in any civil
embrace the S alities under said laws shall
Florid ed in the same manner as if committed;
forfeitures, or liabilities incurred prior to taking
or, under any law embraced in, changed, modified, or repealed by this Act, may be prosecuted and punished in the same manner and with the same effect as if this Act had not been passed.

Nothing in this section shall be construed as authorizing any person now using or operating any apparatus for the transmission of radio energy or radio communications or signals to continue such use except under and in accordance with this Act and with a license granted in accordance with the authority hereinbefore conferred.

Sec. 40. This Act shall take effect and be in force upon its passage and approval, except that for and during a period of sixty days after such approval no holder of a license or an extension thereof issued by the Secretary of Commerce under said Act of August 13, 1912, shall be subject to the penalties provided herein for operating a station without the license herein required.

Sec. 41. This Act may be referred to and cited as the Radio Act of 1927.

Approved, February 23, 1927.

The new radio law as of February 23, 1927.

The Robot 800H

—a specialty terminal for RTTY/Morse/SSTV and you

The clanking of the Model 15 shatters yet another quiet evening with its growl and clatter. Autostart at 2 am certainly makes its shortcomings known quickly.

What to do? Well, how about one of those newfangled computers that can also copy RTTY? Sounds like a good idea to me—so it's over to the back issues of the ham magazines to see what is available. I discovered that there are new models coming out almost every day! Decisions, decisions, decisions. Hmmm, Robot offers a new model, the 800H. It sends and receives Baudot, ASCII, and Morse, and it also has an SSTV character generator. Sounds interesting, indeed, so I call the local Robot dealer to order the Robot Model 800 Super Terminal.

It Arrives

The seemingly endless hours of waiting for the new rig finally came to an end. The UPS man delivers the Robot in perfect condition. I excitedly unwrap it and begin hooking it up in the shack. Included with the terminal are: 1 Model 800 keyboard, 1 six-foot shielded cable with RCA phono plugs on each end, 1 six-foot coax cable with BNC plugs on each end, 2 six-foot three-conductor shielded cables with phone plugs on one end, and 1 instruction manual. Robot has really made it easy to hook up the Model 800!

On-The-Air Performance

The Robot Model 800H is designed to receive and transmit Baudot, ASCII, and Morse code. It will also send SSTV block letters, but will not receive SSTV without using a separate converter.

The Robot Model 800H works wonderfully on RTTY. A status indicator line is provided at the top of the display which gives information about how the terminal is configured, such as receive or transmit, speed, polarity, autostart, Selcal, selcom, and a tuning indicator.

A signal is tuned in by adjusting the vfo until the tuning indicator is at its longest position and is flickering the least. This corresponds to the maximum signal through the filters and to both tones (mark and space) being passed equally well. There are connectors on the rear panel for connecting an oscilloscope if you wish to use one to tune in your signals. The terminal can be configured to receive in one of three modes: normal, autostart, or selcom.

Normal-mode receive allows any signal which makes it through the filters to be printed on the screen. This mode works very well on signals that vary in strength. Were one of the other modes to be used, such as autostart, characters would be lost when the signal dropped out and the autostart delay had not yet allowed the resumption of displaying the received RTTY information.

Autostart mode prevents the display of unwanted characters on the screen without a RTTY carrier being present. There is a built-in 3-second delay before characters will be displayed during which a valid carrier must be present.

Selcom mode is a dual-function mode. It supports WRU ("Who are you") automatic answer-back and automatic message recording (Selcal, or selective calling). The WRU code is user programmable by merely typing in the desired 8-character code, as in the Selcal code. The status line on the display will show the codes as you type them and will allow corrections to be made without any fuss. Merely hit the delete key and the last character entered vanishes from the screen.

There are three transmit modes which are selectable by the user. They are continuous, line, and word modes. Continuous mode is similar to RTTY operation using a teletype™ machine. Your carrier is keyed on and remains on while you hunt and peck for the proper keys. Line mode does not transmit anything until the Model 800 detects a carriage return. It then sends the entire line while still allowing you to type in the next line of text. Word mode sends each word as it is completed and the Model 800 detects a space. This allows the correction of spelling errors before sending the word.

Speeds may be changed between any of six available speeds. They are: 60, 66, 75, 100, and 132 wpm (Baudot) and 110 baud ASCII. Speeds may be changed by merely typing one command. The terminal toggles between the various speeds available in the terminal.

There are three shifts that the Model 800 can copy. The terminal can be toggled between 170 Hz and 850 Hz. By straddle-tuning the signal, 425 Hz can be copied. Each time the CTL-Shift key is depressed, the terminal changes shifts. Should you run into a situation where the received signal is reverse polarity, the polarity may be inverted by pressing CTL-Reverse. Typing CTL-Reverse again will toggle the Model 800 back and forth from normal to inverted modes.

There are RY and Quick Brown Fox test messages available by pressing a key. An automatic CW ID is provided for use in RTTY mode. You can fill up the buffer (up to 511 characters) with any combination of messages and IDs and they will be sent automatically when you switch the Model 800 into transmit mode.

The Model 800 wordwrap feature makes reading the received copy much easier. If a received word will not fit entirely on the present line being typed, the program will erase the unfinished word and move it in its entirety to the next line down. In this way words retain their meaning much better by not being written on two separate lines.

RTTY Performance

The Robot Model 800H is outstanding when used on RTTY. Signals can be tuned in easily by using the status line tuning indicator. The built-in demodulator easily equals the performance of many stand-alone terminal units.

One possible problem exists, though. When ordering the Model 800, be sure to specify that high tones are to be installed in your unit if you want to work 2m RTTY. The standard unit is supplied only with low tones which will work fine on HF but will not be compatible with VHF mark and space tones. My unit was supplied with the low tones, and a trip back to the factory was required to modify it to work on VHF.

Morse Code Operation

The Robot Model 800 also has provisions for Morse Code reception. A very narrow audio filter is built in which helps select the particular signal of interest. The narrow filter also makes it extremely difficult to tune in the signal.

When receiving Morse code, the signal is tuned until the terminal regenerates the code on its internal speaker. The tuning indicator in the status line helps in tuning by indicating the signal level passing through the filter. Merely tune for maximum indication.

Problems arise if you expect the terminal to provide perfect copy under field (read "real life") conditions. It won't. The terminal hopes to see perfect machine-sent code. How could you expect otherwise? It is a machine, too. Its program has some provision for sloppy fists, but when combined with the touchy audio level adjustments and the critical tuning adjustments required for copy, the program tends to let you down.

When the terminal does not understand the character sent, it types an asterisk. International Morse code A-Z, 0-9, .,?:;-/, AR, AS, BT, KN, and SK are all recognized and printed by the terminal.

The terminal will also send Morse from 3 to 99 words per minute. The 511-character buffer is functional when sending code as well as RTTY. Here, too, the buffer allows you to type and edit your message while the buffer is being sent.

The terminal can also be used as a Morse code trainer. It will generate random characters which can be copied by utilizing the split screen. Received practice copy is printed on the bottom half of the screen, and sent copy is typed on the upper half of the screen. Your accuracy can then be checked by comparing the two versions.

SSTV

The Robot Model 800 also supports SSTV. It will send up to a 6 × 6 character message using block letters. This can be a help to contest operators who normally use a menu board to pass QSL information. By merely typing the desired information on the terminal, it will be sent via SSTV.

The terminal also will send a gray scale, checkerboard, reversed black/white characters, large characters, and partial frames. Cursor control is available to help with formatting your message. Home up, line feed, delete, repeat, and return functions are supported in SSTV mode. This allows a greater flexibility in formatting your messages.

Documentation

The Robot Model 800 is supplied with a very attractive three-ring binder to hold the system information and instructions. I consider this to be a plus. Being able to put my finger on the system information quickly helps to learn the commands faster and helps me to find my errors in operating the system faster. The only problem is that my unit, which is one of the earliest with the high tones/split-screen options installed, does not have a complete set of documentation. I find myself looking at advertisements to see just what my terminal can actually do and then experimenting in order to discover the commands required to perform the various "new" functions. What with the rush to get the product into the marketplace, an omission here and there is expected. By the time you read this, Robot will have everything working fine and will be able to supply all the information you might require.

Conclusion

The Robot Model 800H is a very useful piece of equipment to have in your shack. It will provide RTTY, Morse, and SSTV capabilities to you while being packaged in a small neat enclosure. The keyboard provides a good "feel" to the touch typist, which is a real plus when reading the incoming RTTY message and formatting your reply in the buffer.

The terminal has problems copying Morse code, but you must keep in mind that the filter that is as good as the human ear has not yet been designed. The human ear can discern subtle tone differences which can differentiate between two signals on virtually the same frequency. My four years of electronic warfare experience make my standards for copying Morse very stringent. I know of no terminal or program that can equal an experienced operator when copying code. I heartily recommend the Robot Model 800 for the enthusiast who needs a very high quality silent RTTY/Morse/SSTV terminal.

The Better Vertical

—elevated feed means low angle of radiation

How would you like to be a proud owner and user of an inexpensive (around $60-$70) vertical DX antenna which—

- Is self-supporting.
- Is attractive in appearance.
- Can be installed in a limited space.
- Gives a low vertical radiation angle even when it is one wavelength long.
- Can be used on all present and future amateur bands.
- Minimizes TVI because its radiation is vertically polarized and because harmonics are radiated at high vertical angles.
- Is safe from shock hazards because its base is grounded.
- Has a built-in lightning protection system.

If you answered in the affirmative, then this antenna is for you. This article describes how to build, install, and tune a 33-foot, elevated-feed vertical antenna.

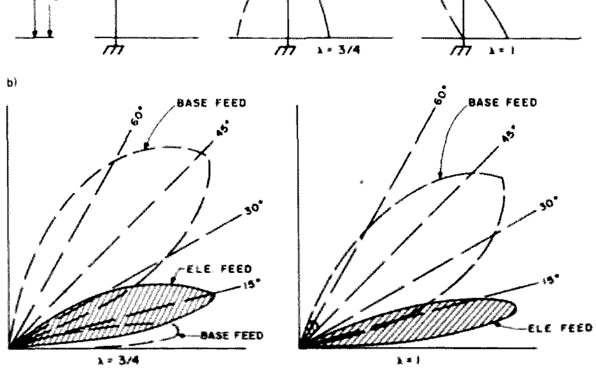

Fig. 1. (a) Current distribution and (b) vertical radiation patterns for 3/4λ and 1λ elevated-feed vertical antennas.

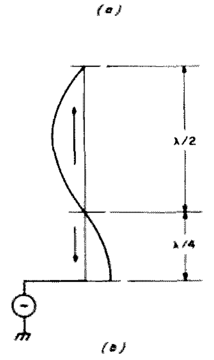

Fig. 2. Currents along antenna element for 3/4λ, elevated feed (a) and base feed (b).

Theory

An elevated-feed vertical antenna is not a vertical antenna which is elevated. It is a vertical antenna which is fed at a point which is 1/3 of its height from the ground—see Fig. 1(a).

I first came across the discussion of this antenna in *Amateur Radio Techniques*.[1] It contains a discussion of how an elevated-feed vertical antenna can be applied to amateur work to obtain "... low-angle radiation, without unwanted high-angle lobes, from vertical aerials of appreciable electrical length."[2] It explains how feeding a vertical antenna at the 1/3 point produces a current distribution different from that of a base-fed antenna. This is true only in cases where the antenna element is 3/4λ or 1λ long. If element length is 1/2λ or less, the elevated feed will perform approximately the same as a base-fed vertical antenna of the same height.

The comparisons of the current distributions and approximate vertical-radiation patterns for the base-

fed and elevated-feed antennas are shown in Fig. 1. To understand how a low vertical radiation angle is achieved in the elevated-feed antenna, one should study the current distribution along an antenna element. *The ARRL Antenna Book* states that current is reversed every 1/2λ along the element.[3] Fig. 2(a) shows how this results in an inphase collinear array in the elevated-feed antenna which is 3/4λ long. This inphase current distribution along the antenna element is the reason for its low vertical angle of radiation. If the same antenna were fed at the base, the current distribution would not be in phase —see Fig. 2(b)— and an unwanted high-angle lobe would appear in the vertical plane as shown in Fig. 1(b).

Design Considerations

In the design, I gave priority to the following considerations:

(1) Limiting the design to a reasonable height.
(2) Incorporating a top hat to dissipate static charge.
(3) Positioning the tuning unit near the ground.
(4) Designing and building a strong yet inexpensive center insulator from readily available materials.
(5) Designing the antenna strong enough to be self-supporting.

I chose an overall antenna length of 33 feet as this would give me a full wavelength—the longest practical length for DX operation—on 10 meters. The 33-foot length meant that the upper section must be 22 feet because the antenna is fed 1/3 of the length from the ground. This would make it 1/2λ from the feedpoint on 15 meters, so I detuned it slightly to lower the impedance at that point. The optimum length of the upper section, as determined by 15-meter and 20-meter band impedance curves, was found to be 24.5 feet.

Because aluminum tubing comes in 8-foot sections, and because I would lose 2-feet in the bushings and overlap, the available length from three sections was reduced to 22 feet. To get around this limitation, I decided to enlarge the considered top-hat section to achieve the desired effective length. Four top-hat radials, each 1.3 feet long, were experimentally found to provide the missing link.

The prospect of climbing a stepladder to adjust the tuning unit did not appeal to me. To avoid this, I chose to place the tuning unit near the ground and to use a 12.5-foot section of RG-8 foam coaxial cable to carry the power from the tuning unit to the feedpoint. Theoretical approximation showed that, at the worst, an swr of 7:1 would be present. The additional power loss for a 12.5-foot section of RG-8 foam cable with an swr of 7:1 was found to be 0.25 dB. I preferred this to climbing the ladder.

Power limit at an swr of 7:1 is found by dividing the power rating of the cable at an swr of 1:1 by the swr under operating conditions.[4] For this application, this is 2200/7 = 314.3 Watts. The output from a kW linear should be approximately 500-600 Watts. For intermittent duty, the average power would be half of this figure, or some 300 Watts. This does not give much of a safety factor, but I decided to go ahead and worry about it when and if I acquired a linear.

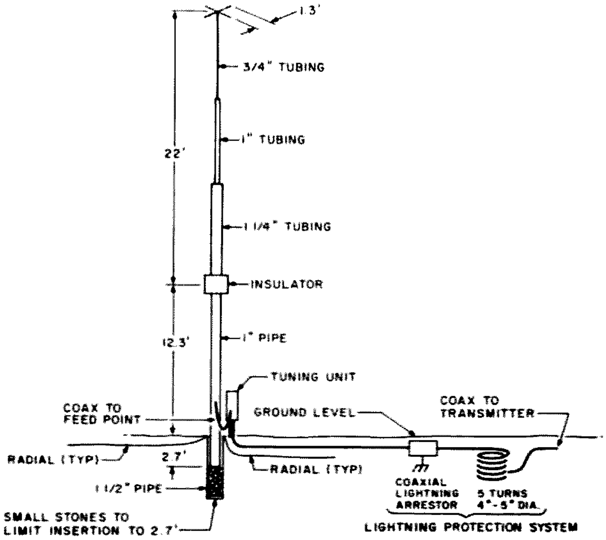

Fig. 3. Final design of the elevated-feed vertical antenna.

To make the antenna as attractive as possible, I designed it strong enough to be self-supporting. This presented no great problem except for the center insulator, which proved to be the greatest challenge of the whole project. It must be strong enough to support the upper 2/3 of the antenna without guying. I finally settled on building the insulator from PVC pipe reinforced with plexiglas™ panels and nylon cord, the whole thing held together with silicone rubber bathroom caulk and epoxy. I calculated the insulator's strength to be much greater than that of the aluminum tubing right above it. So, theoretically at least, the antenna should break at the tubing and not at the insulator.

By calculating stress values for the whole antenna, I found that if I used 1" steel pipe for the bottom 1/3 section and 1-1/4", 1", and 3/4" aluminum tubing for the 3-piece upper 2/3 section, the antenna would be strong enough to be self-

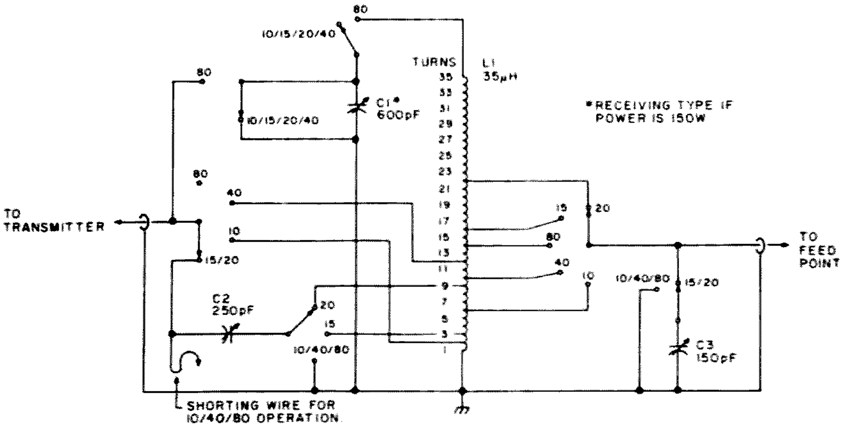

Fig. 4. Antenna tuning unit set for 20 meters. All air variables not in use are shorted and grounded.

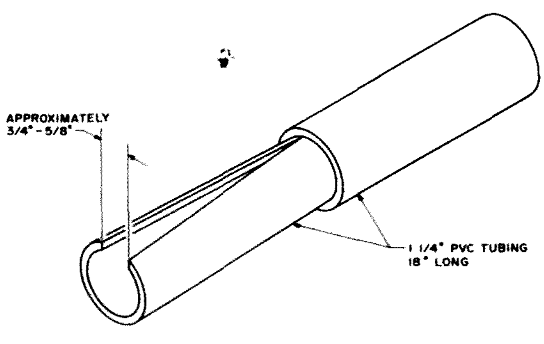

Fig. 5. Joining the two 1-1/4" PVC sections.

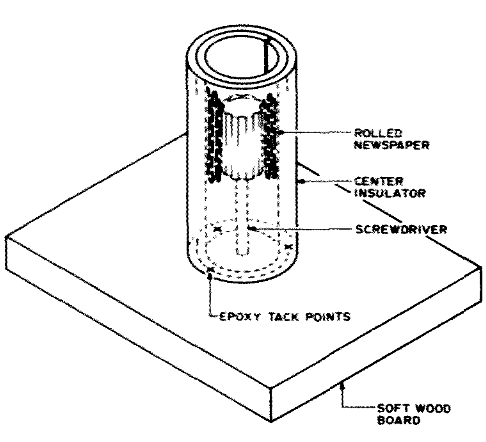

Fig. 6. Jig for the construction of the center insulator.

supporting. The weakest link would be the 1-1/4" aluminum tubing section. Moral support for this decision came from Capt. P. H. Lee's excellent book, *The Amateur Radio Vertical Antenna Handbook*, where he used this size tubing to construct his Mark II antenna.[5] He claimed that the antenna was flexible; it bent with a high wind and did not break.

The final design of this antenna is shown in Fig. 3, and the tuning unit is shown in Fig. 4.

Construction Procedure

The construction is started by the assembly of the center insulator. Fig. 5 shows how one piece is cut and inserted into the other piece. Use PVC pipe cement to bond the two pieces together.

Fig. 6 shows how an inexpensive jig can be constructed from a screwdriver and a piece of soft wood. This jig will hold the cemented PVC pipe in a vertical position to ease the task of cementing the plexiglas panels. The panels can be epoxied to the pipe first so that they will stay in place when applying the silicone rubber bathroom caulk.

Before cementing the plexiglas panels, insert the steel pipe and aluminum tubing into the PVC pipe to the dimensions shown in Fig. 8, i.e., to within 1/2" from each other, centered at the center of the insulator. Mark the radial direction on the pipe, aluminum tubing, and insulator. Drill holes 90° apart in the pipe and tubing for the mounting bolts, drilling through the PVC pipe. When drilling in pipe, *use a 1/4-20 tap drill* and enlarge the hole to 1/4" when the pipe is removed. The position of all holes is shown in Fig. 7. To avoid weakening the pipe, stagger the tap holes. This procedure will align all the holes and assist in the final assembly.

When the bathroom caulk has cured, wind five bands around the panels as shown in Fig. 7. Use nylon or dacron line approximately 1/8" in diameter and space the bands evenly. Epoxy the line for extra strength and to prevent it from unwinding. Drill the two vent holes between the panels in the center of the insulator. Build a little roof over the vent by using caulk. This will prevent moisture from seeping into the insulator.

The three sections of the aluminum tubing are assembled as shown in Fig 9. The bushing is made by cutting 6" from the smaller of the two pieces at the junction, splitting it and forcing it over the shortened piece.

The top hat is made by cutting a 3-foot length from aluminum clothesline, bending it in the center, and bolting it in place as shown in Fig. 10. After it is bolted in place, bend it until it is perpendicular to the tubing. After bending, cut it to the dimension shown (1'4") and spread the two wires until they are 90° apart. Install the top button and seal the whole area with bathroom caulk.

If possible, obtain a piece of 1" Schedule 40 pipe which is 15 feet long. If this cannot be obtained, use one 10-foot and one 5-foot section. Position the 5-foot section next to the insulator and join the two pieces together by using a 12-inch piece of 1-1/4" Schedule 40 pipe and 1/4-20 bolts. Use aluminum sheet between the pipes for a tight fit. Drill and tap the holes at this junction by following the same procedure as outlined previously when drilling holes in the center insulator. Drill one 7/16" hole approximately 4-5 feet from the bottom end of the pipe. This is the exit hole for the coaxial cable.

Cut a piece of RG-8 foam

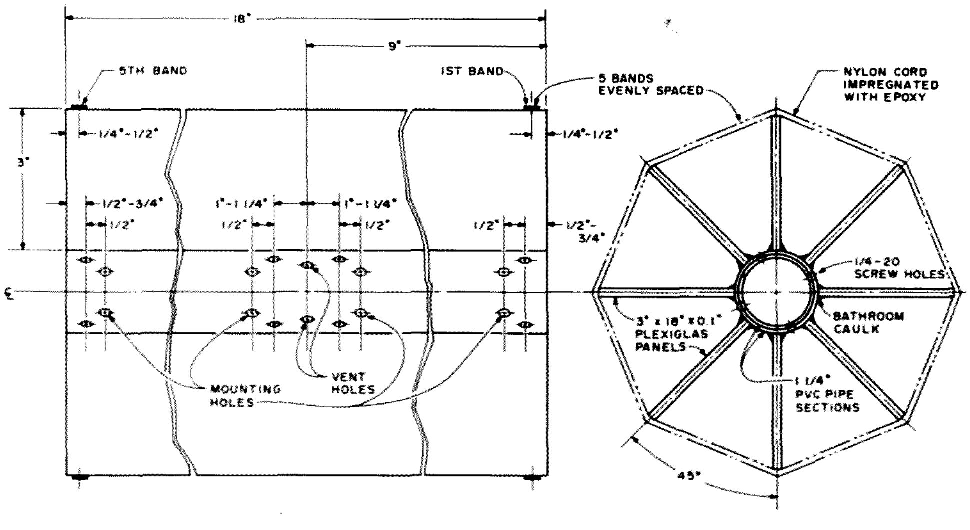

Fig. 7. Construction of the center insulator.

coaxial cable 15 feet long. Strip one end as shown in Fig. 8. Allow sufficient length of shield to produce the slack. During assembly, the pipe and aluminum tubing will come together across the 1/2" gap forcing the coax down. The slack is needed to prevent bending or damaging the center conductor. Impregnate the center conductor and the shield with solder so that about 1/4" of soldered length will protrude from the silicone rubber caulk when applied. Apply silicone rubber caulk as shown in Fig. 8 to seal the cable from moisture.

Thread the cable from the insulator end to the 7/16" exit hole by using a length of wire taped to the cable. Exercise caution in taping the cable since the hole does not allow too much clearance for the RG-8 cable.

Fig. 11 shows the position of the three components prior to assembly. Use electrical tape and aluminum sheet wrapped around the tubing and the pipe as necessary to ensure a tight fit for the center insulator. Cut holes in them for the bolts to pass through and smooth all edges so that the center insulator slides smoothly over the aluminum tubing and the steel pipe.

Slide the center insulator over the aluminum tubing. Verify the markings which were made during the drilling to avoid hole alignment problems.

Attach the shield of the coaxial cable to the pipe first. To do it, drill and tap a 1/4-20 hole in the pipe about 1/2" from the end, as shown in Fig. 8. Screw a 1/4-20 bolt from the outside of the pipe. Secure the shield to the bolt inside the pipe with a nut. Tighten the nut. Cut the bolt flush with the outside of the pipe wall.

Bend one edge of aluminum tubing and drill a 10-32 clearance hole in the bent section, as shown in Fig. 8. Attach the center conductor to the tubing by using 10-32 hardware.

Slide the aluminum tubing until it butts against the pipe. If the slack in the shield is of correct length, the two pieces should butt without any problem. If they do not butt properly, more slack in the shield will be required.

With the two sections butted, slide the whole antenna until it rests against a wall or other stationary object. Slide the center insulator over the pipe until the mounting holes are in alignment. Secure the insulator to the pipe by using 1/4-20 × 1/2 bolts. Gently slide the aluminum tubing out of the insulator until the mounting holes are in alignment. Secure the insulator to the tubing using 1/4-20 × 2 bolts and nuts.

Install the antenna in a 1-1/2" pipe, 5 feet long, which is driven into the ground to a depth of 4-1/2 feet. Small stones are dropped into the pipe to limit the depth of insertion. Aluminum or hardware shims are used to hold the antenna in place.

A ground radial system is needed for optimum performance, especially on the 80- and 40-meter bands. I have five radials, each 33 feet long, and I plan to install eight more. As with every vertical antenna installation, a low ground resistance is necessary for good performance. A high ground resistance (few or no radials) results in high power losses because the ground resistance is in series with the radiation resistance of the antenna.

For this installation, I attached the ground radials to the 1-1/2" buried pipe. I grounded the antenna to the pipe by using a 1/2" × 1/8" aluminum grounding strap.

Tuning Unit Construction

The schematic of the tuning unit is shown in Fig. 4.

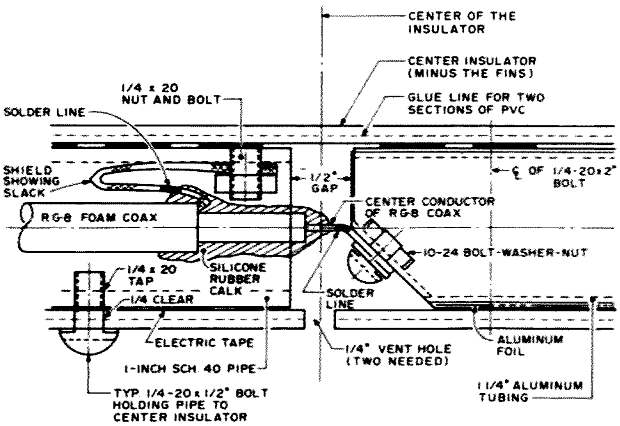

Fig. 8. Locations of the pipe and tubing within the center insulator.

The unit is installed next to the antenna, but not grounded to it. It is grounded only to the shield of the coaxial cable.

I constructed my tuning unit on a piece of plexiglas 7-1/2" × 16-1/2" and mounted it inside a watertight cabinet. Since I had enough air-variable capacitors in my junk box, I decided to be extravagant and use separate C2 and C3 air variables for the 15-meter and 20-meter bands.

One word of encouragement: The construction of this unit is not complicated. The cost to build it need not be high. I obtained all the parts and the cabinet for about six to seven dollars at two hamfests held in my local area. The real bargain find was an old Army surplus tuning unit which was priced at $5.00. This unit yielded two air variables, the coil, and the enclosure. To those of you reading this article who have not been to a hamfest, my advice is to go to one! It is lots of fun plus being a place for some real bargains.

Once the tuning unit is built, connect it to the coax feeding the antenna and to the transceiver placed next to the unit. Follow the procedure below to obtain tap points for your coil.

Tuning Procedure Using Swr Meter

(1) Connect the swr meter in the line between the transceiver and a dummy load.

(2) Tune the transceiver as usual for maximum output on the 80-meter band. Adjust the swr meter sensitivity for a full-scale forward power indication.

(3) Do not change any of the transceiver or swr meter settings. Switch the swr meter to read reflected power.

(4) Disconnect the dummy load and connect the tuning unit in its place.

(5) Using the turns ratio in

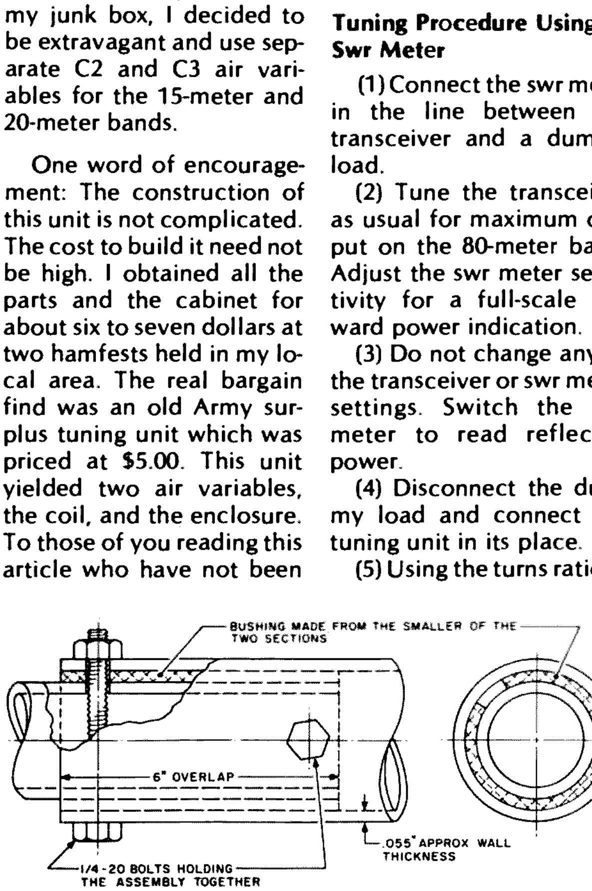

Fig. 9. Assembly of the aluminum tubing sections.

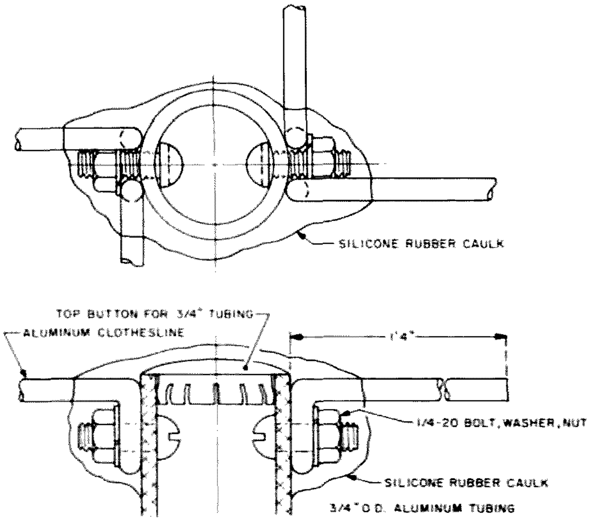

Fig. 10. Top-hat assembly.

Fig. 4 as a guide, connect the appropriate wires to the coil using alligator clips or equivalent.

(6) Position all tuning unit switches to 80 meters and adjust all air variables to *minimum* capacitance.

(7) Watching the swr meter, place the transceiver in the transmit mode. The swr meter may show anything from an off-scale reading to an swr of 1:1.

(8) Not changing any of the settings on the transceiver or the swr meter, note the swr reading. Place the transceiver in the standby mode.

(9) If the swr was high, adjust the taps on the coil and repeat steps 7 and 8. If the swr was low (swr meter deflection is 1/2-2/3 scale, equivalent to an swr of about 3:1 to 5:1), leave the taps alone and adjust the air variable for an swr of 1.3:1 or lower.

(10) Repeat steps 7 to 9 until an swr of 1.3:1 or lower is obtained. Record all settings for future reference.

(11) Repeat this procedure for the other bands.

The procedure is designed to obtain the best possible match by adjusting the turns on the coil first. Once this is accomplished, air variables are used to reduce the swr still further. Always adjust one component at a time and fight the temptation to tinker with knobs. It took me two days to learn this lesson.

Connecting the Antenna To the Shack

After installation and tuning, connect the antenna to the shack by using buried RG-8 coaxial cable. Install the lightning protection system as shown in Fig. 3. It consists of a coaxial lightning arrestor grounded to a 5'-6' ground rod, followed by the turns in the coax. Tape the arrestor well with electrical tape to prevent moisture damage.

Performance

The theoretical performance calculations were hammered out with N9CR during various coffee breaks. He has a newly installed three-element tribander atop a 60' tower. We chose to compare the relative merits of the elevated-feed vertical antenna to those of the beam 60 feet in the air.

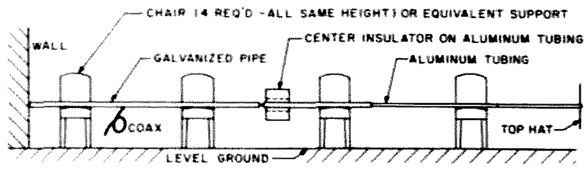

Fig. 11. Assembly of the elevated-feed antenna.

Theoretical data for this comparison came from *The ARRL Antenna Book* and and P. H. Lee's book, *The Amateur Radio Vertical Antenna Handbook.*[6,7] The summary is presented below. We chose the 20-meter band for this comparison.

A three-element beam 1λ above ground has a vertical pattern consisting of two lobes. Only the lower lobe is good for DX. It has a horizontal beamwidth of about 60° (−3-dB points) and a vertical beam width of about 15° in the lower of the two lobes. Judging by the published patterns, we assumed that the power going into the antenna is divided equally between the two vertical lobes.

The beamwidth of the elevated-feed vertical antenna on 20 meters is approximately 20° in the vertical plane. Since it is non-directional, the horizontal beamwidth is 360°.

For DX operation, the spherical area illuminated by the beam is 60° × 15° = 900 "square degrees." The spherical area illuminated by the elevated-feed antenna is 20° × 360° = 7200 "square degrees." The power gain of the beam relative to that of the elevated-feed antenna can be calculated theoretically as

$$\text{Gain(dB)} = 10 \log P_1/P_2$$
$$10 \log 7200/900$$
$$9.03 \text{ dB over elevated feed}$$

Because only half of the power (3 dB down) goes into the "useful lobe," the actual gain that the beam realizes over the elevated-feed vertical antenna is 9.03 dB − 3.0 dB = 6.03 dB, or 1 S-unit.

Jokingly, we both agreed that although N9CR's tribander at 60 feet had a gain of 6 dB over my elevated-feed vertical, I held a 13.3 dB "gain advantage" in cost.

On the air, the antenna performed beautifully for DX on 28 MHz and 21 MHz where the radiation is at low vertical angles. On 14 MHz, the antenna performed very well over the United States and Canada, and fairly well for DX. On 7 MHz and 3.5 MHz, the antenna lays down a strong ground wave; I had very good signal reports from stations 30 to 40 miles away. Many fine 80- and 40-meter QSOs were also had with stations as far as 800 miles away.

Conclusion

I wish to express my thanks to K9CGD to whom this project was first presented and who encouraged me to proceed with it. Thanks are also due N9CR who nursed the project from the beginning to the end and who, having tried the antenna on the air, pronounced that "...it worked as expected." I feel that the elevated-feed principle has much to offer to the amateur radio operator. In fact, I like this antenna so much that I am planning to optimize performance on 20 and 40 meters by designing and building one which will be 66 feet tall. But that's another project. ■

The TET SQ-22 Antenna

—walking the dog with a two-meter quad

The HB9CV Swiss quad designs have been around for quite a while, but they have seen relatively little commercial exploitation in the USA. Available and quite popular in Japan for several years, they are now offered here by TET USA of Norman, Oklahoma.

The TET SQ-22 two-meter antenna is a vertically-polarized Swiss quad antenna that follows the HB9CV design. It consists of two two-element assemblies in a phased configuration, with all four elements driven. The antenna is very compact, yet the gain and front-to-back ratio figures claimed are impressive—16 dB forward gain and 20 dB front-to-back ratio. Without a test range, these figures are impossible to either confirm or deny, although they do seem slightly optimistic. Nevertheless, with the antenna mounted six feet atop a house and turned with a small TV-type rotator, gain and F/B ratio appear to be excellent.

Assembly presented no problems. The parts were carefully marked and packed, and the quality of materials used is higher than average. Assembled exactly according to instructions, the center frequency of resonance was about 146 MHz, a reasonable compromise. Since I rarely operate FM below 146 MHz, I retuned the antenna for a slightly higher center frequency.

N1BEJ with the TET SQ-22 two-meter antenna.

After several months of operation, the SQ-22 has given no cause for complaint. I use it constantly for accessing repeaters and simplex operation and have never wished for more gain. If you're in the market for an antenna for two-meter FM and want something a little beyond the ordinary, you might want to look into the SQ-22. For the truly adventurous, an eight-element Swiss quad for two meters is available from TET, as well as Swiss quads for several other bands from 20 meters to 432 MHz.

For more information, contact *TET USA, 425 Highland Parkway, Norman OK 73069.* Reader Service number 476. ■

Newcomer to Nicads?

—you'll get a charge out of this informative overview

The following covers some of the more common problems encountered by users of nicad batteries. The last section of this article explains some of the technical aspects of the nicad cell.

Virtually all problems involving batteries come with complaints like: "Battery life too short"; "Won't hold a charge"; or perhaps, "Battery too weak." Sometimes there is a real problem—and sometimes the battery is not getting what it must to do a good job.

Here are some practical tips:

1. Fully charge the battery. Some chargers have a NORMAL-TRICKLE switch. In the TRICKLE position, it would take 24 to 60 hours to fully charge a dead battery. On NORMAL, it would take 12 to 14 hours. Nicad batteries can be charged continuously at the NORMAL rate with absolutely no damage to the batteries whatsoever. Leaving the radio on while charging will cause the charging rate to be longer.

2. Don't over-discharge the batteries. Turn OFF the radio when the batteries become low (the SQUELCH control usually won't silence the radio).

3. Never insert batteries backwards. This will almost certainly ruin something.

4. Inspect your batteries occasionally for any indication of rust or corrosion. A white, powdery deposit around the rubber seal at the positve end of the cell or an oily discoloration on the label may be the first sign of an upcoming failure.

5. If your batteries have a short life, check the battery-charging system. Two simple checks will be enough to find the problem. First, check to see if the charger is putting out enough current. Second, check to see if the radio draws too much current. If the charger and radio are OK and you are allowing enough time on charge, then the battery is probably at fault.

Fully discharged, open-circuit	*1.2 V
Fully charged, open-circuit	*1.27 V
Fully charged, charging at 0.1 C	1.45 V
Freshly charged, begin discharging at C	1.4 V
Fully discharged, discharging at C	1.0 V

*These voltages are reached slowly as the cell is allowed to stand for a time.

Table 1. Cell Voltages at 20°C.

What is a Nicad Battery?

The nicad battery is two or more nicad cells connected together. The nicad cell is called a secondary (storage) cell and is used to store electrical energy until needed. It may be recharged many times during its life. The cell may be described electrically by its voltage and capacity.

Cell voltage is determined solely by the materials from which the cell is made. Nickel and cadmium in a potassium-hydroxide electrolyte produce a cell with a nominal voltage of 1.2 volts. There is only a relatively small change in cell voltage from fully-charged to discharged conditions. Refer to the section on battery-testing (following) for cell voltage-measuring techniques. Cell voltage varies from 1.4 volts when just charged to 1.0 volts, at which point it is considered discharged. Nominal cell voltage is 1.2 volts since the cell is very near 1.2 volts for most of the time it is in use. (Of course, if you have a 10-cell battery, the battery voltage is nominally 12 volts.)

Cell capacity is defined as the maximum current the cell will deliver continuously for one hour. This capacity is given by the battery manufacturer in milliampere-hours (mAh) for small cells, and Ampere-hours (Ah) for large cells. Capacity is determined by the size of the cell. For example, an AA-size cell is rated around 350 to 500 mAh and a D-size cell is rated at 2.0 to 4.09 Ah. A very important figure associated with cell capacity is the one-hour discharge rate (C) which is numerically equal to the capacity. For example, for a quantity, C, we can discuss the charge and discharge of nicad cells conveniently without concern for actual cell capacity.

Temperature

Battery operation should be at temperatures between minus 20 and plus 40 degrees C. They may, however, be stored indefinitely at temperatures between minus 60 and plus 60 degrees C. Most batteries will self-discharge at rates dependent upon the storage temperature involved. At 0° C, discharge amounts to 90% in 60 days. At 20° C, it is 50% in about 55 days, and at 50° C, it is 50% in about 20 days.

Life

Generally, batteries may be expected to last several years under normal use. A minimum of 300 cycles of complete charge and discharge is to be expected. If only a partial (say, 20%) discharge is used, the life may extend to 5000 cycles. However, if the battery is partially discharged continuously, it should be periodically deep discharged to realize its full capacity.

Charge and Discharge

Most batteries are normally discharged (in-circuit) at rates less than C and charged at a rate of 0.1 C. If a trickle charge option is available, the charge rate is 0.01 to 0.05 C. Most batteries may be left on NORMAL (0.1 C) charge for indefinite periods without damage. At the normal rate, a completely discharged battery will recharge in 12-14 hours. Less time is required for partially discharged batteries. Charge rates above 0.1 tend to overheat the cell and cause damage. Special "Rapid-Charge" cells are required for fast-charging applications.

Table 1 (showing cell voltages) may be of help in understanding battery function during charge and discharge.

Testing

The battery, charger, and radio constitute a small system which is one end of a communication link. When this system fails, testing each element is necessary to determine the proper correction. Based on experience, the charger is the most likely to fail, followed by the battery and then the radio. However, due to ease of testing, test the charger and radio first.

For the 12-volt, hand-held radio chargers, connect a milliammeter using a D'Arsonval movement (such as: Simpson 260 or Triplett 630), capable of measuring 55 mA, in series with a 240-Ohm, 1-Watt resistor. Connect the meter-resistor combination across each and every set of charging contacts for a 12-volt battery. Observe correct polarity. The charger current should be 45-55 milliamperes.

Consult the appropriate data sheet for the radio under test. Measure all applicable maximum current drain on: full squelch receive, full volume receive, and transmit. Readings should not exceed spec maximums.

A quick battery check would be: Charge at normal (0.1 C) rate for 15-30 minutes. Measure battery or cell voltage. Less then 1.2 volts per cell (12.0 volts for a 10-cell battery) indicates possible defective cells.

For a more complete battery test for a hand-held radio battery with 10 AA cells, fully charge the battery for 12-14 hours at the normal (0.1 C) rate. Connect a 27-Ohm, 10-Watt resistor across the battery and monitor the time required to discharge the battery to 1.1 volts per cell. The time should be close to 60 minutes.

This test will vary according to ambient temperatures. The time will run short if the ambient temperature is much over 25 degrees C, or if started with the battery more than slightly warm to the touch.

Conclusions

The nickel-cadmium batteries will perform excellently if used within their limitations. Poor performance usually results when the limits are exceeded. ■

TR-9000 *from page 32*

supply and standby and power switches, as well as provisions for using external headphones. Another source of memory backup power is the BC-1 power adapter. We suspect that a functional equivalent of the BC-1 could be homebrewed for much less than the $20 list price. One accessory that Kenwood does not offer but in our experience is helpful for weak signal work is a receiver preamplifier. A quality unit can really enhance SSB operation without adding to the noise figure.

We liked the compatibility that Kenwood built into the TR-9000. The power cord and touchtone connector are the same as those used with the TR-7600 and the 7625. The microphone is identical to that used with the TR-7800 and can be pressed into service with Kenwood's VS-230 remote digital vfo. One exception to this area is the rather unusual connector used for the backup power supply.

The TR-9000 offers a tremendous number of features for a reasonable if not downright inexpensive price. If you want to take a crack at two-meter SSB and CW operation and still have a radio that allows you to chew the rag with the gang on the local repeater, you'll find a *flexible* answer in the TR-9000.

For further information, contact *Trio-Kenwood Communications, Inc., 1111 West Walnut Street, Compton CA 90220.* ■

BC-350 *from page 78*

outs to signal priority, lockout, delay, auxiliary, and channel number. The right-hand display may be manually toggled between digital frequency display and alpha readout.

A Closer Look

A glance inside the custom diecast metal cabinet reveals the complexity of the circuit, but shows the precision of professional design.

Frequency increments searched and programmable vary with the band plan procedure. On low and high band FM, channel spacing is 5 kHz, on aircraft band 25 kHz, and on UHF 12.5 kHz.

An automatic squelch circuit may be called up to respond to any signal level which produces 20 dB SINAD (S + N/N). This is handy for most listening requirements which do not require constant juggling of the squelch sensitivity right at threshold.

Frequency coverage was actually somewhat greater in our evaluation unit than advertised. We programmed 30.0-50.995, 118.0-136.995, 144.0-174.005, and 420.45-512.9875 MHz. This allowed reception of the first megahertz of the six-meter band (FM demodulation only) and a few beeps and whistles from NASA's weather satellites!

As with its predecessor, the advanced BC-300, the BC-350 has a non-volatile memory—no batteries to change.

The BC-350 is advertised for $599.95. For more information, contact *Electra Company, PO Box 29243, Cumberland IN 46229.* Reader Service number 480. ■

FUN!

John Edwards KI2U
78-56 86th Street
Glendale NY 11385

"Don't you ever run out of material for your column?" is a question that often crosses your FUN! editor's desk. The answer, quite honestly, is "no." Amateur radio is a subject so full of history and interesting bits of information that, quite likely, the well will never run dry. After all, new ham facts are being created every day.

Take our monthly crossword puzzle. Each month a new topic; each month a new puzzle. Oh, occasionally we may repeat a word or clue here and there, but, on the whole, each month's puzzle is entirely different. And we're never really stuck for material.

Do you know where the world's first crossword was printed? Why, in the FUN! column, of course! No, not this FUN!, but one carried in the December 21, 1913, *New York World*. It's nice to be carrying on a tradition.

Now, what has all this to do with this month's topic, emergency communications? Absolutely nothing. It's just that we occasionally like to digress.

ELEMENT 1—CROSSWORD PUZZLE
(Illustration 1)

Across

1) Emergency messages
2) Mobile antenna
7) Box (abbr.)
9) Where third-party info is entered
11) Emergency's cause
14) Distantly activated (abbr.)
15) ARRL state (abbr.)
16) Over
18) Quasi-military service (abbr.)
21) Emergency service (abbr.)
23) Military colors
26) Strong signal needle action
28) Radiogram
31) Tell you later (abbr.)
33) "_______ the traffic"
35) Brick _______
38) 42 across often needs this (abbr.)
40) Plate voltage (abbr.)
42) Emergency ringleader (2 words)

Down

1) Dits and dahs
2) Erstwhile training contest (abbr.)
3) Old-style Hertz (abbr.)
5) Active circuit condition
6) Desirable emergency gear is this
8) Flood boat's meager propulsion
10) Emergency workers need this (abbr.)
11) Light-bulb action in many emergencies
12) 4-land state (abbr.)
13) ARRL emergency official (abbr.)
17) Peruvian prefix
19) League post (abbr.)
20) Here (abbr.)
22) Big emergency "nuisance"
24) Mode: most 2-meter CD nets (abbr.)
25) Baloney (abbr.)
27) Popular rig prefix
29) Female version: frequency hog
32) End of message
34) Organized roundtable (abbr.)
36) Automatic noise limiter (abbr.)
37) Jams emergency traffic
38) An engineering degree (abbr.)
39) Board type (abbr.)
41) Many clubs use emergency work to gain this (abbr.)

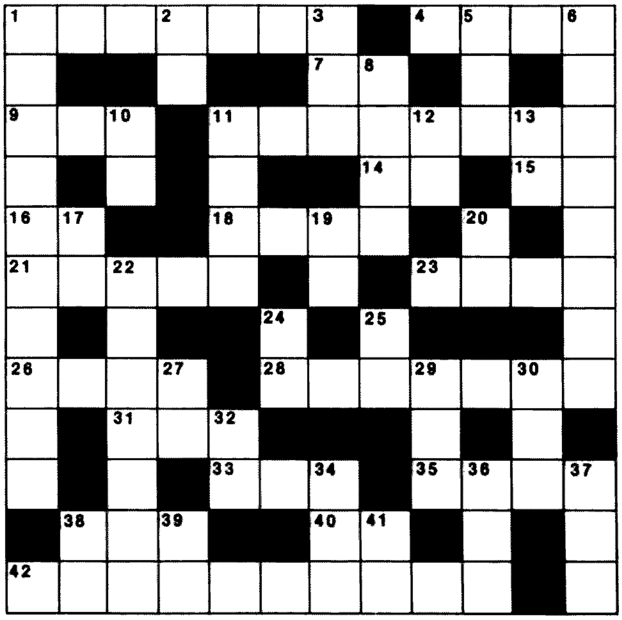

Illustration 1.

ELEMENT 2—MULTIPLE CHOICE

1) We all know that $\overline{\text{SOS}}$ is the distress signal, but what is the urgency signal, signifying a message concerning the safety of a ship or person?

1) $\overline{\text{TTT}}$
2) $\overline{\text{XXX}}$
3) $\overline{\text{URG}}$
4) There's no such thing as an "urgency" signal.

2) While tuning across the band, you hear someone shouting, "Pan, Pan, Pan." What's happening?

1) He's sending an urgency message
2) He's looking for a kitchen implement to fry his eggs in
3) He's calling for an open frequency
4) He's using an international sign that means he's listening 10 kHz up

3) What does $\overline{\text{SOS}}$ stand for?

1) Save our ship
2) Save our souls
3) Secure our safety
4) The individual letters mean absolutely nothing, chosen only for their distinctive sound

4) What were the official Conelrad broadcast frequencies?

1) 540 and 880 kHz
2) 640 and 1240 kHz
3) 710 and 1600 kHz
4) 21.390 and 146.52 MHz

5) How did the word "Conelrad" originate?

1) It's an abbreviation of control of electromagnetic radiation
2) It's an abbreviation of consolidated network for limiting radio
3) From its founder, Joseph Conelrad
4) From the Conelrad video display located at each participating radio station

ELEMENT 3—TRUE-FALSE

	True	False
1) The original official ARRL station, W1MK, was destroyed by a flood.	_____	_____
2) RACES is an ARRL organization.	_____	_____
3) If caught in a life or death situation, you're allowed to operate in any amateur subband, even if it's outside your license privileges.	_____	_____
4) QRRR was the original amateur distress call.	_____	_____
5) Before $\overline{\text{SOS}}$, the international distress call was CQD.	_____	_____
6) "Mayday" is the phone distress call in honor of Marconi, who was born on May 1, 1870.	_____	_____
7) MARS used to be called AARS.	_____	_____
8) Novices may not pass emergency traffic.	_____	_____
9) In an emergency, the FCC may order all U.S. amateurs off an entire band.	_____	_____
10) The *Titanic's* $\overline{\text{SOS}}$ was the first ever sent by a ship at sea.	_____	_____
11) Alaskan amateurs may use 4,383.8 kHz for emergency communications at any time.	_____	_____
12) In RACES, the amateur controlling on-scene emergency communications is called the "Master of Ceremonies."	_____	_____
13) The "Transcontinental Corps" is a radio club dedicated to helping hams in need.	_____	_____
14) ARRL numbered radiograms violate the FCC's rules prohibiting secret codes and ciphers.	_____	_____
15) If a natural disaster strikes a foreign country, third-party emergency traffic can be passed—even without a formal agreement.	_____	_____

ELEMENT 4—SCRAMBLED WORDS

Unscramble these words dealing with things hams might bring to an emergency site.

rotnegera	toobs	dofo
stranvercei	wobtoar	shalltifgh
nett	loots	hotnicgl
	dicnemie	

ELEMENT 5—HIDDEN WORDS
(Illustration 2)

Hidden in this puzzle are the names of 10 different types of emergencies. The words are formed in any direction—horizontally, vertically, or diagonally, forwards or backwards. As you find each word, circle it.

FUN! MAILBOX

Just a note letting you know your work is greatly appreciated in *73 Magazine*. I enjoy your writing. I am studying for my General and would like to have an Advanced someday. There is a lot to learn and I am trying to crawl!

Keep up the good work. Thank you very much.

James Ross
Long Beach CA

Thanks a lot, Jim.—J.E.

THE ANSWERS

Element 1:
See illustration 1A.

Element 2:
1-2 Many hams might send XXX after sitting at their key for more than a few hours. Others just have it written on that jug near their operating station.
2-1 Did we get you again? Of course, he may just be looking for his peanut butter.
3-4 And QSB must mean: "Quickly Sinking Band."
4-2 There you would listen to the president's message—if your receiver wasn't melted by the blast.
5-1 So enemy planes couldn't find our cities via radio. But how would you have shut down the CBers?

Element 3:
1 True—No code practice that night.
2 False—The FCC, when it feels like it.
3 True—if absolutely necessary, you can even operate outside the amateur bands.
4 True—Like SOS, it had a distinctive sound.
5 True—As you may have guessed, it meant "CQ Distress."
6 False—From the French *m'aidez* (help me).
7 True—Back before WWII, when it was the Army Amateur Radio System.
8 False—Why not?
9 True—The FCC, like a 500-pound canary, can do anything it wants to.
10 True—Alternating with CQD.
11 True—As long as they're within 50 nautical miles of the state and are not airborne.
12 False—Only if he has a co-host.
13 False—They're upper-level ARRL traffic handlers.
14 False—Probably not, since the codes are regularly printed. But they're never been challenged on it, either.
15 False—Unfortunately not, and many unwitting amateurs end up violating the law. Usually, however, a temporary agreement permitting emergency traffic is put into place—as in last year's Italian earthquake.

(Reading from left to right) generator, boots, food; transceiver, rowboat, flashlight; tent, tools, clothing; medicine.

Element 5:
See illustration 2A.

SCORING

Element 1:
Twenty points for the completed puzzle, or ½ point for each question correctly answered.

Element 2:
Four points for each correct answer.

Element 3:
One point for each correct answer.

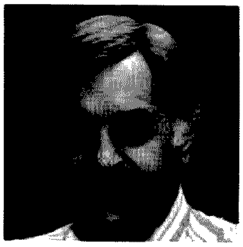
Element 4:
Each word deciphered nets you 2½ points.

Element 5:
Two points for each word found.

So, how well are you prepared?

1-20 points—Emergency? What emergency?
21-40 points—Know someone who passed a message during the great 1951 Philadelphia Hoagie Famine
41-60 points—Regularly checks into local VHF net to "pass a personal"
61-80 points—Spends every night hopping from net to net—your handle is "Sparks"
81-100+ points—Member of RACES, MARS, AREC, NTS, ARPSC, and the National Anagram Society

LEAKY LINES



Dave Mann K2AGZ
3 Daniel Lane
Kinnelon NJ 07405

Perhaps some of you who are reading these lines will have been among the group of twenty-odd hams who happened to be standing around the booth of a company which I prefer to go unnamed. The scene was the recent Dayton Hamvention, and the time was Saturday afternoon at the very height of the afternoon festivities. This particular firm is one of the few remaining American manufacturers engaged in the production of major equipment, that is to say, transceivers, as distinguished from associated items such as microphones, antennas, keyers, and so forth.

Their current model is not new, but has been on the market for some time. But I have had little opportunity to look at it, so this was really the first time for me to see it close up. I was chagrined to see that among other things, they had seen fit to include a pretty shoddy-looking silk-screened knob that probably cost no more than a few pennies to produce. This was the sort of penny-dreadful junk one would only find on inexpensive kits and cheaper rigs. It was certainly grossly out of place on a radio which sells for upwards of 1600 bucks, in my humble opinion. (Actually I've never been humble in my whole life; this figure of speech just happened to issue forth from the typewriter.)

At the precise moment that my eyes happened to light on this misbegotten knob, I was suddenly overcome by an uncontrollable impulse to lash out at someone, and since the only eligible person happened to be the company rep who was manning the booth, he was elected. I said, "You know...you and your company ought to hang your heads in shame. Here we are: The Japanese have their fangs and talons poised at our jugular. We keep talking about the urgent necessity of regaining the markets that foreign business has taken from us. In scores of fields: optics, photography, automobiles, electronics...even pianos and sporting goods such as fishing tackle and baseball gloves...we have lost out, and now we suffer disadvantage, not only to our pocketbook, but our national pride."

The luckless object of my polemic seemed to be looking for a hole to crawl into. His eyes were bugging out of his head. I continued.

"We know that the reason there are so many VWs, Datsuns, and Toyotas on the road is because of the rotten product that Detroit insisted on making.

We drove the car customers right into the arms of the foreign producers. And now what happens? You guys have the gall to do the very same dumb thing that Detroit did, despite the clear and certain knowledge that the American people were sick and tired of getting shafted by our own companies and shifted to imports. You put out a rig that looks as if it were slapped together in someone's garage! You ought to hang your heads in shame!"

I surreptitiously peered at the people standing around the booth and they were all nodding in agreement. I could see that if I continued much longer, this gang might start heating up the tar and ripping open the pillows. So I decided to call a halt to my diatribe, and I walked away, leaving the poor guy swabbing the sweat from his brow.

About a year ago, when I was putting together a little switching arrangement so that I could go from HF to VHF on radioteletype, I needed to get hold of a switch and figured that in the interest of durability and reliable operation I'd better get myself a good American-made one. There were plenty of switches available that would have done an adequate job, but I thought that I would do better with a device of proven reliability. So I spurned all the cute little mini-switches and went to a good store and laid out almost six bucks for an American-made switch. (Again, I will leave the name of the company unspoken.) Well... you guessed it. The switch was an absolute dog! It was constantly intermittent, and I could never be certain that it would make contact. I had to spend much time jiggling the damned toggle back and forth to make sure that the thing switched properly. Please bear in mind that there was no appreciable voltage or current involved, since I was merely activating a pair of sensitive relays that operated from the 13.8-volt 2-meter supply, and since the actual switching took only a split second, there was no way that any operational stress could have played a part in the failure of the device. Any light switch in my house gets more use in a single week than this switch would be likely to get in a whole year!

So what did I do? Simple. I ripped the high-falutin' American-made switch out of the gadget and replaced it with a cheap little import picked up in a blister pack from my handy-dandy neighborhood Radio Shack store. It has now been in use for about three months with no sign of any difficulty. And it cost all of 98 cents, as I recall.

I am outraged. I guess it's no secret that there are more foreign rigs being sold in the US than ever, and it's pretty clear that hundreds of millions of hard-earned American dollars are leaving the country and going into foreign pockets. There's no doubt that this constant drain (and you can multiply it by a large factor because the very same situation can be observed in all sorts of manufactured goods, as I indicated earlier) is virtually crippling the American economy. While our national administration struggles to bring the economy into line by increasing productivity and reducing inflation, we are ignoring this fundamental fact: that American productivity must go hand in hand with quality. For if we produce shoddy merchandise, buyers are entitled to go elsewhere. They yearn to be patriotic, but that does not mean that they will hold still while they are being exploited.

Somehow, American manufacturers of ham gear are going to have to find a way to produce top-quality goods at a price which can compete on an equal basis with the imports. It isn't going to be easy.

By the way, while at the Hamvention, I looked at another line of goods, also produced by an American company. In line with my previous demurral, I will not divulge their name. They had removed the covers so that it was possible to see the circuit boards. I can tell you that I was appalled at the shoddy appearance of the workmanship, if you can dignify it with that term. This is supposedly top-line stuff. Mounted components looked as if they had been scrounged from someone's tailgate out in the flea market, and without particular care in selecting them. Cockeyed, poorly-dressed leads and solder splashes were the rule rather than the exception, and some of the visible hardware had been deformed by the careless application of the wrong-sized screwdrivers.

I have often looked carefully at imported equipment, and I must say that even the most inexpensive gear is generally immaculately assembled and good to look at. Is that too much to ask?

RADAR AND LIVES

I swore that after last year's trip, I would never drive to Dayton again, but would fly. But when the time approached, I forgot all about the resolution. Thirteen hours on the road is getting to be a mite exhausting. And I have yet to ride on Interstate 80 without encountering either a horrendous downpour or impenetrable fog.

Last year, we went in a couple of rented Winnebago RVs. The trip was fun, albeit very tiring, not to mention the horrendous cost of the gasoline. This year, we used two cars. The most impressive thing was the performance of the radar detectors mounted in each of the automobiles. They operated flawlessly, and I am convinced that they are a must, particularly if the vehicle is not equipped with cruise control. The gadgets never failed to alert us to the presence of police radar. I am in no position to give you qualitative comparisons of the brands, not having tried a great variety. But Wayne gave a fairly broad evaluation in one of his columns (June, 1980) and it behooves anyone who is anxious to avoid a nasty confrontation with the gendarmes to consider the purchase of one of these devices.

There are still a few places in which radar detectors are considered illegal. I suppose the authorities consider the collection of fines more important than the prevention of highway accidents. It is obvious that the known presence of radar patrols influence drivers to slow down, thus reducing the accident rate. The fact that most cars I saw on this trip were indeed equipped with detectors and the additional fact that few cars were pulled over by the police must be correlative. I am positive that radar detectors are a demonstrably effective deterrent to traffic fatalities.

Indeed, we can all think of far more urgent jobs for the police to be doing than lying in wait for unwary motorists who are "putting the pedal to the metal." While the original impulse to buy and use a radar detector may be ignited by the simple desire to avoid traffic citations, the end result is fewer accidents. And since the use of detectors by the public invariably results in a lessening of the need for high numbers of police patrolling the roads, this will liberate more officers and make them available to track down the ever-increasing population of real criminals who terrorize society and who run amok in our streets, parks, and subways, creating havoc and tragedy.

If that is the consequence, then every car in America ought to be equipped at the factory with a radar detector.

NO-CODE LICENSES

The response to my April piece about code-free licensing has been practically unanimous. Numerous cards and letters have come in, and only three favored a code-free entry level license. In point of fact, the results of a survey (published in *QST*) showed conclusively that the vast and overwhelming majority of amateurs opposed such a change.

Case closed!

HAM HELP

I'm interested in any information on converting an RCA RT-175/PRC-9 27-38.9-MHz receiver/transmitter. My particular interest is in power supplies and schematic information on these radios. Thank you for your trouble.

Dick Howe
2210 Taggert St.
Wesleyville PA 16510

I am interested in obtaining a schematic for a Precision Signal Generator, series E-200 C, manufactured by Precision Apparatus Co., Inc., Elmhurst, LI, New York, serial number 34845. I would appreciate any help that anyone can give me. Thanks.

CONTESTS

Robert Baker WB2GFE
15 Windsor Dr.
Atco NJ 08004

SARTG WORLDWIDE RTTY CONTEST

Contest Periods:

0000 to 0800 GMT August 15
1600 to 2400 GMT August 15
0800 to 1600 GMT August 16

This is the 11th annual contest sponsored by the Scandinavian Amateur Radio Teletype Group (SARTG). Operating classes include: (a) single operator; (b) multi-operator, single transmitter; (c) SWL. Please note that the logs from multi-operator stations must contain the names and callsigns of all operators involved. The same station may be worked once on each band for QSO and multiplier credits. Only 2-way RTTY QSOs will count.

EXCHANGE:

RST and QSO number.

SCORING:

QSOs with your own country count 5 points. Other countries in the same continent are 10 points. Other continents are 15 points. In the USA, Canada, and Australia, each call district will be considered as a separate country. Use the DXCC list and the above-mentioned call areas for multipliers. Note that contacts with a station which would count as a multiplier must be found in at least 5 logs or a contest log must be received from the multiplier station in order to be valid. Final score is the sum of QSO points times the sum of the multipliers. SWLs use the same rules for scoring, but scores are based on stations and messages copied.

AWARDS:

Top stations in each class, country, W/K, VE/VO, and VK call district.

ENTRIES:

Logs must be received by October 10th and should contain: band, date/time in GMT, call-

RESULTS

1981 SSTV CONTEST RESULTS

This year's SSTV contest may not have been the pinnacle of excitement and fun as it has been in previous years, but it brought several situations into clear focus (no pun intended). As you know, the SSTV Contest and Worldwide DX Contest happened during the same weekend. What you don't know is the problems and entanglements of trying to coordinate with uncoordinative sources. We've outguessed and outmaneuvered obstacles during the past several years, but the law of numbers finally caught us. We have two possible considerations for next year's contest: 1) Conduct the SSTV Contest on either the first or second full weekend of March, whichever one doesn't become scheduled for the DX (phone) Contest. Furthermore, if some "surprise attack" produces contests on both of these weekends, the SSTV Contest will shift to the third weekend of March. If that consideration is accepted, the formal 1982 SSTV Contest announcement will read accordingly. That will necessitate checking with the SSTV Net (Saturdays, 1800 GMT, 14,230 kHz) for specific details. 2) Forego on-the-air operational contesting and conduct a technical achievement contest. If SSTVers as a whole prefer to design, tinker, and construct rather than operate, we're ready to make the change and recognize your efforts. Your opinions and suggestions are vitally important. Please contact Dave Ingram W4TWJ or Brooks Kendall W1JKF during the Saturday SSTV Net with your comments. Now let's look at the results.

1981 SSTV CONTEST COMMENTS

WB4OVX in Virginia was noticed having a ball during the contest, showing his new Collins KWM-380. *N6WQ* related that contacts seemed down approximately 30% and felt this was due to the simultaneous ARRL DX Contest. The most *common comments* heard on the air during the contest related to the two contests (DX and SSTV) falling at the same time. *Fortunately*, however, the SSTV contesters were heard expressing their understanding and sympathy. Although we couldn't get enough forewarning from the ARRL and although 73 coordination was difficult, we still had a good contest. Respect among on-air SSTV contesters was quite commendable. A friendly and relaxed air among all SSTV contesters was apparent. *10* and *20* meters seemed (in that order) the most popular (SSTV) bands.

Thanks to everyone for contest support (whether or not you sent a log!) Congratulations to N9AWR on winning first place in the contest! Bravo!!

Dave Ingram K4TWJ
Brooks Kendall W1JKF

1981 SSTV CONTEST SCORES

Call	Contacts	Countries 5 Points	Continents 5 Points	States/ Prov's	Grand Total
N9AWR	139	16 (80)	6 (30)	36	285
N6WQ	112	14 (70)	5 (25)	29	236
W2GND	38	4 (20)	3 (15)	21	94
XE1HT	15	3 (15)	1 (5)	5	40
XE1AAK	17	3 (15)	1 (5)	7	44

sign, exchanges sent and received, points, multipliers, and final score. Use a separate sheet for each band and enclose a summary sheet showing the scoring, classification, callsign, name, and address. In the case of multi-operator stations, include the names and callsigns of all operators involved. Comments will be very much appreciated by the contest committee. Send logs to: SARTG Contest and Award Manager, C. J. Jensen OZ2CJ, PO Box 717, 8600 Silkeborg, Denmark.

RHODE ISLAND QSO PARTY

1700 GMT August 15 to
0500 GMT August 16
1300 GMT August 16 to
0100 GMT August 17

The Rhode Island QSO Party is sponsored by the East Bay Amateur Wireless Association. RI stations work other RI stations and the rest of the world. Others work RI stations only. The same station may be worked once per band and mode.

EXCHANGE:

Send RS(T) and state, province, country, or RI city.

FREQUENCIES:

Phone—3900, 7260, 14300, 21360, 28600, 50.110, 144.2, 146.52.

CW—1810, 3550, 3710, 7050, 7110, 14050, 21050, 21110, 28050, 28110.

Use of FM simplex is encouraged, but no repeaters are allowed.

SCORING:

All stations score 2 points per phone QSO, 3 points per CW QSO. RI Novice and Technician stations score 5 points per QSO. RI stations score 5 points per QSO. RI stations multiply total QSO points by the number of states, provinces, and DX countries worked. Others multiply total QSO points by the number of RI cities and towns worked. Note that there are 39 cities and towns in Rhode Island.

Certificates will be awarded to the top-scoring station in each RI county, state, province, and DX country; the top-scoring Novice and Technician station in each RI county and state; and the ARC in each state, province, and DX country that submits the highest aggregate score with a minimum of 3 logs per club.

ENTRIES:

Logs must show date/time in GMT, call exchange, band, and mode. On a separate sheet show name, call, mailing address, club affiliation (if any), total QSO points, multiplier claimed, and final score. Entries must be postmarked no later than September 15th. Send logs and summary to: East Bay Amateur Wireless Association, PO Box 392, Warren RI 02885. Include an SASE for a copy of the results.

NEW JERSEY QSO PARTY

2000 GMT August 15 to
0700 GMT August 16
1300 GMT August 16 to
0200 GMT August 17

The Englewood ARA invites all amateurs worldwide to participate in the 22nd annual NJ QSO Party. Phone and CW are considered the same contest. A station may be contacted once on each band; phone and CW are considered separate "bands" but CW contacts may not be made in phone band segments. NJ stations may work other NJ stations, and NJ stations are requested to identify themselves as "DE NJ".

EXCHANGE:

QSO number, RS(T), and ARRL section, country, or NJ county.

FREQUENCIES:

1810, 3535, 3900, 7035, 7135, 7235, 14035, 14280, 21100, 21355, 28100, 28610, 50-50.5, and 144-146.

Suggest phone activity on the even hours; 15 meters on the odd hours (1500 to 2100 GMT); 160 meters at 0500 GMT.

SCORING:

Out-of-state stations multiply the number of complete contacts with NJ stations times the number of NJ counties worked (21 maximum). NJ stations count 1 point per W/K/VE/VO QSO and 3 points per DX QSO. Multiply total QSO points by the number of ARRL sections (including NNJ and SNJ—maximum 74). KP4, KH6, KL7, etc., count as 3-point DX contacts and as section multipliers.

AWARDS:

Certificates will be awarded to the first-place station in each NJ county, ARRL section, and country. In addition, a second-place certificate will be awarded when 4 or more logs are received. Novice and Technician certificates will also be awarded.

ENTRIES:

Logs must show date/time in GMT, band, and emission. Logs must be received not later than September 12th. The first contact for each claimed multiplier must be indicated and numbered and a checklist of contacts and multipliers should be included. Multi-operator stations should be noted and calls of participating operators listed.

Logs and comments should be sent to: Englewood Amateur Radio Assoc., Inc., PO Box 528, Englewood NJ 07631. A #10-size SASE should be included for results. Stations planning active participation in NJ are requested to advise the EARA by August 1st of their intentions so that they can plan for full coverage from all counties. Portable and mobile operation is encouraged.

OHIO QSO PARTY

Starts: 0000 GMT August 22
Ends: 2400 GMT August 23

QSL OF THE MONTH

This month's QSL winner was submitted by Jim Rappe KØHAA of Ipswich SD. It's bold and carries that personal touch.

If you would like to enter the contest, put your QSL *in an envelope* and mail it along with your choice of a book from *73*'s Radio Bookshop to *73 Magazine*, Pine Street, Peterborough NH 03458, Attention: QSL of the Month. Entries which do not use an envelope (the Postal Service does *occasionally* damage cards) and do not specify book choice will not be considered. Sorry.

THE CHAWED RAG.......

NEWSLETTER CONTEST WINNER

We were overwhelmed by the response to the *73 Club Newsletter Contest.* The staff would like to thank the 200+ clubs who submitted material during the first month. Each, in its own way, was a winner. Keep up the good work!

Choosing a winning club newsletter is not an easy task. There are many different kinds of clubs and no two have similar newsletters. How does a judge compare the Abington Amateur Radio Club bulletin with the Kansas Amateur Radio publication? The Abington club has six members while the circulation of the Kansas newsletter is in the thousands.

Even if we could resolve the problem of different sizes, there is the problem of production quality and appearance. The Chicago Autopatch Repeater Organization Limited uses eye-catching graphics in their newsletter while the Minuteman Repeater Association publication employs a slick-looking magazine format. In establishing a set of criteria for choosing a winner in the first month of the newsletter contest, the judges made circulation, style, and looks secondary considerations. What we were looking for was the best source of *information.*

The size of your club, the budget for the newsletter, and the method of reproduction don't matter very much if you are not giving the readers something they can use.

Our August winner, *The Chawed Rag,* published by the Richardson Wireless Klub, offers more than just club news. After all, the members who are interested and involved will probably know all the minute details of what went on at the last meeting. Instead of publishing a rather boring description of who was there and what they argued about, *The Chawed Rag* highlights the club's upcoming activities. The issue we reviewed was full of enthusiastic information about Field Day.

The Richardson Klub's newsletter does not limit itself to local happenings. It offers a look at the DX world, the technical aspects of radio, and the latest FCC actions. Gathering and publishing this kind of information does not need to be a time-consuming job. The savvy newsletter editor relies on someone else to locate, research, and write up the hot ham radio stories. *The Chawed Rag* does this by reprinting material from DX newsletters, *The W5YI Report*, other clubs' bulletins, and even the local grapevine.

There are at least two-dozen specialized ham publications available for a $5- to-$25-a-year subscriptions. You can take advantage of DX tips that are only a few days old by subscribing to a weekly source of DX news. *HR Report* and *The W5YI Report* will supply you with a biweekly roundup of ham radio happenings. You can keep your members informed about the latest satellite news by excerpting material from AMSAT's *Satellite Report*. The gold mine is there; is your club newsletter making the most of it?

Because of the limited appeal of these publications, only a few of your club's members will want to subscribe. But that doesn't stop you from sharing headlines and stories. Club newsletters are in a unique position to share this information because they can print it shortly after it first appears. The major ham magazines, *73* included, have printing deadlines that make much of this material very old news if they try to publish it.

With only a few exceptions, the publications mentioned do not mind if you reprint their material, *provided credit is given*. That way, readers who want to find out more will know whom to contact. You can reprint this material directly or repackage it to fit your newsletter's style; just remember to give credit where credit is due.

Don't be afraid to offer your club members something extra. Your club's newsletter is a valuable tool—use it! Keep those newsletters coming.

Sponsored by the Cuyahoga Falls Amateur Radio Club, the contest is open to all radio amateurs worldwide. All contacts must be made direct on any amateur band from 160 to and including 2 meters. Repeaters and OSCAR contacts are not permitted.

EXCHANGE:

RS(T) and ARRL section, DXCC country, or Ohio county.

FREQUENCIES:

5 kHz up from the low end of each General class band, both on SSB and CW. Club station W8VPV will operate near these frequencies.

SCORING:

Score 2 points for each contact with an Ohio station. Contacts with a Falls member will be worth 10 points and contacts with W9VPV, the club station, will count 25 points. Ohio stations will score 5 points for out-of-state contacts plus the member and club stations bonuses. Multiply your QSO point total times the sum of counties (maximum 88), ARRL sections (maxium 74), and DXCC countries on each band.

Plaques to the top single operator in Ohio and outside Ohio. Certificates to the top single operator, multi-single, and multi-multi in each ARRL section, Ohio county, and DXCC country.

ENTRIES:

Each log must show the date/time in GMT, band and mode, plus the complete exchange. A copy of the official log sheet and reporting form are available from the club by sending an SASE. Dupe sheets must be completed for any stations with more than 300 contacts. Some form of summary sheet showing the scoring and usual signed declaration is also requested. Send a large SASE for a copy of the results. Deadline for logs is September 21st. All entries and requests for forms/logs should be addressed to: The Cuyahoga Falls ARC, PO Box 6, Cuyahoga Falls OH 44222.

OCCUPATION CONTEST

Starts: 1800 GMT August 29
Ends: 2400 GMT August 30

The Radio Association of Erie PA is sponsoring its first contest. The club thought it might be interesting to see what kinds of work or occupations fellow hams are involved in. The contest is open to all amateur radio operators.

EXCHANGE:

RS(T), occupation and state, province, or country.

FREQUENCIES:

CW—50 kHz from the bottom of the ham bands.

Phone—50 kHz from the top of the ham bands.

Repeater contacts are not permitted; however, simplex is permissible.

SCORING:

Count 1 point per QSO with multipliers determined by the number of similar occupations worked. One multiplier point is given for every 5 similar occupations. Also, another multiplier point is given for every 3 retirees worked. Final score is the product of the QSO points times the total multiplier.

AWARDS:

A plaque will be given to the top-scoring station. Certificates for the top stations in each state, province, and country.

ENTRIES:

Mailing deadline for logs is October 1st and they are to be sent to: Chris Robson KB3A, 6950 Kreider Rd., Fairview PA 16415. Please include an SASE for a copy of the results.

BURMA UNLOCKED

What a surprise! After a few years of effort by various groups that were trying to activate XZ-land, all of a sudden there was a signal that got DXers excited and rushing to their rigs to work that #3 on the most-wanted list.

Station XZ5A started the operation on May 22 on 21270 with an opening to the east coast, and then worked some Europeans and Japan. Wow! No warning or announcement preceded this operation, except the unfilled "promises" of JA8BMK about his VU7-Andaman, 3V8, and other possible African operations. He was conspicuously absent from the bands and those looking for him were rewarded by this juicy catch.

As far as we were able to find out, the operation was carried out by JA8BMK and JA8BKM, plus one Burmese national. Operation was quite sporadic with apparently limited operating time (QRM to the chief of police's TV?) on SSB frequencies of 21270 and 14170 and some CW activity around 14007 and 21007. Propagation was what they would say was below normal, or el stinko—the signals were very weak.

On May 23, a number of west-coast stations had their chance of getting through. The east coast was handicapped by the absence of XZ5A when the bands were open to that area. There was a short (a few minutes) "window" around 1200Z on CW and a few SSB contacts were made in what sounded like, perhaps, a demonstration for the local government officials. Otherwise, thousands of DXers were scanning the bands hoping to get their chance to score. It was a battle of good antennas and persistence. You had to hear the signals before you could work them. Fortunately, there were no list "undertakers" and the operators at XZ were doing a good job under the circumstances.

Judging by the propagation conditions and limited operating time, there would be many unfulfilled hopes of getting this rare one. But there is one very positive sign: Burma finally might be unlocked and activated for future operations by nationals or expeditions. We are looking forward to some pictures from the expedition.

Congratulations to "Jin" Tishihiko Fukuta JA8BMK and company for this historic event. If you were fortunate to work XZ5A, QSL cards go to JA8BMK, PO Box 150, Asahikawa, Hokkaido 070, Japan.

ABOLISH RS/RST SYSTEM?

I have read in other magazines about DL7DO's proposal to eliminate our "useless" RS and RST reporting, the reason being that everyone, especially in the contests, is giving out 59 or 599. Apparently it does not mean anything. What is the proposed solution? Use Q1 to Q3, where Q1 would mean: I don't hear you; Q2: I hear you; Q3 (I guess): I hear you too much—you just broke my speaker. This apparently would save a lot of time. Really? I think he is replacing something with "same-thing." He still has two digits to send, so there is no saving there. Only the *range* is reduced, from the scale of 9 down to 3. So we get *less*-accurate reports and from those who were giving out 59s, we now get Q3s.

So what do we gain? Nothing. We do not save time—we are still exchanging two digits. We eliminate more-accurate reporting for those who still use it. "S" has quite a well-defined meaning: It relates to the scale of about 5 dB per one S-unit.

Let's have a look at the contester who is giving out those "meaningless" 599 reports. The majority of contest stations run more than QRPp and a screwdriver for an antenna. When the bands are good, 80% of stations are coming in well over S9. So should we give out "599plus30-zerofour"? Or should we measure our S-meter and give out 58.7 reports? When you work stations at the rate of eight QSOs/minute, do you read your meter with a magnifying glass? Hell, no! You work them as fast as you can. If the station is weak or QRM is on the frequency, then the smart operator gives a 55 or 35 to tell the other guy that he is not that terribly strong and he should repeat his stuff twice.

Would the Q3 reports look any better in the contest log? Or should we not exchange the reports at all? What else is there to say to complete the contact? I'm quite surprised to see the serious magazines support this type of proposal by even printing it. We have more important things to worry about.

If one wants a comparison report on the antennas, the S-meter reading is meaningful. Then it is also good to know what type of rig the other guy is running because not all S-meters were created equally. Some are as generous as QRM and some were made in GM-land. It should be remembered that all this is relative because there are so many factors affecting the signal strength: antenna, propagation, QSB, balun, etc. It is not unusual, with bands being so hot lately, to have that thing sitting at the end of the scale.

So, let's stop worrying about the good and established things that we have and let's spend more time improving our skills and equipment!

GEOMAGNETIC PREDICTIONS

There is a source of very useful geomagnetic activity predictions available from the Ottawa Magnetic Observatory. These can be obtained easily by phoning 1-(613)-824-5595. This service is available 24 hours a day and the latest forecast is updated every Tuesday and Friday.

During the April 11 through 14 period, the activity of the geomagnetic field was very high. The maximum of this magnetic storm was on April 13 at 0000 to 0900 GMT. The last time the magnetic field was disturbed to such an extent was during a nine-hour period in August, 1972. The aurora borealis was seen extensively across Canada and the USA and as far south as Arizona and the Gulf Coast.

There are three levels or magnitudes of geomagnetic activity used to describe the geomagnetic field: active, unsettled, and quiet, meaning, in terms of propagation, rotten, average, and good to excellent. This is especially useful when planning that expedition or contest operation.

Thank you for all the encouragement and letters. I would like to get the feeling of the makeup of the majority of this column's readers. I would like to tailor this column in such a way that we can satisfy the majority of readers. It is impossible to satisfy everyone. There are some of those who love lists and nets and there are also those who consider it to be in the "multi-operator" category. I will try to elaborate more on various techniques and perhaps the "ideal" situation in working DX without getting too many chasers upset.

I am in the process of setting up an Apple II computer with a word-processing program and some other sorting and filing programs. This should help in

setting up the files, DX info, and QSL manager lists.

We will try to get the fresh information on recent DXpeditions, including some photographs. If you have any pictures, especially color ones, please send them to VE3BMV, Box 292, Don Mills, Ontario M3C 2S2, Canada.

Good DX and see you all in the pileups!

10-METER BEACONS

The 10-meter band is very dependent on solar activity. During the peak of the sunspot cycle, the propagation conditions on the higher bands (10, 15, and 20 meters) are superb. The bands are open just about all the time. All parts of the world are coming through at the same time. It is not unusual to work all six continents within five minutes. When there is a disturbance, however, the band is as dead as a doornail.

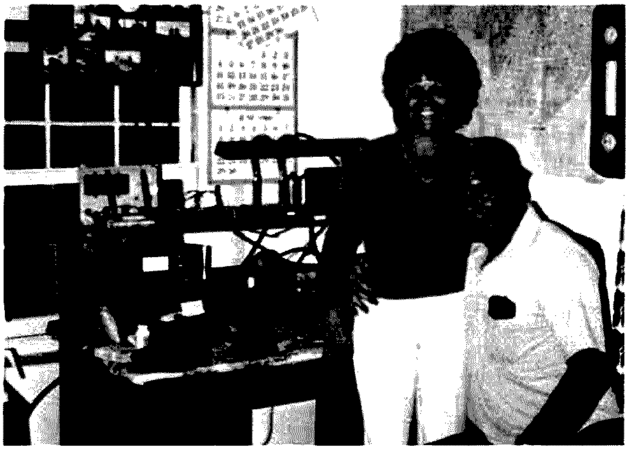
Going back a few years, there was quite a bit of interest in studying propagation, especially on the 10m band. There were some openings, but many times everyone was just listening instead of calling. So, if all were just listening, nobody knew when the band was really open. A number of clubs and individuals started beacon stations, transmitting signals on certain frequencies in the 10m band. This proved to be very useful. Many are using the beacon signals to follow the openings to certain areas of the world. Most of them are using about 100 W and a vertical antenna. It is important to remember that not all of them are active all the time. So don't bet on it—the band could be open without a certain beacon being heard.

DX NEWS

C6A Bahamas was on during the CQ WPX CW contest by K5IU, N5RM, and KC4XR. They were on between May 23 and June 2, operating all bands 10 through 80 on CW and SSB. QSL to their home callsigns.

EA9-EC9 Ceuta Novice net meets at 29000 almost daily, with a number of EC9 stations usually available. EA Novices now are allowed to operate in that segment of the 10m band.

FG7BQ St. Barthelemy Island. Charles is a public official on this island, which is situated between Puerto Rico and FG7 and



Frank WB3KBZ/VP9 and Dotty Blaylock at their shack in Pembroke Parish, Bermuda. Frank is very active, especially on phone, operating on 15 and 20m and the YL SSB system.

is administered from FS7. He hangs around 28635 almost daily from 2100Z. QSL to Charles Querrand, St. Barthelemy City Hall, via Guadeloupe, F.W.I.

FG0DDV/FS Saint Martin by the members of North Jersey DX Association. Active on 10 through 80 in the usual DX splits plus General portions of US bands; also six-meter operation. QSL via W2QM.

FR7AI/G Glorioso was active until May 11. Showed up on various nets. QSL via FR7AI CBA (*Callbook* address).

HB0 Liechtenstein was activated by DA1WA/HB0, members of Wiesbaden ARC, on May 23 through 31, 6 through 160 CW, SSB, and RTTY. Worldwide QSL via DJ0LC; stateside QSL with an SASE to Stephen Hutchins, Box 4573, APO NY 09109.

HS4ANK. Joel is a recent arrival in Thailand and hopes to fill the void left by the departure of Fred Laun and George Collins. Daily schedules are: 14220 at 1200Z and 21300/350 or 28500 from 1600Z. QSL via Joel Duniap, PO Box 38, Khonkaln, Thailand.

H44RW Solomon Islands. Ron ZL1AMO was active mostly on CW on 10, 15, and 20 during his April to May visit. QSL to his home address.

HZ1AB Saudi Arabia is active with a number of operators around 14230 to 14240 at 1500, 1900, and 2200Z and on 7008 at 0430. QSL cards go via K8PYD.

J5HTL Guinea Bissau. Operator Hillar Loor is a resident and he assisted the J5AG DXpedition in their operation. He will be active on 10 and 15 SSB for about a year. J5AG operators SM3CXS, SM0AGD, and SM3DVN made over 20,000 contacts, with 10,000 on CW, during their nine-day stay. Their operation was hampered by only having electricity 14 hours a day. During the off-periods, they used the car batteries to run their IC-701 rigs.

KA2AA Minami Torlshima was supposed to be on again during July. They tried to provide advance word about the operation and to concentrate on 40 and 80.

KH1/KB6 Canton Island was supposed to be activated by an American operator on and after May 20.

KP4/A. Two different groups have filed for the permission to reactivate *Desecheo* In the immediate future.

LU1ZA South Orkneys, Juan Carlos, joins the LU3ZY (S. Sandwich) schedule on occasional Tuesdays and Fridays at 0100Z. QSL via LU2CN. VP8ZR is near 14275 from 1930Z, QSL via G3KTJ.

NN3SI Smithsonian Institution operated during the WPX CW contest within 33 kHz of the band edges. QSL to NN3SI, Smithsonian Institution, Washington DC 20560 USA (indicate

"WPX Contest" on the envelope).

ST0 Southern Sudan. LA1RR/ST0 expects to be there for two years and is usually around 28500/600 kHz from 1000Z. QSL via LA bureau.

S2BTF Bangladesh should have been activated by Peter HS1AMB on June 1-3 and continue on for several months.

TL8CN Central African Republic on CW daily: 7003/7004 from 0400Z and 21020/25 from 1300Z. Tony also runs SSB skeds on 28520/25 from about 1900Z. QSL via W5RU. TL8RC active on low ends of 40 and 80 from 0000Z. QSL via F6EZV.

TY9ER Benin, fired up as planned by DJ2BW and DL8DC, was to be on until May 13. QSL via DL8DC.

UK1PAL Franz Josef Land is expected to be active again. There was activity by the two YL operators, Rita and Natasha, using YL1P and EK1P callsigns. QSL via UP2BBM, Box 88, Moscow. The operators are with the USSR YL Arctic Expedition. Next stop is to be YL0B from Dickson Island.

VK9 Melish Reef is quite possible in the very near future. KB7NW's boat, *Banyandah*, will be refitted in Hawaii for the second leg of the operation by another group of operators. Hopefully, they will have a little bit better signal than the first group had from KH5 and KH5K.

VQ9CCT Chagos is no one other than VK9CCT and is active on 20m SSB.

W8HMI Frank Smith began his *African trip* on May 17. He was to start with EL and then 5Z, 9J2, 5H3, 6O, 5Z, and ST. He planned to operate mainly on 20m SSB. He was to return to the US by June 30. QSL to 6900 Conover Pl., Alexandria VA 22308.

ZA Albania. Very slim chance of getting on. DL7FT was in Dayton and showing his ZA license—but only the old one.

ZD9 Tristan Da Cunha was to be on after May 12 by ZD7AL and ZD7SE, transportation permitting.

ZM7TT Tokelau. Latest news was that Baruch has a license but not the landing permit; expected to get that one around May 20. Also, another group with VK9NS, VK2BJL, was to be on around May 15.

3A0 Monaco DXpedition by the Monaco DX Group (PA0SIM, PA2WLE, PA3AKP, PE1AMC, PE1AUX, and PE1CUG) was planning to be on July 10-20. Will be QRV on VHF, HF, and UHF bands, including OSCAR. No skeds, no lists! QSL via PA3ARM.

3B8AE/3B9 Rodriguez has been showing up on the F6EXV list on 21285 at 1630Z. QSL via Box 18, Rodriguez, via Mauritius. Op is Moussa.

3D6 Swaziland is activated by W6YB/3D6 for two years. He was heard around 21290 on long path. QSL via KA7IJA. Also, ZS6ANL/3D6 is active on 10m CW.

VK4NIC/3X Guinea. Ian is now back in Australia awaiting his next assignment, which he believes will be in Canada. Ian made a very favorable impression on the authorities in Guinea, opening the doors for future operations. PA0FAF expects to be stationed in 3X this summer and hopes to do some operating.

The ten most-wanted countries according to *The DX Bulletin* are: BY, VS9K, XZ, ZA, VU7L, VK Heard, 7O, XU, FB8W, and VU7A.

AWARDS

Since its inception two years ago, *73 Magazine* has absorbed the escalating costs to maintain its world-renowned Awards Program. All expenses directly affecting the program have dramatically shot up in price! As of August 1, 1981, to offset these enormous costs, prices for *73* Awards will become $4.00 each and annual endorsements will become $2.00 each. These prices still will be below other competitive award sponsors in our hobby.

Award applicants are cautioned to be sure their remittance after August 1st reflects the new prices. Unfortunately, any applications received after this date which have the incorrect amount enclosed will have to be delayed while the applicant is notified of the discrepancy. This procedure will cost us both more time and money, so we plead with our readers to have the amount right the first time.

FOREST COUNTY PA

A micro-expedition to Forest County, Pennsylvania, will be held on the 1st and 2nd of August, 1981.

The call will be WB3IQE/3 and the mode is CW only. Frequencies used will be 80, 40, and 15 meters. We will operate on two bands at a time, using the bottom 50 kilohertz of the bands. Exact frequencies and bands will depend on conditions at the time. We will certainly spend some time outside the Extra-only subbands. QSL to WB3IQE, RD1 Box 297, Brockway PA 15824. US stations send a stamped self-addressed envelope. Canadian stations send a self-addressed envelope and unused Canadian stamps good for letter to USA. DX stations include 1 IRC for QSL via ship, 2 IRCs for QSL via air.

THE GREAT ESCAPE EXPEDITION

Members of the Lake County Amateur Radio Club are planning a DXpedition from the jail cell in Crown Point, Indiana, that John Dillinger fled in 1934 during his famous "wooden gun" escape, the final exploit of the notorious bank robber/killer before he was shot to death by FBI agents in front of the Biograph Theater in Chicago.

Dubbed "The Great Escape DXpedition," the operation is scheduled for 1800Z August 29 to 0300 August 30, and from 1400Z to 2300Z August 30.

Operators will be using the club callsign, W9LJ (Leaky Jail), on 14,300 SSB and 7,115 CW, plus or minus QRM.

Each contact will be confirmed, by a special QSL commemorating the escape, upon receipt of a card and a stamped, self-addressed envelope. Send in your QSL to Robert Wiberg WD9EZB, 534 E. 37th Ave., Lot 72, Hobart IN 46342.

The operating site will be the actual cell in which the desperado was held at the time of his breakout.

No longer used as a jail, the old building in which Dillinger was held for murdering an East Chicago policeman during a bank robbery has been restored as part of a commercial complex housing a museum, a restaurant, a ballroom, and a shopping mall.

LITTLE GULL ISLAND

Radio Central ARC will sponsor an unusual 24-hour mini-expedition to Little Gull Island, running August 8th at 1600Z to August 9th at 1600Z. Callsign will be WA2UEC.

Little Gull Island is a small island in Long Island Sound about fifteen miles northeast of Orient Point. They will operate on the lower portions of the General bands, 10 to 80 meters, both CW and SSB. There will also be a Novice station operation. A photo QSL card will supply all information about the trip.

Please QSL via *Callbook* WA2UEC with SASE, the W2 Bureau, or IRCs. This will be the first of a series of mini-expeditions.

For more information, contact Frank Kiefer K2PWG, 1 Sherrill Lane, Port Jefferson Station NY 11776.

PEND OREILLE

On August 27-30, the Pend Oreille Amateur Radio Club will be operating a special event station from the Pend Oreille County Fairgrounds in Cusick, Washington, during the fair. We will be on the air each day from 1600Z to 0500Z using the Newport High School Radio Club's call (WB7TBN). Frequencies will be (SSB) 14.340, 21.400, 28.700, 3945, (CW and RTTY) 3715, 28.090, 21.090, 14.080, and 3650. There will be a special commemorative QSL card available to all amateurs who contact our station and submit an SASE.

SOCIAL EVENTS

Listings in this column are provided free of charge on a space-available basis. The following information should be included in every announcement: sponsor, event, date, time, place, city, state, admission charge (if any), features, talk-in frequencies, and the name of whom to contact for further information. Announcements must be received two months prior to the month in which the event takes place. They should be sent directly to Editorial Offices, 73 Magazine, Pine Street, Peterborough NH 03458, Attn: Social Events.

WEST YELLOWSTONE MT
JUL 31-AUG 2

The WIMU (WY-ID-MT-UT) Hamfest will be held from July 31-August 2, 1981, in West Yellowstone MT. Lodging and campgrounds are available. There will be product displays as well as activities for YLs and harmonics. Talk-in on 146.52, 3.920 or 1.250. For further information, contact "WIMU '81," c/o Les Belyea N7AIK, Box 327, Belgrade MT 59714.

JACKSONVILLE FL
AUG 1-2

The Greater Jacksonville Hamfest Association will hold the ninth annual Jacksonville Hamfest and Northern Florida Section ARRL Convention on August 1-2, 1981, at the Orange Park Kennel Club, located at the intersection of I-295 and US 17 just south of Jacksonville. Advance registration is $3.50 and registration at the door is $4.00. Swap tables are $12.00 per table for both days (no one-day tables). All events will be held indoors and will include a full slate of programs as well as meetings of several statewide and regional organizations. Door prizes will be awarded at both hourly and grand prize drawings. Plenty of free parking will be available. The headquarters hotel is the Best Western First National Inn just across from the hamfest site on US 17. Special hamfest rates will be available. Talk-in on 146.16/.76 and 146.07/.67. For advance registration, hotel rates, or more information, contact Robert J. Cutting W2KGI, 1249 Cape Charles Avenue, Atlantic Beach FL 32233, or Andy Burton, Jr., WA4TUB, 5101 Younis Road, Jacksonville FL 32218. For swap tables, contact WA4TUB at the address listed above.

ESCANABA MI
AUG 1-2

The Delta County Repeater Association will hold the 33rd annual Upper Peninsula hamfest on August 1-2, 1981, at the Flat Rock Township Hall, Escanaba MI. Registration is $2.00. The many activities will include a DX forum, an ARPSC workshop, a satellite-TV seminar, net meetings, and a swap and shop. There will be prizes and a banquet on Saturday evening. For more information, contact Aileen Gagnon WA8DHB, co-chairman of the prize committee, Kipling Loc., Mtd. Rte., Gladstone MI 49837.

LEVELLAND TX
AUG 2

The Hockley County Amateur Radio Club and the Northwest Texas Emergency Net will sponsor their 16th annual picnic and swapfest on Sunday, August 2, 1981, beginning at 8:00 am at the city park in Levelland TX. This event is for the entire family. Bring your own picnic basket for lunch at 12:30. A $3.00 registration is requested. There will be swapping all day, with tables provided. Talk-in on .28/.88 (WR5AFX).

MOBERLY MO
AUG 2

The third annual North Central Missouri Hamfest will be held on Sunday, August 2, 1981, at the air-conditioned Municipal Auditorium, 201 West Rollins, Moberly MO. Doors open at 9:00 am. Tickets are $1.50 in advance and $2.00 at the door. Features include commercial dealers, a flea market (no charge for tables), an ARRL display, exhibits, prizes, women's programs, a special forum with Bob Heil K9EID on CB-to-10-meter conversions, and a buffet lunch. Drinks and hot dogs will be available all day. Talk-in on 147.69/.09, 146.52, and 3963. For more information, contact Charles Coy WB0ENV, 601 McKinley, Moberly MO 65270.

ANGOLA IN
AUG 2

The Steuben County Radio Amateurs will hold their 23rd annual FM Picnic and Hamfest on Sunday, August 2, 1981, at Crooked Lake, Angola IN. Admission is $2.50. There will be prizes, picnic-style BBQ chicken, inside tables for exhibitors and vendors, and overnight camping (with a fee charged by the county park). Talk-in on 146.52 and 147.81/.21.

BELVIDERE IL
AUG 2

The annual Big Thunder ARC Hamfest will be held on August 2, 1981, at the Boone County Fairgrounds, Highway 76. Advance tickets are $2.00. Indoor tables are available at a nominal cost and there will be acres of outdoor space available free. Camping is permitted. For advance tickets, send an SASE and check to Bob Anderson K9DCG, 910 W. Locust Street, Belvidere IL 61008.

COLBY KS
AUG 2

The first Northwest Kansas Amateur Radio Swap Meet will be held on Sunday, August 2, 1981, beginning at 9:00 am at the Community Building, Colby KS. Admission is $1.00 and tables are $1.00 each (same for dealers). An auction will be held at 2:00 pm. Other features will include a TVRO demonstration, activities for the ladies, and old-fashioned informal swapping, selling, and visiting. Lunch will be available. Talk-in on 146.22/.82 and .52/.52. For more information, contact WA0GBN or KA0FBQ.

WINCHESTER VA
AUG 2

The Shenandoah Valley Amateur Radio Club will celebrate "31 years without interruption" at its annual hamfest on Sunday, August 2, 1981, at the Clark County Ruritan Fairgrounds in Berryville VA, 10 miles east of Winchester on Route 7. Gates open at 7:00 am for exhibitors and tailgaters, for whom fees will be the same as last year. Registration is $3.00, and wives and young children will be admitted at no charge. Hourly prize drawings; major prizes will include three transceivers. Breakfast and Ruritan's famous barbequed chicken dinners will be available. Talk-in on 146.22/.82, 147.90/.30, and 146.52/.52. For further information, contact Joann Aaron WB2CMV, PO Box 139, Winchester VA 22601.

POMONA CA
AUG 8

The Tri-County Amateur Radio Association will hold its annual hamfest on Saturday, August 8, 1981, from 9:00 am to 3:00 pm at the Los Angeles County Fairgrounds (Thummer's Patio), Pomona CA. There is no admission charge. Bring your own picnic lunch. Refreshments will be available. Featured at a noon raffle will be grand prizes of a Quasar 10" TV and a Tempo S-1 handie-talkie. The drawing donation is $1.00 and the winner need not be present. Talk-in on 146.34/.94. For additional information, write TCARA, PO Box 142, Pomona CA 91767.

BEAVERTON OR
AUG 8-9

The Willamette Valley DX Club will hold the 1981 Northwest DX Convention on August 8-9, 1981, at The Greenwood Inn in Beaverton OR, just west of Portland. The grand prize will be an Icom-730. Speakers will include Carl WA4ZNH and Martha WB4FVU. For more information, write PO Box 555, Portland OR 97207.

BURLINGTON VT
AUG 8-9

The Burlington Amateur Radio Club will hold its annual International Hamfest on August 8-9, 1981, at the Old Lantern Campground, Charlotte VT (14 miles south of Burlington, just off Rte. 7). Admission is $4.00 (US funds). Planned events include a flea market, commercial exhibits, a CW contest, a tower-raising contest, an HT transmitter hunt, and the traditional Canadian-American tug-of-war. Talk-in on .34/.94. For more information, contact Hap Preston W1VSA, PO Box 312, Burlington VT 05402. For campground reservations, call Old Lantern Campground at (802)-425-2120.

LEXINGTON KY
AUG 9

The Bluegrass Amateur Radio

Society will hold its annual Central Kentucky Bluegrass Hamfest on Sunday, August 9, 1981, from 8:00 am until 4:00 pm EDT at a new location, the Tates Creek Junior High School, Centre Parkway, Lexington KY. Tickets are $3.50 in advance and $4.00 at the door. Outdoor flea market space is free with admission. There will be technical forums, indoor exhibits, door prizes, a grand prize of a two-meter all-mode transceiver, a ladies' program, a protected paved flea market area, and free parking. Talk-in on 146.16/.76. For more information, please contact Ernie Cohen K4DHN, 3379 Sutherland Drive, Lexington KY 40502

WILLOW SPRINGS IL
AUG 9

The Hamfesters Radio Club will hold its 47th annual hamfest on Sunday, August 9, 1981, at Sante Fe Park, 91st and Wolf Road, Willow Springs IL.

ST. CLOUD MN
AUG 9

The St. Cloud Amateur Radio Club Hamfest will be held on August 9, 1981, from 8:00 am to 4:00 pm at the Whitney Senior Center in St. Cloud MN. Features will include a swapfest, prizes, and refreshments. Talk-in on 146.34/.94. For further information, contact Mike Lynch KA0HQS, 2115 1st Street South, St. Cloud MN 56301, or phone (612)-251-2297.

MONTGOMERYVILLE PA
AUG 9

The Mid-Atlantic Amateur Radio Club will hold its annual J.B.M. Hamfest on Sunday, August 9, 1981, from 9:00 am to 4:00 pm, rain or shine, at the Budco 309 Drive-In Theater, ¼ mile north of the intersection of Rtes. 63 and 309, Montgomeryville PA (6 miles north of the Fort Washington interchange of the Pennsylvania Turnpike). Admission is $2.50 with $1.00 additional for the first tailgate space and 75¢ for each additional space. Tailgate setup begins at 8:00 am. Featured will be an Alternate Energy Fair which will include exhibitions of various energy resources, as well as door prizes and a flea market for both the hamfest and the Alternate Energy Fair. Refreshments will be available. Talk-in on 147.66/.06 (WB3JOE) or 146.52. For further information, call Don Schuenemann WB3AYT at (215)-822-9076.

AUSTIN TX
AUG 14-16

The Austin Amateur Radio Club and the Austin Repeater Organization will hold the ARRL-approved VHF '81, a combination state convention of the Texas VHF FM Society and the second annual Super Central Texas Swapfest, on August 14-16, 1981, at the Hilton Inn, Austin TX. Registration is $5.00 in advance (August 1st deadline) or $6.00 at the door. Tickets are good for technical sessions, seminars, the swapfest, and more (all indoors and air-conditioned). Other features include the hidden transmitter hunt, the Saturday night boat ride, and the Texas barbecue dinner, prizes, an ARRL forum, and dealers. Talk-in on 146.19/.79. For additional information, contact VHF '81, PO Box 13473, Capitol Station, Austin TX 78711.

OMAHA NE
AUG 14-16

Satellite Television Technology will hold a Satellite Private Terminal Seminar on August 14-16, 1981, in Omaha NE. Included will be more than 50 exhibit booths with low-cost home satellite TV reception terminal equipment and systems. The seminar program will teach how to make this equipment function at peak performance at all times. Three lecture halls will be set up with test equipment and operating portions of systems where attendees can meet with experts and obtain information about their own installations. For more details on the program and registration, contact SPTS '81 Omaha, PO Box G, Arcadia OK 73007, or phone Rick Schneringer at (405)-396-2574.

OAKLAND NJ
AUG 15

The Ramapo Mountain Amateur Radio Club (WA2SNA) will hold its 5th annual flea market on August 15, 1981, at the American Legion Hall, 65 Oak Street, Oakland NJ, only 20 miles from the GW Bridge. Admission is $1.00; YLs and harmonics will be admitted free. Indoor tables are $6.50 and tailgating is $3.00. Door prizes will be awarded and refreshments will be available. Talk-in on 147.49/146.49 and 146.52. For more information, contact Walt Zierenberg WD2AAI, 344 Union Avenue, Bloomingdale NJ 07403, or phone (201)-838-7565.

HUNTSVILLE AL
AUG 15-16

The Huntsville Hamfest (formerly the North Alabama Hamfest) will be held on Saturday and Sunday, August 15-16, 1981, at the Von Braun Civic Center in Huntsville AL. There is no admission charge. There will be prizes, exhibits, forums, an air-conditioned indoor flea market, and ladies' activities. Tours of the Alabama Space & Rocket Center are available for the family. A limited number of camping sites with hookups are available at the VBCC on a first-come, first-served basis. Flea market tables are available for $3.00 per day. Talk-in on 3.965 and .34/.94. Off-the-shelf models include low-cost units for hobby/educational use and keyboards suitable for a variety of prototype, limited production, and specialized applications. Ruggedized versions for heavy-duty industrial and military applications are also offered.

Free copies may be requested from *George Risk Industries, Inc., GRI Plaza, Kimball NE 69145; (800)-445-5218.* Reader Service number 482.

LOW-COST DATA TERMINAL INCLUDES COLOR GRAPHICS

A microprocessor-controlled, interactive data terminal with color graphics, reverse video, programmable and resident character sets, selectable baud rates and data formats and a light-touch, flexible-membrane keyboard with finger positioning overlay and aural feedback has been introduced by RCA MicroComputer Products.

This professional quality terminal is suitable for a wide variety of applications requiring interactive communication between computer and user. Microprocessor intelligence and LSI video control circuits bring performance, features, and flexibility at low cost.

This versatile terminal can be interconnected with standard RS232 modems for communication across telephone lines. The VP-3301 is compatible with most time-sharing and data-base computer networks.

The character display format, 40 characters by 24 lines or 20 characters by 12 lines, is software selectable. Each character or all characters may be displayed in one of eight colors (or gray scales on a B/W display). The display background may be one of eight colors (or gray scales on a B/W display). There are 125 resident displayable characters or you can define your own characters—Greek letters and other foreign alphabets, graphic symbols, large graphics building blocks, playing card suits, unique character fonts, and "little green men." The reverse video feature creates visual emphasis on single or multiple characters, words, or lines.

The terminal communications interface is industry standard asynchronous RS232C or 20-mA current loop with six switch-selectable baud rates. Switch-selectable configuration control includes line/local, upper case only, full/half duplex, data word formatting, plus two control code options. A built-in tone generator, used for aural keypress feedback, can be programmed for end-of-line bell, error messages, or even music.

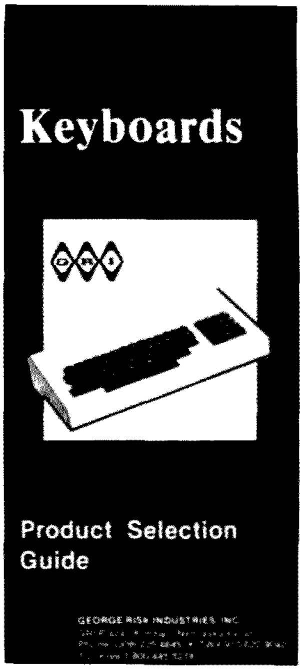
The terminal utilizes modern flexible-membrane keyswitches with a light positive activation pressure. Contact life is rated at greater than five million operations. A finger-positioning overlay combined with the positive keypress action gives good operator "feel." The unitized keyboard surface, impervious to liquids or dust particles, combined with high-noise-immunity CMOS circuitry, make this unit particularly suitable for use in hostile environments.

The base-band video output can be directly connected to a 525-line color or black-and-white video monitor or with an rf modulator to a standard color or black-and-white TV set. A wall-receptacle-type power supply is included.

For more information, contact *RCA MicroComputer Products, New Holland Avenue, Lancaster PA 17604; (717)-397-7661.* Reader Service number 485.

DOW-KEY'S HIGH-FREQUENCY TRANSFER RELAY

The Dow-Key Division of Kilovac corporation has announced the availability of a new high-frequency transfer relay. The Model 412 has four type N female connectors and carries up to 1000 Watts (CW) at



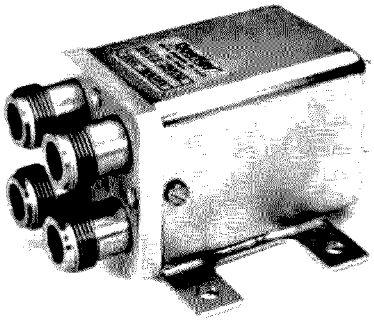
GRI's new keyboard catalog.

dc and 150 Watts at 4.2 GHz. The Model 412 is available in latching and non-latching versions, each with optional form "C" indicator circuit contacts.

The Model 412 has excellent rf characteristics: Minimum isolation at 1 GHz is −85 dB and at 4.2 GHz is −70 dB. Vswr is less than 1.1 at 1 GHz and 1.25 at 4.2 GHz. Insertion loss is −.15 dB maximum at 1 GHz and −.25 dB at 4.2 GHz. The relay was developed for use in Microwave systems to 4.2 GHz. It is ideally suited for transmit/receive switching between an antenna and a dummy load. The relay may also be used to bypass or insert a circuit element.

For further information, con-

RCA's VP-3301 data terminal.



Dow-Key's Model 412 transfer relay.

EZ CORD CONTROL™

Colton Creators, Inc., has developed a new product called the EZ Cord Control™. The patented new product provides an excellent means of holding and dispensing extension cords, coax, twin-lead, and all the other types of cable that have a way of accumulating in a ham shack. This cable organizer is available in three different sizes.

For more information, contact *Colton Creators, Inc., 216 East Second Street, Mineola NY 11501.* Reader Service Number 484.

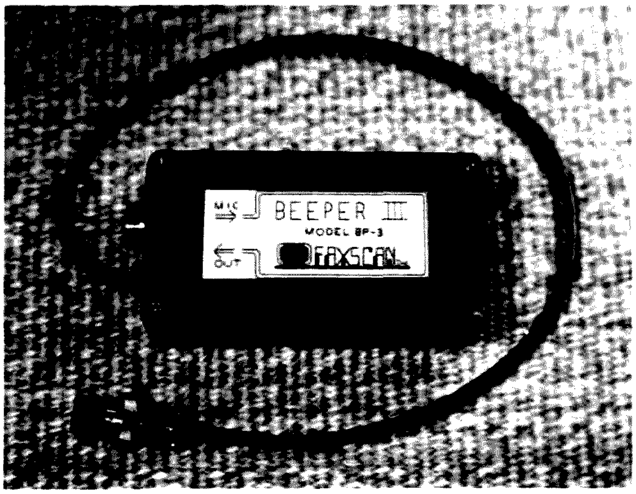
TRI-EX ROTATING TOWER

A new 120-foot guyed rotating tower has been released by the Tri-Ex Tower Corporation. This tower should be of special interest to contesters and other hams who wish to mount yagi arrays in various configurations on the sides of the tower. With this tower, though, these side-mounted antennas can be rotated in any direction just by turning the tower.

Despite its 120-foot height, the tower turns easily by hand, although it is more conveniently rotated by a motorized rotator. The rotator mechanism is mounted inside the tower at its base where it is easily accessible and is completely enclosed for weather protection, reliability, and safety. There are no exposed chain drives or gears which could be a safety hazard to people who enter the tower-site area.

Ball-bearing-type guy attachment rings are at the 30', 70', and 110' tower levels. A mast may be inserted at the top of the tower for additional antennas which can be rotated independently of the tower and its side-mounted antennas.

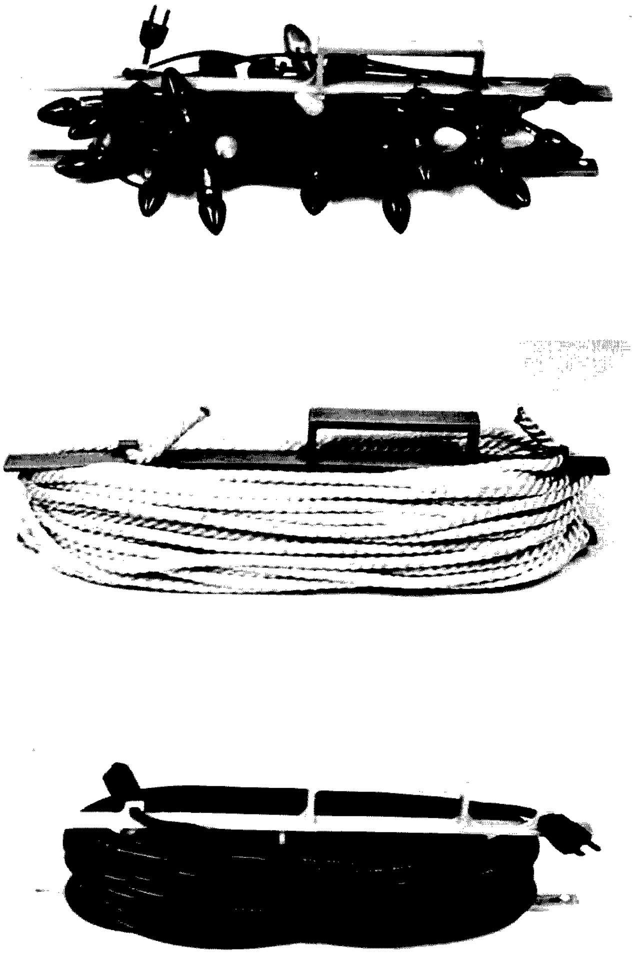
For more information, contact *Tri-Ex Tower Corporation, 7182 Rasmussen Avenue, Visalia CA 93291.* Reader Service number 488.



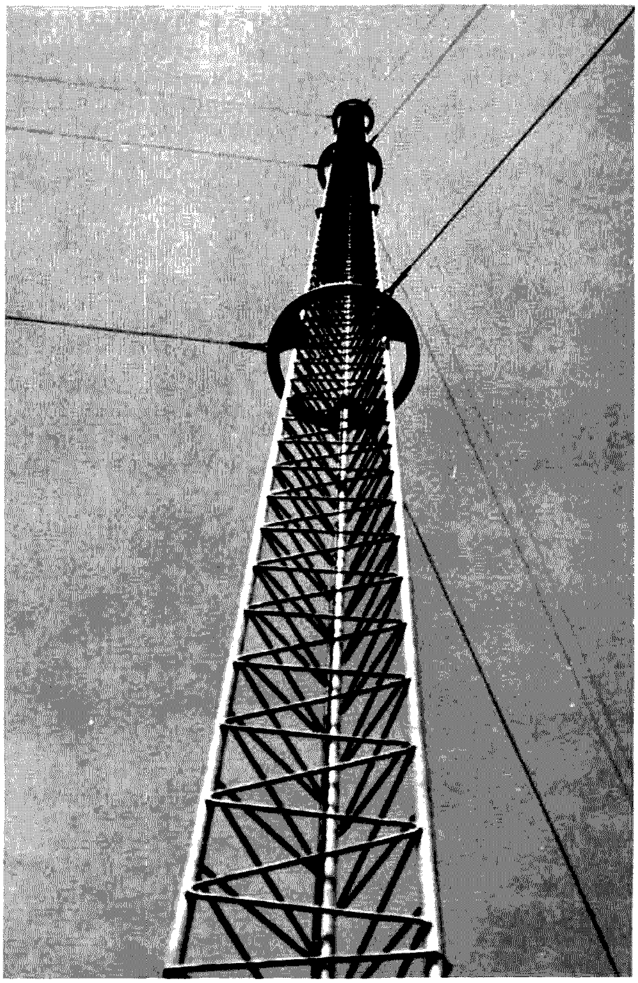
Faxscan's BP-3.

FAXSCAN'S MODEL BP-3 BEEPER

Faxscan, Inc., has announced their Model BP-3, representing the introduction of a new concept for amateur radio operating ease. The BP-3 is based on the idea used for years in commercial, military, and space communications. It provides a gentle beep at the beginning and end of each transmission by sensing the voltage on the PTT



The EZ Cord Control.



Tri-Ex's rotating tower.

line. Further, to differentiate between transmit and receive, the transmit tone has a higher frequency.

The purpose of the unit is to encourage a more natural conversation by eliminating the need to say "over" after each transmission. Under noisy or crowded conditions, the BP-3 virtually eliminates talk-over.

The unit can be directly interfaced to almost all modern gear. The only basic requirement is that the transmitter be keyed by grounding the PTT line and that the voltage at that point not exceed 24 V dc nor the current exceed 100 mA.

The construction is entirely solid state, with CMOS circuitry used to provide a unit that is virtually rf-proof. Current requirements are so low that a single 9-V battery (not supplied) will power the unit for up to one full year.

The BP-3 is perfect for use during nets or emergencies, or under noisy conditions. It is also great for VHF/UHF operation and makes a perfect repeater accessory.

The unit is available as "board-only" or encased. Both are fully assembled and tested. The "board-only" version, a mere 2" × 2", allows for custom installation.

The encased version comes complete with standard 4-pin microphone connectors, shielded cabling, and all interface wiring completed. It is designed for use with rigs using the standard 4-pin connector but instructions are enclosed to modify it for use with most modern gear. The unit is mounted in a "Faxscan gray" cast aluminum enclosure measuring 2-3/8" × 4-3/8" × 1-7/32" (W, D, H). Connection to most rigs involves plugging the mike into the BP-3 and the BP-3 into your rig's mike connector. Operation is totally automatic.

For more information, contact *Faxscan, Inc., 3148 Dorf Drive, Dayton OH 45418.* Reader Service number 483.

MODEL SDI-1150 SLIDE MOUNT

The new Model SDI-1150, quick-connection slide mount being introduced by Scientific Dimensions, Inc., will disconnect ten circuit leads plus coax. Designed for use with mobile two-way radios through the UHF band, this product will handle six more accessory leads than the Model SDI-1050 (which disconnects four circuit leads plus coax). The model SDI-1050 has been reliably used in the mobile two-way market for over five years.

The theft prevention and radio switching capabilities of the Scientific Dimensions line of quick-connection slide mounts have been applied to uses in construction, trucking, oil and gas, small service business, amateur radio, and utilities. The patented product line is sold to Motorola, General Electric, and professional land-mobile radio dealers nationwide.

For more information, contact *Scientific Dimensions, Inc., PO Box 26867, Albuquerque NM 87125.* Reader Service number 481.

HY-GAIN'S NEW DOUBLE ZEPP ANTENNA

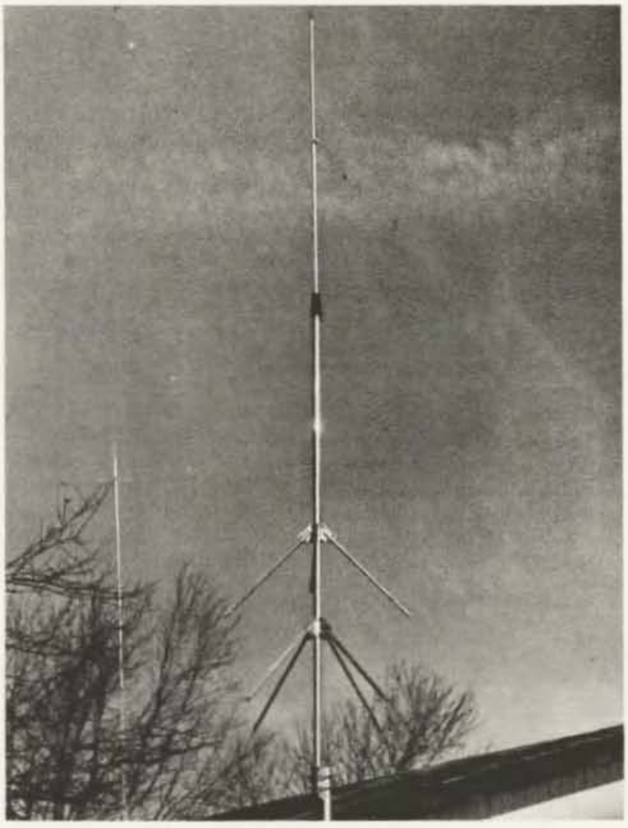
Telex Communications' new V-2 antenna is a 2-meter extended double zepp vertical consisting of two stacked 5/8-wave sections decoupled inside the antenna for complete weatherproofing. The decoupling system allows no rf on the coax feedline. The V-2 is a complete antenna that is easy to assemble and will mount on any mast up to 2" (50.8 mm) in diameter.

Two sets of 1/4-wave radials and a centered feedpoint produce an excellent radiation pattern that is very close to the horizon with a minimum of power loss into the sky. Radiation pattern testing was achieved on a ground-reflection range designed according to IEEE standard 149-1979; the test results of the V-2 and various competitive products are available from Telex/Hy-Gain.

The V-2 is designed to operate from 138 MHz through 174 MHz, obtains a vswr of less than 1.5:1 at resonance, and has a 2:1 vswr bandwidth of at least 7 MHz. The antenna's isolation from the supporting mast is 20 dB minimum.

For more information, contact *Hy-Gain, a division of Telex Communications, 9600 Aldrich Ave. So., Minneapolis MN 55420.* Reader Service number 486.

Scientific Dimensions' Model SDI 1150 slide mount.



Hy-Gain's V-2 double zepp vertical.

See page 117

HF5V-III *from page 34*

best. To tune the HF5V-III, you simply loosen a wingnut and slide the loading coil up or down. There are separate loading coils for 80 and 40, and adjustment of these coils has a negligible effect on the resonance point on 20, 15, and 10. Use a waterproof marker to mark the position of the bottom of the coil for the phone and CW segments and you'll be able to readjust the antenna without even getting near your swr meter!

The other reason I chose the HF5V-III is the obvious care that went into its design and engineering. Butternut designed this antenna to be as efficient as possible on each band. The following theory of operation is excerpted from the instruction manual.

"The HF5V-III operates as a slightly extended quarter-wave radiator on 15 meters, using a quarter-wave decoupling stub to isolate the upper sections of the antenna from the first quarter-wavelength of that band. On 20 meters, the entire radiator is active and functions as a 3/8-wave resonant vertical having much higher radiation resistance than conventional or trapped antennas with heights of one-quarter wavelength or less. On 10 meters, the HF5V-III operates as a 3/4-wave radiator with considerably greater efficiency than quarter-wave types. On 40 and 80/75 meters, the appropriate resonator circuits provide the inductive reactance required for resonance in conjunction with a slight top loading effect from the 15-meter decoupling stub. The L/C ratios of the 40- and 80/75-meter resonator circuits also determine resonance on 20 and 10 meters. Because of the higher than normal 20-meter radiation resistance, the feedpoint impedance on that band is in the neighborhood of 100 Ohms in a typical installation. Therefore, a quarter-wave matching section of 75-Ohm line is used as a transformer for the 50-Ohm impedance of the main transmission line. This matching section has no appreciable effect on operation on other bands."

Power rating is two kW PEP on 40 through 10 meters, and 1.2 kW PEP on 80 and 75 meters. Bandwidth is quite good, covering the entire 40-, 20-, 15-, and 10-meter bands and approximately 100 kHz on 80 meters. With the optional 160-meter attachment, bandwidth is considerably narrowed on 80 and 40 but still covers the entire 20-, 15-, and 10-meter bands. Wind load is 1.5 square feet; overall height is 26 feet. Shipping weight comes in at 12 pounds, and DXpeditioners may be interested in the special version that allows the antenna to be packed in a relatively small package, with no change in operating characteristics.

Installation

Both roof and ground mounting are straightforward and uncomplicated. It takes less than two hours working at a leisurely pace to assemble a Butternut HF5V-III. The parts fit well and needed no remedial hacking or drilling. Both antennas I built required no adjustment beyond setting the 80- and 40-meter coils for the desired portion of the band. The instruction manual is very well done, with clear assembly instructions and diagrams. There are lots of hints on installation and ample detail on ground systems and their necessity. For the roof-mounted antenna, I used the excellent tuned radial kit that Butternut offers. A system of non-resonant radials resides beneath the ground-mounted antenna, with several wires in excess of 350 feet.

If you are interested in a vertical antenna and can't decide whether to mount it on the ground or on your roof, you should know that indications are that the roof-mounted antenna will be the superior performer. In any case, laying the required radial system for a ground-mounted vertical can be extremely time-consuming. I calculate that the time I spent installing the radials for my ground-mounted vertical would have easily paid the difference between a vertical and a small tribander to mount on my roof!

One has to be very cautious when comparing a vertical to random wire or dipole antennas. Initial comparisons between a 100-foot random wire and the HF5V-III were not particularly encouraging. I used a coax switch to flip back and forth between the antenna tuner for the random wire and the vertical, and the wire seemed to run about one S-unit higher on receive. Surprise! The low angle of radiation of the vertical made itself known when we started tuning in DX stations—DX signals were definitely stronger on the vertical!

Conclusion

The HF5V-III goes together easily and is definitely one of the best of its breed. A vertical antenna is no match for a rhombic, yagi, or quad, but for those of us with limited real estate and funding, it represents an alternative worthy of serious consideration.

RTTY LOOP

Marc I. Leavey, M.D. WA3AJR
4006 Winlee Road
Randallstown MD 21133

Last month I promised you something to read and something to help you write. No liar I, here we go with some summertime treats.

As I have mentioned before, one of the popular sidelights of having a RTTY machine in the shack is scouting around for non-amateur RTTY signals. The airwaves are full of such beasties, not all of which are decodable, which represent news services, government radio, and other exotic radio stations. A guide to these signals is always welcome, assuming that it is accurate and complete.

A few months ago I reviewed such a guide: Oliver Ferrell's *Guide To RTTY Frequencies*, published by Gilfer Associates, Inc., at $8.95. This month we shall take a look at another entry, a book entitled *World Press Services Frequencies*. Written by Thomas Harrington W8OMV, the book claims (Mr. Ferrell's work notwithstanding) to be the "only one of it's (sic) kind, up to date," and to lead to "exciting news from the far corners of the world." Pretty tall order; let's take a look.

The book's format is in the large, 8½" by 11" size that most electronic magazines have adopted, in contrast to the 9" by 6" size of the Gilfer book. However, the typography is wide open and large, with generous margins and spaces between lines, accompanied by a cute logo of the world on each page. This severely limits the content of each page.

The opening section of the book is a brief, two-page introduction to RTTY, giving the basic "way in" to reception. It appears to be oriented for the non-amateur, or at least for the amateur not involved with RTTY. Next comes a short discussion of time zones, shift, speed, and Baudot (sic) vs. "Ascii" (sic)—as opposed to Murray vs. ASCII code. The codes, however, are not explained—only mentioned. Two pages of photos of several modern receivers are featured, along with mentions of the Info-Tech, iRL FSK-1000 (reviewed here a while back), and HAL ST-6000 converters. A brief mention of printers and whiz-bang readers concludes the first section.

Information on transmitting RTTY stations is presented in several lists. About 225 entries are for world press stations, listed in order of transmitting times. A second list contains about 150 entries, describing these same stations in order of frequency. A third list shows International Telecommunications Union press stations in frequency order, showing about 250 stations.

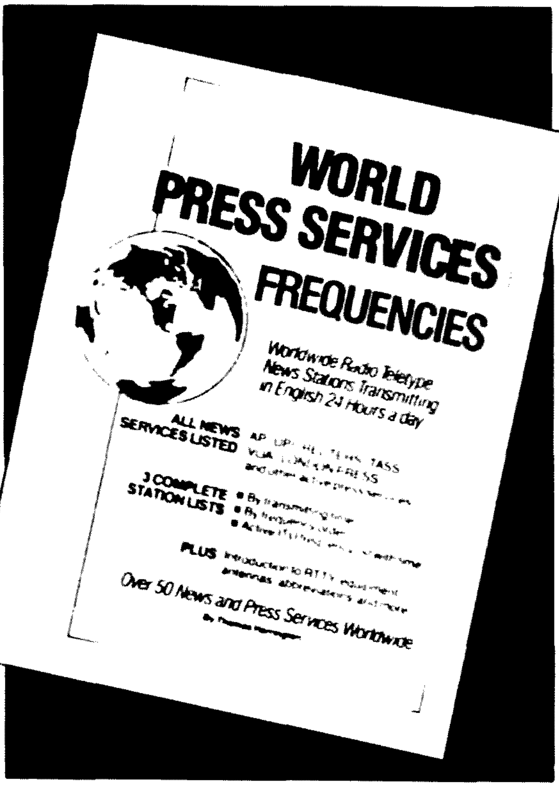

Fig. 1. The Harrington book.

The author indicates his intent to update the information in his book periodically and mail updates to registered individuals. This is an ambitious undertaking and would certainly do much to keep the information current. I should note that this book states, as does the Gilfer one, that all stations listed have been monitored and that this is not just a compilation of stations from a frequency log.

World Press Services Frequencies is available for $5.95 from Universal Electronics, Inc., 1280 Aida Drive, Reynoldsburg OH 43068. It does not have all the listings presented in the Gilfer book, but it may be entirely adequate for the amateur interested in listening in to world press services.

Of course, the other half of my promise, something to write with, is a printer. I have got to tell you about one of the hottest new printers around—one you may have heard about already. Let's take a look at some of its features.

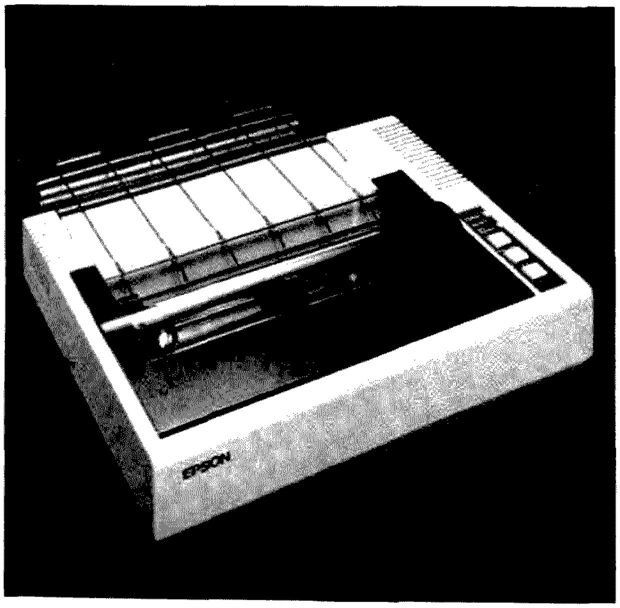

Fig. 2. The Epson MX-80.

This is a dot-matrix printer that supports the full ASCII character set, numerics, symbols, and upper- and lowercase. The print line is a maximum of eight inches and can be configured with character sizes yielding 40, 66, 80, or 132 characters per line. Furthermore, while standard line spacing of six lines per inch is the default condition, the printer may be switched to eight lines per inch (1/8 inch per line) or a tight 7/72-inch spacing. The resolution may be controlled even further to give one-dot vertical spacing or twenty-four-dot double spacing, all under program control.

Like more? The lower case g, p, q, and y all have descenders that make them look more like the letters we are used to. And a double-strike mode is available to fill in the gaps between dots and approach what is commonly referred to as "letter quality."

Like to see a sample? Fig. 3 is a sample printout, set up for 132 characters per line and eight lines per inch. The justification, by the way, is provided by my 6800-based computer. I think this is quite acceptable, don't you?

How about graphics? Well, the standard TRS-80™ graphics character set is supported and usable by even the non-TRS-80 user. Speaking of character sets, flick a DIP switch inside and you can get any one of several foreign language character sets. French, complete with accents, British (the pound sterling, you know), or German, mit der Umlaut, are all available. Not only that, but an entire Japanese Katakana character set may be substituted for the TRS-80 graphics, again, at the flip of a DIP.

Still not impressed, huh? Would you like a vertical format unit that supports vertical tabs? You got it. How about a built-in beeper/bell to sound off for fun, or to tell you something's wrong? That too. Let's add a standard parallel interface that will plug in to just about any computer, and see what we've got.

At a list price of $645, but being sold at considerable discounts, we have the Epson MX-80 printer. Quite a bundle, I'd say. But before we conclude, let's look at some problems. First off, the MX-80 has a one-line buffer for input. One of the nice things about a printer with at least several hundred bytes of buffer is the ability of the printer to "follow" the computer. The computer can dump its output to the printer quickly and then proceed with processing while printing is going on, neatly overlapping functions. With a one-line buffer, this rarely happens, so the computer sits and waits for the printer to finish.

Furthermore, if the MX-80 is used in the serial mode, the user must be aware that the printer will not accept input while the carriage is returning or other functions—such as graphics—are going on. This necessitates the addition of nulls into the data stream, somewhat slowing the printer throughout.

A minor problem is that the platen cannot be moved manually while the printer is energized. Thus, if a slight adjustment is needed, say to place print on a form, the printer must be turned off and any conditions set up in the printer's memory are lost.

All things considered, however, the MX-80 is a gem of a printer. Several new accessories, including full dot graphics and friction feed, broaden the horizon of this versatile unit. At least one manufacturer of a microcomputer-based RTTY station, Microlog, features the MX-80 as a companion to their unit. If you are looking for a printer, take a long look at the Epson MX-80.

Now, every few months I feel I must repeat this request. If you write me or any other author whose works you enjoy, please enclose a self-addressed, stamped envelope if you expect a reply. Also, remember to mention RTTY Loop and *73 Magazine* to those companies whose products you read about in these pages. They appreciate the feedback.

LETTERS

THE FIRST COAX?

In his article "Inside Coax" (*73*, May, 1981, p. 78), Dr. Jenkins states that "Prior to World War II, coaxial cable was unheard of."

In 1940, Rex Bassett sold me 50' of coaxial cable at his factory in downtown South Bend, Indiana. He used some kind of rubber as the dielectric. By today's standards, and I think Mr. Bassett will agree, it wasn't too efficient. But it was coaxial cable and I used it to feed my 10-meter antenna for over a year before WWII shut down ham radio.

By coincidence, on page 37 of the same issue, I see Rex Bassett is still in business some 41 years later, having moved his plant from South Bend to Fort Lauderdale.

Robert H. Pearson KH6AKW
Aiea HI

A SNAP

You can chalk up another ham as a direct result of your code-practice tapes. The FCC 5-wpm exam really was a snap after working with the 6+ tape.

So, now I am on to the 13+ and an Advanced license. Thanks for making the code test easy!

William B. Schneider
Technician (no call yet, but passed the test)
Jacksonville FL

LESS IS MORE

Just two weeks ago, I had a rare privilege. Upon arriving at the home QTH, my son informed me that my new *73 Magazine* had arrived in the mail.

That event was like a cool breeze on a warm day. Finally, I could once again be in contact with my hobby through the auspices of your very fine magazine.

Keep up the fine work and to Mr. Wayne Green, even if you are wrong a fair amount of the time, Wayne, you are upholding a fine north-American tradition of saying your piece in a free press. Stay in there and keep on slugging.

I might add that I was slightly sorry to see a magazine which, while it is up in price, is down in thickness and we therefore seem to be receiving somewhat less for our money. Will be looking forward to receiving future copies.

L.E. Babcock, Sr. VE6BAQ
Edmonton, Alberta
Canada

GETTING HIGH

I rarely write to a magazine, however the article in the June *73*, "Repeater at 102,000 Feet!" by VE4FK, certainly was outstanding in all ways. Give us more like this!

Kenneth C. Haas K2YKE
Buffalo NY

MOUNTAINTOP PARTY

On August 1, 1981, there will be an Amateur Radio Mountaintop VHF Party. From the lowest to the highest, pick your favorite peak. Bring yourself, a friend, your two-meter portable FM station, and go for the top. The official time will be Saturday, from 1000 to 1500, local time. The official frequencies will be 146.55, 6.58, 147.51, and 7.57. The WA6GUO/WA6SUW team will be looking for stations on mountain peaks from the top of 14,000 ft. Mt. Shasta, in northern California. For further information, call Dave Bermann WA6GUO at (916)-877-5606. This is not a contest, just a big party.

David A. Bermann WA6GUO
Paradise CA

IN COHERENT CW

This a note from an amateur, HS4AMI, 420 km, seven hours northeast of Bangkok. When I came here in September, 1980, the ARRL said they would ship my amateur club a couple of their Friendship transmitter kits—but nothing arrives. Oh, well, "drinking" executives can't do everything.

I am teaching amateur radio as an extra course to science and engineering students. We are progressing through tuned circuit to antenna theory.

My coherent CW experiments have been a great success: 559 both ways to California with 1 Watt, on 10 meters. We are going for 100 mW over 10,000 km, at 10 baud, with 24 dB gain and *no* filter. We will be happy to hear if our 10-100 mW are heard on the east coast.

Our format is at a 10-baud, crystal-controlled rate. We send

dots for tuning and then ident on 14,049,000 Hertz ± 1 Hz at 1500 and 2300Z every day.

The transmission can be heard on any receiver. The big gain is when you have the digital filter.

George Collins HS4AMI
Khon Kaen University
Khon Kaen, Thailand

SPREAD THE WORD

I just read Wayne's editorial in *73* in the June, 1981, issue and found it very interesting. You say Japan has twice as many hams as the USA. I can believe this. I'm 51 years old, no kid, and have reasonable intelligence, but it took me 11 months to find out how I could become a ham. After all that time, I get to go to my first lesson for my Novice tonight.

I'm really excited because I think it's a great hobby and will probably invest approximately $2000 for equipment. But what a shame it took me so long to find out how to start. The problem is that you guys are like a secret organization.

I checked all over on clubs and how to get started, (Radio Shack, local electronics parts' houses) and all I got was (at Radio Shack) the advice to read a book. I didn't want to read a book, I wanted to talk to someone. I couldn't check antennas on roofs because CB and ham antennas look alike to me.

So maybe if you folks would put out signs at Radio Shack, etc., about clubs and classes it would help build up amateur radio. I don't mean to be a wise guy, but if you folks did more to promote the hobby, more of us would find out about it. There may be 1000s of people out here just trying to find out where to start.

Robert W. Simpson Sr.
Glen Mills PA

SEEING-EYE HAM

I would like to see a "thank you" printed in your magazine. I drive a semi truck and was directed to the heart of New York City, New York, by a person that did an excellent job. I didn't make one wrong turn and was led by the hand via 2 meters for about four hours without a letup.

I found out later that Butch N2CGQ was blind!

I didn't think much about that because if a person lives in a place many years, he could direct you around town from his QTH. But I just found out yesterday that the fellow only knew New York by what had been described to him. So, Butch put his Seeing-Eye dog aside to help me find my way.

Thank you, Butch, for your assistance and keep up the nice work.

Leo Mercer
Albert Lea MN

ANOTHER POLL?

After having thoroughly enjoyed John Edwards' poll in the June, 1981, issue, I decided to conduct a survey of 20-meter CW. The following results were tabulated:

90% think they have keyers that stick.
2% think I have a receiver that chirps.
87% of those calling CQ are named Noah (why else would they sign with ARK?).
100% think that even though I am hundreds of miles away I am concerned that it is raining there.
67% are quick to point out that they have no problems when I tell them I have TVI.
45% think the band is in bad shape.
13% just got home from school.
12% are just leaving for work.
8% think the QSB is very bad and could I help by slowing down.

I am ever willing to add to the fund of ham radio knowledge.

James F. Reid W8LWS
Laurel MD

GOOD OLD RAY

I am writing to try to clear up a problem I've had ever since I was assigned the call letters W2YI in 1977: I've received many QSL cards from the bureau, dating from 1971 through 1980, for "W2YI, Ray, New Jersey."

To begin: Dear fellow radio amateurs, please accept my apology for any inconveniences you've been caused by this fellow, Ray. He is not assigned the callsign W2YI and, as the FCC has told me, he never was. They have assured me that I am the only person licensed to operate an amateur radio station with that callsign. I am sorry you've been duped by this person.

I would appreciate hearing from any amateur who has any information about good old Ray from New Jersey. He prefers to operate CW on 14 MHz and has worked mostly Europeans. I do have a few QSLs from his expeditions to 40 and 80 meters also.

The FCC has begun a monitoring program, and is fully aware of Ray's activities. It has assured me that I will not be held responsible for Ray's illegalities.

I feel Ray should get off his duff and study for his own Extra class license, since it is not that difficult. It seems he is already a licensed radio amateur, holding a General or Advanced ticket, who is too lazy to take the time to study and upgrade. Another theory holds that he is an ex-military CW operator who likes to DX a bit, but doesn't want to take a test.

And now to Ray: Ray, I am not angry or spiteful about your actions. The FCC understands that I'm not responsible for any problems that may arise as a result of your operations. I do wish to hear from you, though. Please drop me a letter, and enclose a check to cover the costs of maintaining those envelopes at the second call area QSL bureau, courtesy of the kind folks at the North Jersey DX Association.

LOOKING WEST

Bill Pasternak WA6ITF
c/o The Westlink Radio Network
Suite 718
7046 Hollywood Blvd.
Hollywood CA 90028

TOTAL OVERHAUL NEEDED

This will not be a normal Looking West column. That's not to say that you should bypass it, though. In fact, I hope that this month we will attract a far greater cross section of the amateur populace than usual. The reason will become evident as we progress.

Simply said, there's something wrong behind the so-called "Codfish Curtain." For those of you who have never heard the term before, I refer to the upper echelon at Newington. First, there was the Central Division Director's race. This is still in dispute as far as the Indiana Radio Club Council is concerned, and I suspect that Wayne will be covering this in depth. On this one, I bow to our fearless leader.

Now, on the heels of this controversy there erupts yet another. One that hits at the very foundation of amateur radio. For the people involved are considered to be the upper crust of amateur radio, the Big-Gun DXers. Why should a group of these people band together for the purpose of undermining the ARRL's DXCC program? In case you were not aware, that's what has happened. As you read on, I think that the rationale for their actions will become quite clear. If not, then tune in the low end of 20 meters and listen to a few pileups. It will become quite self-explanatory at that point.

I should preface all this with a few remarks. First, I neither condemn nor condone the action taken. I can understand the frustration of those involved. Yet I have to say that nothing has ever been accomplished by "burning down a house because you don't like the furniture inside." Second, I am not a DXer. In fact, I don't really fall into any particular category of amateur except possibly that of observer.

As the latter, I come into contact with hundreds of amateurs annually. With some, I share common interests. With others, there is no commonality. Somewhere in between there is another group: Those with whom I

became friends on a social level, while finding commonality of interest in amateur radio.

It is because of this latter involvement that I can relate firsthand the story which is about to unfold. It is based directly on a taped interview with a very well-known DXpeditioner, Dave Gardner K6LPL. Also, there will be some supposition on my part, but the supposition itself will be based upon the fact that I spent about 50 hours editing the audio tapes of Dr. Gardner's ill-fated 1979 DXpedition to Palmyra. A trip that almost cost Dave and those with him their lives.

I think that the best way to begin is to explain the situation as of this date: the 27th of May, 1980, and then present, verbatim, my interview of the 23rd with "Dr. DX." Here we go:

Westlink Newscast #193 for the week of May 25th, 1981, story item number 4: An amateur has been disqualified from DXCC, and another has quit the program as a result of a bogus QSL card scheme now roaring through the DX community. On April 23rd, the League disqualified Robert Findley W6NZX from DXCC because they allege that Findley submitted forged and counterfeit QSL cards for DXCC credit.

Now, hot on the heels of Findley's disqualification comes word that Dr. Dave Gardner K6LPL has tendered his resignation to DXCC, at the same time stating his part in what appears to be a worldwide attempt by some leaders of the DX community to effect what they feel are needed changes to the DXCC program. [At this point we inserted a 33-second sound bit with Dr. Gardner explaining what transpired and why. This will be reprinted later on, so there is no reason to duplicate it here.]

Gardner told us that the idea began at last year's Fresno International DX Convention, and that 14 well-known DXers were involved, ten of them being Honor Roll members. In our interview, Garner stressed what he felt were three key points. First, that this was not an attempt to discredit either the League or its DXCC program. Second, that all the cards involved, possibly as many as 25,000, were all pre-1975 vintage. [Ed. note: As explained later, the date was chosen to not influence those currently trying to climb the DXCC ladder or affect their standings.] Third, that his three QSL managers, W7PHO, W6AHU, and N6AHU had no knowledge or involvement in what Gardner termed to be an organized protest to point out the greed and avarice of many hams.

What action the League will take from here is unknown. A DXCC Advisory Committee member we spoke with declined to comment officially on the matter. He did say that there was no machinery set up to accept the resignation and that any action taken would be precedent setting.

OK. There you have the capsule version. Your basic one-and-a-half-minute news story. But, there is far more to it than what appears on the surface. This I learned while talking to Dave Gardner. Here is our conversation:

Q: What do you know about the bogus QSLs running around in DX circles?

A: At the 1980 Fresno International DX Convention, 14 hams were engaged in a rap session about improving the sorry state of DXing. We decided we had to get the attention of the amateur community to bring the hobby of DXing back to that which would generate some international goodwill and good times instead of this terrible race for QSL cards which has led to greed and avarice and foul language, etc., on the bands. The way we chose to do it was by flooding the world with pre-1975 QSL cards. These cards were given by the 14 members of our group, 10 of whom are Honor Roll members, to amateurs around the world. Our estimate is that about 5,000 of these cards have made it to DXCC headquarters thus far.

I do want to say that his action was not anti-League or anti-DXCC. It was designed to capture the attention of the world so that we might once again bring amateur radio DXing back to what it was before, a hobby instead of an addiction for QSL cards.

Q: What do you think will happen now?

A: I don't really know. Pre-1975 QSL cards are floating into the DXCC office [ARRL headquarters]. I hope it will help the league reassess its position about DXCC and help to take some of the violent competition out of DXing, and also help eliminate some of the bad feelings all over the world in the DX community. It's impossible for a rare DX station to get on and rag chew with a friend. He's completely smothered by people wanting QSL cards. This forces people onto lists, and that's just like reading out of the telephone book. It's certainly not DXing. All it amounts to is getting the QSL card. While I have not been anti-list in the past, I now see this as being another effect of the whole craze for QSL cards.

Q: Do you blame the DXCC program for all these problems?

A: It's not just the DXCC program. It's partly DXCC's fault, but I think the people at DXCC are well intentioned. I don't think them to be evil people trying to do bad. I do think that their policies, among other factors, have led to a general deterioration in the quality of amateur radio, and amateur radio DXing in particular.

Q: Why this route rather than the political one, i.e., lobbying for change with the DX Advisory Committee?

A: The DX Advisory Committee really has no power. They can only make recommendations to the General Manager [Note: currently Dick Baldwin W1RU] who takes it upon himself to decide what *is* a country and what *isn't*. He's a fine gentleman, but he has been unresponsive to the DX community. I just think that the League's emphasis is so far away from improving the DX conditions (operating standards) that I do not think they really care all that much. We didn't think the League would be responsive at all, because they have not been in the past.

Q: What action have you taken as a result of this so-called scandal?

A: I've personally resigned from DXCC. I know of several others whose resignations are also imminent. My resignation was tendered well before this "scandal" broke. We hope that in the future people will have a bit of a question in their minds: "Is that QSL card really necessary and is it worth the price of my own personal pride I will have to pay?"

As to my own future plans? I will continue to work my DXpeditions in the same way I have in the past. All of my own QSLs are handled by QSL managers and they were not in any way a part of this operation. I should also state that the operation is over. No more cards are going out. No more will go out. We feel we have made the point we had to, and now it's time to go on and try to improve conditions in amateur radio DXing.

There you have it! Right from the source. Dave did not name the others involved. In a subsequent conversation, he explained that it was for each of the people involved to come forward of his own accord if that person felt he wanted to. But there is something far more important than who did what involved here. In the view of this writer, it again points out the inability of League headquarters to deal with the problems of "today's" amateur radio scene. When a group of the world's top DXers has to band together outside the ARRL and try to force change, because headquarters has been unresponsive to their ongoing call for change, something definitely is awry. I think that "unresponsiveness" is the key word here and it's not just in dealing with the DXCC program and the problems some feel it creates. Let's look a bit closer to home.

On the two-meter band, there has been an ongoing call for more years than I can remember that the Board of Directors enact a specific band plan in regard to the 146 through 148-MHz repeater subband. Thus far, there is still no true standard. The east runs repeaters every 15 kHz right-side up; the west runs them every 15 kHz inverted and the Pacific northwest opted to totally recoordinate on 20-kHz centers to match the 144.5 through 145.5-MHz subband. Instead of taking a stand one way or the other, the Board continually postpones making a final decision.

OK. Most of us are lucky enough to have synthesized radios these days and most, though not all, will work under all conditions. Am I being picky? I think not. Keep in mind that several parts of the nation are currently becoming involved in what amounts to a "squeeze play." Inverted systems moving toward them from the west, and non-inverted from the east. One of these days, there may be one heck of a looped lockup when the two forces meet. And who

will suffer? The poor ham caught in the middle. Yet, the Board fails to act. Fails to take a stand. I honestly think that they are unaware of the consequences their unresponsiveness may eventually cause. But, they're going to have to take a stand and they're also going to have to learn that you cannot appease everyone, that a nationally-standardized band plan for this spectrum is essential and whatever one they choose will be unpopular in some quarters. It will probably be met with some resistance. But, choose they must.

I think that Gardner has hit upon something important, perhaps the key to what the real problem is in Newington. If this is the case, and I happen to be a League member and supporter who feels it to be so, then maybe it's time that the rank and file, you and I, start taking some positive steps toward revamping "*our*" organization to what is needed to represent us in today's fast-paced society. I've always said that criticism brings with it a responsibility of alternative, so here goes.

First, I think it's time that the rank and file members of the League are given the opportunity to elect more than just their Division Director, Vice Director, SCM, and the like. We should also be the ones who elect the President, the Vice Presidents and other upper-echelon personnel. Maybe utilize a system similar to the Electoral College as used in our own federal government. Here, though, you would vote to "direct your Director" to cast his ballot for the candidate the majority in a given Division voted for, on a popular-vote basis. If it works for the USA, it can work for the ARRL.

Then there are the many Advisory Committees whose advice seldom is heeded it seems. Suppose they were no longer Advisory Committees. Rather, each was empowered to make decisions and implement them. Here, again, you would need a change in the structure. Right now, the members of these committees are appointees of the given current League president. What they should be are elected representatives of a given Division, elected by their peers to represent their views and ideals. For instance, those serving on VRAC should be active members of the mainstream of VHF repeater operation. In other words, be active on all local 2-meter repeaters, since that's where the bulk of today's activity is. They should be accessible to their constituencies both on the air *and* on the phone. If a problem arises, they should be there to take command and arbitrate a solution. I must ask how many of you know who your VRAC representative is or how to get hold of that person on an immediate basis if an emergency were to arise?

This should hold true of all members of all special-interest committees. If you can't reach the man or woman when they are needed, if they are not willing to express your views as your representative, then why bother having such a person in the first place. By the same token, if your representative or an entire committee is ignored time after time, then the committee structure holds no value other than surface political appeasement. I know a number of people who serve on various committees of this sort, and you have no idea how frustrating it is for them to work diligently for months on end, dedicating their time and efforts in the hope of making our amateur community a better place to be, only to have a group of politicos veto, shelve, or ignore their works.

If Wayne Green and I disagree on any one point it's over the ARRL. Wayne has often stated that in regard to the League, you vote with your checkbook. That is to say, if you don't join or "re-up," you have voiced your displeasure in a way anyone can understand: in their pocketbook. I take a different view. First, I believe we need a strong national organization. Right now, the ARRL is the only game in town, and as of this writing nobody has taken the initiative to start a new organizational effort. Maybe someone will. Right now, the League is it, for better or worse. In that vein, I believe that the only way to make the ARRL into the kind of organization we need is to become active in it. Become aggressive. Work toward change. Yes, you will get shot down by the "old guard." In politics, that's the name of the game. If you have the tenacity and the courage of your convictions and if you can garner the support of your fellow hams, you can and will make your voice heard. Nothing is impossible! It merely takes dedication and the willingness to fight it out.

Since I began Looking West, I have been a League watcher. As you know, I have a very simple way of dealing with them. When they do something that's right, proper, and beneficial to amateur radio, I will be among the first to laud them for their achievements. On the other hand, when something is wrong, I will also be among the first to cast criticism. Yes, I am lucky in that I have a national platform from which to be heard, but even if this were not so, my approach would not differ.

I do not remember who coined the expression "Codfish Curtain" in describing Newington. I heard it expressed at more than one convention of late. Unlike a curtain made of iron which can only figuratively rust and decay with age, one made of organic matter can take on a rather odoriferous characteristic if left to the elements. I do not want to see this happen to the League. Not to *my* League. Yet, one must wonder when even the DX crowd has to rebel. To figuratively take to the hills, grow beards, and wage a guerrilla-type of war to get the attention of Newington. Not that I can or will condone such activities or that of any form of terrorism in the world today. Violence only begets violence; hate only begets hate. There's enough of this in the world today without it seeping into the very fiber of amateur radio.

Maybe the 14 DXers were wrong, but it's evident that they were crying out for needed change only to be met with a deaf ear from League headquarters. They made their decision and must live with it. You and I might have taken a completely different route. Nonetheless, I think the point they were trying to make is the very same one I am trying to make right here and now. A simple message to Newington that says wake up, "the times they are a changing."

KAHANER REPORT

Larry Kahaner WB2NEL
PO Box 39103
Washington DC 20016

. . . IT'S ALL A BIG MICROPHONE

Washington press credentials ought to carry warning labels like the ones on cigarette packs. It should read: "Danger—Covering Congress or federal agencies may result in loss of perspective."

We of the Washington press corps tend to overdo it. Granted, what happens here at the center of the empire eventually affects your life, but we probe every speech from every bureaucrat and analyze every bill even though it stands less than one in a hundred chance of becoming law. What happens as a result of that massive coverage is that we succumb to the forest/tree syndrome. Amid our hunger for details and minutia, we may not see the issues or spot the trends.

Such is the case with reportage of the government's apparent changing attitude toward regulation of the airwaves. Congress, the FCC, and other lawmakers want to change the statutes, little by little, to restrict what we see and what we hear. They wish to deny access to monitor the electromagnetic spectrum, a rather amorphous, albeit quite real, natural resource.

For the past several years, the news media has reported isolated government actions in this area but so far no one has taken a step back and looked at the big picture. *Newsweek* hasn't strung it all together, splashed it on the cover, and pronounced it a trend. Nor has NBC Nightly News run a special report at a quarter past the hour and declared it Truth.

It's not that they're poor journalists, and it's not that they don't care. It's just that we're all too close to the action to see it

clearly and understand that it isn't just a lingering fragment of the '60s paranoia.

Since 1934, when the Communications Act was passed, the law was clear. If it were sent over the air, you could receive it. If you could pick it up, you could listen. Transmissions are regulated for the public good, but receiving is public domain. That's the basis of the Communications Act and, in larger terms, a philosophy that stems from common law.

Constraints exist, however. You can't divulge anything you hear to a third party (that doesn't hold for broadcast or ham communications) but that seems fair; we can live with that.

But we're in a new age and the Communications Act needs rewriting. It's moldy, out-of-date, especially in the area of technology. Last year, Congress tried overhauling it but didn't get very far. They're trying it again this year, but it probably won't go anywhere either. For one thing, the subject is complex and most representatives are afraid to tackle it. However, if you read the proposals, last year's and this year's, you'll notice that they both include prohibitions against receiving so-called pay-TV and other private, commercial transmissions. No one argues that pay-TV operators deserve some sort of protection from video vampires who seek to steal their wares and market them for half price, but that can be handled locally on a case-by-case basis as "theft of service." Growing national policy towards regulating what we may receive seems to be traveling a dangerous path.

In another instance, the FCC has decided to amend the rules to allow licensees in the Power Radio Service to use scramblers. Service members, which includes power companies, prompted the rulemaking to reflect their concern that terrorists and vandals might intercept transmissions and somehow use the information to disrupt a nuclear power plant or blow up a group of hydroelectric generators.

The FCC gave the OK, as it did when police and fire departments requested similar permission. Unless a petitioner convinces the Commission that scrambling is a dumb idea, it becomes law on July 22.

In addition, the FCC said it will allow scramblers in other sectors of the Land Mobile Service on a secondary, noninterference basis. There was even talk of letting taxicabs scramble transmissions.

We can go on. Many states rule that you may listen to police on your scanners at home but not in your car. You may use a microwave receiver at your place of business but not in your car, because then it would be called a radar detector.

The trend is clear. More and more restraints and regulation of the public's access to transmissions that use a public resource.

FCC Commissioner Joseph Fogarty, commenting publicly on the scrambler proposal for the Power Radio Service, recommended formation of a task force "to study the problem of maintaining the privacy and security of the telecommunications network in the face of the threat by the new technologies."

Sorry, Commissioner. The problem can't be solved. There's no way that any telecommunications exchange can be made secure or private, because by its very nature the electromagnetic spectrum is like a city street. If you walk in it, you relinquish your right to privacy, and it seems that everyone really knows that *except* those who try to legislate that security and privacy.

If you want privacy, try a handwritten note. There will always be some high-tech freak who wants to exercise his right to listen and watch while you're using his natural property. Or maybe he'll just do it for the sheer challenge of breaking the code. Nevertheless, no one ever promised that airwaves would be private—in fact, the FCC has historically maintained just the opposite—and to expect it now is socially unreasonable and technologically impossible.

Perhaps the Secret Service—whose field communications consist of simple handie-talkies on easily-found VHF and UHF frequencies—says it best. After the assassination attempt on President Reagan last March, I asked a spokesman if the Service was planning any new procedures to tighten security. He asked in what areas, and I mentioned the handie-talkies. I told him I knew the frequencies and even the code words; Reagan is "Rawhide." "Isn't that a security problem?" I asked.

He replied: "We don't use scramblers because you'll only figure out how to unscramble it. And we use code names because it makes things easier for us. Our philosophy is simple: 'Say nothing over the air that you wouldn't say into a microphone connected to the loudest PA system in Washington. The telephone, the radio; it's all a big microphone, and that's the way it's always going to be.' "

CORRECTIONS

Since my article "The Nicad Conditioner" was published in the April, 1981, issue of *73 Magazine,* I've had many letters from as far away as Honolulu complimenting me on it.

One reader did note a minor error in the diagram shown in Fig. 3 (p. 107). At the top of resistor R2, there should have been a dot to indicate a connection. Without this connection the timer module would not receive its trigger pulse.

Mitchel Katz W2KPE
Flushing NY

Re the article, "Mayday," on page 78 of the June, 1981, *73 Magazine*: After continuous operation for 7 months, we finally had our first Clegg 22'er equipment failure on the ELT detector. The failure was attributed to overheating of an audio loading resistor in the audio output stage. The problem was corrected by circuit changes and relocation of heat-generating components as detailed in Fig. 1.

The DF articles in the June issue were extremely informative and I hope will encourage further innovative advances in the state-of-the-art of DFing.

Ed Sommerfield W2FJT
Poughkeepsie NY

OSCAR ORBITS

Courtesy of AMSAT

The OSCAR satellites are subject to atmospheric drag, of course, and the present period of intense solar activity has accentuated the problem. During this period, our sun has been expelling huge numbers of charged particles, some of which find their way into the Earth's upper atmosphere, increasing the density (and thus the drag) there. It is through this region that the OSCARs must pass. OSCAR 8, in a lower orbit than OSCAR 7, is the more seriously affected of the two.

If the drag factor is not considered when OSCAR calculations are performed, long-range orbital projections will be in error. For example, by the end of 1979, OSCAR 8 was more than 20 minutes ahead of some published schedules. The nature of orbital mechanics is such that extra drag on a satellite causes it to move into a lower orbit, resulting in a shorter orbital period. Thus, the satellite arrives above a given Earthbound location earlier than predicted.

Using data supplied to us by Dr. Thomas A. Clark W3IWI of AMSAT, the equatorial crossing tables shown here were generated with the aid of a TRS-80™ microcomputer. The tables take into account the effects of atmospheric drag and should be in error by a few seconds at most.

The listed data tells you the time and place that OSCAR 7 and OSCAR 8 cross the equator in an ascending orbit for the first time each day. To calculate successive OSCAR 7 orbits, make a list of the first orbit number and the next twelve orbits for that day. List the time of the first orbit. Each successive orbit is 115 minutes later (two hours less five minutes). The chart gives the longitude of the day's first ascending (northbound) equatorial crossing. Add 29° for each succeeding orbit. When OSCAR is ascending on the other side of the world from you, it will descend over you. To find the equatorial descending longitude, subtract 166° from the ascending longitude. To find the time OSCAR 7 passes the North Pole, add 29 minutes to the time it passes the equator. You should be able to hear OSCAR 7 when it is within 45 degrees of you. The easiest way to determine if OSCAR is above the horizon (and thus within range) at your location is to take a globe and draw a circle with a radius of 2450 miles (4000 kilometers) from your QTH. If OSCAR passes above that circle, you should be able to hear it. If it passes right overhead, you should hear it for about 24 minutes total. OSCAR 7 will pass an imaginary line drawn from San Francisco to Norfolk about 12 minutes after passing the equator. Add about a minute for each 200 miles that you live north of this line. If OSCAR passes 15° east or west of you, add another minute; at 30°, three minutes; at 45°, ten minutes. Mode A: 145.85-.95 MHz uplink, 29.4-29.5 MHz downlink, beacon at 29.502 MHz. Mode B: 432.125-.175 MHz uplink, 145.975-.925 MHz downlink, beacon at 145.972 MHz.

At press time, OSCAR 7 was scheduled to be in Mode A on odd numbered days of the year and in Mode B on even numbered days. Monday is QRP day on OSCAR 7, while Wednesdays are set aside for experiments and are not available for use.

OSCAR 8 calculations are similar to those for OSCAR 7, with some important exceptions. Instead of making 13 orbits each day, OSCAR 8 makes 14 orbits during each 24-hour period. The orbital period of OSCAR 8 is therefore somewhat shorter: 103 minutes.

To calculate successive OSCAR 8 orbits, make a list of the first orbit number (from the OSCAR 8 chart) and the next thirteen orbits for that day. List the time of the first orbit. Each successive orbit is then 103 minutes later. The chart gives the longitude of the day's first ascending equatorial crossing. Add 26° for each succeeding orbit. To find the time OSCAR 8 passes the North Pole, add 26 minutes to the time it crosses the equator. OSCAR 8 will cross the imaginary San Francisco-to-Norfolk line about 11 minutes after crossing the equator. Mode A: 145.85-.95 MHz uplink, 29.4-29.50 MHz downlink, beacon at 29.40 MHz. Mode J: 145.90-146.00 MHz uplink, 435.20-435.10 MHz downlink, beacon on 435.090 MHz.

OSCAR 8 is in Mode A on Mondays and Thursdays, Mode J on Saturdays and Sundays, and both modes simultaneously on Tuesdays and Fridays. As with OSCAR 7, Wednesdays are reserved for experiments.

HAM HELP

I need mint-condition ARRL *Handbooks* for 1947, 1952, 1955, 1961, 1962, 1966, 1967, 1975, 1977, and 1979. Top Dollar Paid.

Norton K. Earle
6421 Burgundy Way
Las Vegas NV 89107

I am looking for parts and cards for a Hickock Cardmatic tube tester. I have a Bell System model number KS-15874-L2 serial number above 900; the military model is AN/USM-118 and the commercial version is 1234 commercial 4. The test cards can be used with any unit. Thank you.

Karl D. Burket
PO Box 790
Payette ID 83661

I need a schematic and/or manual for a Measurements Model M-216 signal generator. I will pay copying and mailing costs.

Oliver Wayne
514 Park Ave.
Hoboken NJ 07030

Would someone who has a copy of a Hallicrafters S-27 receiver schematic let me borrow it or send me a copy of it? I will gladly pay costs.

Jules Vetter KH6YU
3657 Tantalus Drive
Honolulu HI 96822

Any amateurs with Sinclair Z80 or 81 or Micro-Ace microcomputers: Please write to me if you are interested in exchanging programs/ideas for ham use.

Paul L. Newman G4INP
3, Red House Lane, Leiston
Suffolk IP16 4JZ
United Kingdom

I am looking for a portable intercom circuit with the following features: one master station with power supply, up to 10 slave units small enough to wear as belt packs, three-wire connection between units, call light and call switch on each unit, individual volume control, and headset earphone/boom mike.

Fred Musgrave, Major
The Salvation Army
Special Projects Director
Suc 3 Cass 194
1403 Buenos Aires, Argentina

I need a schematic and/or an alignment procedure for a Hallicrafters SX62A general-coverage receiver. I will pay for copying and postage or I will copy and return.

Dick Roux N1AED
25 Greenfield Dr.
Merrimack NH 03054

DEALER DIRECTORY

Phoenix AZ

The Southwest's most progressive communications company stocking Kenwood, ICOM, Yaesu, MFJ, B&W, Astron, Larsen, Cushcraft, Hy-Gain, Bearcat, and more. Would like to serve you! **Power Communications Corp., 1640 West Camelback Rd., Phoenix AZ 85015, 241-Watt.**

Culver City CA

Jun's Electronics, 3919 Sepulveda Blvd., Culver City CA 90230, 390-8003. Trades 463-1886 San Diego. Call us for a low quote.

Fontana CA

Complete lines ICOM, DenTron, Ten-Tec, Mirage, Cubic, Lunar, over 4000 electronic products for hobbyist, technician, experimenter. Also CB radio, landmobile. **Fontana Electronics, 8628 Sierra Ave., Fontana CA 92335, 822-7710.**

San Jose CA
SAN FRANCISCO BAY AREA

Homebrewers' haven; tons of new and used Ham/Computer gear and components. Serving Hams since 1958. We specialize in ICOM, KLM, Mirage, Comptronix. We ship worldwide. **Tele-Com Electronics, 15460 Union Avenue, San Jose CA 95124, 377-4479.**

San Jose CA

Bay area's newest Amateur Radio store. New & used Amateur Radio sales & service. We feature Kenwood, ICOM, Azden, Yaesu, Ten-Tec, Santec & many more. **Shaver Radio, Inc., 1378 So. Bascom Ave., San Jose CA 95128, 998-1103.**

Aurora CO

Electronic parts, surplus, used ham gear and test equipment, catering to radio amateurs, electronic hobbyists and small manufacturers. Low prices, growing selection. Come see us! **Electronic Bits 'n Pieces, Inc., 9717 E. Colfax, Aurora CO 80010, 361-6530.**

Denver CO

Experimenter's paradise! Electronic and mechanical components for computer people, audio people, hams, robot builders, experimenters. Open six days a week. **Gateway Electronics Corp., 2839 W. 44th Ave., Denver CO 80211, 458-5444.**

Columbus GA

KENWOOD—YAESU—DRAKE

The world's most fantastic amateur showroom! You gotta see it to believe it! **Radio Wholesale, 2012 Auburn Avenue, Columbus GA 31906, 561-7000.**

Smyrna GA

For your Kenwood, Yaesu, ICOM, Drake and other amateur needs, come to see us. **Britt's Two-Way Radio, 2506 N. Atlanta Rd., Smyrna GA 30080, 432-8006.**

Preston ID

Ross WB7BYZ, has the Largest Stock of Amateur Gear in the Intermountain West and the Best Prices. Call me for all your ham needs. **Ross Distributing, 78 So. State, Preston ID 83263, 852-0830.**

Terre Haute IN

Your ham headquarters located in the heart of the midwest. **Hoosier Electronics, Inc., #9 Meadows Center, P.O. Box 3300, Terre Haute IN 478003, 238-1456.**

Littleton MA

The ham store of N.E. you can rely on. Kenwood, ICOM, Wilson, Yaesu, DenTron, KLM amps, B&W switches & wattmeters, Whistler radar detectors, Bearcat, Regency, antennas by Larsen, Wilson, Hustler, CAM. **TEL-COM Inc. Communications & Electronics, 675 Great Rd., Rt. 119, Littleton MA 01460, 486-3040.**

Medford MA

New England's Distributor and Authorized Service Center for all Major Amateur Lines. Located Just North of Boston at Exit 5 on I-93. **Tufts Radio Electronics, Inc., 206 Mystic Ave., Medford MA 02155, 391-3200.**

Ann Arbor MI

See us for products like Ten-Tec, R. L. Drake, Dentron and many more. Open Monday through Saturday, 0830 to 1730. WB8VGR, WB8UXO, WD8OKN and W8RP behind the counter. **Purchase Radio Supply, 327 E. Hoover Ave., Ann Arbor, Michigan 48104, 668-8696.**

St. Louis MO

Experimenter's paradise! Electronic and mechanical components for computer people, audio people, hams, robot builders, experimenters. Open six days a week. **Gateway Electronics Corp., 8123-25 Page Blvd., St. Louis MO 63130, 427-6116.**

Phila. PA/Camden NJ

Waveguide & coaxial microwave components & equipment. Laboratory grade test instruments, power supplies. Buy, sell & trade all popular makes, HP, GR, FXR, ESI, Sorensen, Singer, etc. **Lectronic Research Labs., 1423 Ferry Ave., Camden NJ 08104, 541-4200.**

Somerset NJ

New Jersey's only factory-authorized ICOM and YAESU distributor. Large inventory of new and used specials. Most major brands in stock. Complete service and facilities. **Radios Unlimited, 1760 Easton Avenue, P.O. Box 347, Somerset NJ 08873, 469-4599.**

Amsterdam NY
UPSTATE NEW YORK

Kenwood, ICOM, Drake, plus many other lines. Amateur Dealer for over 35 years. **Adirondack Radio Supply, Inc., 185 West Main Street, Amsterdam NY 12010, 842-8350.**

Syracuse–Rome–Utica NY

Featuring: Kenwood, Yaesu, ICOM, Drake, Ten-Tec, Swan, DenTron, Alpha, Robot, MFJ, Tempo, Astron, KLM, Hy Gain, Mosley, Larsen, Cushcraft, Hustler, Mini Products. You won't be disappointed with equipment/service. **Radio World, Oneida County Airport-Terminal Building, Oriskany NY 13424, 337-0203.**

Columbus OH

All major brands featured in the biggest and best ham store for miles around. Come in and twist the knobs before you buy. **Universal Amateur Radio, Inc., 1280 Aida Dr., Reynoldsburg (Columbus) OH 43068, 866-4267.**

Scranton PA

ICOM, Bird, CushCraft, Beckman, Fluke, Larsen, Hustler, Antenna Specialists, Astron, Avanti, Belden, W2AU/W2VS, CDE, AEA, Vibroplex, Ham-Key, CES, Amphenol, Sony, Fanon/Courier, B&W, Ameco, Shure. **LaRue Electronics, 1112 Grandview St., Scranton PA 18509, 343-2124.**

Houston TX

Experimenter's paradise! Electronic and mechanical components for computer people, audio people, hams, robot builders, experimenters. Open six days a week. **Gateway Electronics Inc., 8932 Clarkcrest, Houston TX 77063, 978-6575.**

San Antonio TX

Complete 2 way service shop. Call Dee, W5FSP. Selling Antenna Specialists, Avanti, Azden, Bird, Hy-gain, Standard, Vibroplex, Midland, Henry, CushCraft, Dielectric, Hustler, ICOM, MFJ, Nye, Shure, Cubic, Tempo, Ten-Tec and others. **Appliance & Equipment Co., Inc., 2317 Vance Jackson Road, San Antonio TX 78213, 734-7793.**

Tacoma WA

Tacoma area dealer for Kenwood, Cubic, Cushcraft Antennas, Hustler Antennas, all amateur marine and commercial two-way radio supply. See our used radio dept. **Northwest Radio Supply, 5240 South Puget Sound, Tacoma WA 98409, 475-2619.**

W2NSD/1 NEVER SAY DIE

editorial by Wayne Green

CONSUMER PROTECTION

A flyer being passed out at some Chicago area hamfests is a case where it is not always the customer who is right. In point of fact, I've found that in a surprising percentage of the complaints I've received, it has been the ham who has been the real troublemaker. In this case, we have a flyer, unsigned, but allegedly being perpetrated by K9SOA. The flyer is based upon distortions and innuendo.

I talked with a dealer recently who ran through some of his recent battles with hams. One brought in his rig to be fixed. He was given an estimate of the cost of repairs. The rig was repaired and the bill was close to the estimate. The chap then beefed about how much it cost and asked for something which took the salesman out of the room. The ham grabbed the rig and ran out of the door with it, refusing to pay anything. It took a judge to make him pay up.

Another customer brought in a rig with intermittent output. With final transistors at $85 a clip, he was aware that the bill could be heavy. The serviceman (ham) tried a new final, but that didn't do it. Then he switched the final board with a brand new one. Still no go. Next he tried a brand new master board. That fixed it. Upon checking the faulty board, he found that a coil was causing a short when it heated up...so he fixed that. Rather than taking another hour and running up the repair costs even more, he left in the brand new boards.

The ham came in for his rig while the repairman was out. He asked for the bum part. The salesman went to the repair bench, spotted the final transistor, and gave it to the customer. When the repairman came in and discovered the $85 transistor missing, he had the store owner get in touch with the ham and ask for it back. The ham insisted that the transistor had his call engraved on it and that it was from his rig. The owner explained the whole situation and that the part had the date on it of manufacture, which was quite recent. The ham told the store owner where he could stick it and hung up. The call of this ham had an FAO in it, I understand. Is it any wonder that more and more ham dealers are giving up on even trying to make repairs? They find the customers making every effort to screw them...the repair techs are making so much that often the dealer has to swallow part of the repair costs, and so it goes.

Oh, there are sharks out there among the manufacturers and dealers, too, but very few...and I generally hear about them as soon as they start causing trouble. I've been able to put a lot of these turkeys out of business.

One recent rip-off ended with the ham pulling the stunt being convicted. This is not the first time for him. Knowing his history, I have never accepted ads from him. The first time, he got a lot of *QST* readers through his ads in that magazine. This last trip he stung quite a number of *Ham Trader* readers.

This was the same chap who appeared at Dayton in 1980 and was selling memberships in a national amateur radio organization out of a booth there. I was in Europe at the time, so I didn't hear about it until I arrived in Wiesbaden to give a talk at a hamfest and met a chap who had been to Dayton the previous week. I was suspicious immediately. How can any group even think of trying to start a national organization without at least talking with me? They can't get anywhere without a publication...and *HR* is totally tied up by the ARRL, which doesn't leave a lot.

When I got back, I looked into it and lo, there was our ham from the *QST* rip-off fame, now in Connecticut. His pitch was that a group of ten wealthy hams had gotten together to form a national ham group, each putting up $15,000 in seed money. I knew that had to be hogwash. That wasn't likely to happen without me hearing about it. I wrote about the scam in *73* and did not get sued, further confirming it as a caper. The ham quickly left Connecticut and reopened in Virginia, where the *Ham Trader* rip-off came from. Well, he's been convicted...again...so let's see what is next.

Even prison doesn't stop the truly dedicated bunco artists. In the computer field, we have a chap who ran two rip-offs and was convicted and sent to prison for both of them. The first time he crawled under the fence and escaped, only to turn up in Tulsa a few months later with another way to cream computer hobbyists willing to believe they could get something for almost nothing. This chap turned up a third time recently, this time operating from prison with the help of a guard. There's no stopping a truly dedicated man.

ETHICS

Yes, surprisingly enough, an ethical question has been causing some storms in DX clubs. The question raised is this: How much is it ethical to charge a fellow club member for the date and time you worked a rare station using his call?

Sure, there was a time when

W2NSD/1 ON-THE-AIR SCHEDULE SEPTEMBER, 1981

1	20-40 CW
8	15-20 Phone
15	20 RTTY
22	15-20 Phone
29	15-20 Phone

Response to our 15- and 20-meter phone sessions has been especially strong, so we have scheduled additional time on these two bands. On both phone and CW nights, look for us in the first 25 kHz of the General portion of each band. We'll be on the higher frequency band first, starting at 7:00 pm eastern time.

WE HAVE WAITED LONG ENOUGH!

73 has waited patiently for the past couple of years; we are not waiting any longer. We are taking up the TVRO challenge.

Amateur radio's innovation capabilities are enviable. It is time that we donned our collective thinking cap and began to produce some workable systems at reasonable costs. This not only will get us in on the satellite TV fun, but, more importantly, will sharpen our skills for use in the neglected areas in which much of ham radio's future lies—the microwave region and worldwide communications via satellites.

We are interested in complete systems, in individual components (receivers, low-noise amplifiers, etc.), antennas and antenna mounts, and everything it takes to produce an operational system. So, get writing! If you have any questions, get in touch with us. And don't forget: *73* pays on acceptance—you can build or improve your TVRO station at our expense.

something like that was done for pure friendship, but leave it to some hams to get commercial about their hobby. For many years we've seen some of the DX clubs swapping lists of needed countries..."Hey, if you hear an XZ on, work him for me, okay?" So the big signal corps often gets in there and whips off a dozen or so contacts, making sure that friends and club members have the new country nailed down.

Ten dollars for the date, time, and frequency-of-your-choice contact seemed reasonable for quite a while, but now inflation has hit and friendships are being debased with demands for more cash. $20 is a more acceptable "gift" for a new one, with some rumors of $50 being asked. What is amateur radio coming to? I think that anything over $25 is outrageous.

MENTAL INCOMPETENCE

With the recent court decision to deny K6EOA his license on the basis of mental incompetence, many feel that things may have gone too far. Indeed, it has been reported that amateurs in southern California are in a panic, with many barricaded in their homes against a possible FCC onslaught.

Much of the mail in the last few weeks has expressed legitimate concern over this situation, bringing up again that old and unanswered question: Which comes first? Amateurs want to know whether normal people lose their sanity when they get ham licenses...or whether licenses are only issued to mental cases. It has apparently leaked out that amateurs must travel in pairs to get two oars in the water.

Frankly, I think this is a tempest in a teapot. I say that before judges rule on *our* sanity, someone should rule on *theirs*...and we would be in a standoff immediately. Remember that most judges started out as lawyers. I rest my case.

10,000 Contacts from Easter Island

—four Minnesotans make a dream come true

Easter Island, Isla De Pascua in Spanish, is positioned 2,500 miles west of Santiago, Chile, in the South Pacific, one of the most remote inhabited islands in the world. The island is substantially triangular in shape, 13 miles in length by four miles wide, and has three inactive volcanic formations.

The soil of the island is primarily of red volcanic dust which constantly found its way into the equipment, clothing, and the skin of the operators.

A group photo while sightseeing in the cave area. We are standing in front of Moai that face toward the town. From left to right, Hugh K4ESQ, Dick WØRIF, Father Dave CEØAE, George KØDHI (Steve's father), and Steve NØNO.

The island is accessible either by twice-weekly air service or by ship which sails one or two times a year.

Easter Island is governed by Chile and is assigned the call prefix CEØ. The island has not been active on the air for the past two years—from May, 1979, to February, 1981—as the station of Father Dave, priest of the Catholic Parish Parroquia, had been out of operation due to a storm in May of 1979.

Easter Island is noted for the Moai religious carvings which are positioned on the island, with numerous theories behind the some 600 statues as to who carved and erected them.

Steve Boller NØNO of Lake Minnetonka, Minnesota, and George Boller KØDHI (NØNO's father), Dick Linder WØRIF of Winona, Minnesota, and I operated the Easter Island DXpedition from February 17 to 24, 1981.

Thanks

While most articles give the "thanks" at the end of the article, it is particularly noted that this DXpedition would not have been possible but for the help of the following:

Burghardt Radio provided transceivers and accessories with expert follow-up advice on equipment repair while we were on Easter Island. It was discovered that one of the transceivers developed a receiver problem during operation and no courtesies are extended to the manufacturers of the transceivers who were very reluctant to assist in this DXpedition.

Butternut Electronics supplied their HF5V-III vertical, which performed perfectly and was an ideal antenna to transport as check-on baggage. Heathkit provided an SB-200 linear amplifier on loan, which worked marvelously. Sid Kitrell WØLYM at Telex/Hy-Gain assisted with a TH3 Mark II triband beam. Hiawatha Electronics of Winona furnished coaxial cable at cost. Lan-Chile Airlines and Braniff Airlines transported the four operators and all of the associated equipment including the triband beam, as discussed later, from Minneapolis to Easter Island by way of Santiago.

Patricio Fernandez, CE3GN, of Radio Club de Chile, assisted with the licensing procedures through the Secretaria de Telecommunications of Chile who graciously issued each operator an individual license. It is interesting to note that the Chilean licenses are considered a work of art, contrary to the computer-generated licenses issued by the Federal Communications Commission in the United States.

Finally, and most important, thanks goes to Father Dave CEØAE, whose accommodations for the operators and assistance with the many other important facets of this operation are deeply appreciated.

Preparation

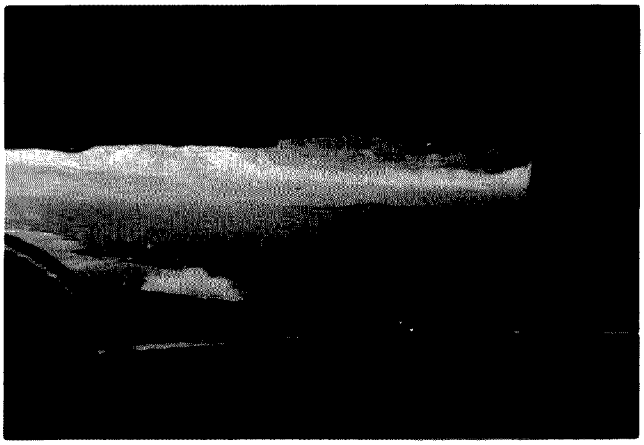
The first objective for a DXpedition is to determine the location, feasibility of operation, transportation, availability of power, lodging, food, and licensing for operation. Fortunately, Easter Island provided a superior location in the South Pacific during the middle of their summer, which was during the middle of the cold Minnesota winter, thus providing a major incentive for the operators.

Easter Island is accessible by transportation on Lan-Chile which flies two flights a week out to the island, using Boeing 707s. The island provides essentials of dependable electrical service and adequate housing facilities which made for an enjoyable trip and encouraged over 10,000 contacts in less than a week's time. The government of Chile granted reciprocal licensing to US amateurs with the assistance of the Radio Club de Chile.

Once the location of the DXpedition had been chosen and licensing procedures instituted by executing the documentation and forwarding the documents to the Radio Club de Chile, preparation of airline reservations was undertaken, along with the securing of equipment for operation. The airline reservations were particularly important because of the fact that there are only the two flights a week to the island, so, consequently, extra time was allowed for incoming and outgoing flights to prevent any scheduling problems.

The planning for the DXpedition began in September and was seriously undertaken in December, including the licensing procedures. Numerous discussions were conducted over "DX juice" (pitchers of beer), laying the groundwork for the operation and drafting lists for operating equipment and supplies. During these discussions, it was decided that two stations would be utilized, that the stations would be identical for interchangeability in the event of equipment failure, and that each group traveling to Easter Island would carry an operational station. Each group could operate independently of the other in case of separation of the parties and if only one party made it to the island.

In late December, with the licensing underway and airline reservations con-



Flying in on approach to Easter Island. This shot was taken by Steve NØNO from the cockpit of the Boeing 707.

Take-List for Easter Island DXpedition

FL-200 coax input single wire relay	Lights (7½ Watt)
SB-200	Miscellaneous wire goods
Transceivers (2) w/filters	VOM
Pwr supplies (2)	Wire nuts
Memory keyer	Screwdrivers—regular and phillips
Standby keyer	Diagonal cutters
Microphones (2)	Needle nose pliers
Paddles	Pencils
Logs	Tape—black plastic and cloth
SB-200 spares	#14 wire and connectors
Small speakers	Fuses
2 Verticals	Fans
Beam	Crescent wrenches
Dipole wire for 40 and 80	Vise grips
Coax—300' RG-8X	Travel Plugs
Radials	Flashlight
Fishline	Strapping tape (fiber)
Assorted coax connectors, male and female	Hose clamps
Swr bridge	Foot switch
Nylon cord for beam	Scrap paper
Beam mount	Swiss army knife
Insulators for dipoles	Spare SB-200 tubes
T-connectors	Ground radials
20,15,10m stubs	Aspirin
Soldering iron and solder	Band-Aids™
220-110-volt stepdown trans	Thermometer
Extension cords	Motion-sickness pills
	Gum

I had to go up on top of Father Dave's church to do antenna repairs for Father Dave in order to place his station back in operation. The church roof was rather rusted, so one always had to watch where he stepped.

firmed, contact was made with manufacturers and suppliers regarding any sponsorship and assistance for the DXpedition. It was noted that all of the manufacturers and suppliers were willing to cooperate by providing equipment at the lowest possible cost or on loan, which was graciously accepted.

All of the manufacturers and suppliers previously thanked were very cooperative in the spirit and brotherhood of amateur radio, with the exception of the manufacturer of transceivers who unfortunately not only did not reply to our requests but when contacted by telephone had a lack-of-candor problem in acknowledging assistance. This would not have upset the DXpedition as much except that the equipment suffered operational problems on Easter Island. As many an amateur can realize, there is no local radio store or supply house down the street to run to pick up a replacement i-f transformer for the receiver, or other parts.

Spare parts were taken along, but working on solid-state equipment in the middle of a remote island is not the most ideal situation, especially lacking the sophisticated testing equipment required. In spite of all this, repairs were made to a receiver i-f transformer by removing the opened transformer and using a capacitor as a substitute, although this resulted in reduced receiver sensitivity.

When the receiver problem was recognized in the middle of the week of operation, stateside amateurs in Ohio and California assisted by telephoning Jim Smith WBØMJY of Burghardt, who came up on frequency on 15m to diagnose the problem. Burghardt immediately identified the problem after being informed of the symptoms and instructed in disassembly of the transceiver to reach the opened transformer.

Disassembling a foreign-made transceiver to reach a circuit board below another circuit board can be a jigsaw puzzle on first-time disassembly. Burghardt advised on disassembly and stood by on frequency for advice on successful repairs. The operation continued for the week with little downtime.

Most important to the DXpedition after securing the licenses and equipment was drafting lists and dividing equipment prior to departure for equal weight distribution as well as independent operation of stations. The individuals traveled in groups of two and divided all equipment, including antennas, *prior* to departure to avoid any last-minute preparations.

The DXpedition was publicized in *The DX Bulletin*, the *Long Island DX Bulletin*, Geoff Watt's, and other DX bulletins as well as foreign publications, advising of operation and QSL procedures. This was undertaken a month prior to departure.

Final Travel Arrangements

While it is not an absolutely mandatory requirement, every DXpedition should have an airline pilot who knows his way around airlines. Our airline captain, Steve NØNO, prepared preliminary letters of introduction on company letterhead, not only in English, but also in the foreign language needed, which in our case was Spanish, just in case the letter was required for customs or for airline identification. The letters we had proved to be invaluable, especially the Spanish letters, when Lan-Chile was waiting for lost luggage to arrive from the Minneapolis airline.

Our travel arrangements were further expedited and secured by Steve, who was instrumental in obtaining transportation for the 12-foot-long beam package and masting from Minneapolis to Santiago and Easter Island, as well as meeting the other operators on arrival at customs in Santiago, where a Chilean customs pass allowed access and movement through the customs area. Finally, Steve coordinated the arrangements with Lan-Chile, who were most hospitable and accommodating to the DXpedition.

Travel

The two groups departed a couple of days before leaving for Easter Island on separate flights when Steve NØNO and his father George KØDHI left for Santiago from Minneapolis by way of Dallas, New York, Buenos Aires, and Santiago. Dick WØRIF and I departed the following day on a Minneapolis-based carrier to Miami, where that carrier managed to misplace the vertical antenna at the change-over in Chicago. This required numerous phone calls after arrival in Miami to not only track down the antenna but to expedite its shipment to Miami for departure on the Miami-Santiago flight of Lan-Chile.

Due to the short time between flights, it was necessary to secure the antenna in Miami, as otherwise the antenna undoubtedly would not have followed the group to Easter Island, making operation rather

difficult with only a beam and wire antennas. Fortunately, Lan-Chile was most cooperative in securing the antenna from a third carrier, Eastern Airlines, which transported it from Chicago to Lan-Chile in Miami.

It was found that the Lan-Chile personnel understood the urgency of the matter by reading the Spanish letter prepared by Steve on his airline stationery and made a special effort to locate and secure the antenna prior to our departure for Santiago. WØRIF and I proceeded to Santiago via Lima, Peru, with an extra long stopover due to the hydraulic failure in the DC-10. On our arrival at Santiago, NØNO was at the airport to assist in going through Chilean customs.

Going through customs is interesting, especially when one is carrying brand-new communications equipment through a country where possession of such equipment is a sensitive matter due to prior political considerations. It always helps to have someone in the group speak the language of the country and, fortunately, three of the operators were fluent in Spanish, although it was interesting to observe that the customs individual didn't want to discuss the matter in Spanish but preferred to discuss it in English. After the mission and purpose were explained to customs and the documented paper work, including licenses, was shown, the operators were waved through customs with only a cursory inspection. However, we learned that it is best not to show any papers or documents unless requested, to avoid prolonged questions and delays.

Layover

After spending over a day in the air between Minneapolis and Santiago and transferring through airports with the weight of the equipment, which was all carried on as hand luggage to avoid its being lost, let alone being banged around by the "baggage monkeys," everyone was ready for a good meal, hot shower, and a good night's rest before departing for the operation point at Easter Island. It also gave everyone a chance to have a final checkout of procedures and make final arrangements with the airline, Lan-Chile, for the five-hour flight to Easter Island.

After breakfast the next morning, we discovered on our trip out to the airport that our flight was to be delayed six hours, to late afternoon, so everyone decided to return to Santiago for more sightseeing. The tour was held by the senior member of our crew, George KØDHI, who had previously been to Santiago. Later, everyone returned to the airport for the afternoon departure on Lan-Chile. Fortunately, Steve had arranged to leave all of our baggage at his airline operations office, eliminating the need to carry the equipment between the airport and the hotel, let alone worrying about security of the equipment.

On boarding, Lan-Chile was most gracious in serving DX juice to the group to motivate our operational spirits and provide in-flight briefings in the cockpit by the Lan-Chile captain to our captain. The five-hour flight was rather uneventful, very enjoyable, and provided for interesting discussion up in the wheelhouse due to the professional courtesy of one airline captain to another captain. Thus, NØNO had the first view of Easter Island.

Arrival

The biggest asset to the DXpedition was that, by coincidence, the local amateur on Easter Island was also the priest of the only church on the island and a very highly regarded individual. Father Dave CEØAE, with his Jeep, awaited our arrival at the airport, dressed in his DX hat, T-shirt, shorts, and work boots. He had arranged accommodations for the group and assisted with the transferring of luggage (numerous trips) between the airport and the residence where we were to stay. Situated on an upper portion of the island, the residence afforded a beautiful view of the South Pacific. Father Dave had made arrangements for our group to have three rooms: two for operating and one for sleeping. This plan made operations on a twenty-four-hour basis possible.

These Moai statues on the hillside were carved and left standing before having been moved to the other side of the island. Many were still buried under the ground and some may have been washed out to sea.

The first introduction to the house, which I am sure by Pasquinian standards is upper middle class, was rather surprising to all of the operators. Fortunately, the majority of the homes have running water, electricity, and the infamous flushable toilets, and the climate is such that one can stay very comfortable both day and night.

Our first requirement was electricity for the rigs. Besides using a three-prong 220-volt plug which looked like a socket out of a 1920 radio set, it was noted that our house was wired with lamp cord, which obviously would have caused problems for our linear. After discussion on what to do, the decision was made to take one of the heavy-duty extension cords, cut off the plug, and wire directly into the knife switch of the 220-volt fuse box. The box was interestingly constructed, with fuses which looked to be something out of the 1920 era of ceramic fuses. The whole thing had obviously seen much use, and our questions as to the electrical system were many. Our fears proved to be true the following morning when the fuses blew and, as seems to be the custom on the island, one places a number of strands of lamp cord wire across the fuse instead of replacing it!

As a goodwill gesture to our host family, the group compensated them for all electricity used during the week, which also included *their* electricity. The total bill turned out to be about $40, or $10 per person for the week, certainly not unreasonable, considering that the electric power on the island is generated by

Everywhere Father Dave's Jeep went, a cloud of volcanic dust followed. This cloud eventually covered all of us with the red powder.

diesel-electric equipment with four generators, two running and two on standby. All of the fuel is brought in by ship once or twice a year and therefore the cost is much higher than elsewhere.

As a matter of fact, a majority of everything is brought in by ship. If you have ever thought that a can of Coke is expensive out of a machine, wait until you have to pay $2 for a can of Coke on Easter Island. You can't appreciate the real convenience of those 35-cent or 40-cent machines nowadays until you've bought a can on Easter Island.

Now back to the electrical system. It was jerry-rigged and served the group well when we ran an extension cord directly from the knife switch of the fuse box into the operation shack. We soon found that extension cords were invaluable pieces of equipment, as were multi-socket switchboxes, both of which we should have brought more of. Also, small step-down transformers of 220-110 were invaluable for powering extra cooling fans on the linears, soldering irons, and other accessories.

Operations

The transceivers were easily put into operation with the vertical antenna going up first and the tri-band beam following the next morning due to the late arrival of the plane at the island and rainfall that night. Numerous contacts were made the first evening with the Butternut five-band vertical, including our pipeline back to the Twin Cities. We had almost a daily schedule with Joe KBØCO, who operates from the notorious radio hill in Minnetonka and provided assistance and attended to some of the errands.

Included on page 1 of the logs are the calls of the Twin City DX Association, whose meeting adjourned just in time to get in on the opening volleys from CEØA. Numerous other amateurs provided phone patches to the members of the operators' families, including my patch home to Delaware at no cost, which we are so grateful for. Our other needs, such as getting Burghardt on the air the morning when we discovered we had receiver problems, also were attended to. Burghardt was able to remedy the situation in the field with the components which we had on hand, subsequently ensuring continuous operation of the stations.

We operated almost around the clock, usually stopping at 2 or 3 in the morning and then starting up early in the morning on 80 and 40 meters. The JA runs on 80 were a lot of fun, to say nothing of working the boys back home. Prior to departing home, Stig LA7JO called NØNO on the landline to arrange some 80-meter schedules. What a surprise it was when he talked for 15 minutes, at long-distance rates, just to get zone 12 on 80 meters. For two or three nights 80 meters was salvoed by S7 static and we thought we would never get in touch with Europe. We finally hooked up late one evening and made about 40 European QSOs before the sun rose there.

We operated contest-style for the most part and ended up with 10,000+ QSOs for the one-week operation. That's an average of one per minute, which includes sleeping time thrown in. We usually had two kWs in operation simultaneously and were saved from crossband interference by 1/4-wave stub traps which were connected to the output of the kWs with a T-connector. Without them the crossband interference was intolerable. That is a handy idea for Field Day operations.

All in all, most operators were courteous—with the usual exceptions. Our pet peeve was ops who would consistently, time after time, call out of turn when we had to resort to working call areas. There weren't many, but we feel that the "phantom" logger jotted their calls down in the list of bad guys. Maybe lists aren't that bad after all.

We also could not have existed without our outboard vfo's. We felt sorry for those who were unable to work split from the home front, but then again there probably weren't too many at home who felt sorry that we had spent mega-bucks to put Easter Island on the air. In other words, if you're really going to be serious about DX, buy yourself an external vfo.

In the dark of one of the evenings, one of the operators, in trying to rotate the antenna, thought he had the rotating line and just couldn't understand why the beam wasn't rotating—until he discovered that he had one of the guy lines and was trying to rotate the whole beam with the guy wire.

Credit has to be given to Hy-Gain for constructing a beam which performed very well under the conditions of erection as well as operation and rotation. Special thanks go to Sid Kitrell for assisting us with arrangements on the Telex/Hy-Gain beam.

Operation was smooth, and the operators had time to assist Father Dave in placing his station back on the air. I ended up on the roof of the church working on the vertical antenna, which gave me the opportunity to experience religion above the church as well as in the church. Father Dave's station was placed in operation within days after our arrival on Easter Island, and it is now being operated on a daily basis, time permitting, due to all of his other church duties on the island. While we were operating, Father Dave was sometimes able to stop in at the shack and do some operating himself, although being the only priest on the island places many demands on his time.

It is a custom on the island that blessings can be obtained from the church for such things as the tourist buses, the landing craft used to bring goods in the yearly visits by the ship to the island, fishing boats, and any other things for which the Pasquinians may want to receive blessings. It is interesting to note that

The picture above shows the operating home, which is in the upper portion of the village, the Butternut vertical, and the Telex/Hy-Gain beam. The road is made of red volcanic dust; the vegetation just grows wild. The small shack behind the large home houses a family of three.

Father Dave operating the station with the Kenwood TS-130S and Heath amp. Note cooling fan.

while we were there a fishing boat was blessed. The boat was blessed independently of the motor, which then was also blessed.

We sometimes thought that if we had observed proper customs and had had each piece of our equipment blessed, we may not have experienced some of the transceiver problems we encountered. We therefore concluded that it is very important to observe the local customs on the island and advise all others proceeding to Easter Island that they might want to undertake the blessings of the church on their equipment before beginning operation.

Father Dave took time to spend free moments with the operators individually, which was a rewarding experience for each of us, and he also spent time with us as a group, which included swimming at the beach, picnicking, and a very extensive tour and discussion of the past history of Easter Island. For a priest, Father Dave drove a four-wheel vehicle better than most people. He had no qualms about cutting through the ruts in the road and endured the red volcanic dust which permeated our nostrils and vocal cords, in addition to turning everyone a very particulated red color —that of volcanic dust. By the time of our departure, the operators, equipment, clothing, and baggage were all thoroughly saturated with volcanic dust.

One of the lighter moments of the trip occurred one evening when an operator came wild-eyed into the bedroom where another operator was sleeping. He had a panic-stricken look on his face, scanned the room with a flashlight, and in sheer terror pushed a stone up against the door. When questioned by the now-awakened operator as to what the hell was going on, he excitedly announced that he had seen a rat. I surmise that that operator may have had too much DX juice, which was strictly for medicinal purposes and for putting one into the proper frame of mind to secure the DX contacts. But the operator still swears to this day that the animal he saw was a rat.

It is possible that it may have been a little cockroach or a salamander, but if he says it is a rat, we'll let you decide for yourself. Later on in the evening when the "rats" were running through the ceiling, another operator banged on the ceiling to quiet them down so he could pull in some of the rarer DX locations and the "rat" person rose out of bed with that sheer panic-stricken look of terror again written across his face.

Pileups

Unfortunately, the group was not able to work all of the stations who wanted to work us, yet we were enthusiastically received by amateurs worldwide. Everyone participated in the spirit of amateur radio and brotherhood in an orderly manner, and the operators were QSLing those with SASEs to beat the new postal rates. Not one of us seemed to have thought of this, but a lot of the other stations who have QSLed have thoughtfully taken this into consideration and we graciously thank those who had more foresight in this area than we.

Incidentals

On every Dxpedition, the operator should consider taking along items which would have meaning and promote friendship among the individuals with whom we spend time. Fortunately, the operators took along some of the necessities which are not always readily obtainable at an economical cost on the island: soap, cigarettes, and articles of a radio nature for Father Dave.

When you consider putting seven people plus four amateur radio operators in one home, you can just let your imagination run wild on how most people would get along in an average American home. Fortunately, there was never a problem in spite of what little TVI or RFI we caused, and there were always pleasant words exchanged from early morning to late evening. We even performed babysitting duties and a little bit of emergency first-aid when one of the children of our host family cut his hand on a piece of broken glass. We used bandaging in the form of good old black electrical tape, which provided for a clean wound until the child could get down to the hospital and receive stitches by the doctor.

It is interesting to note that Easter Island, while being so remote, has a hospital with two doctors able to perform surgery and take care of any emergencies or illnesses. The hospital was prefabricated in Florida approximately ten years ago and shipped directly out to Easter Island. It includes all the modern conveniences of our hospitals, with x-rays, laboratory facilities, and

Here we are ready to leave, with the beads of the island around our necks. From left to right, Hugh, Steve, Father Dave, George, and Dick. Father Dave was prepared to pick up the new Mother Superior who was arriving on our departing flight.

dentistry. It was good to see, too, that there was a tennis court on the hospital grounds.

Toward the end of the week, the operators were beginning to become DXed out and beginning to think of home, especially with the wish to take hot showers, since none of the facilities on the island had showers except for the motels.

You can only do so much operating before becoming DXed out. Toward the end of the week and approaching 2,500 contacts per operator, operations were becoming more difficult due to lack of sleep and the constant pileups.

Departure

Leaving was much easier to do than arriving, but certainly was one of the sadder moments of the trip. Prior to the night of departure, we were visited by the English-speaking daughter of the local police sergeant who had previously stopped by a day earlier to ask what all of the shiny new antennas were for and to inspect our license documentation. It certainly was important to have proper documentation of the licenses issued by the Secretaria de Telecommunicationes of Chile, and upon presenting those to the sergeant, the only word from him was "perfect." Had we not had our licenses in order, God probably would have had us operating our DXpedition behind bars. It is important to observe the proper international regulations and laws of the host country.

The following night the sergeant dropped over with his daughter, so she could practice her English with our group, and it made for a very enjoyable evening. Our hosts and the operators exchanged gifts, took pictures, and hugged one another before an early bedtime. As the plane flight was oversold by *only* thirty seats, it was important to plan on an early arrival at the airport for seat selection.

Driving to the airport with Father Dave, I expressed to him that I really wouldn't have been disappointed if the plane had not come for another couple of days, as I would have happily continued operating. Unfortunately, the Lan-Chile flight arrived right on time, which, considering the five-hour flight across the ocean to Easter Island, was amazing. The group loaded into the plane and bade farewell to those who had come out to the airport to see us off. This is quite a custom and included decorating our group with native-made necklaces. We were to depart for home by way of Santiago.

W4PRO and W4GSM and their stations arrived on the same aircraft that we left on. They were met by Father Dave, who was picking up the new Mother Superior, which naturally had to take preference over the arriving amateurs. The other amateurs were to continue operations for the next month and also were to share operations with Chod Harris who was arriving on an archaelogical expedition.

Santiago Festivities

Arriving at the airport, I continued home to my patent law practice in Minneapolis, while the other three operators laid over in Santiago and went to a steak fry the following evening at the QTH of Patricio CE3GN. The Radio Club de Chile overextended their courtesies and provided for a fitting end to a DXpedition, which included gracious hospitality by the amateurs of their city and the country of Chile.

Chile is a very European country which exhibits very interesting French Provincial architecture along with people who are the most caring I have ever seen. You cannot really appreciate their hospitality until you spend time in their cities or fly on their airline. The hospitality was really overwhelming.

Tying It Up

On arriving home, all of the operators found stacks of QSL cards, and the first thing my neighbors said to me was that they knew we were busy down there because they had a large grocery bag stuffed full of QSL cards. Equipment had to be returned, accounts had to be divvied up between the operators, and equipment repairs had to be undertaken for our transceivers which were brought home in a state of makeshift repair. Fortunately, all of these were small matters, but all these things take time, including the unpacking of bags, returning of equipment, washing and cleaning of clothes, and processing all of the photographs that had been taken, including those that appear here.

After being home a week, thank-you notes were still being written and requests from others are still being undertaken and fulfilled. We tried to beat the postal rate hike, but then there's the processing of other cards which are expected to arrive over the next year or two, possibly from the bureaus.

Conclusion

As far as the operators were concerned, the DXpedition was a success, and people in Chile as well as others along our route have a much better feeling for amateur radio and what amateur radio is. The group was very careful to leave behind the true reputation of the spirit and brotherhood of amateur radio so that others will be welcome in the future, whether it be on Easter Island or at some point in between. Truly, it was a remarkable experience for all the members of the group and for the others who came into contact with us. It is something that will be remembered for the rest of our lives as being very rewarding and highly fulfilling. The members of our DXpedition strongly encourage those who are able to to undertake such an DXpedition should the opportunity ever arise. ■

A Very "Special" Weekend

—hams help New York's Special Olympics run smoothly

The motto of the 1981 New York State Special Olympics was "Let me win, but if I cannot win, let me be brave in the attempt" and it had a very special meaning to the Rookies Amateur Radio Association of Elmira Heights, New York. This is our story of a weekend for all to remember and the part amateur radio played in this unprecedented event.

I suppose one might say it all began with the 1980 Summer Games held in Elmira, New York. The amateur radio community was approached to provide communications for the event. After much planning and hard work, the 1980 games went on without a hitch. In fact, the state committee was so pleased with our communication efforts that they not only decided to make amateur radio a permanent part of the Special Olympics, but also elected to return to Elmira for a second consecutive summer. Never before in Special Olympic history had the event been repeated in the same town two consecutive years.

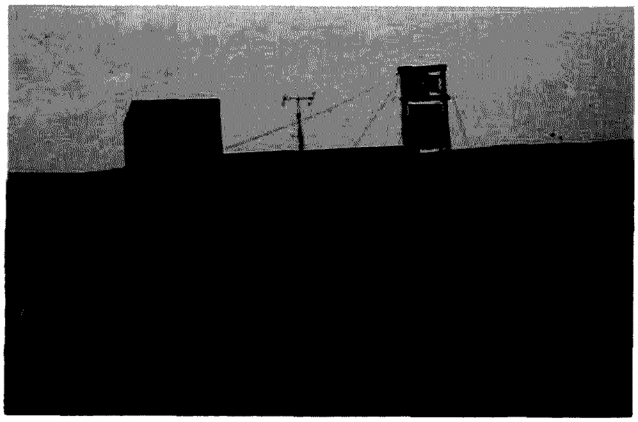
Special Olympians are really special.

Our goal now was not just to provide communications, but to provide *better* communications in 1981. In order to do this, planning for the June 13th weekend began in October, 1980. Every Wednesday evening for the entire winter, Frank Freeman WB2LMB could be found at Elmira College, meeting with the executive committee of the Special Olympics. Because an amateur was asked to be a member of the executive committee, this enabled us to provide more efficient communications. Information WB2LMB gained at these planning sessions was brought back to Jack Daugherty WA2DGS, who was in charge of organizing, assigning, and scheduling all volunteer amateurs and equipment for the Rookies and all area amateurs.

Our work for Saturday's event began Thursday evening, June 11th. There was much to be done. Assembling both two-meter net-control stations became first priority. A conference room in the college campus center was transformed into communications headquarters. Meanwhile, a crew was at Southside High School pitching a 20-man tent and tuning their new 80- and 40-meter bazookas. When all the groundwork was complete, a 32' tower and triband beam were erected. Late Thursday evening, all equipment was in readiness.

Friday morning came quickly to those who helped the previous evening, but by 7:30 am Bill MeadeKA2BED officially called the N3AQ .96/.36 repeater to Special Olympics traffic status only. By 8:00 am, 25 hams were at their assigned posts awaiting the arrival of buses from all 36 areas of New York State.

At the public address desk: WB2UOG, WA2FJM, KA2CLI, and WA3EBG.



A shot of the PA system, the low-band tent, and tower and beam.

Meanwhile, various amateurs were heard checking with net control concerning their weekend assignments and last-minute scheduling changes. It was really gratifying to see amateurs give so freely of their time to help, but to be staffed so well and running by noon Friday seemed really incredible, considering most had to find a way to be absent from their places of employment.

By 12:00 noon, along with bus arrival came K2GOO, a representative of a New York City amateur radio club. Since amateur radio is now to be a permanent part of the Special Olympics, an amateur representative from next year's host city was sent to observe our operation and the services that we provided.

By 1:00 pm, buses were arriving in a steady stream. Hams posted at the exit of the expressway stopped all buses and they were checked in with net control and assigned courtesy cars to follow through the city to the college.

At 2:00 pm, the 26 members of the executive committee had met with their personal amateur communicators. This enabled all members of the committee to be in constant contact with each other for discussions of hundreds of last-minute details. This chore took communicators to many areas, from Southside High School to the Chemung County Airport.

By 6:30 pm, most of the Olympians were settled into their living quarters and awaiting the evening's activities. By this time, roving Red Cross teams had been established and a communicator was assigned to each team. A second net was established on the .10/.70 repeater with net control at the college health center.

At 7:30 pm, the parade began to progress through downtown streets toward the main campus for opening ceremonies. Amateur radio operators ran at the beginning, middle, and end of the parade to provide information on the parade's progress through the city streets. Finally, the climax of the parade arrived—the torch bearer to light this year's Olympic torch. Close behind was his communicator, relating torch progress to net control. Although some of us had difficulty keeping up with our assignments, this had to be one of the most difficult.

At 9:00 pm, news from N3AQ, stationed at the airport, indicated that Governor Carey had indeed landed and would be rapidly proceeding by state-police escort to the site of the block dance on main campus. After a few words to the Olympians, he joined the band in a dance with his wife.

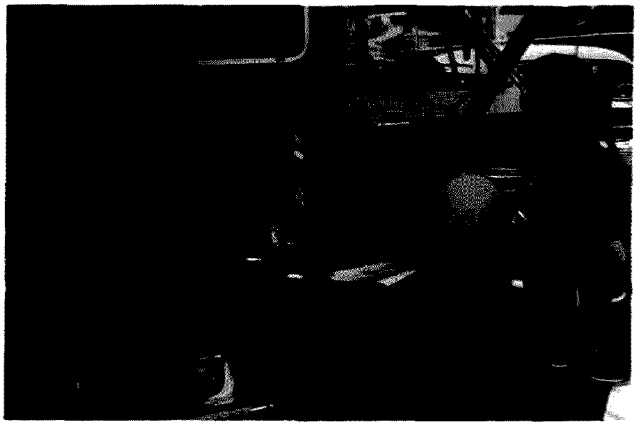
By now, approximately 65 radio operators were working in their assigned areas. As the music of the block dance rang in our ears and the children danced, our activity began to wind down. One exception, however, was the communicators with the roving first-aid crews.

By 11:30 pm, cleanup complete and all first-aid crews relieved by the Elmira Fire Department paramedics for their 11:00 pm to 7:00 am shift, the N3AQ Rookies repeater was released for normal use.

All in all, the first day went quite smoothly. One lost athlete was found quickly and there were only a few minor medical problems— bellyaches and pregame butterflies.

To most amateurs who worked Friday evening, Saturday arrived too quickly. At 6:00 am, personal communicators met with their assigned executive committee officials. KA2BED once again opened the .96/.36 repeater to official Special Olympics net traffic, for administrative messages. Meanwhile, the .10/.70 repeater handled a net for statistical data and various other traffic. Communicators aided in loading the many buses for the ride to the games' site.

9:00 am saw all contestants at the high school awaiting the torch bearer's arrival from the college. After a very touching ceremony and lighting of the



John N2AFW directing spectators to proper area.

Some of the crowd at the 1981 Special Olympic Games.

torch, the games officially began.

At this point, over 125 amateurs were involved in the event, providing communications with thousands of dollars worth of equipment. Of course, all this was at no cost to the Special Olympics and any cost incurred was absorbed by the Rookies as part of their community service.

Was it all worth it? After 6 hours out in the blazing sun, many may have wondered. This question was quickly answered with the smile of a winning athlete as he proudly ran up to you to show off the medals he won. It definitely was all worth it!

The 3:45 pm closing ceremonies were followed by the extinguishing of the torch until next summer in New York City. Bus loading began for the return to the college, and by 7:00 pm, all were reloaded for the trip to the victory dance at Elmira College's Murray Center, eight miles away. This dance was for the 1000 Olympians, 400 chaperones, and over 1500 volunteers. By 8:30, the victory dance was hopping. I personally don't know where they got all their energy. We again supplied security and first-aid communications.

By Saturday evening at midnight with all the buses back at the college, 85% of the Olympics were over. With nearly 4000 manhours of work behind us, we still had to secure the nets and get ready for tomorrow.

Sunday morning at 8:00 am, the .96/.36 net traffic resumed. Buses were checked out as they left the bus parking lot, loaded, and departed from the dorms. By 12 noon, all participants were on their way home.

What are our final thoughts now that it is all over? We would do it again without a doubt. This was a very satisfying and beautiful experience. Not only was it satisfying from a personal aspect, but also because of the banding together of all the amateurs from the southern tier of New York and the northern tier of Pennsylvania for a common cause. On a larger scale, you saw people from all walks of life in the community giving their time and individual talents to work together toward one common goal: providing the best Olympic Games ever for the children. Amateur radio operators were proud to have done their part for this common cause and to have served their community.■

Getting Ready for the Real Thing

—emergency preparedness that works

We picked our way carefully through the staging area out onto the open road. Clusters of brightly-colored tents and campers dotted the field. Strapped in the passenger seat of the open jeep, I warned Dave WA3THB whenever motorcycles crossed close to us. It was a hot, dry Memorial Day weekend at Fort Indiantown Gap in southeastern Pennsylvania. During the seven years that we had provided ham radio communications for the motorcycle enduro, this was the best weather we ever had.

Photos by WA3REY

The 146.04/.64 portable repeater atop Second Mountain. Don WB3AXO (left) and Keith WA3UDJ.

Up ahead the road straightened out as we ran the length of the valley. A thick plume of dust followed us as Dave picked up speed. The dust blocked my sight of the ambulance following close behind. The quick rise and fall of the ambulance siren told me that they were still with us. Quick jabs of the siren pierced the dust. I held on tighter. I was on the edge of my seat watching the road and the front right wheel, some three feet away. My cameras swung wildly from their neckstraps as Dave turned onto Cold Springs Road. The front tire whined as we came out of the turn.

"It's got to be right up ahead," Dave yelled above the siren, pointing towards the base of the mountain.

"NCS, this is W3FEY," the portable repeater on top of Second Mountain came to life. "Request that they expedite that ambulance, Net Control." George, W3FEY arrived at the scene of the accident and gave us the location. We were leading the ambulance to a motorcycle and car accident that happened a few minutes earlier along the enduro route.

Up ahead, a tight knot of people surrounded a downed rider lying in brush along side the road. Dave ran the jeep into a field. The ambulance passed us on our right. Grabbing cameras and HT, I followed Dave and the ambulance crew to the injured rider. George was standing in the road with an HT.

"W3FEY, this is Net Control."

"This is W3FEY."

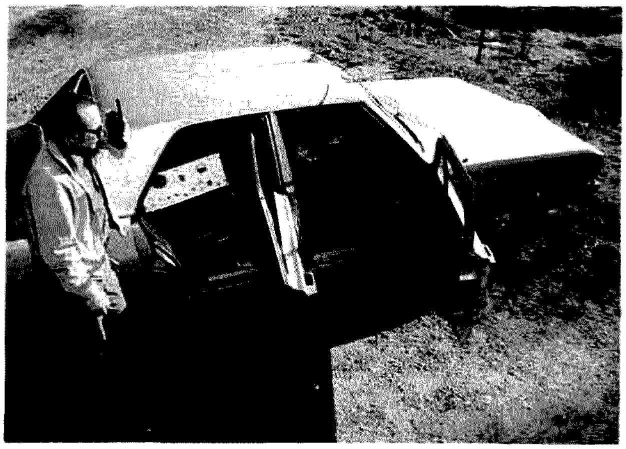
"George, we got a request to get somebody from the Trail Riders to go up the road and block traffic so we don't have any more trouble." Net Control's request was answered as George and a rider headed up the road.

"Hang in there, John, keep talking to me. Don't go to sleep, John," one of the EMTs was saying as they worked on the injured rider. "Keep talking to us, John. Don't go to sleep," the EMT kept repeating over and over again as they loaded the rider into the ambulance.

This was the first of five injuries on the enduro course that day. Ham radio directed each rescue.

Beginnings

In 1974, Jim Moore W3ASA, then president of



Frank N3RZ stands next to his portable repeater, a .70/.30 220 repeater linked to the main .40/.64 machine to extend coverage. The duplexer is in front seat, the machine and battery in the back, and the antenna is on the car roof.

Keith WA3UDJ at the starting line.

the Valley Forge Trail Riders (VFTR), persuaded a few hams to help his club provide communications over the 100-mile enduro route. The Moonshine Enduro takes its name from Moonshine Church, located next to the staging area.

The enduro trail starts from that staging area and snakes its way up mountains, across streams, and, in general, takes the most difficult, indirect route between start and finish lines. Jim repeatedly told us that the *enduro* is *not* a *race*. Instead, it is a course marked with paper arrows. Checkpoints dot the course. Riders have a specified time to travel from checkpoint to checkpoint. They are penalized for arriving early or late. The VFTR marks the riders' time cards as they arrive at each checkpoint. Hams have one basic job—communications. With 12 checkpoints along the route and between 300 and 500 riders, that means a lot of messages. Messages are either emergency or routine. The NCS directs the net from the staging area.

After seven enduros, I've come to some conclusions about things that have worked for us. A few of them are technical; some of them are operational. All of them are common sense. If you are at all interested in improving amateur emergency communications, stay with me. But don't limit these ideas to enduros only. They just might work during the next Hurricane Agnes or TMI.

Technical

The first two years, we attempted the impossible. We tried to cover two mountains and a valley on .52 simplex. The VFTR laid out 12 checkpoints over an area about 10 miles long and 5 miles wide. Not only was the enduro route tough for the riders, but it was rough on rf. At times, I've believed the VFTR purposely placed key checkpoints in the rf shadow of a mountain.

My main complaint with simplex operation over the enduro course is that all stations cannot hear each other all of the time. An early-morning situation might impact on stations later in the day. For instance, this year, course-direction arrows were maliciously removed early in the enduro. By operating through the repeater, all checkpoints were aware of the situation throughout the day. The other problem with simplex operation is the constant need for relays. This takes time. The NCS was located in the staging area. When operating simplex, a relay station had to repeat many of NCS's transmissions for outlying checkpoints. Solution: Replace the relay station with a repeater. Chances are very good that if you can get a ham into an area, then you can also put a portable repeater there. You might as well go first class and use the repeater as the relay. Put the ham somewhere else, where thinking and decision making is required, such as at a checkpoint.

People

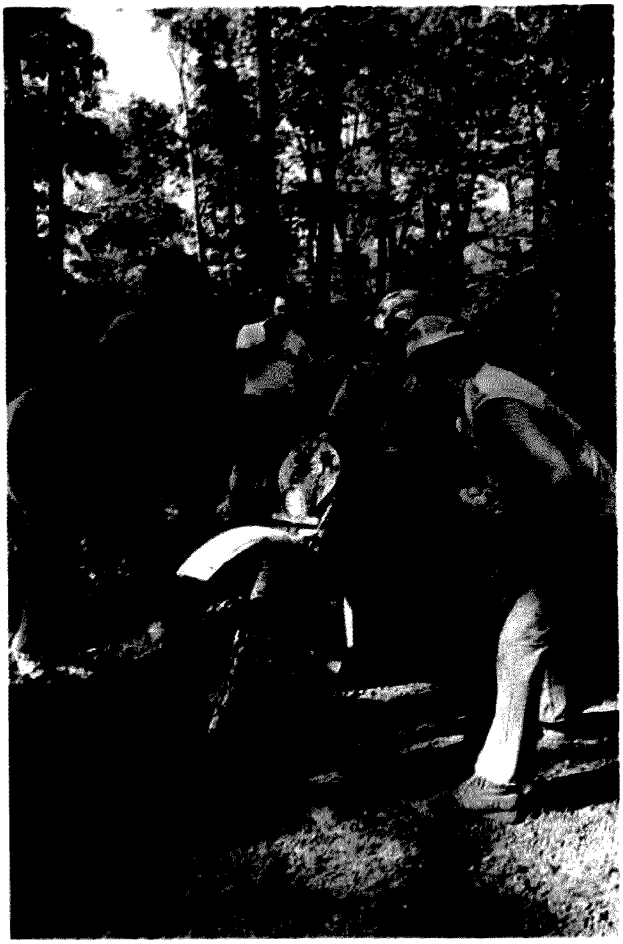
"People" also can be read as "volunteers." There are 12 checkpoints with, ideally, two hams to a checkpoint and the NCS, one ham for each of the ambulances, and one or two hams to ride dirt bikes into remote areas. That's at least 30 volunteers! Find me 30 volunteers, all hams, willing to give up one-third of their Memorial Day weekend. Sound impossible? It is, unless the event is really outstanding and you understand volunteers.

Ever wonder why the ARRL has so little participation in its simulated emergency tests or why the local radio club has a bad turnout for weekly RACES nets? And why does the local emergency coordinator have trouble filling out his yearly activity report? You've all heard them complain that hams are like everyone else. They don't want to get involved. They say that hams are complacent.

They are right.

Hams are complacent about simulated emergencies. Think about that. *Simulated* emergencies. Do you really get turned on by the idea of a simulated hurricane hitting Anytown, USA? If you do, I've got this nice piece of swamp land I'd like to talk to you about...

The problem is that there is very little that gets the adrenalin flowing during a simulation. That's why emergency tests and practice nets are failures. Why not give your volunteers the real thing—or at least a chance that the real thing might happen? If you can't find a motorcycle club with an enduro, then find a police chief up to his armpits in Halloween pranks. Or a citizens' crime watch patrolling the neighborhood with 100-mW CB HTs ("...Hey! Want to see how I can dial 911 through my Wilson HT?"). The idea just might catch on.



Ron K3TZJ, middle, with white shirt, watches from a safe distance as scores are marked by the checkpoint team.

I guess the greatest *simulation* of them all is Field Day. The club plans all year long how it's going to be tops in the *QST* listing. Everybody takes off that weekend for the country with emergency power from real emergency generators. I think you get extra points for that. Anyway, when the 24-hour emergency is over, everybody packs in the KWM2, the tribander, and the empty beer cans and heads home. Terrific emergency preparedness.

The first thing I don't understand, and I'm sure someone will help me, is why are all those hams running to the country when the emergency strikes? The other thing I can't quite figure out is if it's such a great emergency exercise, why didn't all those prepared contesters help us back in 1972 when Hurricane Agnes flooded the east coast during Field Day weekend.

Let's face it. Field Day is a great contest, but it's really only a simulation.

OK. You've got your enduro or crime watch or public transportation Guardian Angels and you are ready for the real exercise. Now you need people, pronounced, "volunteers." Two things are important here. First, don't limit your exercise to club members only. Find volunteers both in and outside of clubs. Just because a ham isn't a joiner doesn't make him a bad communicator. In the event of an emergency, the guy is a volunteer first and a club member second. During TMI, the only prerequisite was a valid ham license. ("I've got this great shift for you in the Hershey Sports Arena watching TMI evacuees from midnight until 3:00 am! You can join the club later.")

Now for the second thing about volunteers. There is no faster way to turn off a volunteer than to persuade him to leave work early and lose half a day's pay. Then, when he arrives on the scene, let him stand there with nothing to do. If you request volunteers, make sure that there is meaningful work for them to do or you probably just lost a future resource.

Estimating the number of people needed to do a job is difficult. During TMI, I estimated wrong. I was a local township CD director and I requested five more people than I actually needed to help me evacuate a nursing home. When the five volunteers arrived, the fire company had almost finished carrying bedfast residents into waiting ambulances. The county CD director saved me. He suggested that I find substitute work for those five people that were kind enough to lose a half-day's wages. Those volunteers did a great job cleaning, carrying, and loading cots from the nursing home onto waiting trucks destined for the mass care center. The task was modified, but they donated 15 valuable manhours during the emergency.

Operations

Our enduro taught me one lesson I won't forget. If you are assigning hams to checkpoints, give the guys a break. Assign two-man teams whenever possible. Many times, such as in an enduro, the terrain will be unfamiliar and two hams will work better than one.

Case in point: Three years ago, at one of the enduro checkpoints, the nicest-looking 100-pound female checkpoint crew person was run over by 450 pounds of enduro bike and rider. This happened on one of the many trails that crisscross the area. It wasn't too difficult to find the macadam road and to flag down the ambulance. The hard part was finding the right turns to take to lead the ambulance back to the injury. The trails all looked the same to me!

After trying three wrong trails, I called for help. Don WB3AXO saved ham radio's and my reputation that day. He rode his dirt bike along the enduro route until he found the accident. Then he talked me and the ambulance into him. The lesson is simple. Teams of two hams in unfamiliar territory work better than one ham alone.

Let's assume you've got your teams and you are ready to begin. Our operation isn't much different than everyday repeater operation. The big difference is that the repeater is closed. The NCS courteously tells stations outside the event that the machine is closed for the duration of the project. All stations request permission to communicate with other net stations. This is about the only formality needed to control the net.

There are only two kinds of traffic: emergency and routine. We don't use ARRL message forms, nor do we use standard texts. Sorry, this is the real world. It's much faster saying it and, if required, repeating it, than sitting down at a checkpoint and composing a message, counting the words, assigning the priority and handling instructions, etc. That stuff is great for 75 phone nets but it sure isn't needed on a 2-meter FM repeater.

And remember, good ham operation is measured by only one thing, effective

Accident! Dave checks location on map (WA3THB in center).

Accident! Dave WA3THB, holding blue bag and HT, as ambulance crew prepares to load.

communications. From the beginning, everyone is briefed on the mission. We are there for one reason and that is to communicate. We don't put arrows up on trails, pick up wrecked bikes, or mark score cards. The same thing applies to other activities. If you are working with a crime watch, you don't apprehend criminals. That's police work. In short, we are communicators.

Have Fun

I'm afraid to this point I've been pretty serious about injuries and nets and things. But there is a fun side to it all. Whatever event you choose, it just has to expand your life. Seven years ago, I thought dirt-bike riders were troublemakers—a little lower than the Hell's Angels and a little higher than Pagans. Wrong again. They're family people. And they have fun. That's the other nice thing about these activities. For one day, you mix with all kinds of people. There's time to swap ham stories and time to learn about motorbikes. But when it's all over, the best thing is that good feeling from a job well done that comes back to you every time you remember last year's enduro. ■

The FRG-7700 General-Coverage Receiver

—a first-rate rig for the shortwave bands

Yaesu has been producing shortwave general-coverage receivers for some time now, and their latest offering, the FRG-7700, obviously benefits from that experience. This machine represents a serious attempt to produce a receiver that is free of the shortcomings that plague many similar units, an attempt which largely appears to have succeeded! With no further ado, let's look at what the Yaesu has to offer.

The Features

The FRG-7700 is a PLL synthesizer-controlled receiver, boasting upconversion to a first i-f at 48 MHz. It covers the entire spectrum between 150 kHz and 29.9 MHz in one-MHz steps. For convenience, there are ten additional positions on the bandswitch for the ham bands. Both digital and analog readouts are provided and bandspread (tuning rate) is good for a receiver of this type. The tuning knob covers about 40 kHz per revolution, and all tuning is accomplished with a single tuning knob—gone are those irritating secondary controls that plagued early general-coverage receivers.

One of six bandpass filters is diode-selected by the bandswitch, allowing Yaesu to dispense with preselector and peaking controls. A 12-frequency memory is available as an option, which allows frequencies to be dialed up with the main tuning knob, stored with the push of a button, and recalled at will with the 12-position rotary M CH switch. A fine-tuning control with a range of about four kHz is provided for these memory channels.

A rotary switch selects mode: FM, LSB, USB, and AM. Three levels of selectivity are provided in the AM mode—2.7, 6, and 12 kHz at the −6-dB points. Selectivity in the SSB modes is rated at 2.7 kHz, and for FM it's 15 kHz. CW signals are tuned in either of the sideband modes, using the 2.7-kHz filter.

Other useful items found on the front panel include rotary attenuator, noise blanker on/off switch, volume and tone controls, agc fast/slow switch, panel-light dimmer switch, squelch for FM, two audio output jacks, and a speaker.

A 12-hour clock is included in the 7700's circuitry, and a number of front-panel switches are devoted to its various functions. These are clustered in the upper right-hand corner, and provide for setting the radio's on and off times. A countdown "sleep" timer allows you to program the radio to shut down after a period of up to 59 minutes. Time is displayed with the same readout as the frequency display, and a switch selects display of either one. Since the clock display can be left on while the rest of the radio is shut off, the FRG-7700 is an exotic but practical substitute for the more mundane AM/FM clock radio.

Rear-panel options are

Two Meters Getting A Little Boring?

—maybe you need to try crossband DXing

I was enjoying "the best cup of coffee in Pine Grove," according to Denny Gibson K3SLG. It was one of those cold January mornings when you drink 3 cups of coffee just to put off that inevitable walk to the truck. Lehman's Luncheonette was warm and friendly in the small Pennsylvania coal region town. Denny and I talked about converting the Regency high-band transmitter on the table in front of us to use in the Palmyra repeater. After the third cup of coffee, I picked up Denny's Icom IC-2AT HT and looked it over closely.

Denny K3SLG shortens a CB antenna to 10 meters.

"Dial up 145.25 and try it," Denny suggested. The thumbwheels clicked in place showing "5.25" on top of the HT. A full-quieting kerchunk came back in reply to the Icom push-to-talk switch.

"So where's the new repeater?" I asked, a little puzzled. For as long as I had operated 2-meter FM, Pine Grove was famous for having one of the best repeaters in the area. The 146.64-MHz machine had been operating on nearby Blue Mountain for the past 7 years. Denny was the owner of that repeater and was responsible for putting Pine Grove on many a ham's map through the repeater's reliable service and friendly operation. Now there apparently was a new subband repeater somewhere close by and my curiosity was growing.

"Where's the new machine, Denny?" I said impatiently.

"Across the street in my basement," he smiled. "It's all clip leads and parts lying on the bench right now, but I want to package it and put it up on the mountain alongside the .64 repeater."

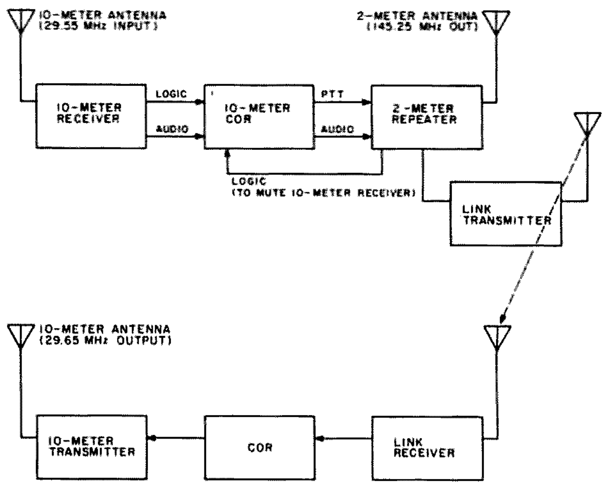

Fig. 1. Pine Grove 2/10-meter crossband repeater.

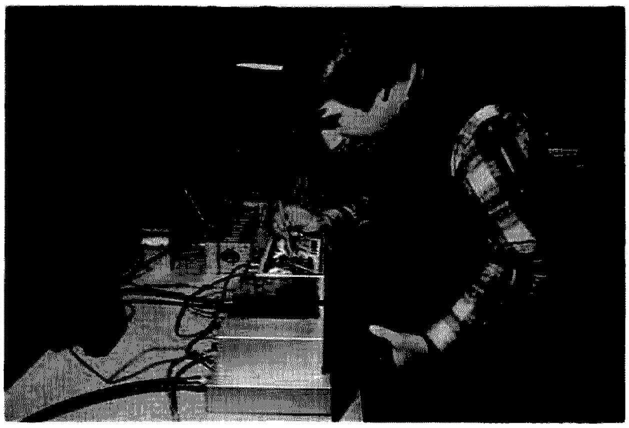
Denny K3SLG checks 10-meter FM with an Azden rig.



Close-up view of the 10-meter receiver and the Standard repeater with K3SLG.

Denny went on to explain that it was linked to a 10-meter repeater and had been on the air for about a week.

Somewhere in the back of my mind I remembered Don Yorty WB3AXO talking about converting a lowband RCA Supercarfone to 10-meter FM.

"The output is down at Don's house. He's using a Carfone on 29.65 MHz into a cut-down CB antenna," Denny added. "It runs about 100 Watts from a pair of 6146s."

Don lives a few miles east of Hershey, Pennsylvania, about 15 air miles south of Pine Grove.

"I have the receiver strip from the Carfone on my workbench. We're using my tribander for the 10-meter receiver antenna." Denny went on to describe the rest of the equipment. The 10-meter receiver was tied into a Standard 2-meter repeater and duplexer.

"We worked Germany, Sweden, England, and the Scottish Highlands through it since it's been on the air," Denny answered. He must have been reading my mind, I thought.

As we talked, the Icom 2AT kerchunked randomly on what sounded like noise bursts.

"That's something on the 10-meter input," Denny explained. "It comes and goes when the band is open."

But so far I didn't hear any Germany or Sweden. Just a sweeping carrier going across the 10-meter input. Oh well, I thought, to each his own or something like that. I guess it's the variety that makes ham radio interesting. No sense in getting all excited about DX on a 2-meter repeater, I concluded as I handed the HT back to Denny.

I picked up the Regency transceiver and headed across the street in the cold January morning. Turning my truck around I picked up Interstate 81 and started the long drive home. What the heck, I thought, I might as well dial up the new repeater and see how far out on the interstate I can hear the machine.

On 145.25 MHz the static bursts were replaced by a QSO. WA3YMU was working a station in Scotland. The Scottish GM4 station mentioned how glad he was to hear that our 52 hostages had been freed. He talked about how closely Europe had followed the whole ordeal.

Somewhere out there on the interstate, that QSO sparked new interest in me. Things had been going downhill in my ham radio hobby ever since my Novice days. I can still remember how exciting it was to work stations using CW with my old DX-20 and HR-10 receiver back when I was a WN3. After I got the Advanced ticket, my new TS-520, and some FM gear, things began to cool down.

But here I was again, feeling just as pumped up as when I was working stations on the Novice bands. This was something *really* different. Ham radio was unique again. Here was the chance of working Europe from my Datsun truck on the interstate. Or maybe even taking my Wilson HT to work some morning and sitting down at my desk and monitoring 145.25.

I'd be cool about it. I'd just let the HT sit there on my desk and wait for the band to open. The guys in the office would ask where that station was from and I'd say, "Oh, that's Tom over in Aberdeen, Scotland." Or maybe it would be Klaus in Denmark. Anyway, I'd pick up the HT and work Sweden or Denmark or Scotland right there from my desk.

I woke up at the next exit and turned around, headed back to Pine Grove. I wanted to learn more about this new crossband repeater.

A Closer Look at the Repeater

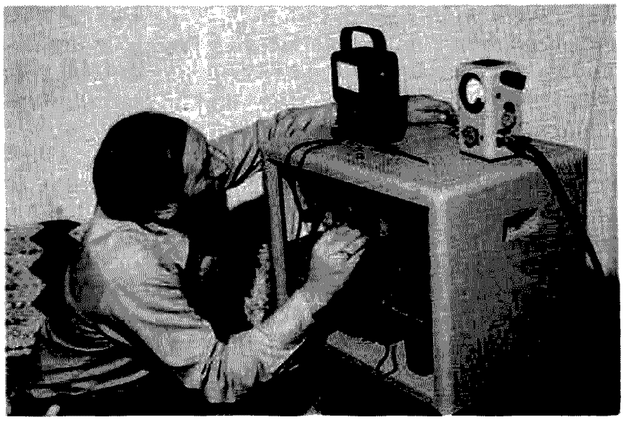
A glance at Fig. 1 shows what I learned about Pine Grove's 2-meter/10-meter crossband repeater. The equipment at the top of the diagram is located at K3SLG's home in Pine Grove. The 10-meter receiver is an old tube strip from an RCA Supercarfone. The 2-meter repeater is a Standard repeater with a duplexer connected to a 2-meter antenna on Denny's backyard tower. A link transmitter sends the signal to be repeated on 10 meters to Don WB3AXO, whose station is 15 miles away.

The 10-meter output at Don's home is quite simple. A link receiver picks up the Pine Grove signal and couples it through a COR into the 10-meter transmitter. Don converted the transmitter strip of the lowband Carfone to 29.65 MHz. The transmitter antenna is a $22 Channel Master 1/2-wave CB antenna cut down to 10 meters. It stands on top of Don's TV antenna tower.

The entire 10-meter transmitter package is about 2 feet high and sits neatly in a cabinet in the corner of Don's living room about 4 feet away from his wife's TV set.

Don invited me to his house one evening to show me the package. As he tuned up the transmitter, he pointed to the needle on the wattmeter as it came to rest on the 100-Watt mark. Don's wife sat next to him watching Buck Rogers' latest adventure on the TV, oblivious to the whole tune-

"Communications via 10 and 2 FM," 10-meter Carfone receiver, Icom 2AT.



Don WB3AXO with 10-meter Carfone transmitter.

up procedure. Obviously the 6146s caused no TVI.

Back to the top of Fig. 1, the block marked "10-meter COR" is the heart of the Pine Grove repeater system. The 10-meter COR looks into the 10-meter receiver squelch circuit. When it sees a 10-meter signal it closes a relay. That relay does 2 things.

First, it turns on the 2-meter transmitter by grounding the PTT line in the 2-meter repeater. The relay also couples 10-meter received audio into the 2-meter repeater transmitter.

When the 2-meter repeater receiver picks up a signal, the 2-meter repeater COR turns on the 2-meter repeater transmitter. At the same time, the 2-meter repeater COR sends a logic signal back to the 10-meter COR. The relay cuts off audio from the 10-meter receiver. This prevents random noise from being repeated along with 2-meter audio. The action of the 2 CORs gives priority to 2-meter signals over 10-meter signals in the Pine Grove system.

The 10-meter COR used at Pine Grove was taken from a GE Master Pro 4-channel scan head. Any similar COR could be used that turns on when the 10-meter receiver sees a signal.

Problems on 10 FM

Back in Pine Grove, Denny told me about some of the misadventures he ran into while putting the new machine on the air.

Finding a 2-meter frequency was relatively simple. Denny searched the 2-meter band using his Kenwood 7800. It was obvious that the only choices fell in the new repeater subband. Denny called Joe WA3GMS, the area frequency coordinator, and talked over a list of 4 proposed frequencies. They agreed on 145.25 MHz for the 2-meter output with a standard input down 600 kHz. Finding the 10-meter pair was a little more difficult.

At the suggestion of a local ham, Denny and Don chose 29.64 MHz for the repeater output with a standard input down 100 kHz on 29.55 MHz. The crystals were ordered for both repeaters and tune-up and testing began in early December. The repeaters were linked and on the air for 2 days when Denny remembers a short QSO he had with a veteran 10-meter FM user.

"It was our second day of operation on crossband. This W7 came on just as I was signing clear with a local station through the 2-meter side of the repeater. I asked the local to pick up the W7 because I had to get to work.

"The W7 said, '. . . No, I want you, K3SLG.'

"So I asked what I could do for him. He told me in no uncertain words. I can still remember. He said, 'Hey, old man, where are your brains?'

"I asked him if he'd care to explain what he meant. He said, 'I don't know where your brains are . . . You're on a well-established repeater frequency. Since you guys came on we can't work through the Metroplex repeater.'

"We told him we understood now after some 10-meter operation that 29.64 MHz is probably the most crowded 10-meter frequency and that we planned to move . . . that we were only testing. But that really didn't seem to satisfy him."

It was clear early on that finding a good 10-meter pair was going to be much more difficult than finding frequencies on 2 meters. For one thing, Denny found no rigid band plan as on 2 meters.

There are 2 acknowledged simplex frequencies on 10 FM, 29.5 and 29.6 MHz. Four repeater pairs round out the band plan: 29.62 MHz, 29.64 MHz, 29.66 MHz, and 29.68 MHz with respective inputs 100 kHz down on .52, .54, .56, and 29.58 MHz. But with a little more listening, repeaters were also found on 10-kHz splits.

"The repeater pairs given in the band plan were too crowded already for us to fit in . . ." Denny noted. "So it was like using a shoe horn. We squeezed in on 29.65 MHz and have been having good luck there."

Denny looks at coordinating 10 FM as pretty much an impossible job because of the band conditions.

"What you probably wouldn't tolerate on 2 meters you shrug off on 10-repeater overlaps, heterodynes and simplex operation on the repeater inputs. Coordination on 10 meters has been set at 1500 miles. That's half way across the country. If you take 4 repeater pairs like they have set up and spread them across the country, that gives you very few repeaters.

"That's why we moved to 29.65 MHz," Denny concluded.

The new crossband repeater's problems didn't end with the new frequency. A carrier sweeping across the 10-meter band keys up the repeater on a random basis. Denny and Don found that not only Pine Grove but also other east coast repeaters were being hit by the carrier.

Denny described it to me as "...an erratic series of transmissions like someone coming on frequency with multiple key-ups. The carrier remains there for a second or so, then disappears. Sometimes it sounds like a gunshot."

K3SLG calls the sweeping carrier the repeater's number one problem. Tom GM4HIG in Aberdeen, Scotland, hears it in Europe and terms it "a propagation phenomenon." Operators aren't at all sure if it is related to the Russian woodpecker. Ski W5MYH in Truth or Consequences, New Mexico, reports hearing the sweeping carrier on other east coast 10-meter repeaters.

Denny has considered building a delay into the repeater to prevent the key-ups but concluded that the variable length of time the carrier stays on frequency would probably make the delay useless.

Equipment for 10 FM

Listening to stations using the 10-meter side of the repeater reveals quite a mix of rigs. I've heard many Yaesu FT-901s, especially from Europe. The Azden PCS-2800 is another very popular rig used here in the states. The preprogrammed −100-kHz offset makes the rig as easy to use as my Clegg FM-28 on 2 meters.

I've heard of some hams in the York, Pennsylvania, area that have made a club project of 10 FM. It looks like the Pierce-Simpson Tiger 40A is the rig they like to convert. One of their members has a kit available to convert the 40-channel CB rigs to FM. I understand that the kit includes FM limiting and improved squelch action. More about the conversion as it becomes available.

For the present, I plan to operate through the 2-meter side of the repeater by using my Clegg FM-28. I can't forget my Wilson HT either. I have a set of crystals ordered. As soon as they come I'll be working Europe from my desk at work...

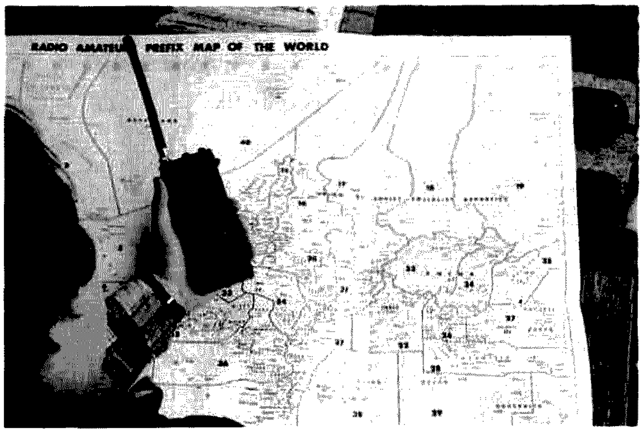
What's Ahead

Denny tells me that the next step in the crossband repeater's growth is getting it out of his basement and up on the mountain alongside the 146.64-MHz repeater. When that happens, the 145.25-MHz subband repeater and the 10-meter receiver will be housed on the mountaintop.

The final move will bring the 10-meter transmitter from WB3AXO's home up onto the mountain. Denny is negotiating for space at a site about a mile east of the present .64 repeater. He believes that should provide enough horizontal separation between transmitter and receiver to avoid desense. The two sites should be close enough, however, to provide a balanced 10-meter repeater for local hams working through the 10-meter side.

The whole system has been designed with simplicity in mind. The crossband repeater is open. No special tone control is required to use it.

In K3SLG's words, the crossband repeater "...gives the 2-meter hand-held or mobile operator the capability to work the world. It really gives ham radio an edge when compared with other radio services."■



Icom 2AT works Europe through the crossband repeater.

Left to right: Denny K3SLG, Don Melnicove, and Dave Lehman WA3ZEG gather in Lehman's Luncheonette to discuss 10-meter DX through the crossband machine.

A Lot of Hot Air

—keeping balloons aloft

If you are wondering what the relationship between hams and balloons is, read on.

It all started in 1979 when Dr. Tom Heinsheimer, an aerospace scientist with a sincere love of ballooning, according to Nate Brightman K6OSC, decided to revive the once-famous Gordon Bennett International Cup Race. The race continued with great popularity through the years 1906 to 1938. World War II quenched the race and nothing was done until 1979 when Dr. Heinsheimer caused its revival. Enter amateur radio!

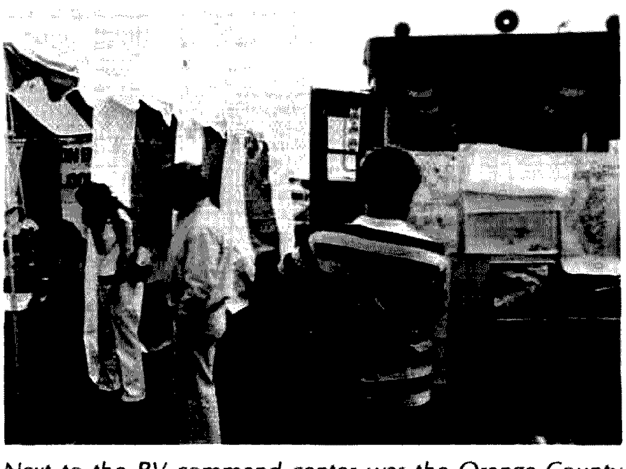
Nate was approached by Dr. Heinsheimer to provide help with the logistics. Keeping track of eighteen balloons that might go anywhere strongly suggested a widespread communications group. The Associated Radio Amateurs of Long Beach (ARALB) was challenged to the task and the wheels were set in motion. The Queen Mary W6RO, was the Net Control Station. W6RO is also the club station of the ARALB. Ron Boan AK6Y, the Emergency Coordinator of the Long Beach section of Los Angeles County, organized many volunteers to help with the tremendous number of tasks to be done. Since Mile Square Park in Orange County, an old Marine Corps Air Station, was chosen for the launch site for the 1980 race, the Orange County amateur radio clubs filled many of the positions as launch control checkpoints, net control operators, and observers.

This year, 1981, the race expanded under the leadership of Ron Boan, myself, and Joe Brown W6UBQ, SEC of Riverside and San Bernardino counties ARES groups. Two objectives were put to the test. The first objective, of course, was to provide communications for the race. The second was to handle the traffic, assign the personnel, etc., in the format of an ARES drill.

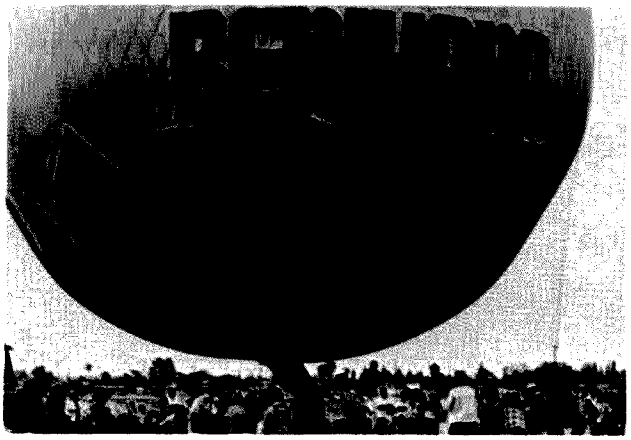
Mile Square Park was the starting point of the communications. Their assignment was to report via 145.52 simplex the actual time of launch of the balloons, or if there was a malfunction and delay, to report that also to net control. Since the balloons were to start launching at about 0900 on Saturday, April 25, everybody was in position and ready to start communications at 0600.

Some of the operators that helped at Mile Square Park on Saturday morning were: Al KA6IIJ, Glenn N6AFZ, Carol KA6JMW, Walt WB6RQT, Bob KE6C, Hector WB6WLB, Scott KE6B,

Launch-site communications for the Gordon Bennett International Cup Race were headed up by Ron AK6Y from his RV.



Next to the RV command center was the Orange County Sheriff's Department who maintained contact with the hams for emergency coordination.



The eventual winner, Benihana, *from Japan. Each balloon used an individual launch pad.*

Sandi WA6WZN, Herm K6TSM, and Jim W6PGM "manning" two meters.

Activity at the Orange County Communications Center.

Chuck KD6BX, Rosie WD6ERM, Jim KB6EX, John WA6HIJ, Chuck WB6ZAL, Dan WD6AWG, George N6AWF, Bob KA6CSS, Herb WB6USF, Paul N6DWR, Ken N6CCE, Bart W6CKT, Frank WB6JBV, Chuck WB6QKW, and Bob K6PHE. Ron AK6Y headed up the park operators from his RV. The various support groups, such as the Orange County Sheriff's Department, kept in constant touch with the hams in case of unexpected landings in the nearby area.

I might mention at this time that the Keller Peak Repeater, WB6FUB/R, which has a fantastic coverage of southern California, was turned over to the Balloon Race to provide the widespread communications link out of the park to net control and the observers. WB6FUB/R repeater is basically an ARES machine and its use provided an exercise in its coverage and the discipline of its users.

Net control, which interfaced Mile Square Park to the rest of the world, was located at the Orange County Communications Center located in the City of Orange, California, some 8 or 9 miles east of the Park. From this point, the launch information provided by the Park, such as balloon colors, markings, and headings, were transmitted through the repeater to the observers. They used both repeater frequencies of 146.985 and 223.80 MHz.

The hams manning net control over the weekend were: Don WB6GBW, Tom KA6MZN, Willis WB6WHT, Alex W6RE, Bob WA6SKE, Judi WB6SKE, Maggy KA6CVQ, Tom W6HT, Sherwood WD6CZE, Ed N6AEY, Fred K6KNC, Bill KB6HK, Judy KA6FBI, Gerald W6PCI, Frank KA6BUX, Bob KD6CF, Gordon W6SGI, Bob KD6DA, Rosemarie N6BCY, Mark KJ6H, Pat KA6ENG, Bob WB6FCP, Archie WD6CSL, Al KA6BNI, Lyle N6LB, Esther WA6UBU, and Bill W6TNR.

Since the balloons were intending to travel long distances, contact between our net control in Orange County and California's neighboring states was essential. The amateur radio station of K6RTR has a phenomenal "hot spot" for a straight shot to the Kingman, Arizona, repeater, WR7AEL. Del K6RTR, along with Ernie WA6FOW, Robin KA6HNY, and John KA6HRK provided this link to net control.

The prevailing winds across Orange County are marine onshore breezes from the Pacific Ocean toward the east. Since the balloons can be controlled only up and down, they are at the mercy of the wind direction. This means that the balloons must gain sufficient altitude in a relatively short distance to clear the tops of the Chino Hills and eventually the San Gabriel mountains. The San Gabriels reach 7,000 to 10,000 feet in certain locations. The chance that a balloon might not clear a hill or mountain made it mandatory that observers be stationed at the high points to watch for unscheduled landings.

Observers were stationed at strategic high points throughout Orange, Riverside, and San Bernardino counties. The following hams headed for the hills with their mobile units using portable beams, quads, or whatever it took to get into WB6FUB/R: Ted KB6IW, Jim WB6UIG, Oscar KA6GJI, Charlie WB6LKW, Roger WB6ARK, George W6LJK, Randy WA6WVJ, Sterling KD6Z, Jim WB6BZW, John KB6PT, Larry N6BNM, Dale WAØNKE/6, Gary WB6GCT, Clancy WA6HNQ, Lloyd WB6ULU, and Sid N6AQC. Fortunately, no balloons came down in the southern California area so no rescue operations were needed.

The winning balloon was the *Benihana* of Japan, traveling 1,346 miles to Millarton, North Dakota. Second was the US *Rosie O'Grady*, which landed 634 miles away in Myton, Utah. Third was another US balloon, *Ghost Rider*, landing in Nephi, Utah, 458 miles away.

Next year's Gordon Bennett balloon race will be on the weekend of April 24, 1982, and of course there will be hams and balloons once again.■

The DS2050 KSR RTTY Terminal

—top performance at a bottom price from HAL

For those of us who have only become interested in RTTY and are looking for equipment, there are only three alternatives worthy of serious consideration. The first is to build the equipment yourself. Sure to earn you the admiration of your friends, building is time-consuming if you want your station to enjoy the sophistication that is now taken for granted in commercial RTTY products.

The second alternative is to buy a microcomputer, some software, and an interface designed to mate the computer with your ham equipment. The advantage to this approach is that you have a computer that will play games with you or even do serious work when you aren't on the air. The disadvantage is that such systems are still comparatively expensive.

The final alternative is a dedicated system that is designed specifically for RTTY. The dedicated terminals available now offer a high level of sophistication at a very reasonable price. You take one out of the box, plug it into the rig, and you are on the air. If the manufacturer provides a cable set for your rig, you can unpack the stuff and be done with your first contact in less than twenty minutes! The HAL DS2050, an excellent example of such a terminal, is the subject of this review.

For those really new to RTTY, a little history is in order. HAL has been producing the DS2000 terminal and the ST5000 demodulator for several years; the pair sold in such quantities that it seemed only logical to put them in a single enclosure. Since there was plenty of room in the DS2000 for another circuit board, the DS2050 KSR was born. At a list price of $649.00, it offers a lot of RTTY performance at a relatively low cost. What will it do? I thought you'd never ask!

The Features

The DS2050 is essentially a Z-80-based electronic data terminal and a RTTY demodulator in a single package. Transmit and receive text is displayed on a video monitor (available from HAL), so the various noises associated with mechanical RTTY are blissfully absent. The DS2050 is capable of communicating in three different modes—Morse, Baudot, and ASCII. It will transmit Morse at speeds from one to 175 wpm (Morse at one wpm is good for a couple of laughs!). Baudot is supported at your choice of five speeds, 60, 66, 75, 100, and 132 wpm, and ASCII will zip along at either 110 or 300 baud. Morse also can be decoded and displayed on the screen if the Morse-receive option is installed.

The DS2050 was designed with convenience in

The Welz SP-300 Swr and Power Meter

—a little digging for this meter is worth the effort

Behold, there are swr meters thick upon on the Earth, but a truly great one is as rare and elusive as a camel without bad breath. So says a ham friend of mine from SU-land, and, you know, he's right! There must be at least a thousand different swr meters available, but of all these, I can count the ones which do everything well on the fingers of one hand.

It seems that there are two basic varieties of swr meters. The most common is the box with a two-position switch marked forward and reflected, and a sensitivity control. You flip your rig into the transmit mode, set the switch to forward, and adjust the control to full-scale. Flip the switch to reflected, and you can read swr directly. Neat, except that the thing is only good for relative measurement of power output.

I can think of several situations in which I need to measure absolute power output, and for this, I need a meter with a calibrated scale. Such meters have the same switch as the first example, but they dispense with the sensitivity control. The meter tells you how many Watts are going out, and how many Watts are being reflected. Theoretically, you still have the little chart that came with the meter, so you look up the two values and, bingo, you know what the swr is.

This method gets old fast when you are using the meter to set an antenna tuner, particularly when using a solid-state transmitter, since output of these varies with swr. You will be misled unless you look up the swr on the stupid chart every time you adjust something.

There are a few meters that offer the best of both worlds, and one of these is the Welz SP-300. Now, I won't feel bad if you've never heard of Welz, since their products haven't been available in the US until recently. The Welz meters enjoy a sterling reputation in Europe and Japan, but the only US distributor that I know of is NCG Company of Anaheim, California.

Welz offers a wide variety of meters, and the SP-300 that NCG imports is their best model. As you can see in the photograph, it doesn't look that much different from any other meter, but don't let that fool you. This meter is first cabin all the way. The first hint I got of its quality was when I pushed the buttons and rotated one of the pots. I'd forgotten how good expensive controls feel! The all-metal construction gives the meter a satisfying heft, which, aside from feeling good, keeps it from disappearing over the back of the table, as lightweight meters in my shack are wont to do.

I popped off the cover and was rewarded with a view of a lot of serious shielding—the meter, swr

Free PR for Ham Radio!

—how to cooperate with the news media

We hams do a lot of good for our communities. All too frequently, though, people don't hear about our deeds. Whether through modesty, apathy, or simply from not knowing how to avoid it, hams' civic contributions are often anonymous. That is unfortunate at best and, considering the fact that our regulated hobby needs all the help it can get, probably foolhardy to boot.

We need more favorable publicity to impress the public with the positive impact of amateurs' public service efforts. The few negative impressions ham operators have made, largely unintentional through TVI and antenna squabbles, will fade to an appropriately insignificant proportion if the hobby begins to get more of the "good press" it deserves.

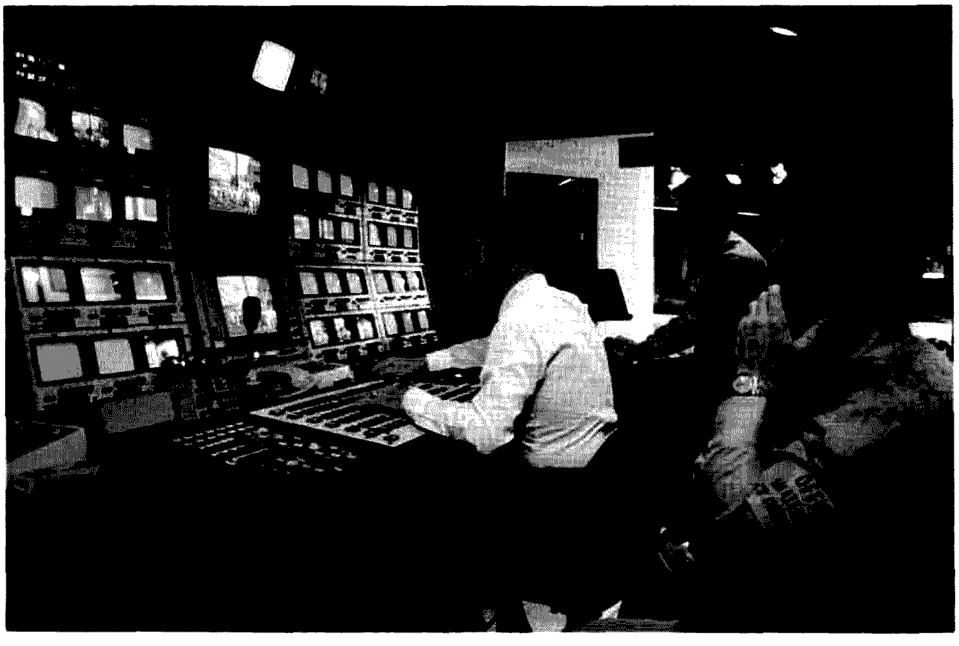
The ladies and gentlemen of the print and electronic media have an immense ability to focus public attention, but the news business is as competitive as pro football; it is a fact of life that reporting bad news usually scores more points than reporting good deeds. Editors, whose very jobs depend on the numbers of readers/listeners/viewers they attract and retain, will not ignore that fact without a good, businesslike reason. Listen up, gang, while I give you one.

The most hard-nosed editor will pay attention when you offer *free* expansion of his or her coverage of news events. Generally, the editor will be happy to reciprocate with just the kind of printed or broadcast publicity that ham radio wants and needs.

It works this way. When your ham group agrees to provide communications for a newsworthy event, invite the press to monitor your operation and to use what they hear as a part of their news coverage. I am referring to events planned in advance, not to emergency communications—except under controlled circumstances described later.

Now don't jump up on your soapbox and say "That's not legal!" According to what I have been told by an FCC official who should know, it *is* legal if you take a few simple steps in advance.

Amateur radio transmissions are protected as "private" by federal law despite the obvious vulnerability of that privacy to anyone with a receiver capable of tuning the ham bands. Under Section 605 of the Communications



John Snellen WD4FBG monitors operational frequency during an event and shares information with WTBS control room crew. Photo by Susan DeShazo, courtesy of WTBS Superstation, Atlanta.

Act, anyone violating that privacy by intercepting and divulging the content of a QSO could earn a criminal penalty of up to $10,000 and one year's imprisonment. Despite the long odds against being found out and prosecuted for eavesdropping, a news service would be crazy to risk even the possibility of running afoul of that law, by, say, repeating information picked up from a synthesized scanner in the newsroom.

It is nice to know that our transmissions are protected. But, for the purposes of getting publicity, it is also nice to know that we can shed that protection and openly urge the press to monitor our QSOs and use whatever they find newsworthy.

All that is necessary, according to FCC Associate General Counsel Lewis J. Paper, is for the hams to *agree in advance* to having their transmissions intercepted and their contents divulged.

Counselor Paper has confirmed, in an exchange of correspondence with me, that if amateurs give their permission in advance, the media or others can freely eavesdrop and make use of what they hear. This does not mean that radio or television stations can rebroadcast amateur transmissions as they happen, or live. That is banned by regulations governing commercial licensees. But insofar as use of the data contained in the ham transmissions is concerned, prior approval of the hams is all that is needed to avoid privacy violations under Section 605.

How do amateurs "give their prior approval" in a way which satisfies the rules? No clearcut way is given, but obviously it is best to use a method which can prove, if a challenge is ever made, that their permission to intercept was given *before* interception of their transmissions. When recruiting communicators for planned events like marathons, water events, or parades, it is a simple matter to make each operator's approval a condition of his or her participation. A clear caveat to that effect can be included in whatever recruiting messages you put into the mails or on the air and any communications plan you publish for the event.

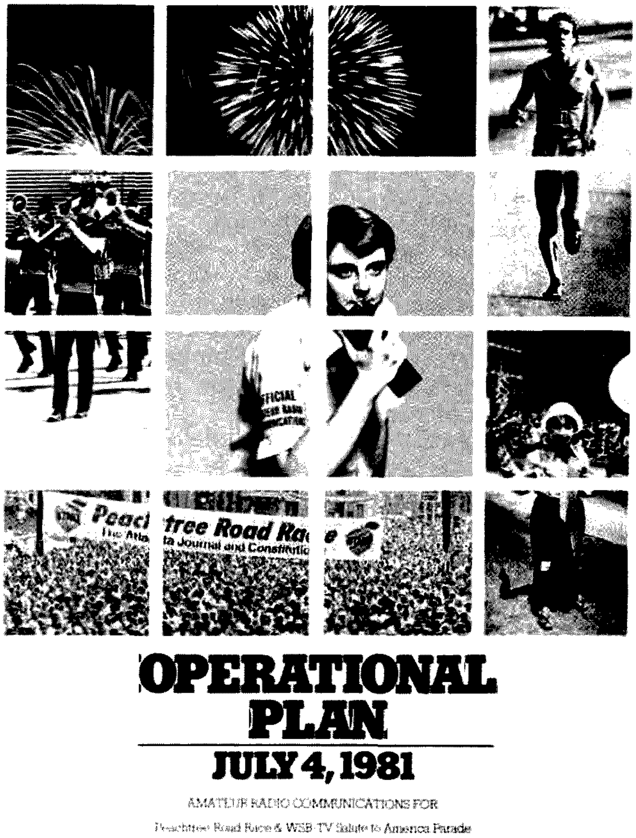
I realize that the communications which might attract the most media attention, and thus the most publicity for amateur radio, are those involved with emergency situations. But under most emergency operating conditions, asking and getting each communicator's permission for interception/divulgence could take so much time that the entire operation might be endangered. For that reason I would advise that amateurs not invite press coverage of their emergency communications except in cases of tightly organized and controlled local nets where all members have given blanket authorization for interception of transmissions whenever the net is called into session. Coordinators of local emergency nets whose members have agreed to being monitored can notify the media as an automatic part of calling up their nets for actual emergencies.

Just inviting the press to legally eavesdrop during amateur public service efforts is no guarantee they will accept the invitation. Even if they do, there is no assurance that hams will get the favorable credit they would like for material the media overhears and uses. Reaching that goal will take planning, sales ability, tact, and realistic caution. Here are some points to keep in mind:

● *Don't waste time. Your time and that of your media* contacts is too valuable to waste by suggesting that they monitor any amateur operation that common sense tells you couldn't interest them less. Before approaching an editor, make an effort to learn his or her organization's news interests. The organizers of the event you are working on probably will know from previous experience which media will cover it and can suggest those which might find it helpful to monitor your communications.

● *No time for shyness.* You cannot be shy or overly modest about asking the press to "plug" ham radio. Print space and broadcast time are for sale. The media rarely volunteer to give either away but, for a reason as good as yours—free expansion of media coverage—will usually be receptive to the idea when asked. You may find yourself the subject of a "sidebar" interview during a break in the activity reporters are covering. Be prepared, but be brief. The more you and your media contacts credit amateur radio overall rather than your ham club or group by name, the bigger the service you will be doing for your hobby.

● *Beware overselling.* Be honest. Tell editors accurately what their reporters can expect to hear if they *monitor your operations*. Don't try to sell the idea that only reports of serious traffic tie-ups will be heard on 146.82 MHz between seven and nine am when you know there will be rag chewing, too. The



This is the cover of the 16-page booklet that covers the monumental Peachtree Road Race and Fourth of July festivities. It provides in great detail the information required to successfully manage an event of this size.

Gene McCall WA4OAU, on board camera truck just ahead of the leaders in the Avon Atlanta Women's 10-km race, reports early changes in the lead.

WGST Newsradio sports reporter Steve Holman (in car) does an "on-the-scene" broadcast using information relayed by Gene Davenport N4AJL. Photo by Barry Milberg WD4DAA.

newsroom scanners will be programmed off that frequency, probably never to return, after the first minute's chitchat about swr or the next club meeting.

● *Be accommodating.* Chances are that only a few of the news organizations you approach will have receivers capable of monitoring amateur transmissions. You can accommodate those which don't by assigning hams to make their equipment available during the operation, wherever the editors ask. You should be prepared to provide this service at the scene of the event, in vehicles of any sort, and in newsrooms or studios.

Amateurs assigned this responsibility should be reminded that the news organization's business is collecting and reporting facts, and that messages on its behalf would thus have monetary value. Such messages are taboo. Even a simple request for another ham to repeat a missed message or to check a name could place *the amateur* in violation of FCC regulations.

Earphones are a must for operators assigned to radio or TV reporters who may need to go on the air themselves. Their stations don't want (and legally shouldn't have) background sound of ham transmissions rebroadcast on their own frequencies.

● *Caution: Don't accept payment.* Hams, as individuals, in clubs, or in other groups should remember that accepting payment of any kind for allowing the press to intercept and divulge their transmissions could result in suspension or loss of their licenses.

● *Think before transmitting.* Hams are morally, if not legally, responsible for the effect upon others of information which they transmit. When the press is known to be monitoring and to be free to use overheard information, the level of a hams' responsibility increases dramatically. A thoughtless transmission, possibly occasioned by overeagerness to please the media, could have unexpected and perhaps harmful results. The name of an accident victim or a guessed-at but false diagnosis could easily be reported on newscasts before the data are confirmed or families are contacted. If potentially alarming messages must be sent, hams should clearly state their source of information. "Officer J. D. Smith, badge number 1234, has talked with the doctor. Officer Smith says. . ." The ham would be wise to make a written record of the officer's name and badge number, just in case.

● *You can withdraw consent to monitor, but. . .* The amateur group's permission for the press to intercept and divulge transmissions can be withdrawn at any time—even during an operation if something urgent makes it necessary. A need could arise, for example, to transmit medical or security messages which should be kept as confidential as possible. Such messages, before their content is revealed, should be clearly identified as private and not intended to be divulged. But think twice before withdrawing the very permission you have gone to some effort to give and exploit. When there is a story in the wind, trying to keep the press away from it can be a very unpleasant experience. Your whole press relations program could explode in your face. Most aggressive reporters will ignore the prohibition against divulgence, anyway, figuring that this is a problem for the lawyers, not for them!

● *Explain. Don't threaten.* Early on, and for two reasons, editors, and reporters should be made aware of the privacy provisions of Section 605. Hopefully, they will be impressed with your group taking the initiative to help them expand

POSITIVE PUBLICITY

The author organizes communications in Atlanta, Georgia, for events like the huge (over 25,000 runners!) Peachtree Road Race. Thirty ham operators used two-meter equipment to work the annual Fourth of July race this year. They provided logistic, course, and medical communications.

Following the guidelines spelled out in this article, the Atlanta hams gained excellent national publicity for the hobby by allowing their QSOs to be monitored by commercial broadcasters, including the "Superstation," WTBS-TV. The race—and a lot of nice credit for amateur radio—was telecast into an unbelieveable 15,560,000 homes via satellite and cable. Viewers in all 50 states and Puerto Rico, more than had ever seen a road race before, saw The Peachtree and learned that ham radio played a major role in making it happen.

pand their coverage of whatever event you are supporting by allowing interception and divulgence of transmissions, and they also should be impressed with (but not scared off by) the fact that this is a privilege rather than a right, given for a specific time and purpose. At the risk of boring them with what many may consider bureaucratic trivia, you should be certain that the press understands that this privilege can be immediately cancelled at the amateurs' discretion and that there would be criminal penalties associated with willful violation of the hams' thus-reinstated privacy. A thorough, non-threatening explanation up front could prevent embarrassment or worse if something unforeseen comes up later.

This article deals with an interpretation of the regulations, and I must point out that I am not an attorney and am not intending to give legal advice to readers. I have no doubts at all, personally, however, that my correspondence with the Commission's associate general counsel confirms that hams can use this method to legally solicit publicity for the hobby. Based on Mr. Paper's letters, I intend to include cooperation with the press as an integral part of any ham communications effort I am asked to organize.

The FCC may have something to say about amateurs going after favorable publicity so aggressively, although to disagree with hams' right to do so would seem to dispute the Commission's own legal interpretation as stated by their associate general counsel. If any such dispute arises, I suspect that you will read about it right here in *73 Magazine*. ■

Tricking-Out the FT-901/902

—some competition mods from the Fox-Tango racing team

In the almost ten years that Milt Lowens has served as editor of the *Fox-Tango Club Newsletter*—at the beginning of which time he founded the International Fox-Tango Club for Yaesu equipment owners—literally thousands of suggestions for improving Yaesu rigs have crossed his desk. Among the best in terms of simplicity and effectiveness was one first written in abbreviated form by Harold Johnson for the November, 1980, issue of the *Newsletter*.

The first part of the following article is that 1980 piece essentially as written, but with some italicized parenthetic comments by Milton Lowens. The second part (written by Milt) gives generously illustrated instructions which should enable even a comparative neophyte to do the job. No irreversible changes are involved, no drilling or panel changes are needed, and no wiring changes are required except on one, easily unplugged, circuit board. Considering the reported effects of this modification and his own experience with it in his FT-901D, it is no wonder Milt rates it as a "winner"!

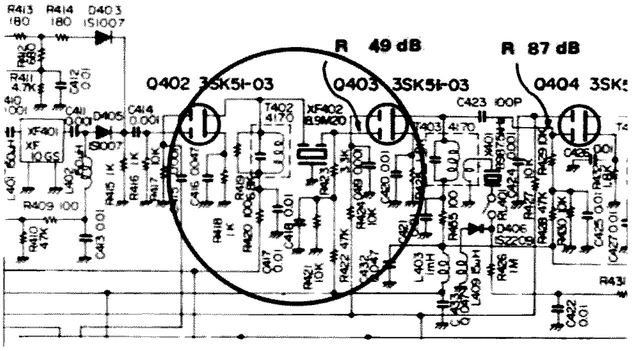

Fig. 1. Partial schematic of i-f board PB-1704 showing original connections of XF402 and related components.

Part I: Significantly Improving the FT-901/902 Receiver

In a continuing search for a replacement for my 20-year-old KWM-2 receiver, I have either purchased or borrowed almost every "new" radio that has come down the pike. It is a sad commentary on the state of the art that, despite fringe bells, whistles, and cosmetic changes, nothing I can find on the market has measured up to the 25-year-old design, at least in the receiver department. In the final analysis, I have been forced to the conclusion that, because of deficiencies in various parameters, the present solid-state radios cannot copy signals that are still solid on the KWM-2.

Of several makes and models owned and evaluated, the Yaesu FT-901DM [*and now the 902 with all the WARC bands and other improvements, including an excellent new true-reading digital display*] came closest to measuring up to the very stringent standards I had set. Besides, its bells and whistles included the 160-meter band, all of ten meters, FM, AM, and FSK operating modes in addition to the standard SSB and CW, memories galore, RIT tuning for RX, TX, or both, built in ac and dc supplies, true rf speech processing, an automatic Curtis keyer, true variable passband and rejection notch tuning, and a very fine audio peak filter (to mention a few!).

After the first blush of ownership pride, however, one major problem with this competition grade radio (as Yaesu calls it) was a total lack of ability to compete in the receiving department. In the presence of strong signals outside the receiver passband, readability of weak signals was degraded by reciprocal mixing and agc pumping. The radio actually was in my operating position three times and each time was replaced with "old grandad." The last time, I fully intended to get rid of it as another lost cause when I decided to try to cure the shortcomings since the fringe benefits were so great. Measurements taken on the radio prior to attempting surgery revealed an ultimate rejection of only 55 dB, and I began to realize that there was a task of some magnitude ahead if I were to effect a "cure."

It was assumed initially that there must be some leakage around the existing selectivity circuits in the radio, and the search for the path was on. Since the crystal filter was diode-switched, there was the possibility of inadequate bypassing and feed-around

occurring via the dc control lines. Twenty dollars worth of glass 0.1-μF caps at strategic spots on the filter board later, showed a total improvement of 0.

Reading of similar problems plaguing the TS-820 where the problem was in the noise-blanker circuitry, C225 on the noise-blanker board of the 901 was removed. This certainly opened the noise-blanker path but improved the ultimate rejection by not quite 1 dB. Hardly a dramatic improvement! Then noting that the i-f was passed around the filter in the FM mode, here was another possibility; diode D310 on the filter board was removed. Alas, life was not to be so easy. This simple cure netted only another 1.5 dB of improvement. Obviously, the engineers at Yaesu had cleaned up these paths right well! After all this I could see only two other possibilities: I figured I might as well tackle the cheapest one first.

That was the chance of cross-coupling in the common cabling under the pluggable board sockets. The filter board was pulled; the jumpers bypassing the optional (but not installed) CW filter were removed [*thus opening the i-f chain*]. Upon re-installation of the filter board, no difference could be determined between power on and power off in the CW mode. The radio was dead with 100,000 microvolts at the input. That experiment satisfied me that the ultimate rejection was really a function of the factory-installed filter; it just flattened out for me at −55 dB. Unfortunately, there are still lots of countries on the air that I need that are represented by signals lots weaker than 55 dB down from some of the W2s heard at the QTH.

A custom filter of at least 12 poles that would mechanically fit the filter board was a bit rich for my blood (about half the price of the radio), so an equivalent of the existing filter was ordered from the Fox-Tango Corporation for something less than $60.00. Although there was some delay at the time, this excellent filter is now available from stock. (See Parts List.) The filter was installed with diode switching at the input to the balanced modulator—after the i-f gain, as suggested by Sabin and Hayward. Skirt selectivity improvement was noticed, but since the agc amplifier is fed from a point ahead of the second filter, agc pumping from strong adjacent signals was still present and tended to mask or distort weak signal reception.

So I tried another approach (no one can accuse me of not being persistent, hi!). To obtain the band-pass-tuning feature, Yaesu up-down converts the 9-MHz i-f to 10.8 MHz with filtering at each frequency to permit a variable-width window of common passbands. This feature, first advanced by Bill Orr in the 50s, works superbly since using a common oscillator results in passband tuning with zero tracking error. After the dual-heterodyning process, a modest filter is required to rid the radio of mixing products. An extremely simple two-pole crystal monolithic filter, XF402, was utilized for this purpose (by Yaesu). See Fig. 1. While it cleans up these spurious products nicely, the filter is so elementary that it provides no help at all in enhancing the skirts of the main filter (XF302, 3, or 4).

Despite a disparity in impedance levels, filter XF402 was removed from the i-f board, the switching diodes and filtering on the added filter were removed, terminating resistors were changed, and the new filter was patched in in place of XF402. No attempt was made to add gain to the i-f amplifier to compensate for the insertion loss of the new multi-pole filter. [*Subsequently, Harold did devise a simple method for adding gain; it is described below.*]

The unconverted radio has an i-f gain such that a .7-microvolt signal gives 10-dB signal-to-signal + noise, and the MDS figure remains unchanged with the additional filter installed. I have cascaded filters in my KWM-2 and several "S" lines with spectacular results. Addition of this second filter to the FT-901DM [*and probably to the 902*] is no less startling. It turns this "competition grade" radio into a real contender.

In performing this surgery on two different radios (4 filters), the filters seem extremely well matched for center frequency with practically no effect on the "nose." The skirts, however, take a real nose dive. Ultimate rejection is beyond my ability to measure (in excess of 100 dB) and the agc system just doesn't respond to anything that isn't in the passband.

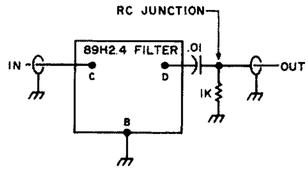

Fig. 2. Connections to new 8-pole filter YF89H2.4.

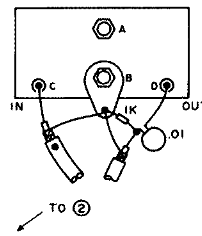

Fig. 3. Pictorial showing connections to new 8-pole filter YF89H2.4.

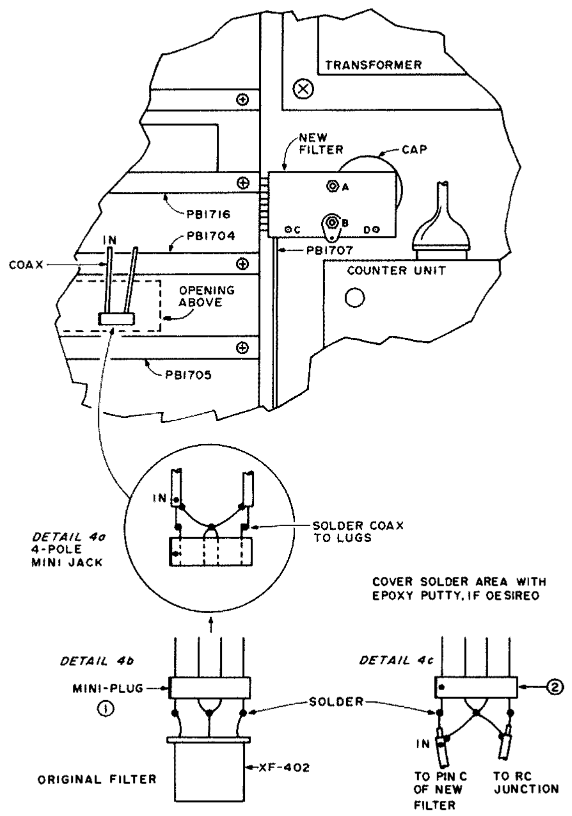

Fig. 4. Pictorial showing placement of new filter and its related connectors and cables.

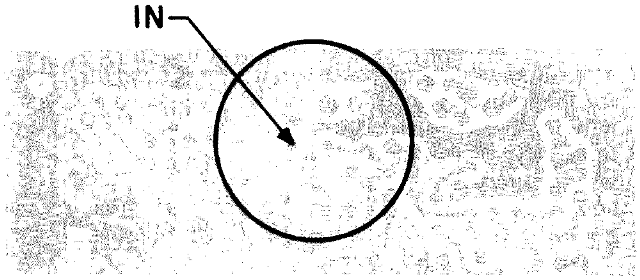

Fig. 5. Foil side of PB-1704 with detail showing required changes. Also see detail 8c.

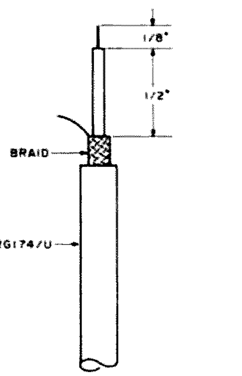

Fig. 6. Preparing the ends of RG-174/U coax for connection to PB-1704.

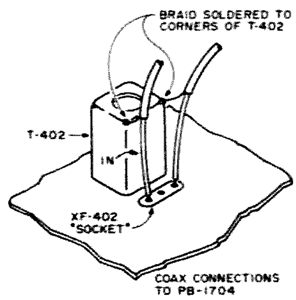

Fig. 7. Detail showing method of connecting coax to PB-1704.

Table 1 details the before and after bandwidths but cannot adequately describe the increase in depth and steepness of the skirts. You almost have to hear it to believe it.

Now, if someone would just figure out how to make the *backward* radio tune forward, I would be as happy as a clam with my "new" FT-901DM! [*Too bad you were a bit early, Harold. The new 902 model tunes, as it should, so that clockwise rotation of the knob increases the frequency.*]

Many Fox-Tango Club members besides the authors have tried this filter-cascading modification and have found it relatively easy to make and very effective. We would appreciate receiving your reports if you try it.

For the purpose of "before and after" comparison, tune your rig for maximum S-meter deflection with the CAL signal at 14,200 kHz and make a note of the reading.

Test Conditions and Instrumentation

Set-up conditions for Table 1 were Hewlett-Packard 608 signal generator through 5-dB pad, passband tuning at 0, USB mode, notch filter out, and agc off.

Effects of Filter Cascading In FT-901

Signal Level uV	dB	Bandwidth in Hz With Cascade Filter Out	In	Reduction
1	−6	2400	2050	350
10	−20	2500	2100	400
100	−40	2800	2400	400
1000	−60	3400	2600	800
10k	−80	12400	4200	8200
100k	−100	33000	15800	*

*Reciprocal mixing at this signal level.

Table 1.

Part II: FT-901/902 Filter Cascading

Harold mentioned two problems in the first part of this article which troubled me a bit: the impedance mismatch when inserting the new filter and the resulting losses. Even though neither of these had a significant effect in terms of day-to-day operations because of the inherent sensitivity of the 901, I realized that some purists might be unhappy. However, before I could even write Harold about the insertion loss problem, he solved it in a simple and ingenious way by changing the location of the output coupling 1k resistor so as to load down and slightly change the bias on the next stage, Q403. This increased its gain just enough to offset the filter insertion losses almost exactly. (See Fig. 2.)

The matter of improving the impedance matching seemed like a more difficult problem until a fortunate discovery was made. Fig. 1 shows pertinent portions of the original circuitry of PB-1704C, the i-f board. The basic idea of the modification was to remove XF402 (between Q402 and Q403) and to substitute the 8-pole, 2.4-kHz bandwidth Fox-Tango filter for it. Note that the input end of the original filter is attached to the upper end of the coil in T402 which, with its shunting capacitor, looks more like a simple resonant circuit than a transformer. *If it's a transformer, where is the secondary winding?* All the other "T's" had them! Maybe T402 did too! A study of the parts list in the service manual vindicated my hunch: T402 *and* T403 had identical part numbers and a step-down secondary winding—ideal for impedance-matching the new filter! I could hardly wait to examine the back of PB-1704C in the vicinity of T402 since the parts layout diagram (Fig. 5) showed what looked like a transformer pin not connected to anything.

Eureka! I had found the solution. A few checks with the ohmmeter confirmed the presence of the winding with one end grounded, just like T403. Prior to this discovery, I had made the modification in my own FT-901D and was pleased with its results. However, upon making the simple change to utilize the newly-found secondary winding, the maximum CAL signal indication increased several dB! Talk about gilding the lily—I was delighted since the selectivity also seemed even better than before. So the following detailed instructions include the use of T402's "invisible" secondary. (See Fig. 8.)

One thing more. As originally proposed, W4ZCB's mod eliminates the possibility of AM/FM operation, a serious loss since the FM, at least, is a very desirable feature in the FT-901DM and D models (even though the DE and SD models do not have it, and for them the first design was fine—except for that secret secondary). This problem was solved by, in effect, providing a "socket" at the end of coax leads connected to the points on the board to which the original 2-pole filter was soldered.

This new socket terminated under a small removable lid in the top of the cabinet so that, by using matching miniature plugs, either the original 20-kHz filter (very small) or the new 2.4-kHz filter (at the end of another short length of coax) could readily be plugged in when desired. Further, for special purposes, *any* filter could be plugged in at this point temporarily while resting on top of the cabinet as long as a mating plug was connected to it.

They say that one picture

is worth a thousand words, and there are lots of pictures so I'll try to keep the words to a minimum. Anyway, start by comparing Figs. 1 and 8 carefully, noting the differences. Then become familiar with the others—especially the details. Next, take off the top cover of the cabinet (don't be afraid) and remove the black plastic panel at the left, over the circuit board compartments. Using the markings on this panel, locate PB-1704, remove the two screws at the ends of its hold-down strap, and using a knife blade or thin screwdriver, wedge up first one end of the strap and then the other, a bit at a time, until the board comes out of its socket. Examine the board carefully, noting the location of XF402, T402, and R419. All components have their identifications printed on the board, and the photographs in your owner's manual will help further to identify the key components.

Turn the board over and note that a portion of the foil side is covered by a metal shield which makes it difficult to see or gain access to the three soldered connections of XF402. Using long-nose or small ignition pliers, bend up the obstructing corner of the shield temporarily and you are ready to begin. Practically all the work is done right on PB-1704, no wiring is changed under the chassis, and no changes are irreversible. So heat up your light-duty, fine-tipped soldering iron, clean and tin its point, and go to work.

Detailed Procedure

A. Modifying PB-1704.

1. Clearly identify the three soldered connections of XF402. (See Fig. 5.) Unlike a crystal (which it resembles), it is not plugged into a socket—it is soldered to the board. Its three leads are thin and usually bent over before soldering. Carefully remove the solder from the three points using de-soldering wicking or suction. Straighten the leads so that when the solder is removed, XF402 can be lifted from the board without using any force.

2. Study Detail 8c and locate the short trace (foil strip) which must be cut with a hobby knife or sharp blade. Use a strong light since the trace may be hard to see under the green varnish-like solder-resist which covers all of the board except the solder points. Use your ohmmeter to be sure the trace is actually cut.

3. Locate blank pin (S) of T402 and solder a short, thin, insulated jumper wire to it. Note that it connects to the IN connection of XF402, but do not solder it there until the coax is inserted. See Fig. 7.

4. Prepare both ends of the RG-174/U coax as shown in Fig. 6. Tin the exposed ends of the center conductor and insert them as shown in Fig. 7. Solder them to the foil side (as the filter was previously). Now connect the jumper wire from pin S. Next tin the upper corners of T402 and solder the braid tails to them for grounding and strain relief. Hold the braid tail with long-nose pliers to act as a heat sink to prevent melting the plastic insulation of the coax.

5. Optional: Locate R419 adjacent to the right side of T402. Since its solder points are blocked by the shield on the foil side, cut the resistor lead as shown in Detail 8a. The cut ends can be re-soldered if ever desired.

6. This completes the work on the board. After bending the shield back to its original position, more or less, re-install it in its socket temporarily and bring the coax loop toward the front panel. Drop the black plastic panel into place after slipping the coax through the large rectangular opening in the black panel. Cut the coax at the front end of the opening. (See Fig. 4.) It is important to identify the IN lead with a bit of white tape, paint, etc. Once again, take off the plastic panel and remove PB-1704 to simplify making the connections shown in Detail 4a.

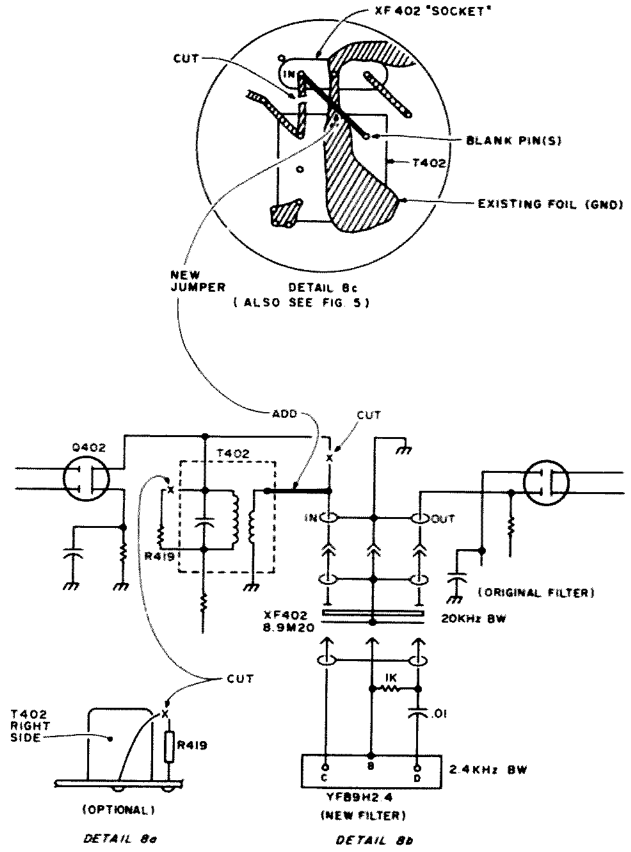

Fig. 8. Revised schematic showing essential changes involved in the modification (compare with Fig. 1).

B. Connecting the connectors.

1. Detail 4a shows a mini-jack; B and C are matching plugs. Though only three pins are needed, the four-pin type is used to make soldering of the braid tails easier and to help separate the input and output connections. The illustrations are practically self-explanatory; just expose no more of the unshielded center conductor than is necessary; tin the solder points and work carefully. The two inner lugs of the connectors are bent towards one another. A third hand to hold the connectors during soldering will make the work much easier. Use a light touch with the iron and work quickly. The leads in Detail 4c will be connected to the new eight-pole filter.

2. Re-install PB-1704, including its hold-down screws.

C. *Installing the new eight-pole filter.*

1. See Fig. 4. Mount the ground lug on filter stud B using the nut and star washer unless one is stamped into the lug itself. Rest the filter on top of the black cylindrical filter capacitor and slide it towards the left until it touches the metal shield of the circuit board compartment. It will be secured at this point later with special copper double-stick tape (for grounding the filter case) called a "Mount-It."

2. Solder the capacitor and resistor between filter post D and the ground lug as shown in Fig. 3. Note that the common point forms the RC junction to which the coax will connect. See also Fig. 2.

3. Remove the protective paper from the Mount-It (or use foam-type double-stick 3M mounting tape) and press it against the end of the filter nearest pin C (IN). Repeat step 1, resting the filter on top of the large capacitor and sliding it to the left until it contacts the shield. Press it firmly; the special adhesive grounds the filter case (if copper) and bonds more strongly with time.

4. Remount the black plastic panel and tighten its six hold-down screws. Bring the coax with connector 4a up through the rectangular hole. Mark the IN end with paint, brush pen, etc. Do the same for the end of the 4C connector to be chosen as IN. The two must always be connected so that the IN marks match. 4B can be connected either way. The area where the connectors and cables are joined can be covered with epoxy putty to make a neater and more secure job. Try plugging 4B into 4A. Then try 4C; its leads are longer than necessary to reach the eight-pole filter. Cut them to a suitable length with a bit of slack; bare the ends and connect as shown in Fig. 3.

5. This completes the modification. Note that the XF402 assembly (Detail 4b) can be secured to the black plastic panel at a convenient point with double-stick tape; the same is true of connector 4C. Thus, connector 4A (which is loose) can be shifted readily from one to the other. Turn on the set and test its operation. The S-meter deflection should be about the same as before or perhaps a bit greater. Adjusting the slug of T402 might improve matters a bit more, but since an extender board would be needed, it is usually not worth the expense and trouble. If desired, adjust VR401 on PB-1704 to get the original S-meter reading with the CAL signal.

6. Close the cabinet by remounting the top cover and test the connectors for accessibility by removing the small access lid. Connector A makes it possible to experiment with other filters in the future without removing the top of the cabinet. Just duplicate the 4c and Fig. 3 assembly, using clips at the filter end, if desired.■

Parts List

1 Ground lug
1 1k 1/4-Watt, 5% resistor
1 0.01 50-V disc capacitor
1 Female four-contact mini-connector*
2 Male four-pin matching connectors*
1 Mount-It (copper double-stick tape assembly)
1 3/4" square of double-stick foam-type tape
12" RG-174/U high quality coaxial cable
1 Fox-Tango 8-pole filter (2.4 or 2.1 kHz bandwidth; No. 2110 and 2009, respectively).

*Mini-connectors are made from sections of 36-contact header strips by AP Co., Nos. 929834-01 and 929974. The above Parts Kit 4J, including choice of filter bandwidths and complete instructions, is available for $60 from the Fox-Tango Club, Box 15944, West Palm Beach FL 33406. Airmail postpaid US and Canada. Overseas, add $5.00.

SOCIAL EVENTS

Listings in this column are provided free of charge on a space-available basis. The following information should be included in every announcement: sponsor, event, date, time, place, city, state, admission charge (if any), features, talk-in frequencies, and the name of whom to contact for further information. Announcements must be received two months prior to the month in which the event takes place. They should be sent directly to Editorial Offices, 73 Magazine, Pine Street, Peterborough NH 03458, Attn: Social Events.

GEORGETOWN IL
SEP 5-6

The Illiana Repeater System will hold the 12th annual Danville Area Hamfest on September 5-6, 1981, at the Georgetown Fairgrounds, Georgetown IL. The gates will open at 6:30 am. Tickets are $1.50 in advance and $2.00 at the gate. There will be a flea market, forums, family entertainment, many prizes (including a Santec synthesized hand-held), and free parking. Talk-in on 146.22/.82 and 146.52. For more information or advance tickets, contact Lowell Wells WD9AFG, Hamfest Chairman, RR 3, Box 215, Danville IL 61832, or phone (217)-759-7560.

BLOOMINGTON IN
SEP 6

The Bloomington Area amateur radio hams will hold their 4th annual Hoosier Backyard Hamfest on Sunday, September 6, 1981, rain or shine, from 7:00 am until 5:00 pm at 2335 Vernal Pike, Bloomington IN. Admission is $2.00. Features will include door prizes, a swap 'n shop, vendors, free setups, balloon rides, a 50/50 drawing, refreshments, ATV demonstrations, and an Aptron ATV converter as the grand prize. Talk-in on 147.78/.18, 146.04/.64, or 223.26/224.86. For further information, contact Bob Myers K9KTH at 2335 Vernal Pike, Bloomington IN, or call (812)-332-2433.

UNIONTOWN PA
SEP 12

The Uniontown Amateur Radio Club will hold its annual gabfest on September 12, 1981, starting at noon, on the club grounds located on the Old Pittsburgh Road, just off Route 51 and the 119 bypass, Uniontown PA (about 40 miles south of Pittsburgh). The pre-registration fee is $2.00 each or 3 for $5.00. There will be free parking, free coffee, and free swap and shop setups (bring your own table). Food will be available at our refreshment stand. Talk-in on 147.045/.645 and 146.52. For preregistration and further information, contact UARC Gabfest Committee, c/o John T. Cermak WB3DOD, PO Box 433, Republic PA 15475.

AUGUSTA NJ
SEP 12

The Sussex County Amateur Radio Club will hold its third annual SCARC '81 hamfest on Saturday, September 12, 1981, from 8:00 am to 3:00 pm at the Sussex County Farm and Horse Show grounds, Plains Road off Rte. 206, Augusta NJ. Pre-registration for outdoor flea-market sellers is $4.00; at the gate, $5.00. Pre-registration for indoor flea-market sellers is $5.00; at the gate, $6.00. Other registration is $2.00. There will be door prizes and plenty of free parking. Talk-in on 147.90/.30 and 146.52. For additional information or preregistration, write Sussex County Amateur Radio Club, PO Box 11, Newton NJ 07860, or Lloyd Buchholtz WA2LHX, 10 Black Oak Drive, Vernon NJ 07462.

MONTGOMERY AL
SEP 13

The Central Alabama Amateur Radio Association will hold its 4th annual hamfest on Sunday, September 13, 1981, at the Civic Center, downtown Montgomery AL. There will be free admission, free parking, and 22,000 square feet of air-conditioned activities, including a flea market. Setup will be at 0600, doors will be open from 0800 to 1500, and a prize drawing will be held at 1400 CDST. Restaurants and motel accommodations are located within a short walk of the Civic Center. Refreshments will be available in the Civic Center. Talk-in on 146.04/.64 or 146.52; rag-chew on 146.31/.91, 147.78/.18, or 147.045/.645. For further information or market reservations, write Hamfest Committee, PO Box 3141, Montgomery AL 36109.

PORT JEFFERSON LI NY
SEP 13

The Suffolk County Radio Club will hold its ARRL-supported 4th annual Electronic Flea Market on Sunday, September 13, 1981, with a rain date of September 20, 1981. The site is the Odd Fellows Hall, Jane Boulevard, Port Jefferson LI NY. Walk-ins will be $1.50 and sellers will be $3.00. There will not be any charge for XYLs and harmonics of attending hams. Gates will open at 7:00 am. Bargains, prizes, food, and hamship will be available. Talk-in on .52, .94, and 223.50. For more information, contact Floyd Davis at (516)-234-9376.

TIVERTON RI
SEP 13

The Bristol County Amateur Radio Association will hold its annual indoor/outdoor flea market on September 13, 1981, from 12:00 noon to 4:00 pm at the VFW hall in Tiverton RI. Admission is $1.00 and flea market spaces are $6.50. Door prizes will be drawn. Talk-in on 147.63/.03 and .52. For maps, send an SASE to Ann M. Carro KA1DNB, 652 Old Colony Terrace, Tiverton RI 02878.

FINDLAY OH
SEP 13

The Findlay Hamfest will be held on Sunday, September 13, 1981, at the Hancock Recreational Center, just east of I-75 exit 161, on the north edge of Findlay, 40 miles south of Toledo. Tickets are $2.00 in advance and $2.50 at the gate. Tables are $2.50 per half. Setups on Saturday are from 5:00 pm to 9:00 pm and on Sunday at 6:00 am. Major prizes include a deluxe low-band rig, two hand-helds, a memory keyer, and more. For tickets, information, or reservations, send an SASE to PO Box 587, Findlay OH 45840.

PENNSAUKEN NJ
SEP 13

The South Jersey Radio Association will hold its annual hamfest on Sunday, September 13, 1981, from 10:00 am to 4:00 pm, at the Pennsauken High School Grounds, Remington Avenue and US Route 73, Pennsauken NJ. Features will include a swap shop, tailgating, games, and door prizes. Food and refreshments will be available. Admission is $3.00; tailgate space is $5.00. Talk-in on 146.22/.82, 146.52, and 147.48. For information and reservations, contact Edwin T. Kephart W2SPV, 4309 Willis Ave., Pennsauken NJ 08109; (609)-663-6710.

GAITHERSBURG MD
SEP 13

The Foundation for Amateur Radio, with the support of more than 50 affiliated clubs in the greater Washington-Baltimore areas, will hold the Gaithersburg Hamfest on Sunday, September 13, at the Montgomery County Fairgrounds, Gaithersburg MD. Gates open at 8:00 am; setup and talk-in begin at 6:00 am. Events featured include commercial exhibits, indoor flea market, tailgating, and ladies' activities. Admission is $3.00 at the gate; children under 12 admitted free. For further information, write Foundation for Amateur Radio, PO Box 523, Bowie MD 20715, or contact Stuart Meyer W2GHK, hamfest chairman, 2417 Newton Street, Vienna VA 22180; (703)-525-6286 (office) or 281-3806 (home).

KEW GARDENS NY
SEP 13

The Hall of Science Amateur Radio Club will hold its annual electronic hamfest on Sunday, September 13, 1981, from 9:00 am to 4:00 pm, at the municipal parking lot, 80-25 126th street, Kew Gardens, Queens NY. Featured will be free parking, door prizes, refreshments, a raffle, and an auction. Sellers' spaces are $3.00; buyers' admission is $1.00. Talk-in on .52. For additional info, contact Tom Doyle KA2DTB at (212)-351-6354 (days).

HAMBURG NY
SEP 18

The 10th annual Ham-O-Rama '81 will be held on Friday and Saturday, September 18-19, 1981, from 7:00 am to 5:00 pm at the Erie County Fairgrounds near Buffalo NY. Advance tickets (deadline: September 4th) are $3.00 and tickets at the gate will be $4.00. Children under 12 will be admitted free. The outside flea market is $2.00 per space and the inside flea market

is $7.00 per space. Features will include new equipment displays, computers, technical programs, ladies' programs, and valuable awards. Talk-in on 146.31/.91. For advance tickets, send an SASE to David G. Baco WA2TVT, 130 Vegola Avenue, Cheektowaga NY 14225.

GRAND RAPIDS MI
SEP 19

The Grand Rapids Amateur Radio Association will hold its annual Swap and Shop on Saturday, September 19, at the fairgrounds in Hudsonville MI. There will be door prizes, dealers, an indoor swap area, and an outdoor trunk swap area. Gates will open at 8:00 am for both swappers and the public. Talk-in on 146.16/.76. For more information, write Grand Rapids Amateur Radio Association, Inc., PO Box 1248, Grand Rapids MI 49501.

GRAYSLAKE IL
SEP 19-20

The Chicago FM Club will hold Radio Expo '81 on September 19-20, 1981, at the Lake County Fairgrounds, Rtes. 45 and 120, Grayslake IL, about 30 minutes north of Chicago and 45 minutes south of Milwaukee. The flea market is open from 6:00 am to to 6:00 pm and the exhibits are open from 9:00 am to 9:00 pm on both days, rain or shine. Tickets, good for both days, are $3.00 in advance and $4.00 at the gate. Features include seminars, a ladies' program, prizes, free parking, a new camping site with hookups, commercial ham and computer displays, and full food services. Bring your own tables and chairs to the indoor and outdoor flea market (or even tailgate). Space is free with a gate ticket. Talk-in on 146.16/.76, 146.52, and 222.5/224.10. For more information, call (312)-BST-EXPO. For advance tickets, send a #10 SASE to Box 1532, Evanston IL 60204.

PEORIA IL
SEP 19-20

The Peoria Area Amateur Radio Club will hold the Peoria Superfest '81 on Saturday and Sunday, September 19-20, 1981, at the Exposition Gardens, W. Northmoor Road, Peoria IL. Gate opens at 6:00 am; commer-

That They Might Communicate

—one group's efforts to get the vision- and hearing-impaired into hamming

Would you like to help another ham to break out of a silent, sightless world in which he or she perceives only through the senses of touch, taste, and smell? If you get the chance, you might have to slow down your code speed and sharpen your listening a bit, but when you are hit with the full impact of what you are helping another human to do, you just might shed a few tears of joy. Others have. You might even get hooked on the program to get the deaf and deaf-blind into ham radio, as members of the Scottsdale Radio Club have.

Unable to see well enough to read hand signs, J. C. Betner must receive Larry "Plato" Plate's (KA7JCJ) communications through "finger signing," wherein he "reads" the signs with his own sense of touch. Betner will soon be on the Novice bands, receiving code through one of Jack Lattin's (KA7BUT) vibrator boxes.

Led by Jack Lattin KA7BUT, Dottie Brown K7ESA, and Clyde Baker KB7BQ, a determined group of hams in the Valley of the Sun has constructed code "feeling" devices and purchased code viewers to instruct the deaf and the deaf-blind in learning Morse code. The hams have also set up a program for teaching radio theory and the practice of radio communications to the visually and hearing impaired.

You have only to visit the home of blind and deaf J.C. Betner and watch him receive coded messages through a fingertip to realize the value of this totally free program. Recently, in his silent, dark world, where he lives with three other vis-

ually and hearing-impaired people under the care of Irene and Louis Springgay, Betner was given the silent message that Jack Lattin and an article writer had arrived for his lesson in Morse code. Betner smiled, and in the measured, purposeful way of the blind, he walked from the living room to the kitchen and took a seat at the kitchen table, leaving the seat on his right for Jack Lattin.

A former accountant who was bom deaf, Betner has long been locked in a narrow world where the feel of sunshine and the touch of a human hand were his greatest pleasures. He could talk with sign language, but he could "receive" nothing but finger spelling from another person grasping his hand and with various finger movements and pressures, communicating ideas. He wears glasses out of hope, but his eyesight is so poor that he recently spent all night in a bus after the driver had forgotten to let him out at his stop and had parked the bus, thinking it was empty. Also without the power of speech, Betner couldn't even call for help.

Jack Lattin came into Betner's life a year and a half ago. Jack had learned sign language and finger spelling from Gilbert Leon, a deaf coworker at Airesearch, twenty years earlier. Shortly before he met Betner, Jack had constructed a code buzzer for the deaf from plans he had seen in a magazine.

"But it didn't work," he said. "The cone was absorbing all the power the speaker had, and the deaf couldn't feel the buzzer well enough to distinguish between dots and dashes."

Jack boosted the speaker power to eight Watts and the relatively high wattage output overrode impedance-matching problems. Then Jack cut away most of the cone of the speaker and glued a 5/8" starter button to

The blind quickly learn hamming through the Scottsdale Radio Club's program to help the handicapped. Here Cheryl Fitzwater KA7DWP enjoys operating her Heathkit rig built and provided free by SARC members. Cheryl's roommate, Cheryl Waters, who can see, tunes up the set and keeps the log.

the center of the cone for the deaf to feel, and he had a vibrator strong enough of the deaf to sense dots and dashes easily. Glued to the inside bottom of a margarine tub or a wooden box, and with a finger hole cut in either, Jack's vibrator was ready to go to work teaching Morse code to the deaf and deaf-blind.

It was one such vibrator box that he placed on the kitchen table in front of J.C. Betner when it was time for Betner's code practice session. Jack placed Betner's hand on the receiving box to get things rolling, and Betner stuck his forefinger through the vibrator hole and touched the button. Jack sent slowly-paced messages to Betner, telling about the good evening weather and important new events. After each letter, Betner gave the hand sign for the letter, and after each sentence, he signed the whole sentence.

Lattin kept on sending, and Betner's face broke into a grin like a kid's at a watermelon bust

"The deaf like humor," Lattin said to the writer. "I just told him how fat you are."

Clyde Baker WB7BQ, a telephone company marketer, arrived to check out the TVI from Cheryl Fitzwater's (KA7DWP) Heathkit setup which had been provided to her by the Scottsdale Radio Club, members of which had built the set. Cheryl is blind but hears well, so she has no trouble communicating with standard equipment as long as her roommate, Cheryl Waters, who can see, tunes up the transmitter.

While Clyde worked on Cheryl Fitzwater's TVI problem, Jack Lattin continued sending to J.C. Betner, the whole lesson lasting about an hour.

"J.C. has really come on fast the last six months," Lattin said. "It was very slow the first year or so when he had to learn the code, but he'll be on the air soon now."

The full significance of going on the air to blind, deaf, and speechless J.C. Betner has gradually been communicated to Jack Lattin with signs and smiles.

"It will be like giving him the whole human race again," Lattin said. "It will give the world back to him."

Lattin's method of teaching the deaf looks simple. He has a deaf student touch one of his vibrator buttons, and then he sends code and has it appear on a Kantronics code-reader screen. For the deaf-blind, the method of instruction is obviously more complicated.

"First of all, you've got to be a good B-S'er," Lattin said. "I tell them with finger spelling that I'm going to teach them a whole new communications method. That really gets them interested because for them it *is* a whole new method."

Then Lattin introduces the deaf-blind to his code symbol board, where letters and

Not permitted to use bolts on club roof to attach antenna base built by Jack Lattin, the four original members of they Valley Center for the Deaf ham club demonstrate how they intend to weight the corners of the base frame. The four "bags of sand" are, l to r, Alan Wilson KA7JCR, Jim Goodson KA7JCS, Bruce Weir KA7JBA, and Larry "Plato" Plate KA7JCJ. Shack is located in Phoenix Lions' Club Building.

numbers are represented by dots made up of brads driven into the wood, and dashes are represented by flat-top metal staples driven into the wood. Lattin takes one hand of a deaf-blind student and places the fingers on the brads and staples representing a letter, and he takes the other hand and puts a finger on the same letter on a braille card.

"They get the idea pretty fast," Lattin said. "Then it's just a matter of a whole lot of practice."

Once the deaf-blind have mastered the code, Lattin moves them on to the vibrator. They learn the use of the vibrator by placing the fingers of one hand on the brad and staple code board and a finger of the other hand on the vibrator button. Then Jack slowly sends code to them and moves their fingers to the proper brad-staple letters and numbers that correspond to the letters and numbers they feel through the vibrator. Jack said the deaf and the deaf-blind are better motivated to learn than is a person with all senses intact.

"They try harder," he said. "The deaf get the receiving part of hamming down pretty fast," he said, "and the deaf-blind learn it quicker than you might think. But both groups have trouble with the difference in dots and dashes when they are sending."

Lattin solved the sending problem for the deaf very quickly when he bought his first Kantronics code reader and had them send into it.

"It won't show a letter or number on the screen unless it is sent practically perfectly," he said. "That frustrates them for a little while, but it motivates them to send clearly different dots and dashes."

For the deaf-blind, the problem can be solved only with many hours of patient instruction and many hours of private practice. Recently, Jack bought a Universal Data Transceiver 170 automatic keyer into which he can type practice messages and have them come out at a variety of speeds to be taped for both the deaf and the deaf-blind to practice with. Provided with a tape that can be run in a keyer that actuates either the Kantronics code reader or the vibrator, both groups can practice as many hours a day as they like.

"These tapes will make it possible to give practice to a lot more students than if somebody were to send code to them by hand," Jack said, "and it will be perfect code for all of them."

To date, four deaf hams have passed their Novice code and theory exams and have formed the first ham club for the deaf and deaf-blind in Arizona. Al Wilson KA7JCR and Bruce Weir KA7JBA have joined with Larry "Plato" Plate KA7JCJ, director for the Valley Center for the Deaf in Phoenix, and with Jim Goodson KA7JCS to establish the nucleus of a communications group that will put the deaf and deaf-blind in daily contact with each other. With help from their friends in the Scottsdale Radio Club, they have set up the Dottie Brown radio room in the Valley Center for the Deaf.

"It's the first ham shack in the world for the deaf and deaf-blind," said Dottie K7ESA, after whom the shack is named.

Once skeptical of the aid offered by the Scottsdale Amateur Radio Club, the four deaf club members had a flyer printed up which they passed out at a recent carnival for the deaf, in which they said, "SARC (Scottsdale Amateur Radio Club) has been totally devoted in volunteering hours and in being patient in working with us."

"We can see," the report went on, "that in the future the deaf and presumably the deaf-blind will be able to use ham radio with Morse code or teletypewriter in substitution for audio conversation to people in all parts of the world."

The group had special thanks for Jack Lattin and Clyde Baker, giving Jack credit for using his ability to communicate with the deaf "to stimulate us to want to study," and thanking Clyde for teaching them electronics theory.

Behind every good man there is a woman, the saying goes, and according to Jack Lattin there is a great woman behind the radio program for the deaf and deaf-blind. That woman is Dottie Brown K7ESA, mentioned earlier.

"Without Dottie, there would be no program," Lattin said. "She raises all of the money and scrounges the parts to build the vibrator units and to buy transmitters, receivers, and viewers for the handicapped."

A former writer-photogra-

pher for a Bangor, Maine, newpaper, Dottie has transferred her drive from news gathering to fundraising, and with considerable success. By raffling off a pair of handheld transceivers, she netted $1200 which was used to help buy a Century 21 transceiver, a Kantronics Minireader, and a TRAC Message Memory Keyer. She picked up an additional $435 raffling off a frequency counter at a hamfest. When the $1635 didn't stretch far enough, Dottie noticed a refuse container full of aluminum cans in a friend's title guarantee office, and she got permission to collect and sell the cans. A young janitor in the title guarantee building increased the number of cans for Dottie by charging non-employees two empty cans for each full one taken, and a nurse in a hospital scrounged up hundreds more. The ever-loyal Scottsdale Radio Club members brought bags of cans to club meetings for Dottie, and eventually the equipment was bought and given to the Deaf Center radio shack.

"I found out that can collectors for charity get ten percent more from the reclaimers, too," Dottie said. "That will help us to buy more equipment."

Assisting Dottie in procuring equipment is the membership of the Thunderbird Council of Telephone Pioneers, whose retired and longtime members of the Telephone Company collect old radio and television parts. Chet McClellan K7HNM, Jack Fuller W7AVX, and Carl Wolford N7AJK handle most of the salvaging of parts and the building of vibrator boxes.

Special help, according to Jack Lattin, came from Field Engineer Earl Carpenter and his Long Beach, California, Federal Communications Commission staff in the area of instructing and licensing the deaf and deaf-blind.

At this point, the ham radio program for the deaf and deaf-blind is a winner. Jack and Clyde have completed the training of four deaf and deaf-blind instructors who are beginning the instruction of other hams-to-be. Two classes of deaf, ten to a class, are beginning their training, and four deaf-blind are being prepared for instruction.

It hasn't all been easy. There have been disappointments, such as Jack's spending six months trying to teach Morse code to a deaf-blind girl before he learned that she had learned only about six words in braille. It was impossible to teach her to use code until she was sent to a deaf-blind school where she will be taught a functional vocabulary by specially-trained instructors. She had apparently been one of the forgotten ones that nobody pays much attention to.

"She'll be ready for radio instruction after a while," Jack said optimistically. "Then we'll be able to teach her Morse code and ham radio."

There are encouraging signs that the program to teach ham radio to the deaf and deaf-blind could spread out from Arizona to the rest of the country and to other parts of the world. Jack has gotten calls and letters from people as far away as France who are thinking about setting up code and theory classes for their deaf and deaf-blind.

One day, Dick Wharton W4LWI dropped in to the Valley Center for the Deaf and told Dottie Brown that he had made a vibrator after the pattern conceived by Jack Lattin and was teaching a deaf person in his home town of Norfolk, Virginia.

For Jack Lattin, the deep meaning of what he is doing comes through the signing fingers of his promising deaf-blind student who tells him simply and with a smile, "Jack Lattin and J.D. Betner."

Jack knows exactly what he means.

Hams on CW are sure to hear the enthusiastic deaf radio operators operating from the Dottie Brown radio shack in the Valley of the Sun. They are working in the Novice frequencies now, and soon they will be working the General and Advanced frequencies. If you are especially lucky, you may soon hear J.C. Betner or one of the other deaf-blind hams calling CQ from his dark and silent world. He'll be sending slowly, and he won't say he's deaf and blind until after you've hooked up with him. But when he does, and you think of how you are communicating with another human mind in a way that recently seemed impossible, you will get a thrill you will never forget.

And if you come to the Valley of the Sun, drop in and visit with the deaf hams in the Dottie Brown radio room of the Valley Center for the Deaf in the Lions' Club Building in Phoenix. They will catch on fast if you can't talk sign language. They will read your lips and write messages to you, and you will have a satisfying eyeball QSO. You might even get to see J.C. Betner or one of the other deaf-blind operators running the rig.

Should chance or intent bring you to Scottsdale from October 9 to 11, catch the Southwest District Convention of the ARRL in the Safari Hotel. The Scottsdale Radio Club will have a booth manned by deaf members demonstrating handicapped ham radio, and they hope to have deaf-blind members there who will communicate briefly with visitors by code. Getting in on that would give you free an experience that would top having any of the souvenirs you could buy on Scottsdale's famous Fifth Avenue.■

A Cost-Effective Approach to OSCAR

—sources and suggestions for getting started

Editor's Note: At press time, the latest word on OSCAR 7 was that it was barely alive! What is apparently a battery short has put this bird on the endangered list. So, don't try to access the satellite—just listen for it and pass your findings on to AMSAT. For the full story, see "Death of a Satellite" on page 97.

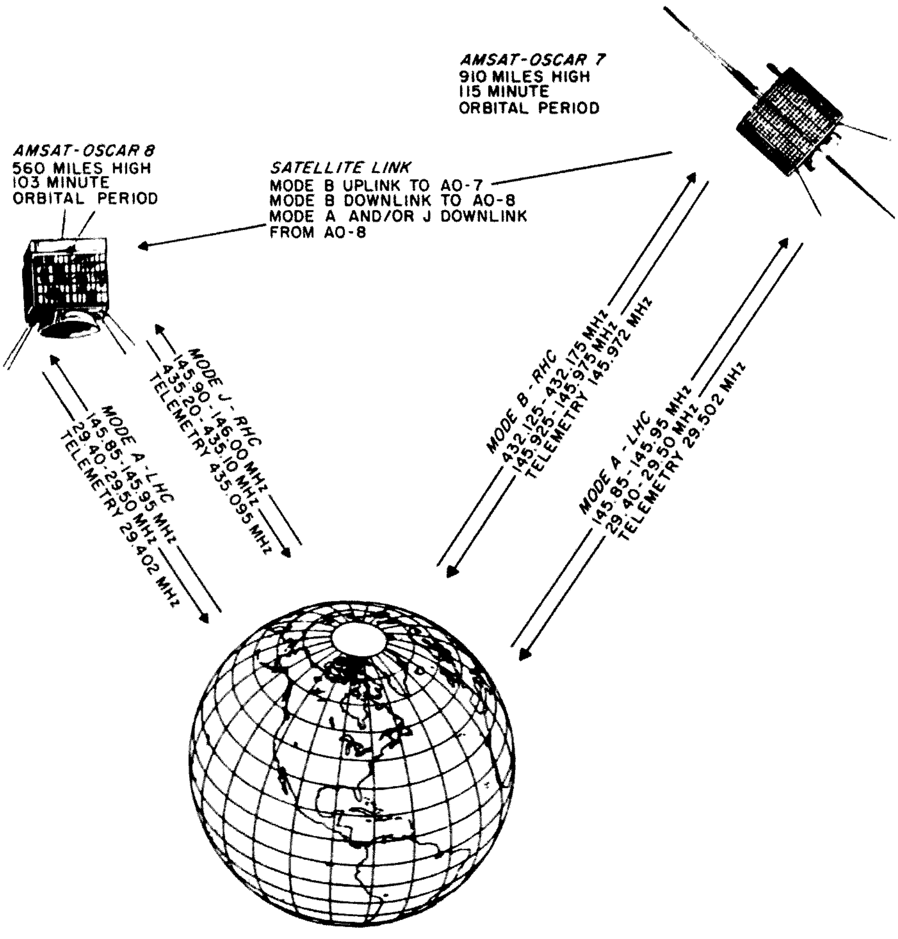

Fig. 1. Frequency and orbital relationships.

Taylor Klett KA5EIM
16831 Grampin Drive
Houston TX 77084

Every time I look at the advertisements in my favorite ham magazines, I envision the ultimate "superstation" ready to zap any unwitting amateur satellite that dares to get within range of my home. But then reality steps into the picture. How dare everyday living expenses take precedence over such a glorious dream?

I feel that many a potential OSCAR enthusiast or old pro has had his enthusiasm dampened when the prices of the various components seemingly needed to accomplish satellite communications came head to head with the family budget. Others read about exotic equipment used by some operators and don't realize that much simpler rigs are all that are really needed to operate effectively.

What I hope to do in this article is to give you some practical and cost-effective ideas and alternatives with the goal of no lost operating efficiency. I do not intend to provide an introduction to OSCAR communications, its history, or its operating procedures. These topics have been covered many times in various articles in the ham magazines. A very good source of this type of information is the "Satellite Communications" package available from the ARRL and at most ham shops. This includes reprints of previously published articles in *QST* and also includes three OSCAR-locators™—a device used to locate the satellites.

I have included a few operating aids that could save you some time and frustration in attempting your first satellite contact. Also included in the article is a list of equipment suppliers that can save you some time-consuming research.

The Bare Requirements for Those Who Have Nothing

Any amateur who has a rig capable of operating in the ten-meter band or has a multi-mode two-meter radio has a tremendous head start. The lucky ham who already has some equipment merely needs to read on, substituting his equipment in the obvious spots.

Let's briefly review just what frequencies we need to operate on both the existing birds and the planned AMSAT-OSCAR Phase IIIB. Mode A's uplink is 145.85-145.95 MHz, with the downlink at 29.4-29.5 MHz; Mode B's uplink is 432.125-432.175 MHz, with the downlink at 145.975-145.925 MHz (inverted); Mode J's uplink is 145.9-146.0 MHz, with the downlink at 435.2-435.1 MHz (inverted); and Phase IIIB's planned Mode B transponder's uplink is 435.3-435.15 MHz, with the downlink at 145.97-145.82 MHz (inverted). The common denominator of all these combinations is the capability to transmit and/or receive on two meters.

The station requirements aren't like those for regular terrestrial transceive operations, due to the very nature of the satellite transponders. As Fig. 1 shows, the satellite accepts one transmitted frequency, amplifies it, and linearly translates the signal into the transmitted downlink frequency. Two rigs (or a separate transmitter and receiver) are required for this duplex operation.

It's not impossible to operate with a single transceiver (with the proper converter) into the spacecraft; several hams have done it. However, the Doppler shifts (frequency changes in received signal due to satellite motion in relation to the ground station) and the inability to hear the strength or quality of one's downlink while transmitting usually cause hopping back and forth in the passband and cause unnecessary QRM. It really is preferable to operate with two independent units, be they two separate transceivers or a separate transmitter and receiver combination.

Let's begin with equipment commercially available and develop alternatives for all three operational modes. Almost any multi-mode two-meter radio on the market today will serve you well and also give you a nice, solid ten-Watt output. Another nice benefit is FM, if you're into that. But those multi-mode units are expensive.

A cheaper alternative is the Icom 202S or 202, which allows SSB and CW two-meter operation within the 200-kHz range of OSCAR operations. It gives you, after the installation of the readily-available crystal, three primary mode capabilities: uplink with a linear amplifier on Mode A and Mode J or barefoot on QRP days (UTC Mondays) and downlink on Mode B. The radio has a very hot receiver—in fact, downlink on Mode B easily can be copied from horizon to horizon with the collapsible antenna provided. (Of course, much better reception results with the use of an external antenna.)

The radio has an output of three Watts PEP and can operate independently with its self-contained battery pack. The Icom 202 can be modified to receive lower sideband (it only transmits and receives upper sideband) and is available used at very reasonable prices. The Icom 202S already has the lower sideband capability. Articles in the September, 1978, and December, 1979, *AMSAT Newsletter* illustrate the conversion, or you can contact Icom directly for conversion information.

The twin to the 202S is the 402, Icom's 432-435-MHz SSB/CW transceiver. This radio also has a hot receiver section, while the transmit section also has an output of three Watts PEP. The 402 retails for approximately $100 more than the 202S. With the appropriate crystals, this radio covers the OSCAR 7 and Phase IIIB Mode B uplink frequencies and the OSCAR 8 Mode J downlink frequency. Icom recently introduced the new IC-451A, a 432-MHz multi-mode radio capable of ten-Watt output, similar to their two-meter multi-mode series. KLM also has available a 432-435-MHz SSB/CW transceiver with a ten-Watt output.

Other commercial radios are available, and while these radios could prove to be the cornerstones of your operations, there are cheaper alternatives. If straight CW is your bag, the Ameco 62 (AM/CW only) provides an excellent two-meter uplink at a good workable power level. The radio can be operated VXO (variable crystal oscillator) with the modifications as described by Raphael Soifer in the March, 1976, *AMSAT Newsletter*. The radio easily can drive a varactor tripler to 432 MHz for a CW signal that won't need an amplifier for OSCAR 7. This is a very popular radio with the CW crowd. The Ameco often can be had for less than $100 through ads, at hamfests, and as used equipment at ham shops.

The local pawn shop, want ads, or flea market may provide one of the cheapest and best additions you can ask for: an SSB/AM CB radio. Most of the phase-locked loop radios are capable of extended-frequency operation and expanded-clarifier (VXO) operation. This inexpensive radio (after conversion) could truly turn out to be the workhorse you have been needing: downlink for Mode A and, with separate downconverters, for Mode B and/or J, and, finally, rf drive for your 145-MHz and/or 432-435-MHz uplink converter.

It should be noted that the new CBs have a much sharper and more sensitive receiver than almost any ham rig capable of operating in the ten-meter range. Obviously, this is a tremendous asset for operating; as we all know, you have to hear 'em before you can work 'em. The cost is nice, too. Two new or recycled CBs, after commercial conversion (if desired), plus the purchase of the required

Table 1. Mode A and Mode J frequency relationships (± Doppler).

converters will be cheaper than the purchase of a single new or used multimode rig. With luck, recycled rigs could be cheaper than the cost of the new Icom 202S described earlier. Thus, the recycled CB could prdve to be both highly useful and cost effective.

Even cheaper are the CB boards available from various sources. These boards can be modified to receive SSB/CW signals and can be used to provide rf drive for CW into converters or varactors (as could an AM CB radio). The board(s) also could be dedicated to receive the telemetry channel(s) of both the existing satellites and the upcoming birds. A recent ad offered two of these boards for $25. A note to the wise, though: Be sure to specify the sixteen-pin PLL 02A boards, as the eighteen-pin boards may be next to impossible to convert. Two of the best conversion articles are in the June and September, 1980, issues of *73 Magazine*.

Kits can save many dollars if you have the time and necessary equipment available. Something to remember is that unassembled kits gathering dust do not pay off as do already-assembled operating units. You have to decide how much time you have and just how valuable it is to you, weighing also the educational aspect of the construction project.

For CW-only operation, for both 145 MHz and 432-435 MHz, new FM transmit board kits can be purchased for under $50 to provide drive for a suitable amplifier. The boards usually provide one to two Watts output barefoot. These boards are for crystal-controlled operation, but many on-the-air operators are using them with great success. Someone must have come up with a VXO scheme by now.

Another source of CW

UHF is a varactor tripler which can cheaply convert 144-MHz signals into 432-MHz CW output. Varactor designs can be found in the ARRL *Handbook* and in the September, 1976, *AMSAT Newsletter*. This device can triple your 144-MHz drive to 432 MHz (or 145 MHz to 435 MHz for Phase IIIB). Depending upon signal input into the device, there may be no need for an amplifier. The typical efficiency is around 60%. Remember that the device is useful only for CW operation. It will not linearly translate SSB.

Kits and assembled units are available for linear transverters and converters capable of operation in almost any desired band or frequency. For example, kits or completed units are available for converting received ten-meter signals into two-meter signals for those persons possessing a two-meter radio. Usually these transverters take ten-meter (or two-meter, depending on the unit) rf drive and linearly convert that signal into the desired output frequency. The resulting output varies from a few milliwatts up to two Watts (again depending on the unit), usually just the right amount to drive an amplifier.

The receiving converters operate on the same principle. Naturally, the higher the frequency the higher the cost, and also the more critical the construction techniques required. The beauty of these transverters and converters lies in their ability to be adjusted to various frequency requirements merely by crystal changes. For example, you can permanently convert your SSB CB radio to the 29.4-29.5-MHz Mode A downlink frequency and still use this radio to provide your intermediate frequency (i-f). I-f is the frequency that is mixed with the transverter's or converter's crystal-generated harmonics and results in the final product, either transmitted or received. The "normal" comparison is 28.0 MHz, equaling 432 or 435 MHz (crystal frequencies of 44.888 MHz or 45.222 MHz multiplied by nine and added to 28.0 MHz).

As is obvious, all that really needs conversion—if the 28.0-MHz or 144.0-MHz i-f is not precisely available (but is reasonably nearby)—is the rather cheap converter crystal. In other words, you could use the orginal frequencies the CB radio generated, if you so desired. You probably would want to expand the clarifier adjustment to allow the radio to expand both its transmit and receive variable capability to 10 kHz (the difference between channels). Another advantage is that the converter can be remotely mounted at the antenna or in the attic closer to the antenna, both of which placements reduce line loss.

Antennas: Large Signal from Small Size

Antennas have been and will be exhaustively discussed everywhere. As hams know, there never has been a perfect design for all applications. While many antennas give the overall desired results, the inborn tinkering instincts of most hams dictate modifications and/or designs of their own. Satellite antennas are no exception, especially since signals to and from the satellite experience Faraday rotation. This effect causes fading and loss of signal if the antenna is not circularly polarized. (See the ARRL's *Satellite Communications* for a more technical explanation.) Obviously this effect opens up a fertile area for antenna design and experimentation.

The nice things about VHF/UHF antennas are their relatively low cost and small size. These antennas can fit easily into most zoning laws and regulations of local neighborhoods, especially since the antennas are not 50-150 feet in the air. These antennas can be mounted easily low on the roof, or even at ground level. You can experiment cheaply with various designs and approaches as you dream them up. The connectors may cost as much or more than the other materials in the antenna! Home-built antennas do require accuracy in measurements, especially at UHF, but there is no real problem if you're careful.

For Mode A downlink, an inverted single-loop quad with a preamplifier is a very cheap but effective antenna and is easily placed out of sight in your attic or attached to your ceiling. This antenna is essentially a full-wave loop pointing straight up. Bernie Glassmeyer of ARRL headquarters is the designer of this antenna and will supply you with the design for an SASE. Briefly described, the loop is 34′ 1″ of regular antenna wire, with a 5.5′, 72-Ohm coax cable matching stub into a 52-Ohm coax mate.

Of course, other antennas are useful, such as converted CB antennas, dipoles, and existing ten-meter beams. However, the ten-meter directional antennas are really effective up to 30° above the horizon. Unless you can control or modify your elevation, you really need the inverted-loop quad above this elevation. Some possibilities include permanently tilting your directional antenna 30°+ above the horizon, but you may still get overhead fading and/or nulls. This is due to the beamwidth and orientation of your antenna—the higher the gain, the more compressed is your beamwidth. Your antenna is not circularly polarized, either, which contributes to the fades. These considerations normally are not a concern for non-OSCAR operations, but our little birds up there are consistently changing their positions relative to ourselves at 15,000 mph!

Telemetry: 145.972 MHz

Table 2. Mode B frequency relationships (± Doppler).

The turnstile antenna also is a cheap and effective antenna that can be built easily for 145-MHz and 432-MHz transmitting without worrying about tracking the satellite. This antenna is especially recommended for the novice at satellite operation. The prime advantage is the reasonable gain achieved without the need to track the satellite's motion. Of course, signal levels may not be the highest S-9s, but the idea is to gain the needed experience with the

least possible amount of frustration. You will have plenty of time to get into more directive antennas and az-el (azimuth/elevation) later. This antenna can be built cheaply from almost any material available. A good article on this antenna's construction is in *Satellite Communications*.

Various VHF/UHF antenna designs have been offered by various authors, including quads, quagis, helicals, and crossed yagis. Excellent construction articles are referenced at the end of this article.

Quality commercial antennas are available from several reputable manufacturers (see Table 3). Cushcraft also offers an az-el mounting boom perfect for use with the Alliance U-100 rotor I will mention later. These antennas commercially available are crossed yagis with matching harnesses to provide an adjustable (i.e., left- or right-hand) circular polarization. These antennas usually have ten elements plus and provide 13 dB gain or more.

Something to remember, with whatever type of UHF antenna you do use, is that you should try to keep the line of sight clear to the satellite if at all possible. Unlike HF, signals on these frequencies are absorbed by trees and the like.

Preamplifiers, or How to Copy the Weak Ones

It is remarkable that we amateurs can hear and communicate through our OSCAR satellites when you consider the many factors against it, such as: the up-/downlink attenuations of the atmosphere, the relatively low power output from the satellite (100-milliwatt output on telemetry to a peak of two to ten PEP on the transponders), and so on.

But we can. And most of us are not merely satisfied to hear a weak signal when, with a little extra effort and expense, we can copy strong signals without an increase in transmitted power. The best selling point about preamplifiers is the increase in sensitivity and selectivity to the receiving system for a relatively low cost. Preamps are commercially available for all the downlink frequencies (see Table 3).

Preamps normally are located at the antenna or in the attic as close to the antenna as possible, to allow peak efficiency. If the downconverter (especially for Mode J) is located at the antenna just following the preamp, maximum signal strength is achieved due to the UHF signal not being absorbed by the coax. Ten-meter signals are not attenuated nearly as much as those higher VHF/UHF frequencies. Power to the preamp located at the antenna can be duplexed up the coax to the antenna mounting to reduce additional wiring, if desired. The power requirement for these devices is quite low, and, in a pinch, a nine-volt transistor battery will suffice nicely.

Most enthusiasts use the preamps on Modes A and J. Mode B users, with adequate gain on their two-meter antennas, usually do not need a preamp. Signal levels for OSCAR 7 usually are more than sufficient for adequate reception, but it all depends on the station's receiver sensitivity, antenna, and length and type of coax used. It should be noted that most authorities are recommending the use of a preamp for the downlink from the Phase III satellites. One thing not usually mentioned is the possibility of achieving too *much* gain, thereby overloading the receiver and effectively reducing the quality of the signal. If overloading does occur, it usually occurs on direct overhead passes.

The purist on Mode J may want to resort to a more expensive low-noise preamp, but to get started, good results are achieved daily with the less-expensive but higher noise figure preamps. Another benefit of the less-expensive preamp for Mode J is its resistance to overloading and the resulting need for cavity filters (such as the 4×3×5 filter in *Satellite Communications*). The overloading, if it occurs, is a direct result of the 435 downlink being the third harmonic of the 145-MHz uplink. Usually the overload/crosstalk desense occurs in the more sensitive UHF preamplifiers.

These preamplifiers are readily available from commercial sources. They may be purchased anywhere for $12.00 for a kit on up to an average ready-built price of $25.00.

Another nice thing about preamps is the many good home-brew designs that are available using inexpensive parts. The *AMSAT Newsletter*, *73*, and the ARRL *Handbook* all have carried several designs for the various frequencies and additional references are at the end of this article.

All in all, you can expect 12-20 dB of amplification of the received signals by use of the preamplifiers. If the noise figure of the preamplifier is below 2 or 3 dB, this amplification is generally enough to ensure that no deep fades are constantly encountered, assuming the use of a circularly-polarized antenna.

Az-El, or To Point or Not To Point?

Many methods are employed by OSCAR users to point antennas at orbiting birds. As with most things, results depend on what the individual wants to spend.

One of the easiest methods is to use simple omnidirectional antennas, preferably with preamps for receiving and a slightly higher output power into an omnidirectional antenna for transmitting. Unfortunately, omni antennas do not furnish an abundance of gain; thus the need for higher power. This is not always needed, however, during periods of low load such as on weekday mornings and on QRP days.

Another easy method is the tilting of the directional antennas at the mast 30°+ above the horizon and using a regular rotor (if you have one) as the azimuth movement. The primary problem with this approach is on overhead passes, where the station could then experience a null. The null lasts only two minutes or so, however, and the vast majority of the time the satellite doesn't pass directly overhead. This is probably the cheapest of all the alternatives involving a directional antenna, other than pointing antennas by handpower.

The drawback with using higher power into omnidirectional antennas for constant use after you've gained your initial experience on the satellite is that the cost of the amplifier usually required to get the signal *consistently* into the bird exceeds the cost of two Alliance U-100 rotors and two directional VHF/UHF antennas. Two U-100 rotors and the commercially available mounting boom mentioned above (or a homemade mount) can easily furnish you both azimuth and elevation control.

Many hams use a heavier rotor for the azimuth rotor, but the U-100 is capable of handling the small antennas *and* a sister U-100 for this function. It does have the tendency to lose orientation in high winds, but several articles by Jim Bartlett in June and Sep-

tember, 1979, *QST* give some excellent methods of superior az-el control at a very reasonable cost. Nonconversion is quite acceptable, as well, however, as the rotors track in 10° progressions. The advantage of the Bartlett system is its precise tracking (within two or three degrees) of the birds. This is exceedingly useful for high-gain, narrow-beamwidth antennas such as those for use with Phase IIIB, and another benefit is that no recalibration is necessary after windstorms.

More expensive elevation and azimuth rotors are available but really aren't needed unless you want to get into EME or computer control. An excellent article on computer control was in the November/December, 1980, issue of *Orbit*, the AMSAT magazine. In that article, the author describes the computer program, the interface needed, and conversion mechanical aspects.

Essentially, az-el takes the place of more expensive linear amplifiers at a less expensive price, but it also takes its toll in necessary attention during flyby operation. You have to orient two rotors, adjust for Doppler, etc., and operate. (But that's part of the fun! If nothing else, imagine your neighbor catching glimpses of your antenna moving in some rather peculiar fashions, wondering if he is going crazy.) You also need to know where the satellite will be at three-minute intervals. Many calculator programs and computer programs have been written to solve this problem for you or you can "eyeball" it by using your OSCARlocator™ or Satellabe™. If your antenna does not have too narrow a beamwidth, this method, in conjunction with listening to your downlink, can usually suffice.

Table 3. OSCAR supplier chart (not all inclusive).

It should be remembered that az-el is *not* needed for beginning OSCAR communications; preferably, it should be graduated into as the operator's experience increases.

Power Supplies, or Cut-Rate Juice

Most of the various components mentioned require 12 volts dc at various amperage ranges. Unfortunately, commercial power supplies for anything over two Amps are rather expensive. Depending on the equipment used, two to ten Amps may be required at a time of peak usage.

Probably the cheapest source of power is an old car or motorcycle 12-volt battery. The battery is recharged during periods of nonuse, such as out-of-range periods and overnight. A very good article for a charging regulator to ensure that the battery is not overcharged was in the September, 1980, *73 Magazine*. Of course, this assumes you own a battery charger.

Batteries can be either new or used, including the kind that won't hold a charge for an extended period. These can be used since demand on their power is usually for less than 25 minutes at a time. As mentioned in the *73* article, be sure to allow for adequate ventilation of the battery during charging.

If you operate in or near your garage, you can always run a power cord to your car's battery. You may want to start up the car after usage to make sure the battery didn't run down too far.

Commercial power supplies sometimes can be found cheaply at ham auctions, close-out sales, or occasionally as a loss leader at a ham store. Home-brew power supplies can be built, also.

Coax and Connectors, or The Forgotten Line

Coax and their connectors can be bothersome for satellite communications or VHF/UHF work if some basic facts are not con-

sidered. Briefly stated, the higher the operating frequency, the higher the transmission line loss. With the already weak signal from the satellite received at the antenna, any long runs of cable and use of connectors not designed for VHF/UHF frequencies will wipe out whatever signal was left.

To combat this loss, you need to do some (or all) of the following: Mount the downconverter/upconverter at the antenna; mount the preamp at the antenna; mount these devices in the attic closer to the antenna; don't use a coax grade below RG-8/U; or use hardline if you can't remotely mount the converters at the antenna. Try to use at least BNC or, preferably, N-type connectors if you can afford them. These connectors do not introduce as significant an impedance "bump" (or reduced signal) as do the more conventional PL-259s.

Some potential sources for the more expensive hardline include cable TV companies. There is a definite upswing in cable TV installations around the country; companies may have some coax they would be willing to sell cheaper than their prime stock.

Simply put, the higher the grade or quality of coax and connectors (and the mounting scheme employed), the higher the quality of your received signal. Ask your dealer to show you the specifications on the coax you are contemplating purchasing for your station; he should have them readily available. Also, when making the connections to the coax, take your time and do a good job. For your outside connections, make sure to have good weatherproof connections. The easiest way to do that is spray them with clear lacquer. It's amazing how easily a little corrosion will degrade your signal.

Amplifiers—Needed? Linear or Class C?

Before you purchase an amplifier, be sure you *really* need it for the Phase II satellites. Remember you need only 100 Watts erp to fully and consistently access the satellite. A 10-dB gain antenna with ten Watts into the antenna should more than adequately serve your purposes.

For Phase III, the requirements do increase to 500-1000 Watts erp. Again, you may be able to use precise az-el and a highly-directive (and cheaper) antenna, with only a small increase in needed rf wattage. Remember, the Phase III satellite will not be changing its position in the sky rapidly.

Whatever you decide, many amplifiers have recently hit the market, some as kits and some fully assembled. (See Table 3.) If you are going to operate SSB, be *sure* the amplifier is linear, or you will be able to operate only CW (Class C) or FM terrestrially through it. Some of the nicer amps include a built-in preamplifier.

Remember that the current requirements directly affect your power supply—the higher the power output, the higher the current requirements and the more potentially expensive the power supplies.

Bells and Whistles, or Neat Things

As everyone knows, there can be additions to any operation that make life much easier and more enjoyable. So it is with satellite operations. Digital or other clocks set at UTC make it easier to be consistent with orbital charts. You will need some method of properly telling the correct time, since Phase II satellite operation really is precise to the second; Phase II birds fly by with windows of a maximum of 22 minutes at a time. Phase III will be much more relaxed operationally, since the bird will be visible usually for ten plus hours at a time.

OSCARlocators and similar devices are exceedingly useful and necessary to exactly visualize and track where the birds are: their approximate elevations and azimuths and the associated windows for the time periods of the pass selected. These devices are easy to use and understand and should be part of your operations unless you are computer-controlled. Even then, you would want one for use in visualizing your coverage and respective communication possibilities. They are useful for planning your DX operations, allowing you to see when your windows open up (i.e., such as for Hawaii).

That's one really neat thing about satellite operation: It's really rather predictable, allowing you to set up schedules well in advance, if so desired. Tables for calibration of these devices are reproduced monthly in *QST, 73,* and other monthly amateur publications, and in *Orbit* semimonthly. They also are available on a quarterly basis from Project OSCAR in a very useful individual

orbit and time format for each day's pass.

A large map of the world is a very useful addition, especially if for Phase II satellites you mark the extreme limits of normal communications from your QTH. This marking is especially useful when you notice unusual propagation.

A tape recorder is a nice addition and can help you relive (and possibly verify) some of your more exciting experiences. Any type of recorder is OK, just as long as you can record continuously for 25-30 minutes. The tape recorder is especially useful if you have a desire to tape telemetry and later decode it, or if you have developed a separate receiver for telemetry. Obviously, you will want a tape recorder if you plan any SSTV operation —transmission or reception. The recorder could also be put into use for taping the upcoming SSTV UOSAT weather picture transmissions and other experimental telemetry, and then taking the tape to a friend who has SSTV capability for viewing. Cheap sources of tape recorders are places like GE Service Centers and discount stores.

Speech compressors have received some attention by some authors for use through the satellites. The problem with using such a device is that it puts an undue extra strain on the satellite system, and AMSAT authorities not only do *not* recommend its use, they discourage it.

Weatherproofing of some components such as preamps and converters can be done in some instances by the manufacturer. Where this feature is not available, other effective alternatives exist. Depending on the component's size, old Tupperware™ containers can be placed into service, sealing the openings after insertion of the component and its wiring. Other possibilities include using the Seal-A-Meal™ plastic bags (double sealed), jars (sealing the lids), or simply placing the component in the attic. You can even cut off tops of smaller containers, such as antifreeze containers, resealing them with Super Glue™. Obviously, other alternatives exist as well.

A computer would be the ultimate addition, since it could track the satellite, control your rotors, decode telemetry, and "talk" through the Phase III computer channel.

Operating Aids, or Easy Help

Probably one of the most confusing aspects of your initial satellite operation is the determination of where your uplink signal will be translated into and received on the downlink. Tables 1 and 2 show you approximately, plus or minus Doppler effect, where the downlink should be heard. Be sure to notice that Mode A downlink is not exactly the same for OSCAR 7 and 8, as there is an offset of eight kHz between the two satellites. This is to allow the user to differentiate between the two satellites, as OSCAR 8 catches up with OSCAR 7 every three days due to its lower orbit. If the satellites are in the proper modes (AO-7 in Mode B and AO-8 in any mode), satellite links are possible.

Summary

The world of OSCAR is there just waiting for you. Nothing is quite as exciting as hearing your first satellite telemetry and your first contacts through the satellite. You will have many a fond memory of those occasions.

The station you assemble can be as expensive or as inexpensive as you desire. There's one advantage of slowly building up a station as I did, and that's having the time to review the many various alternatives, products, and ideas of others before actually operating (other than SWLing the downlink).

I hope you can employ some of the ideas given in this article, but no matter which way you go, there is an exciting QSO awaiting you. I also recommend that you contact AMSAT (PO Box 27, Washington DC 20044) and/or the ARRL for more information.

While you're at it, why not throw in a few bucks toward the satellite matching fund, the dollar-for-dollar tax deductable matching fund set up after the demise of Phase IIIA. (See "Phase III Tragedy," *73*, August, 1980, p. 28.) AMSAT has secured a date with the French project Ariane for an operational (not experimental) launch in the spring of 1982—but be sure to check this date from about March on. The effort being made now is to get the spacecraft ready in time for this near-term launch opportunity. When the Phase III satellites are operational, the benefits will be taken for granted in a short time. Predictable, reliable, and effective worldwide operation, depending on the satellite's orbit, will become a reality. And due to be launched before Phase IIIB on September 15, 1981, is the first scientific amateur satellite (UOSAT). This satellite will carry several scientific experiments, SSTV, and propagation beacons which will open up yet another fascinating aspect of our hobby.

I hope you, too, take up the challenge of satellite operations. The thrill never wears off. I hope I hear from you and talk to you soon! ■

DX Program Roundup
—for the SWL with DXitis

At last count, there were about 30 DX programs being broadcast in English over the shortwave bands by international broadcasters. Most of these are weekly and some are offered more than once or twice a week. The sheer number of such programs is some indication that station managers either know or believe that shortwave radio listeners like this type of broadcast.

The *World Radio TV Handbook*—the "bible" of the shortwave listening world—defines a DX program as a "broadcast intended for the enthusiasts interested in the various non-programming aspects of radio reception. Covers a wide range of material and can vary from a 3-minute talk on a certain topic to a half-hour magazine program."

This pretty well sums up the content of most of the current DX programs and, by and large, the broadcaster's attempts to produce what the listeners want—up-to-the-minute information on shortwave frequency changes, additions, etc., and any other news that can help or interest the shortwave listener.

Information these programs provide is, of course, only as good as its source. Sources might include the station's own monitoring efforts and those of a commercial monitoring service, such as provided by the British Broadcasting Service. Other important sources are the various DX club bulletins which often are sent to international broadcasters with loggings recorded by their members. And some DX programs receive tips directly from listeners and hasten to put them on the air—with or without confirmation.

Finally, there is, for the less-principled broadcaster, another reliable source of information. This is the material put out on the air by another DX broadcaster. Recently, one of the Iron Curtain DX programs reported the same frequency-change information that had been broadcasted by another European station the week previously!

Just how worthwhile is the information put out by these DX programs? And how many of these broadcasts should the hobbyist who wants to keep abreast of the shortwave radio world listen to each week?

Depending upon an individual's specific interests in shortwave radio listening, I would say that a handful—four or five—of these programs will keep you very well informed. Why just a few?

First of all, if something major in the way of news breaks—such as a big change in broadcast times

Home of the famous DX Juke Box *program.*

or frequencies of the BBC (British Broadcasting Corporation)—just about all of the thirty DX programs on the air will have this news item.

Second, the greater part of the DX program information you will hear each week is really worthless to the average listener. It may be interesting, for example, to hear that a listener in Finland has picked up a station in Siberia on a new frequency, but the chances of the listener in Indiana being able to tune for the same broadcast is very remote.

A third factor is that while all of these DX programs give out information, some of it is rather special in nature and may or may not be of interest.

In rating the DX programs, I would pull some out and say that regardless of your interests, they are so bad that they are not worthwhile tuning for. On the other end of the spectrum are a few programs that are excellent and very worthwhile for every North American listener to tune for each week. Finally, there are the good but primarily special-interest DX programs which some will want very much to hear each week.

I rate five DX programs of the general-interest type as excellent, and I try to monitor at least three of them each week. These are Radio Canada International's *DX Digest*, Radio Netherlands' *DX Juke Box*, Ecuador's HCJB *DX Party Line*, Sweden's *Calling DXers*, and Austria's *Shortwave Panorama*.

Canada's DX Digest

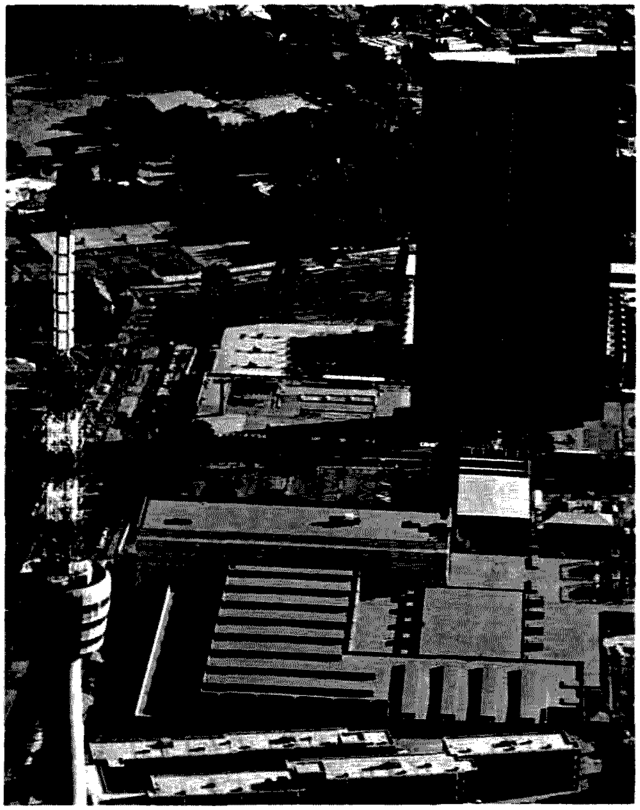
DX Digest is one of the best DX programs on the air. It's on weekly with a half-hour magazine format and has good, solid news and information that you can use. Ian McFarland, the show's host, has been around shortwave radio circles a long time and has put together a program that is made to order for the DXer in North America. First of all, Ian makes sure that his listeners are kept up to date on the latest equipment that hits the market —receivers, antennas, etc. —and has interviews with users or question-and-answer sessions about them. Then, *DX Digest* has Glenn Hauser (a world-known DXer) with the latest in shortwave frequency news. Apart from special interests, you can solve about 90% of your DXing information problems right here on this program.

Listen to it on Saturdays at 2130 GMT on 17.875, 15.325, and 11.945 MHz. On Sundays it is on at 1930 GMT on 11.905 and 15.325 MHz, and on Mondays it is on at 0100 GMT on 11.850 or 5.960 MHz.

Radio Netherlands' DX Juke Box

This old standby of the DX programs has recently undergone a face-lift and the jury is still out as to whether or not they have improved or harmed the show by the changes. The title, *Juke Box,* came from the idea of breaking up the long chain of frequency-change announcements by recorded music—primarily jazz. Before the change in format, they used to devote each weekly program to a particular area of the world. Thus, one week they would have reports from Arthur Cushen in New Zealand, and another week, they'd have reports from the United States by Glenn Hauser, etc. For the listener, it was a very good way to get an idea what was available to pick up from his part of the world.

The new *DX Juke Box* does away with this and has switched to the magazine format with some frequency changes, some questions and answers, and interviews; it has become similar to *DX Digest*. It is still a good program, in my opinion, and worth tuning to each week.



This Johannesburg complex is the home of Radio RSA—the Voice of South Africa. The FM tower is at the left.

Radio Netherlands has a booming signal into the US by virtue of its relay station in Bonaire in the Caribbean. You can hear *DX Juke Box* on Fridays at 0250 GMT on 9.590 and 6.165 MHz. West coast listeners may find it more convenient to tune for it on the same day at 0550 GMT on 6.165 or 9.715 MHz.

Ecuador's HCJB DX Party Line

This religious station is one of the old-time international shortwave broadcasters, and its DX program is also one of the first of its kind. Clayton Howard, the program's host, has been doing this broadcast for many years and has a loyal following. This is principally a "frequency-change" program. The information they give is, however, very accurate and comes from various DX clubs, such as SPEEDX in the US—one of the best of this type of association.

Some listeners complain that the program mixes in too much religion with the DX listings, and if this concerns you, don't listen. For those who don't mind the religious discourses and want up-to-the-minute DX news, you can hear *DX Party Line* easily many times during each week.

On Saturdays, it's on at 0800 GMT on 11.835, 9.760, or 15.235 MHz, and at 2130 GMT on 26.020 or 17.790 MHz. On Sundays, listen at 0230 GMT on 15.155 or 11.915 MHz. Mondays at 0330 GMT it is on 15.155 or 26.020 MHz, at 0800 it's on 11.835 or 9.760 MHz, and at 2130 GMT it's on 21.480 or 17.790 MHz. Tuesdays at 0230 GMT tune in on the

Kol Israel brings you the latest on the Middle East DX scene from Jerusalem.

usual 15.155 or 11.915 MHz. Finally, on Thursdays, at 0230 GMT go to 15.155 or 11.915 MHz, at 0800 GMT to 11.835 or 9.760 MHz, and at 2130 GMT tune in on 21.480 or 17.790 MHz.

Sweden's Calling DXers

This is another old standby and a very solid DX program. The host, George Wood, is an American and knows what we DXers are looking for. George depends a great deal on listeners who send in their rare catches and in return get a weekly summary of the program, which saves tape-recording time and ensures accuracy. You can hear it on Tuesdays at 1415 GMT on 21.615 or 21.700 MHz and at 2315 GMT on 15.380 and 11.705 MHz. On Wednesdays it is at 0245 GMT on 15.315 or 9.695 MHz.

Austria's Shortwave Panorama

This is a relatively new program which has fast become very popular. First of all, it is on the air at a somewhat novel time for DX shows—Sunday mornings. Second, it has recently upgraded itself by signing on Glenn Hauser after he went out of Radio Netherlands when their big changes took place. Listen to this one at 1235 GMT on 21.655 MHz.

More Specialized DXing

So much for the good general-purpose DX shows. I rate the following programs good, too, although they will appeal more to some listeners than others.

South Africa—Radio RSA's *DX Corner*. If you are into DXing the African continent, this is a must program every week. Pieter Martins, the principal engineer of the station, keeps a close watch on broadcasters and their frequencies in all the African countries, including the Third World nations. Last year, I had the privilege of spending a day with Pieter and others of the staff of Radio RSA in Johannesburg, South Africa, and was interviewed for the program during my stay. My impressions of Radio RSA were very good. They have a large staff and the most modern facilities.

You can hear *DX Corner* easily Tuesdays at 1120 GMT on 25.790 MHz, Saturdays at 2140 GMT on 17.795 MHz, and Sundays at 0240 GMT on 9.625, 11.900, or 9.585 MHz.

New Zealand—*NZ Calling*. This is another old favorite, particularly with DXers who are interested in keeping up with broadcasters in the Pacific. Recently, this program has moved up its broadcast time so that it is now on at a decent hour for those of us in the US. Hear it first and third Mondays at 0315 GMT on 17.860 MHz.

Israel—*Calling All Listeners*. This is one for those of you who are interested in keeping up with the Middle East. You can hear it Sundays at 2030 GMT on 15.105, 9.815, or 9.009 MHz and Mondays at 0025 and 0220 GMT on 11.637 or 9.815 MHz.

Switzerland—*Swiss Merry-Go-Round*. Another veteran in DX circles. This one features the "Two Bobs"—Bob Thomann and Bob Zannotti, and its format is the "letter-and-answer" technique. Unlike some DX programs, the questions brought up and answered are not necessarily elementary ones. The two Bobs often wind up in a lively discussion on antennas or some other aspect of the hobby. The program is on only twice a month, on the second and fourth Saturdays at 1320 GMT on 21.570 MHz, at 1535 GMT on 21.570 MHz, and at 2150 GMT on 21.585 or 17.850 MHz. (Later, on Sundays, you can hear it at 0150 GMT on 6.135 and 11.715 MHz.) This is an enjoyable show to hear, and while you won't get many new frequencies to try for from it, you will pick up a good deal of technical knowledge.

Bulgaria—*Radio Sofia*. This is one of the best of the Iron Curtain stations, and its DX program is primarily concerned with information for radio amateurs—news of clubs, some frequency information, etc. Sometimes they hold contests for listeners. Listen to it Fridays at 2135 GMT on 9.665 or 7.115 MHz and Saturdays at 0025 GMT on 15.330 or 9.705 MHz or at 0435 GMT on 7.115 MHz.

The programs reviewed above are the best of the lot—the "Top Ten." There are, of course, others, and while I cannot recommend them, you never can tell when suddenly someone new gets put in charge and you have a winner.

Belgium—*DX Corner*. At present, it is on a kick where it reviews a different international broadcaster, its programs and times of broadcast, etc., each week. Sundays at 1740 GMT on 21.525 or 6.010 MHz; Mondays at 0045 GMT on 11.695 or 15.365 MHz.

Czechoslovakia—*Radio Prague*. While this program

pays particular attention to the radio amateur, the information it gives is very elementary. Recently, they devoted a whole program to telling us what the Morse code requirements were for various Czech licenses. Heard on Fridays at 0135 GMT on 11.990 MHz and at 0335 GMT on 7.345 MHz.

East Germany—*Radio Berlin International*. Not much to offer and not too good a signal at present. Best time seems to be Tuesdays at 0130 GMT on 9.730 MHz.

Hungary—*Radio Budapest*. Tune for this one on 9.835 MHz on Sundays at 0210 and 0310 GMT.

Japan—*Radio Japan*. A brief program of frequency-change announcements; Mondays at 0210 GMT on 21.640 MHz.

Portugal—*Radio Portugal*. Heard at 0310 GMT on 11.925 MHz and at 0510 GMT on 9.575 MHz.

Poland—*Radio Polonia*. Not an easy station to get, but often heard on early Monday mornings—0220 GMT on 15.120 or 7.270 MHz. Not much in the way of DX help, but interesting to hear.

Rumania—*Radio Bucharest*. Listen Saturdays at 0245 GMT on 9.570 MHz.

Spain—*Spanish Foreign Radio*. A few listings. On Mondays at 0050 GMT on 11.880 MHz.

Turkey—*Voice Of Turkey*. What there is pertains to amateurs. Heard on Saturdays at 2100 GMT on 9.725 MHz.

USSR—*Radio Kiev* and *Radio Moscow*. Sometimes the first has interesting material for the radio amateur on Thursdays at 0050 GMT on 15.240, 15.100, and 11.770 MHz. The other, however, is the worst DX program on the air these days. A typical program tells you all about Greenwich Mean Time or the reasons for radio interference. Easily heard on Sundays at 1320 and 1920 GMT on 17.810. Also assorted other frequencies at the same time.

This pretty well sums up the DX programs heard relatively easily in most parts of the U.S. As you know, these programs come and go. New ones crop up all the time as old ones fade from the air. Recently, a couple of the biggest international broadcasters did away with their DX programs. These were Radio Australia and the BBC.

What causes a station to give up a program like this? Both of these broadcasters have plenty of air time—the BBC is on 24 hours every day. It might be because they think the audience is not interested in DXing, yet in both cases, the shortwave radio world was outspoken in its criticism of these deletions from the air.

More likely is the fact that these broadcasters feel that their audience is changing from a few DXers and radio amateurs to a mass group who have recently purchased multiband portables which easily can bring in the powerhouses like the BBC and Radio Australia. Interestingly enough, the BBC replaced their DX program with one called *Waveguide* which tells all about how to tune in their *own* station better—latest BBC times and frequencies. After all, why devote air time to the competition and *their* times and frequencies when you can use it to make sure the listeners keep tuning into your own programs! ■

TRS-80: Your Electronic Brasspounder

—automated CW for Level I owners

Its advertisement boasts that it is able to copy Morse code over the air at the unbelievable rate of 100 words per minute and transmit at the same rate, selecting from ten message buffers. Just think! No more frantic searches for scrap paper to jot down the answer to a misshapen CQ!

The only requirement for owning this fantastic ham aid—a Radio Shack TRS-80, Level II microcomputer and possession of more than a few dollars. But being an owner of a Level I, 4K machine *without* more than a few dollars, I began to wonder just what my computer was good for if I couldn't use it in the ham shack?

The answer was to make the Level I just as powerful as the Level II by breaking the BASIC barrier and going to machine-level language. By using just the T-BUG™ Z-80 Monitor and Debugging Aid available from Radio Shack (catalog number 26-2001), I was able to program my microcomputer to send Morse code at a selectable rate and choose between two message buffers each capable of storing 400 ASCII characters. The addition of a programmable peripheral interface (National Semiconductor's 1NS8255) and a tone decoder (Signetics NE567) allowed me to receive code over the QRM and watch as the computer printed the translation in plain English on the video display.

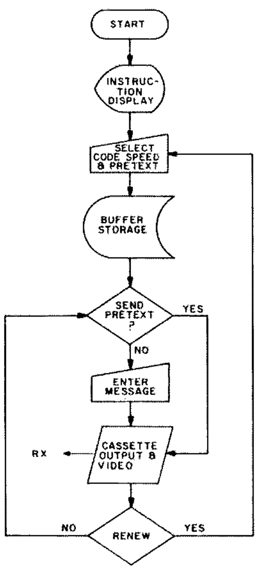

Fig. 1. TX program flowchart.

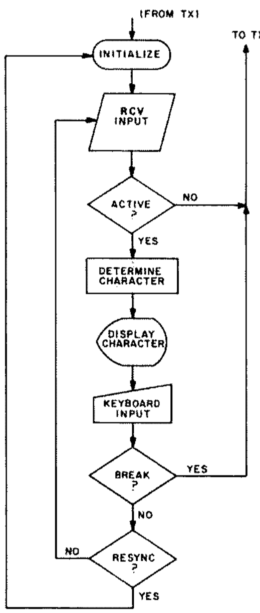

Fig. 2. RX program flowchart.

My system is not as fancy nor as versatile as the commercial product, but it is just as effective and was produced without the expense. (On my budget, $30 qualifies as a few dollars.) This article will show how you, too, may effectively increase the power of your TRS-80 microcomputer and make it talk the international language of Morse code with the bigger machines or with someone with a reasonable fist.

How It Works

The program can be divided into two parts, transmit (TX) and receive (RX). The TX program flowchart, Fig. 1, and RX program flowchart, Fig. 2, outline general operation of the program. TX will output a keyboard-entered message in Morse code through the cassette remote jack of the TRS-80. This portion of the program is detailed in the program listing, Fig. 3. To begin the program, the T-BUG must be loaded and the program tape loaded using the LOAD command and JUMP to 4E01; alternatively, the tape may be loaded using the INITIATE sequence found in the program listing. Initial programming will be done using the T-BUG memory function.

Program execution of START will display the title of the program and instructions as listed in the Instruction Block of Fig. 4. The operator is asked to select the code speed at which he wishes to transmit by entering 1, 2, or 3 from the keyboard, corresponding to 5, 13, or 20 words per minute. (It will be explained later how the program may be changed to adjust the code speed to other than the mentioned speeds.) According to the code speed input,

Fig. 3. Program listing.

the wpm factor is established. The function of this and other variables subsequently used is described in Fig. 5.

Immediately upon making the selection of code speed, program execution is passed to PRETEXT ENTRY INSTRUCTION which prints "PRETEXT:" from data located in the Instruction Block. Up to 488 characters or seven video lines may then be entered from the keyboard under control of PRETEXT LOAD and stored in the Pretext Buffer occupying memory locations specified in the Memory Map of Fig. 6. Text stored in the Pretext Buffer is protected for repeated use and requires a restart of the TX program to change, but may be called for at any time.

PRETEXT LOAD writes text into the Pretext Buffer by the WRITE subroutine. All alphanumeric characters plus punctuation (, . ? / and space) are supported. Corrections to the text as it is being written may be made by using the backspace key on the keyboard. The backspace key also permits retention of the previously entered pretext if the backspace key is depressed when "PRETEXT:" appears and the ENTER key is then depressed. A summary of the keyboard control key functions is listed in Fig. 7.

When the text is complete, the ENTER key is depressed, setting a flag (FF) to mark the end of the text in the buffer, and the program jumps to RX. RX will decode a Morse code signal present at port A as outlined in Fig. 2. (A more detailed description of this portion of the program will follow.) If the input from RX is inactive for six seconds, the program returns to TX, where initialization occurs. The WRITE subroutine permits the setting of the Buffer Register to the Pretext Buffer if the # key is pressed, at which point the program goes to ENCODE; otherwise, it enters the text into the Message Buffer (see Fig. 6) similar to that described for the Pretext Buffer above. Previously entered text in the Message Buffer may be saved using the same procedure outlined above by using the backspace key and ENTER. A total of 397 characters or 6¾ video lines are permitted in the Message Buffer before becoming full and passing to ENCODE.

Upon completing the text, depressing ENTER marks the end of text and the program goes to ENCODE. ENCODE reads the Buffer Register which has been established as the Message or Pretext Buffer by WRITE. Each character of the buffer is read by BUFFER SEARCH. The letter in the buffer is matched with the code found in the TX Character Search Table (see Fig. 8) by BANK SEARCH. If the letter is the end of the text (FF) the program goes to RX. (This can be used to enter RX directly with no message by depressing ENTER. The Message Buffer text will be lost by using this method of reentering the RX program). If the letter is other than FF, BIT TEST determines how many characters are in the letter by testing the letter's position in the table. Each sequential character is determined to be a dot or dash from the code. This character information is processed by SEND, which turns the cassette remote jack on by CASSETTE ON. The program then branches to the appropriate DOT DELAY or DASH DELAY.

In the two subroutines, the cassette jack is left on for the wpm factor selected earlier. This factor is used in determining the minimum cassette-on time in the subroutine DELAY, based upon the Delay Base and Delay Register as described in Fig. 5. The dash is three times as long as the dot. The character type sent is stored in the Dot Flag (see Fig. 5) to determine the Morse code graphic character to be printed in DOT DELAY. DOT DELAY turns the cassette remote jack off by CASSETTE OFF and delays the program the length of a dot before getting the next character of the letter, or

going to LETTER SPACE if the letter has been completed as determined by BIT TEST. LETTER SPACE delays the program for the length of one dash before proceeding to BUFFER SEARCH to get the next letter. If the letter is a space (FE), the program executes WORD SPACE and is delayed the length of seven dots before getting the next letter from BUFFER SEARCH.

Code speeds other than those provided for in the program can be obtained by changing the Delay Base Register. By changing the contents of 475C to any value between F5 and FE, a wide range of speeds can be obtained. Let trial and error be the guide. The relative code speed selection (5, 13, and 20 wpm) is determined by the wpm factor. This can be adjusted by changing the value of addresses 4E27, 4E2F, and 4E37. After determining the newly adjusted wpm value, changing the values of addresses 4DAE, 4DA4 and 4DA3, and 4D99 and 4D98 to correspond to the ASCII code of the new first, second, and third selections will print the new selections from the Instruction Block.

The receive portion of the program (RX) depends solely on the interpretation and timing of ON and OFF inputs representing Morse code characters. The initialization of RX provides for rapid synchronization of the variables to the ON-OFF input states. If timing is awry, resynchronization must be accomplished by reinitializing.

After initializing, the program proceeds to STATUS where the operator may, through the SCAN subroutine, command a jump back to START and TX by depressing the BREAK key, or resynchronization may be accomplished using the → key (see Fig. 7). With no keyboard entry, the program goes to the SKEY subroutine. The SKEY tests the input and determines whether it is ON (key down) or OFF (key up), returning the status as 80 or 00, respectively. Based on the status, the program jumps to DOWN or UP.

In the UP routine, the time the key is up is established and stored in the Uptime Register (see Fig. 5). If it is up for more than six seconds, the input is considered inactive and the program prints the last letter received in LAST LETTER and then proceeds to TX. If the status changes to key down within six seconds, the Uptime is compared to twice that of the Character Space. If Uptime is greater than twice the Character Space, a word has been received and the program goes to DECODE. If Uptime is less than twice the Character Space, it is compared to the Character Space. If Uptime is greater than Character Space, a letter has been received which sets the Character Flag and the program jumps to DECODE. If the Uptime is less than Character Space, it is doubled and becomes the new Character Space. The program then branches back to STATUS to verify that a key-down status exists.

The Downtime is compared to 1½ times the Dot-time (see Fig. 5). If Downtime is less than 1½ times Dot-time, a dot has been received; otherwise, it is a dash. If the character is a dot, DOT sets the Downtime equal to the Dot-time and the Code Register is shifted to add 01. The program then jumps back to STATUS to get the next character. If the character was a dash, the Code Register is shifted and 02 added. The program then jumps to STATUS.

DECODE is entered only when it is determined that a letter or word has been

REGISTER	TITLE	FUNCTION
441Ø 11	Buffer Register	Contains address of currently used message or pretext storage buffer.
4412	Dot Flag	Set if character sent is dash to determine graphic character.
4413 14	Buffer Location Register	Contains current buffer address during TX table search.
4415	Character Flag	Identifies received character as an incomplete letter if reset.
4416 17	Character Space Register	Determines minimum time between received characters.
4418 19	Uptime Counter	Contains count between received characters.
441A 1B	Dot-time Register	Determines duration of shortest received character.
441C 1D	Downtime Counter/ Delay Base	Contains duration of current received character/Establishes code speed for transmitted character.
441E	Code Register	Contains received characters making up letter.
442Ø 21	Delay Register	Determines transmitted character duration.
4761	WPM Factor	Internally adjusts Delay Base.

KEY	DESCRIPTION
BREAK	Program restarted to allow reselection of code speed and pretext entry.
←	Backspace will protect previously entered text in Buffer if depressed initially and ENTER. Also allows correction of text by erasing incorrectly entered text.
→	RX program reinitiated to allow proper timing.
#	Transmits message in pretext.
ENTER	Indicates end of text and allows transmission of text in message buffer.
SPACEBAR	Enters blank space in text.

formed. DECODE takes the letter formed in the Code Register and matches it with the code contained in the RX Character Search Table of Fig. 9. The corresponding ASCII code (* for error) then is printed on the video display after the appropriate letter or word space has been printed from a test of the Character Flag. The program then jumps back to STATUS to get the next character.

Interfacing and Operating

The RX portion of this program requires the addition of an interface and tone decoder or key as shown in Fig. 10. Construction of these circuits is not critical. Breadboarding is acceptable; masking of the input is required to prevent false states, however. The 1NS8255 is a little more than needed but permits adding additional ports to three eight-bit ports. Only the 0-bit A port is used in this program. The nice thing about this chip is the pin-for-pin compatibility with the TRS-80 expansion port. The +5-V power supply of the chip (pin 26) can be connected to the microcomputer's +5-V output on pin 39 of the expansion port edge card. Level II does not have +5 V on this pin; a separate power supply will therefore be necessary. Three 16-pin DIP shunt jumpers were used with the expansion port card edge connector (AMP P/N 88103-1) to tie into the interface. The interface was mounted on a PC board and housed neatly in a Kitchen Maid plastic utility tray that fits nicely beneath the keyboard. The tone decoder cannot be placed near the computer because of logic switching noise getting into the detection circuit.

This system has performed without difficulty for over six months. I have used it to generate code tapes used in teaching Morse code to Novices and have had excellent comments from the students. Over the air, I have never sounded so good. My usual, sloppy fist is now letter perfect. Morse code has been received with perfect copy at 35 wpm from W1AW. A few operating hints follow to permit the user a full appreciation of the system's capabilities.

Transmitter keying is not done directly with the cassette remote jack but through a keyer. This is done to protect the cassette relay's contacts. Weak or fading signals do cause timing problems as the signal is lost; resynchronization will correct the improper timing, however, once the signal is regained. Erratic code speed will likewise cause improper timing requiring resynchronization. The need to resynchronize is seen by the improper generation of letters or no generation on the video display.

Attempts to overcome signal loss by increasing the audio level causes overloading of the NE567, resulting in lockup. Noise or QRM can be filtered out quite effectively through use of the receiver's clarifier which also adjusts the signal's audio tone to put the tone into the detection band of the NE567. Difficulty has been experienced when noise from the high speed logic circuits of the computer are picked up by the receiver resulting in rampant generation of characters across the screen as the computer listens to itself. This is prevented by operating elsewhere on the band where the computer is not as noisy. Excessive RFI from the transmitter does affect the video display but does not interfere with the completion of the TX program.

Level II users may have noticed that their keyboard input and memory map are not compatible with the program. By calling their own keyboard subroutine and reassigning memory, Level II users may adapt the program.

If you are as lazy as I am, I am sure you will find the use of the TRS-80 a great way to just sit back and let the machine do the work. With the addition of the interface, the capabilities of your machine will be improved greatly. The whole outside world awaits—I may even figure out how to turn my coffee pot on.

I wish to thank Laris Pickett WB0QNT for his technical advice on the use of the cassette remote jack and John Engel WA0LPV for his support and suggestions in developing this program. ■

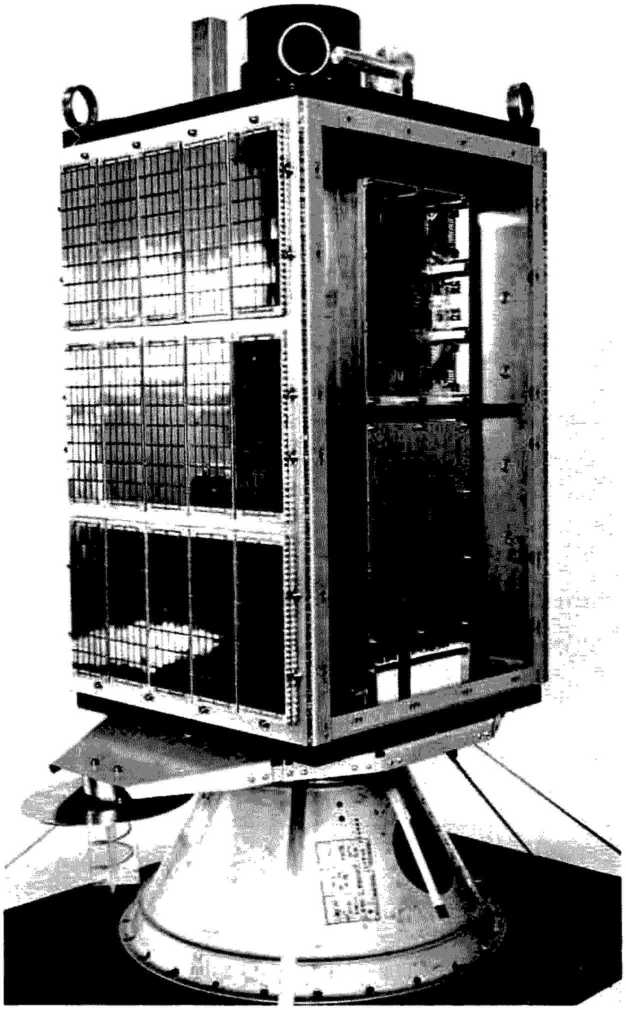
Phase III and Beyond

—the down-to-Earth satellite service



UoSAT, an amateur satellite built in the United Kingdom, will give experimenters a chance to receive pictures from a slow-scan TV camera pointed towards the Earth. The spacecraft also features beacons on two meters and 70 cm, as well as provisions for HF and microwave propagation experiments.

May 23, 1980, is known as Black Friday among amateur radio satellite enthusiasts. At 1430 GMT on that fateful day, the rocket carrying amateur radio's most ambitious spacecraft yet failed shortly after launch, sending Phase IIIA to a watery grave. One year later, hams still remember the tragedy, but they are not defeated by it. Building from the ruin and despair that accompanied the loss of Phase IIIA, the amateur satellite community has even more ambitious plans for the future. Through persistence and loyalty, these hams have organized the construction and launch of two satellites in the next year.

UoSAT

An early September, 1981, launch is scheduled for UoSAT, an amateur scientific and educational spacecraft conceived and constructed by radio enthusiasts from the United Kingdom. UoSAT is sponsored by the University of Surrey, AMSAT, the Radio Society of Great Britain, and the British Industry and Research Organization. The mission objectives for UoSAT represent an attempt to provide a means for analyzing radio propagation and satellite teleme-

BIRTH OF A SATELLITE SYSTEM

December 12, 1981, will mark the 20th anniversary of amateur radio's first satellite. The Orbiting Satellite Carrying Amateur Radio, OSCAR 1, circled the Earth transmitting the greeting "HI" in Morse code. This battery-powered spacecraft weighed a mere 10 pounds and cost about $65.00 to build.

We have come a long way since the days of OSCAR 1. In 1969, the Radio Amateur Satellite Corporation (AMSAT) was founded. Now in its second decade, AMSAT provides the coordination and support that makes the amateur satellite program possible. Hundreds of hams have committed their energy and resources towards the world's only "amateur" satellites. They have built, launched, and controlled eight satellites for a fraction of the commercial cost.

The success of amateur radio's satellites is directly linked to the support individual hams provide. *73 Magazine* urges you to join AMSAT. They offer a bimonthly magazine, *Orbit*, and a biweekly newsletter, *AMSAT Satellite Report*, full of information about the latest satellite developments. Write to AMSAT, PO Box 27, Washington DC 20044, or call (202)-589-6062.

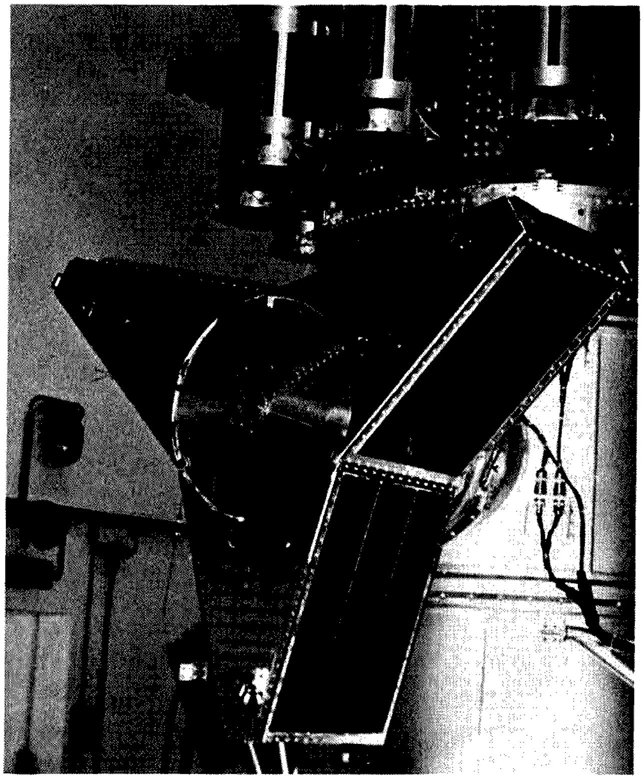
try from HF to microwave frequencies. The thrust of the UoSAT craft will be to develop experimental skills rather than relaying communications, so all of the satellite's functions will be "one way" (i.e., listen-only) for amateurs.*

UoSAT features two "regular" beacons, one on 145.825 MHz transmitting general data, the other relaying engineering and scientific data on 432.05 MHz. Both beacons will have 1200-, 300-, and 110-baud ASCII, and 45.5-baud Baudot capability. The two-meter beacon also can be modulated by a speech synthesizer or asynchronous interface to the spacecraft computer. The 70-cm beacon will provide a high-speed data channel intended for advanced amateur ground stations. In addition to the ASCII data sources, the 70-cm beacon can transmit information from three different computer interfaces, a magnetometer, and two radiation counters.

Receiving the two-meter beacon should be easy with a simple crossed-dipole antenna and an ordinary NBFM receiver. The AFSK signals can be demodulated by a low-cost terminal unit. Reception of the 432-MHz beacon is more involved since the signals will be modulated with bi-phase shift keying. One exciting piece of hardware that will accompany UoSAT is a CCD camera. This device will be pointed at the Earth, transmitting images composed of 256 × 256 pixels, with each image taking about 3½ minutes to transmit. The demodulator, memory, and interface circuitry needed to view these pictures can be built for about $250. The images can be transmitted on either beacon.

Propagation studies for the HF bands will be possible through the use of UoSAT's phase-referenced beacons on 7, 14, 21, and 28 MHz. Information about the Earth's magnetic field will be available from a flux-gate magnetometer. Solar disturbances can be monitored via two particle-flux (radiation) detectors. Another set of experimental beacons will be used to evaluate the use of microwave frequencies for amateur satellites. They will transmit on 2.4 and 10.47 GHz. UoSAT's lack of conventional two-way communications capability is eclipsed by the wide variety of signals that a ground station can receive. There is something here for everyone.

UoSAT is scheduled to ride on a NASA Delta 2310 launch vehicle as a secondary payload accompanying



Close-up of Phase IIIA satellite as it appeared mounted on the application technology capsule below the Firewheel satellite. (AMSAT photo by W4PUJ, taken in May, 1980, at the Kourou ESA facility.)

*Ground-originated telecommands to UoSAT excepted, of course.

DEATH OF A SATELLITE

A worldwide family of amateur satellite users watched anxiously during mid-June as AMSAT engineers, controllers, and managers tried to piece together a picture of AMSAT-OSCAR 7 while the old bird lay perilously close to the end of its productive life. Serious problems began to show up June 11 and 12 when the satellite was not fully responding to commands. The last confirmed QSO took place on orbit 30075 (June 12) with VK3ACR participating.

From that time onward, the transponders and beacons on AO-7 exhibited a worrisome silence and numerous monitoring stations were placed on alert on every possible orbit. This strategem paid off when several stations reported hearing transponder hash and other signs of recovery. The optimism was short-lived—in the days that followed, all transmissions ceased.

While at first it was feared that the malfunctions had been catastrophic and total with no symptoms at all to diagnose, now there are a few pieces of the puzzle to assemble. Jan King W3GEY, AMSAT Vice President for Engineering, stated that he felt a 5- or 10-degree Celsius thermal shock caused by the sudden exposure to deep shadow might have been enough to cause a failure in one of the weakened, aged nicad batteries. Such a failure mechanism might come about through nonuniform heating of a cell, causing, for example, the plate separators to warp and cause a short circuit.

The thermal stress hypothesis is based on the fact that OSCAR 7 experienced a solar eclipse for part of each orbit. The eclipses, which, in theory, started on June 1, were calculated to end on or about July 5. The reports of OSCAR 7's demise are tempered by its exemplary record. The 64-pound bird was launched on November 15, 1974, making it one of the longest-lived satellites in history. Its 6.6 years of service is more than double the three years originally expected. An estimated 10,000 to 15,000 amateurs utilized the satellite, making millions of QSOs.

The construction of the spacecraft was an international effort, with the Mode A transponder built by Americans, the Mode B transponder supplied by German hams, the RTTY encoder coming from Australia, and the 70-cm beacon constructed by Canadians. OSCAR 7 also included a super high frequency (SHF) beacon that was never turned on because the FCC failed to provide authorization.

The failure of AO-7 is like losing a close and valued friend. However, we can look back with pride at OSCAR 7's multitude of accomplishments.

The preceding report is based on material in the June 19 issue of the AMSAT Satellite Report.

the Solar Mesosphere Explorer spacecraft. The satellite's orbit wil resemble the OSCAR 7 and 8 orbits. The 530-km, sun-synchronous, polar, Earth orbit will result in UoSAT circling the Earth every 95 minutes with a latitude increment of approximately 23.75° per orbit. If all goes according to plan, UoSAT will be launched in September, 1981, and, assuming success, become known as OSCAR 9.

Phase IIIB

The OSCAR 9 designator was originally going to belong to the Phase IIIA spacecraft. After its ill-fated launch attempt, the dream that accompanied this ambitious AMSAT program almost came to a halt. Not only did the complex expensive electronic hardware have to be replaced, but a new launch opportunity also was needed. Without a ride, a satellite would be next to useless! In the year that followed Black Friday, the AMSAT crew has overcome these problems. Two new spacecraft are being assembled (Phase IIIB and C) by an international team of amateurs. Phase IIIB is scheduled for a launch during the summer of 1982 aboard an Ariane rocket which will also carry ECS-1 (European Communications Satellite #1). Phase IIIC is being built for a 1983-1984 launch.

The Phase-IIIB bird, with the emphasis on "B", will resemble its predecessor but also will incorporate some significant changes. There will be the mode-B transponder, which has an uplink on 70-cm and a downlink on two meters. In addition to mode B, the new satellite will have an L-band transponder. Users will transmit to the satellite on the new 1269-MHz satellite allocation and receive on a 70-cm downlink. The use of the new 1269-MHz allocation presents some unique challenges to UHF-microwave experimenters since very little commercial equipment is available in the Western Hemisphere. (It proliferates in Europe.)

Several weeks after the spacecraft is launched from the European Space Agency's French Guiana facility, a kick-motor (a small liquid-fuel rocket) will be used to move it into a highly elliptical orbit. This orbit will allow some users to have access to the bird for approximately eight hours at a time. The "slow" apparent movement of the satellite will greatly simplify antenna tracking.

Phase IIIB promises to be the ultimate repeater, where nearly a third of the world will be in range. DXers will have the capability to work stations on four continents without having to worry about propagation. Through its technical challenge and communications capability, Phase IIIB will be a big part of ham radio in the 1980s.

Sky-High Dreams

The future of amateur radio's satellite program does not end with UoSAT and Phase IIIB. Plans are being made for another Phase-III bird. While the Phase-III program promises to give worldwide communications capability, it still does not fulfill the dream of providing global coverage for every ham, 24 hours a day. Enter Phase IV, in which SYNCART satellites are being planned for geosynchronous orbits. If three SYNCART packages were linked, it would be possible to talk to almost any ham on the Earth, 24 hours a day, with 100% reliability. Transforming this dream into reality will require an extraordinary amount of cooperation and innovation. Where does the future of our hobby lie? Perhaps we should look to the sky for an answer. ■

You Can Scan with the Iscan

—memory scanning for the TR-9000

Kenwood's TR-9000 is a fine radio—no doubt about that. In fact, it has turned out to be exactly what I wanted in an all-mode 2-meter transceiver . . . with one small exception. While the 9000 has the built-in capability to perform scanning of the entire band, no provision is made for scanning the five memories.

The TR-9000's memories are selected by means of a front-panel rotary switch. However, since I like to keep tabs on several repeaters when I'm driving, I discovered that I was forever reaching down to fumble with the switch, much to the detriment of my driving. Sure enough, the minute I selected one frequency, it would go silent, and I'd again be groping for the memory switch. Enter the Iscan I-90, a memory-scan modification for the TR-9000.

Installation

Adding the I-90 to the 9000 is a relatively simple procedure. The I-90 package consists of an assembled 2" × 2" PC board containing four ICs, 12 pieces of very small-gauge insulated wire already cut to the proper lengths, and three pages of instructions, one sheet of which holds several helpful illustrations.

Installation of the I-90 involves attaching the 12 wires to various points inside the TR-9000 and to the I-90 PC board. For the most part, the wires are simply tack soldered to convenient pads inside the 9000, although one existing wire must be rerouted. It is a very clean modification and from start to finish, the whole procedure takes less than an hour. The instructions proved to be complete and understandable. A steady hand and a fine-tip soldering pencil are necessary due to the close quarters inside the 9000. The I-90 fits into the bottom of the TR-9000 cabinet, and absolutely no external modifications to the rig are required.

Operation

Using the I-90 is simple. With the Memory Recall button on the TR-9000 depressed, a touch of the 9000's Scan button sends the rig scanning through the five memorized frequencies. Scanning stops whenever a busy channel is encountered and resumes again when the carrier drops. A quick depression of the microphone's push-to-talk button forces the scan to continue past a busy channel. To return the radio to normal operation, it is necessary only to touch the transceiver's Hold button.

As you can see from the above description, the I-90 is a very clean mod. It makes use of existing controls and does not impair normal operation in any way. The many other scanning features of the TR-9000 are unaffected.

Summary

Although it was a minor annoyance in an otherwise fine rig, I did feel the lack of a memory scan in the stock TR-9000. When the I-90 came along, I was a bit hesitant to grab my soldering pencil and attack a nearly new radio. The results, however, have been well worth the small investment of time and money. In fact, the Iscan I-90 is so simple and does its job so well that one wonders why Kenwood did not include a similar circuit as standard equipment on the TR-9000. At $39.95, it's a bargain. The I-90 is available from *Iscan Engineering, Route 1, Box 90A, Antioch IL 60002.* Reader Service number 478. ■

SOCIAL EVENTS

from page 65

cial building at 9:00 am. Activities include forums, amateur and computer product displays, a flea market, ladies' programs, and children's activities. Full camping facilities are available. Talk-in on 146.16/.76. For more information, contact Charles W. Kuhn WD9EGW, 7005 N. Tobi Lane, Peoria IL 61614.

NEWTOWN CT
SEP 20

The Candlewood Amateur Radio Association's flea market and auction will be held on Sunday, September 20, at the Essex House, Rte. 6 in Newtown CT, Exit 8 off I-84, from 10:00 am to 4:00 pm. Admission is $1.00; tables are $6.00. Activities include door prizes, a raffle, dealers, and a magic show for the kids. Talk-in on 147.72/.12. For more information, contact George WB2THN at (914)-533-2758 or Ken KA1GDS at (203)-744-6953.

ROSS OH
SEP 20

The Greater Cincinnati Amateur Radio Association, Inc., will hold its annual Cincinnati Hamfest on Sunday, September 20, 1981, at Stricker's Grove on Ohio State Rte. 128, one mile west of Ross (Venice) OH. There will be exhibits, 10 major prizes, food, and refreshments available. Activities include a flea market with radio-related products only, a transmitter hunt, entertainment, and an air show. Admission is $4.00. For further information, contact Lillian B. Abbott K8CKI, 1424 Main Street, Cincinnati OH 45210.

MT. CLEMENS MI
SEP 20

The L'Anse Creuse Amateur Radio Club will hold its 9th annual Swap and Shop on Sunday, September 20, 1981, from 9:00 am to 3:00 pm at the L'Anse Creuse High School, Mt. Clemens MI. Take I-94 east-bound to the Metropolitan Parkway exit, then the Metropolitan Parkway to Crocker, go left on Crocker to Reimold and then right on Reimold to the last school, L'Anse Creuse High School. Admission is $2.00 at the door or $1.00 in advance. There will be FCC representatives and a test equipment table. There will be plenty of food and parking, plus hourly prize drawings. Prizes include a first prize of $250, a second prize of $100, and third prize of $50. Talk-in on 147.69/.09 and 146.52. For more information, send an SASE to Mike Corcoran N8CEN, 650 Chippewa, Mt. Clemens MI 48043.

AUGUSTA GA
SEP 20

The Augusta Amateur Radio Club will hold its annual hamfest on Sunday, September 20, at the Julian Smith Casino in Augusta GA. Tickets are $1.00 each; tailgaters, $3.00. Open at 9:00 am, everything is indoors except the flea market. There will be door prizes, a grand prize drawing at 3:00 pm, bingo, and refreshments. Talk-in on 146.34/.94. For more information, contact Diane Miller WB4YHT at (404)-860-3700.

FLINT MI
SEP 20

The Genesee County Radio Club, along with the Bay Area Amateur Radio Club, the Lapeer County Amateur Radio and Repeater Club, the Saginaw Valley Amateur Radio Association, and the Shiawassee Amateur Radio Association, will hold their fifth annual Five-County Swap-N-Shop on Sunday, September 20, 1981, from 7:30 am to 4:00 pm at the Bentley High School, 1150 Belsay Road (just north of I-69), Flint MI. Tickets are $2 per person in advance and $3 at the door. Children under 12 will be admitted free. There will be a food concession, free parking, and prizes (including a main prize of a Bearcat 210XL scanner). Talk-in on 146.52. Rent for an 8-foot table is $8; for reservatons, write Ed King K8OT, 10885 Dehmel, Birch Run MI 48415, or phone (517)-624-9094. For advance tickets, contact Ed King at the above address, or Don Williams KG8X, 5114 Knapp Drive, Flint MI 48506.

ARGOS IN
SEP 20

The Marshall County Amateur Radio Club will hold its 6th annual hamfest and electronics flea market on Sunday, September 20, 1981, at the 4-H Fairgrounds in Argos IN. Activities will include door prizes, refreshments, and a grand prize of $200. For more information, contact Paul R. DeVos WB9VFJ, 109 Maple Avenue, North Liberty IN 46554; (219)-656-4631.

ELMIRA NY
SEP 26

The Elmira Amateur Radio Association will hold the sixth annual Elmira International Hamfest on Saturday, September 26, 1981, at the Chemung County Fairgrounds. Gates will open at 8:00 am. Tickets are $2.00 in advance and $3.00 at the gate. Features will include a free flea market, tech talks, and dealer displays. Food will be available and door prizes will be awarded. The grand prize will be three items: an Icom IC-255A, an Icom IC-2AT, and an Avanti mobile antenna. A shuttle service from the Chemung County Airport will be provided for fly-ins who bring an HT. Talk-in on 147.96/.36, 146.10/.70, and 146.52/.52. For more information and/or tickets, contact John Breese WA2FJM, 340 West Avenue, Horseheads NY 14845.

LOUISVILLE KY
SEP 26-27

The eleventh annual Greater Louisville Hamfest and the 1981 Great Lakes Division Convention will be held on September 26-27, 1981, at the East Hall of the Kentucky Fair and Exposition Center in Louisville KY. There will be a large indoor exhibitors' area and flea market, completely air-conditioned. For more information, write The Greater Louisville Hamfest, PO Box 34444, Louisville KY 40232, or phone (502)-634-0619.

VIRGINIA BEACH VA
SEP 26-27

The 6th annual Tidewater Hamfest-Computer Show and ARRL Roanoke Division Convention will be held in the Virginia Beach Pavilion on September 26-27, 1981. Featured will be ARRL, traffic, and DX forums and XYL free bingo. FCC license exams will be given to those sending a form 610 request in advance. Free transportation to the oceanfront will be provided for the Neptune Festival. Admission is $3.50. There will be an advance ticket drawing for a handheld FM transceiver. Flea market tables are $5.00 for one day or $7.00 for both days. For tickets and information, write TRC, PO Box 7101, Portsmouth VA 23707, or phone (804)-587-1695.

ANNISTON AL
SEP 26-27

The Calhoun County Amateur Radio Association will hold its second annual hamfest on September 26-27, 1981, from 9:00 am to 5:00 pm on Saturday and from 9:00 am to 3:00 pm on Sunday, in the Municipal Auditorium, 1128 Gurnee Avenue, Anniston AL. Admission and parking will be free. Donations are $1.00 for one or $5.00 for 6. Tables are $3.00 for one day or $5.00 for two days. Free overnight parking for self-contained RVs will be available. Features will include a large air-conditioned exhibit area, free bingo on both days, hourly door prizes, MARS and ARRL forums, FCC examinations, and a final drawing on Sunday to award a Ten-Tec Delta Model 580, plus many other prizes. Talk-in on .69/.09; rag chew on .10/.70. Reduced rates will be available at the Anniston Downtowner Motor Inn. There will be a hospitality room at the Downtowner on Saturday evening. Contact Dale Boothe KA4LRL, c/o CCARA, PO Box 1624, Anniston AL 36202 for additional information.

CEDAR RAPIDS OH
SEP 27

The Cedar Valley Amateur Radio Club will hold its 7th annual CVARC Hamfest on Sunday, September 27, 1981, starting at 7:00 am at the Hawkeye Downs exhibition building in Cedar Rapids OH. Included will be an overnight camping area, picnic facilities, food, prizes, ARRL representatives, and movies. Talk-in on 146.16/.76, .52, and 223.34/.94. For advance tickets and reservations, write CVARC Hamfest, PO Box 994, Cedar Rapids IA 52406.

BEREA OH
SEP 27

The Cleveland Hamfest Association will present the 7th annu-

al Cleveland Hamfest on Sunday, September 27th, 1981, from 0800 to 1500 hours, at the Cuyahoga County Fairgrounds in Berea OH. Activities will include indoor exhibits, forums, a ladies' program, and an outdoor flea market with separate parking. Food services will include both breakfast and lunch. There will be three main prizes and a mobile check-in prize. Talk-in on 146.52 (W8QV). Advance tickets are $2.50 prior to August 31; $3.00 at the door. Contact the Cleveland Hamfest Association, PO Box 27211, Cleveland OH 44127.

BOULDER CO
SEP 27

The Boulder Amateur Radio Club will hold Barcfest/81 on Sunday, September 27, 1981, beginning at 9:00 am at the Boulder National Guard Armory, 4750 North Broadway, Boulder CO. An admission donation of $2.00 per family includes swap space and door prize drawing. There will also be a snack bar and an auction. Talk-in on 146.10/.70 and 146.52. For further information, contact Mark Call NØMC, 4297 Redwood Court, Boulder CO 80301, or phone (303)-442-2616.

ISLIP LI NY
SEP 27

The Long Island Mobile Amateur Radio Club (LIMARC) will sponsor the ARRL Hamfair '81, part II, on Sunday, September 27, 1981, at Islip Speedway, Islip NY. Food and refreshments are available at concession stands and many awards will be presented all day. General admission is $2.00; exhibitors' space is $5.00. Ladies and children will be admitted free. For more info, contact Sid Wolin K2LJH at (516)-379-2861 (nights) or Hank Wener WB2ALW at (516)-484-4322.

GAINESVILLE GA
SEP 27

The 8th annual Lanierland ARC Hamfest will be held on September 27, 1981, beginning at 9:00 am in the Holiday Hall at the Holiday Inn, Gainesville GA. Doors will open at 8:00 am for dealer setups, and free tables and an inside display area will be provided. A large parking lot will be available for the flea market, and all activities and facilities will be free to all. A boat anchor auction and prize drawings will be featured. Prize tickets are $1.00 each or 6 for $5.00. Food will be available next door. Talk-in on 146.07/.67. For more information and free dealer space reservations, contact Paul Watkins W4FDK, Rte. 11, Box 536, Gainesville GA 30501, or phone (404)-536-8280.

GRASS VALLEY CA
SEP 27

The Golden Empire Flying Club and Radio Systems Technology are pleased to announce the annual fly-in and avionics swap meet to be held at the Nevada County (CA) Airpark on Sunday, September 27, 1981. The pilot of any antique or home-built aircraft will receive a free "miner's lunch" and a beverage of the pilot's choice. Pastries, bratwurst, and hot dogs will be available also. The swap meet will be free. Table space is limited and it is first-come, first-served. This is the only swap meet in the country to feature the trading of used avionics products. Pilots are reminded that Nevada County Airport is considered a mountain strip, and are advised to check density altitude. For more information, contact Golden Empire Flying Club, PO Box 375, Grass Valley CA 95945.

ADRIAN MI
SEP 27

The Adrian Amateur Radio Club will hold its hamfest on September 27, 1981, at the Lenawee County Fairgrounds, Adrian MI, from 8:00 am to 3:00 pm. There will be prizes, games, and programs. Limited tables available and inside space available for your table. Tickets are $1.50 in advance; $2.00 at the door. Talk-in on 146.31/.91 and .52. For tickets, tables, and information, contact the Adrian Amateur Radio Club, Inc., PO Box 26, Adrian MI 49221. Tables reserved by check no later than September 20.

NEW LONDON NH
SEP 27

The 5th annual Connecticut Valley FM Association hamfest/flea market will be held on Sunday, September 27, 1981, from 9:00 am to 5:00 pm at the King Ridge Ski Area, New London NH. Adult admission will be $1.00 and flea market setup will be $5.00. Children under 16 will be admitted free. The food concession will be by King Ridge.

NEW BERLIN IL
SEP 29

The Sangamon Valley Radio Club of Springfield, IL, will hold its sixth annual hamfest on Sunday, September 29, 1981, at the Sangamon County Fairgrounds, New Berlin, IL twelve miles west of Springfield on Rte. 36. There will be an indoor display and a covered pavilion for the flea market. Exhibits, kids' activities, and food will be available, along with overnight camping. First prize is an Icom synthesized HT. Tickets are $2.00 in advance; $2.50 at the gate. For more information, contact SVRC, c/o Red Cross Building, 1025 S. Sixth St., Springfield IL 62703.

WAUKESHA WI
OCT 11

The KMRA Hamfest '81 will be held on Sunday, October 11, at the Waukesha Exposition Center, Hwy. FT, Waukesha WI. Tickets are $2.00 in advance; $3.00 at the gate. Talk-in on .52. For more info, or advance tickets, write KMRA Hamfest '81, 315 Morey Street, Waukesha WI 53186.

HAM HELP

I'm looking for a Swan 500 transceiver operation manual and schematic diagram. Thank you very much.

Manuel Avendano XE1ABR
Sur 141 #2316
Mexico 8, D.F.

I have been doing some serious listening at low frequencies—50 to 500 kHz—where noise is the problem.

I would like to correspond with anyone who has good technical information and/or experience with shielded antennas, loops or otherwise.

James L. Weiss W9ZMV
Box 840
Hillside IL 60162

I need a schematic for an American Bosch Radio Receiver, model 5A, manufactured by United American Bosch Corporation, Springfield MA. Thanks.

Jeff DeTray WB8BTH
73 Magazine
Peterborough NH 03458

I need some assistance with a problem I've been having. I have been trying to build a large Tesla coil for a while now. The project has been worked on when I have spare time (which is hard to come by these days, as you well know). My problem is that I can't get the thing to work! I'm sure the problem is resonating the coil. I can't seem to come up with the right value capacitor. I have a few books on Tesla, but none of them gives details on figuring out circuit values. Could anyone suggest any books or articles where I might find detailed information on building the coil?

Bob Billson WA2TXY
837 Summit Ave.
Westfield NJ 07090

I need a schematic and/or manual for a Dumont 401B oscilloscope. I will pay for copying or will copy and return, all postage paid.

Arthur Durea N4CJW
102 Indian Lane
Oak Ridge TN 37830
(602)-483-0784

Is anyone using the Heath H-89 on CW? Where can I get CW software?

D. R. Kight WA5RER
PO Box 1651
Abilene TX 79604

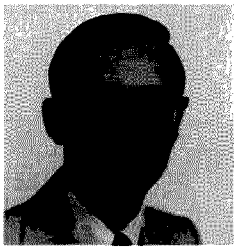
I need a manual and/or schematic diagram for a Globe Electronics Globe Scout Deluxe. I will pay for postage and copying costs.

Brian T. Sullivan
4300 Ivanhoe Place
Alexandria VA 22304

I need a schematic or operating instructions for pre-zip-code Simpson Model 372 ohmmeter. I will reimburse expenses.

Mickey McDaniel W6FGE
940 Temple St.
San Diego CA 92106

CONTESTS



Robert Baker WB2GFE
15 Windsor Dr.
Atco NJ 08004

WAS SSTV CONTEST

Starts: 1300 GMT September 5
Ends: 0100 GMT September 8

This is a simple A5 SSTV "Worked All States" contest designed to give the operator a maximum of 60 hours of available time in which the purpose is to work as many of the states as possible via slow-scan television. The time limitations were chosen for operating convenience and propagation fairness. Don't forget Alaska and Hawaii if available.

As in the January contest sponsored by *Amateur Television Magazine*, the contest is designed for quality rather than quantity. The extended operating time period and encouragement of unpopular SSTV band segments ensures minimum QRM between SSTV operators and experimentation in operation on all amateur bands.

All contacts must incorporate the video/signal report in video as well as the call letters of the stations worked. A bonus factor of 10 may be added to those SSTV contacts on non-popular bands as noted with an asterisk in the list of frequencies. Additional contacts within the same state count only as bonus points. Other than suggested frequencies may be used as long as the frequency used is legally authorized for SSTV operation. Log entries (or submitted copies) must include the signature of the operator and be mailed to Mike Stone WB0QCD, *A5 Magazine* Contest Manager, PO Box H, Lowden IA 52255 by midnight, September 10th. Include an SASE for logs that are to be returned. Results will be published in the Nov/Dec issue of *A5 Magazine*.

The winning entry with the most states worked and bonus points will receive a one-year subscription to *A5 Magazine* and a contest certificate. Second and third place winners will receive certificates. Stations completing all 50 states will have their picture published in *A5 Magazine* with a writeup.

FREQUENCIES:

3845-3855*, 7220-7230*, 14230-14240, 21340-21350*, 28680-28690, 50.20-50.21*, 144.23-144.24 (SSB)*, 146.43 (FM)*.

NEW MEXICO QSO PARTY

Starts: 0000 GMT September 12
Ends: 2400 GMT September 13

Sponsored by the Albuquerque DX Association. Crossband and repeater contacts may not be counted for scoring. Each station may be worked once on each band and each mode. NM stations operating mobile may be worked again in each county.

EXCHANGE:

RS(T), QSO number, and state, province, DX country, or NM county.

FREQUENCIES:

CW—63 kHz from the low end of each band; SSB—3900, 7265, 14285, 21365, 28650; Novice—3705, 7105, 21105, 28105. Stations outside NM please refrain from calling CQ NM near these frequencies!

SCORING:

Each QSO counts one point. NM stations multiply total QSO points by the total number of states, provinces, and DX countries worked on each band, each mode. All others, multiply total QSO points by the total number of NM counties worked each band, each mode.

AWARDS:

Plaques will be presented to the top scorers from NM and outside NM. Certificates awarded top scorers from each state, province, and DX country. Special award presented to any station working all 33 NM counties during the QSO party!

ENTRIES:

Stations reporting 100 or more QSOs please include dupe sheets. Entries must be postmarked no later than October 15th and addressed to: Albuquerque DX Association, PO Box 997, Corrales NM 87048. Include an SASE for complete results.

WASHINGTON STATE QSO PARTY

Contest Periods:
0100 GMT to
0700 GMT September 12
1300 GMT September 12 to
0700 GMT September 13
1300 GMT September 13 to
0100 GMT September 14

The sixteenth annual contest sponsored by the Boeing Employee's Amateur Radio Society (BEARS) is divided into three operating periods as shown. All amateurs are invited to participate. Use all bands and modes, but no CW QSOs are allowed in the phone bands. Stations may be worked once on each band and mode for contact points and more than once each band/mode if they are additional multipliers.

EXCHANGE:

QSO number, RS(T), and state, province, country, or Washington county.

FREQUENCIES:

Phone—1815, 3925, 7260, 14280, 21380, 28580; CW—1805, 3560, 7060, 14060, 21060, 28160; Novice—3725, 7125, 21150, 28160.

SCORING:

Washington stations score 2 points for each phone contact and 3 points for each CW contact, including contacts with other Washington stations. Multiply QSO points by the total number of different states, Canadian provinces, and other foreign countries worked. All others score 2 points for each phone contact and 3 points for each CW contact with a Washington station. Multiply QSO points by the total number of different Washington counties worked (39 maximum). There will be an extra multiplier of one for each group of 8 contacts with the same Washington county for all non-Washington stations.

AWARDS:

Certificates will be awarded to the highest-scoring station (both single and multi-operator) in each state, Canadian province, foreign country, and Washington county. Additional

CALENDAR

Sep 5-7	**WAS SSTV Contest**
Sep 12-13	**European DX Contest—Phone**
Sep 12-13	**G-QRP-Club CW Activity Weekend**

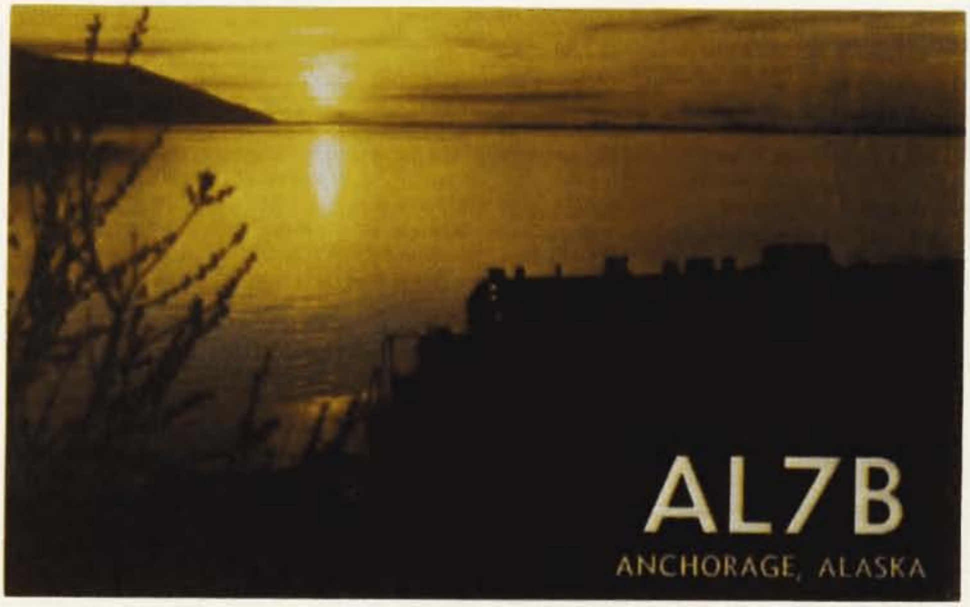
Jan 16-17	***73*'s International 160-Meter Phone Contest**
Jan 16-17	**International SSTV Contest**

certificates may be issued at the discretion of the Contest Committee. Worked Five BEARS Awards are also available to anyone working 5 club members before, during, or after the QSO party (unless previously issued). All QSO Party entries will be screened by the Contest Committee for possible Worked Five BEARS Awards. Worked Three BEAR Cubs Awards are also available for working 3 Novice members.

ENTRIES:

Logs must show dates/times in GMT, stations worked, exchanges sent and received, bands and modes used, and scores claimed. Include a dupe sheet for entries with more than 100 QSOs. Each entry must include a signed statement that the decision of the Contest Committee will be accepted as final. No logs can be returned. Results of the QSO party will be mailed to all entrants and an SASE is NOT required. Log sheets and summary sheets must be postmarked no later than October 15th and be sent to: Boeing Employees' Amateur Radio Society, c/o Contest Committee, Willis D. Propst K7RS, 18415 38th Avenue South, Seattle WA 98188.



QSL OF THE MONTH

This month's winner was submitted by Dick Mobley AL7B of Anchorage AK.

If you would like to enter the contest, put your QSL *in an envelope* and mail it along with your choice of a book from *73*'s Radio Bookshop to *73 Magazine*, Pine Street, Peterborough NH 03458. Attention: QSL of the Month. Entries which do not use an envelope (the Postal Service does *occasionally* damage cards) and do not specify book choice will not be considered. Sorry.

EUROPEAN DX CONTEST—PHONE

Starts: 0000 GMT September 12
Ends: 2400 GMT September 13

Sponsored by the Deutscher Amateur Radio Club (DARC). Only 36 hours of operations out of the 48-hour period are permitted for single-operator stations. The 12 hours of non-operation may be taken in one period, but not in more than three periods, at any time during the contest. Operating classes include: single-operator allband and multi-operator single transmitter. Multi-operator, single-transmitter stations are allowed to change band only one time within a 15-minute period, except for making a new multiplier. Use all amateur bands from 3.5 through 28 MHz. A contest QSO can be established only between a non-European and a European station. Each station can be worked only once per band.

EXCHANGE:

Exchange the usual five-digit number consisting of RS and progressive QSO numbers starting with 001.

SCORING:

Each QSO counts 1 point. Each QTC (given or received) counts 1 point. The multiplier for non-European stations is determined by the number of European countries worked on each band. Europeans will use the last ARRL countries list. In addition, each call area in the following countries will be considered a multiplier: JA, PY, VE, VO, VK, W/K, ZL, ZS, UA9/UAØ. The multiplier on 3.5 MHz may be multiplied by 4, on 7 MHz by 3, and on 14 through 28 MHz by 2. The final score is the total QSO points plus QTC points multiplied by the sum total multipliers.

QTC TRAFFIC:

Additional point credit can be realized by making use of the QTC traffic feature. A QTC is a report of a confirmed QSO that has taken place earlier in the contest and later sent back to a European station. It can be sent only from a non-European station to a European station. The general idea is that after a number of European stations have been worked, a list of these stations can be reported back during a QSO with another station. An additional 1 point credit can be claimed for each station reported.

A QTC contains the time, call, and QSO number of the station being reported, i.e., 1300/DA1AA/134. This means that at 1300 GMT you worked DA1AA and received number 134. A QSO can be reported only once and not back to the originating station. Only a maximum of 10 QTCs to a station is permitted. You may work the same station several times to complete this quota but only the original contact has QSO point value. Keep a uniform list of QTCs sent. QTC 3/7 indicates that this is the 3rd series of QTCs sent and that 7 QSOs are reported. Europeans may keep the list of the received QTCs on a separate sheet if they clearly indicate the station who sent the QTCs.

AWARDS:

Certificates to the highest scorer in each classification in each country, reasonable score provided. Continental leaders will be honored with plaques. Certificates also will be given stations with at least half the score of the continental leader or with at least 250,000 points. The minimum requirements for a certificate or a trophy are 100 QSOs or 10,000 points.

ENTRIES:

Violation of the rules, unsportsmanlike conduct, or taking credit for excessive duplicate contacts will be deemed sufficient cause for disqualification. The decision of the Contest Committee is final. It is suggested to use the log sheets of the DARC or equivalent. Send a large SASE to get the wanted number of logs and summary sheets (40 QSOs or QTCs per sheet). SWLs apply the rules accordingly. Entries should be sent no later than October 15th, and North American residents may send their applications and logs to: Hartwin E. Weiss W3OG, PO Box 440, Halifax PA 17032 USA.

EUROPEAN COUNTRY LIST:

C31, CT1, CT2, DL, DM, EA, EA6, EI, F, FC, G, GC Guer, GC Jer, GD, GI, GM, GM Shetland, GW, HA, HB9, HBØ, HV, I, IS, IT, JW Bear, JW, JX, LA, LX, LZ, M1, OE, OH, OHØ, OJØ, OK, ON, OY, OZ, PA, SM, S, SV, SV Crete, SV Rhodes, SV Athos, TA1, UA1,3,4, 6, UA2 UB5, UC2, UN1, UO5, UP2, UQ2, UR2, UA Franz Josef Land, YO, YU, ZA, AB2, 3A, 4U1, 9H1.

NEWSLETTER CONTEST WINNER

This month's winner of the *73 Magazine* Club Newsletter Contest is the *Birmingham* (Alabama) *Amateur Radio Club Newsletter.* Not only does this publication have a very attractive layout, complete with photographs, it also offers some darned good technical information.

We found an article describing a simple RTTY demodulator and a "Technical Corner" where real-to-life problems are tackled. Your newsletter does not need to limit itself to ham-radio subjects. The BARC technical data included mention of a troublesome remote controller for a TV. Even if the readers cannot use such information immediately, they'll be able to store it away for future reference. A bit farther afield, *Zero Bias*, the Aroostook (Maine) Amateur Radio Association newsletter, published details on how to grow strawberries in a barrel.

Technical articles don't *need* to be long, involved technical treatises with professional illustrations. A few paragraphs of text accompanied by some simple drawings is all you need for a first attempt. What kinds of things can you write about? We liked the external microphone for the IC-2A described in the *Metropolitan Amateur Radio Club* (Tucson, Arizona) *Bulletin*, and the two-meter pocket antenna featured on the back cover of the *Parking Ticket*, a Plano (Texas) Radio Klub publication.

The pages of a club newsletter are an ideal place to introduce and perfect projects before submitting to magazines such as *73*. Don't let your club's editor send out a newsletter that has too much white space; contribute ideas and projects so that everyone can enjoy them.

Is your club sending its newsletter to *73*? Be a nuisance until they do.

G-QRP-CLUB CW ACTIVITY WEEKEND

Starts: 0900 GMT September 12
Ends: 2300 GMT September 13

All radio amateurs interested in QRP are invited to take part in the club's activity weekend. No special exchange information was mentioned in the information provided by the club. The operating schedule for this weekend is as follows:

3560 kHz = 0900-1000, 1700-1800, and 2200-2300 GMT;
7030 kHz = 1200-1300, 1500-1600, and 1900-2000 GMT;
14060 kHz = 1000-1100, 1400-1500, and 2100-2200 GMT;
21060/28060 = 1100-1200, 1600-1700, and 2000-2100 GMT.

Reports on the Activity Weekend will be welcomed by Christopher J. Page G4BUE.

MARYLAND-DISTRICT OF COLUMBIA QSO PARTY

Starts: 1900 GMT September 19
Ends: 1900 GMT September 20

Sponsored by the Columbia Amateur Radio Association, the contest is open to all single-operator stations.

EXCHANGE:

QSO number, RS(T), and state, province, country, or MD county. Remember that Baltimore and Washington are independent cities!

SCORING:

MDC stations multiply total QSOs by sum of MD counties, states, provinces, and countries. Others multiply MDC QSO total by number of MD counties and independent cities (25 maximum). Also, multiply score by 1.5 if running 200 Watts or less.

FREQUENCIES:

Phone—3950, 7250, 14290, 21390, 28590; CW—60 kHz up from low end; Novice—3720, 7120, 21120, 28120.

AWARDS AND ENTRIES:

Plaques and certificates for top scores in each category. Mail entry by October 20th to CARA, Inc., c/o Robert K. Nauman WA3VUQ, 4017 Font Hill Drive, Ellicott City MD 21043.

COLLEGE SCRIMMAGE

Starts: 0200 GMT September 19
Ends: 0400 GMT September 20

The idea of this contest is to put long-lost alumni in touch with their alma mater. Entry classes include alumni and college stations (one transmitter only). Exchange name of college, Jr. college, or university you last attended, and the last years of the year you graduated or will graduate. Club stations substitute "Amateur Radio Club" for number. Non-collegians, substitute "high school" for college name. Stations may be worked once per band. Multiply total QSOs times number of different colleges, Jr. colleges, and universities worked. Logs must be received by November 1st. Send to Penn State ARC (K3CR), 202 Engineering Unit E, University Park PA 16802. Please include an SASE for results.

FREQUENCIES:

SSB—1815, 3895, 7230, 14280, 21355, 28560; CW—60 kHz from low end; Novice—25 kHz from low end.

CAN-AM CONTEST

Phone
Starts: 1800 GMT September 19
Ends: 1800 GMT September 20
CW
Starts: 1800 GMT September 26
Ends: 1800 GMT September 27

Multi-operator stations can operate the full 24-hour period. Single-operator stations can operate a maximum of 20 hours with a maximum of two rest periods totaling a minimum of 4 hours.

Sponsored by the Ontario Contest Club and Canadian DX Association to increase the friendship among Canadian and American amateurs and to provide a means of measuring the performance of their operating skills and equipment.

Operating categories include: (1) Single operator—all bands with station operated by the station licensee; (2) Multi-operator, single transmitter—stations operated by more than one operator, or single operator other than the licensee, or club station; (3) club competition.

Use all bands, 160 through 10 meters. USA General portion of the bands is recommended. The same station can be contacted once on each band. Stations operating from outside of their own call area must sign slash and the area they are operating from.

EXCHANGE:

RS(T) plus sequential QSO number starting with 001 and multiplier (MX) area abbreviation (in that order). Multiplier-area abbreviation is the usual two-letter postal abbreviation for 50 US states, CN for Caribbean (KC4, KG4, KP1, KS4, KV4), PC for Pacific (rest of US possessions). Canadians will use: NF for VO1 and VO2, NB for VE1 New Brunswick, NS for Nova Scotia, PE for Prince Edward Island, SI for Sable and St. Paul Islands, PQ for VE2, ON for VE3, MB for VE4, SK for VE5, AT for VE6, BC for VE7, NW for VE8 NWT, and YU for VY1 Yukon.

SCORING:

The multipliers are the 50 US states, 2 US possessions (Caribbean & Pacific), 10 Canadian provinces, 2 territories (NWT & YU), 1 island (Sable or St. Paul). Total of 65 multipliers per band, maximum possible on all 6 bands is 390.

QSO points for Americans to Americans or Canadians to Canadians is 2 points per QSO. American to Canadian and vice versa counts 3 points per QSO. The final score is the result of the total QSO points from all bands, multiplied by the sum of the multipliers from all bands. Phone and CW sections of the contest are considered separate contests. However, combined score for phone and CW will be used for overall competition. Combined scores will be calculated by the contest committee as a result of the addition of the phone and CW scores.

AWARDS:

First-place certificates will be awarded in each multiplier area on both modes in single-operator categories. Top five multi-operator stations will receive certificates for high claimed phone and CW scores. All scores will be published in *CQ Magazine*. One year subscriptions to *Long Skip*, the CANADX bulletin, will be awarded to the 5 US stations. Additional trophies and plaques will be awarded the overall winners for the Canadian and American champions on phone, CW, and combined. Also, an award for the club having the highest score as a result of adding the 5 best scores on phone and CW by its members. A club officer must submit the summary showing the callsigns and

scores. Each station is eligible for one trophy only. In cases where one station qualifies for another trophy, the less significant trophy goes to the next eligible station.

ENTRIES:

All times must be kept in GMT. Indicate multipliers the first time only on each band. Log must be checked for duplicate contacts, correct QSO points, and multipliers. Do not use separate logs for each band. Rest periods must be clearly marked in the log. Each entry must consist of: log sheets, summary sheet showing all scoring information, category of competition, operator's name and callsign, address of the station, and signed declaration. Entries with over 200 QSOs must include check sheets for each band. Official logs, check sheets, and summary sheets with multiplier tables are available from the contest chairman; a large SASE with Canadian stamps (for US stamps *not glued to the envelope*) will bring you samples. Usual disqualification rules apply, and the decisions or actions of the Can-Am Contest Committee are official and final. All entries must be postmarked not later than 30 days after the contest and mailed to: VE3BMV, PO Box 292, Don Mills, Ontario, Canada M3C 2S2.

DARC CORONA 10-METER RTTY CONTEST

Contest Period: 1100 to 1700 GMT September 26

This is the third of four tests during the year sponsored by the DARC eV to promote RTTY activity on the 10-meter band. Each of the four tests is scored separately. Use the recommended portions of the 10-meter band.

EXCHANGE:

RST, QSO number, and name.

SCORING:

Each station can be contacted only once. Each completed 2 x RTTY QSO is worth 1 point. Multipliers include the WAE and DXCC lists and each district in W/K, VE/VO, and VK. The final score is the total number of QSOs times the total multiplier.

AWARDS:

Plaques will be awarded to the leading stations in each class with a reasonable score present. Operating classes include: Class A for single- or multi-operator stations and Class B for SWLs.

ENTRIES:

Logs must contain name, call, and full address of participant. Also show class, times in GMT, exchange, and final score. SWLs apply the rules accordingly. Logs must be received within 30 days after each test. Send all entries to: Klaus K. Zielski DF7FB, PO Box 1147, D-6455 Erlensee, West Germany.

The remaining contest period is on November 8th.

MAINE QSO PARTY

Starts: 2300 GMT September 26
Ends: 2359 GMT September 27

Sponsored by the Portland Amateur Wireless Association, the contest is open to all. Stations may be worked once on phone and once on CW, for each band.

EXCHANGE:

RS(T), serial number, and state, province, country, or Maine county.

FREQUENCIES:

SSB—1815, 3930, 7280, 14280, 21380, 28580; CW—1805 and 55 kHz up from low end of band; Novice—3720, 7120, 21120, 28120.

SCORING:

Complete QSOs count 3 points. Out-of-state stations multiply the total number of QSO points by the number of Maine counties contacted (maximum of 16). Maine stations multiply the total number of QSO points by the sum of Maine counties, states, provinces, and countries.

ENTRIES:

Mail entries by December 1st to PAWA, Box 1605, Portland ME 04104. Applications for the Worked All Maine Counties award may go to the same address.

HAM HELP

I need a schematic and service manual for an HF receiver unit of Model RBM-3 radio equipment type CCT-46077. I will pay for schematic/manual (or copy) or I can copy and return original. Thank you.

Larry Steele K0UKO
5060 Chickweed Dr.
Colorado Springs CO 80917

I need instruction manuals for the Realistic DX-160 and the Allied Radio 2589 receiver. I will pay postage for photocopies or originals. I also need a Knight T-60 transmitter unit and schematic.

Kevin Neal
Rte. A, Box 221A
Flippin AR 72634

I need some help in obtaining the following books: *Radiotelegraph Operator's License Q&A Manual* by Milton Kaufman and *Radio Operating Questions & Answers*, 15th Ed, 1977, by Jules L. Hornung and Alexander A. McKenzie. I will gladly pay for these books if someone could provide me with a source for them. Also, if there are any Maritime Radio Officers going to be in port in Athens, Greece, drop me a line. Thanks.

SSG Gary S. O'Neal
HHD, 558th USAAG
APO NY 09253

I desperately need a source of tubes for my linear. It uses surplus-type RK-65s. If anyone can help me I will certainly appreciate it. Thanks.

Larry Ennis K8AXS
394 Leota
Union Lake MI 48085

I would like very much to obtain an instruction, operator's, or service manual for a DSI frequency counter, model no. 3600. This unit was manufactured by Diversified Security Industries, San Diego CA 92111. I think that perhaps the company has gone out of business; my letters have been returned. Can anyone help me out?

Mr. Lawrence Neel, Jr. W8PKV
1236 Bondick Dr.
Cincinnati OH 45230

I need a manual and schematic on an Itron model 680 frequency counter/timer. I will pay for manual or copy or will copy and return. Any help will be appreciated.

J. O. Dickinson W4LLF
1408 Monmouth Court West
Richmond VA 23233

CORRECTIONS

There is an error in my article on the Robot 800H specialty terminal in the August, 1981, issue. On page 92, column 4, the sentence begun in the seventh line from the bottom should read: "Word mode sends each word as it is completed *when* the Model 800 detects a space."

Wayne E. Elseth WB9PKD
Carbondale IL

In my review of *Guide to RTTY Frequencies* in the August, 1981, *73*, my address was incorrect. The street address should be *204* Dellwood Drive.

Dennis G. Brewer K8DIU/4
Greenville NC

NOISE BRIDGE PARTS KIT

A complete kit of parts, including PCB and cabinet, for a noise bridge similar to the one shown in Fig. 2, p. 41, of the August issue, is available for $31.95 plus $2.50 shipping from Radiokit, Box 4115, Greenville NH 03048. The bridge covers 1.5 to 30 MHz with a resistive range of 0 to 250 Ohms and a reactive range of −180 to +180 Ohms.

DS2050 *from page 42*

mind. All functions are keyboard-controlled, involving pressing the control key and one of the keys on the top row of the keyboard. Unshift-on-space can be selected in the Baudot mode and automatically resets the receive circuitry to LTRS (letters) case when a space character is received. Sync idle (often referred to as "diddle") can be switched on or off in all modes, and causes a nonprinting character to be transmitted when your typing rate is slower than the transmit-output rate.

Unlike mechanical RTTY terminals, the DS2050 does a lot of the drone work for you. Start typing, and it keys the transmitter. Stop, and the transmitter shuts off. Word wrap-around is provided in both transmit and receive. In transmit, if you are typing along and come to the end of the line, the computer will bump the word to the next line and insert a carriage return, line feed, and LTRS shift. In addition, when the ENTER key is pressed, a carriage return, line feed, and LTRS shift is generated. In receive, whenever a line feed is received, a carriage return is performed as well. What all this boils down to is that you sit there and type your message and the computer takes care of the rest.

Test messages are generated by pressing CONTROL and one other key. Hit the RY key, and an entire line of RYRY will bless the eyes and ears of others on the same frequency. The same with the traditional Quick-Brown-Fox message. The CQ button generates a bunch of CQs in the blink of an eye. These are augmented by two 32-character ID message buffers which must be loaded each time the system is turned on. The first buffer is used also for the CW ID, so I usually program a short message like DE KA1LR into that. The second buffer is used only for RTTY ID, so I often program something like KA1LR "PAUL" HARRISVILLE NH.

The ability to type a message for transmission while receiving (pretyping) is almost a necessity, and the 2050 can do it, although in a limited fashion. There is a hidden buffer that will hold 255 characters, and it can be typed into at the same time you are receiving a message.

Transmitted text is printed dimmer on the screen than received text, and you can type straight in while receiving, but since it mixes the transmit text in with the receive text, it makes it all a little hard to read. Mind you, it will be sent correctly—it just looks a little strange. In short, the 2050 offers two varieties of pretyping, but neither is quite as convenient as terminals with split-screen operation.

If your typing is as bad as mine, you'll appreciate the DS2050's approach to sending text. It is word-oriented and always stays at least one word behind your typing. As you type a sentence, if you are typing slower than the unit can send, it will stop before the word you are typing and wait until you hit the space bar to send it. This allows you to go back and correct spelling mistakes before the word goes out. A nice touch!

The receive mode works beautifully. The ST5000 demodulator can decode tones I can barely hear and dutifully ignores a fairly high level of QRM. It will tune either 170- or 850-Hz shifts, so you'll be at home both on the HF bands and two meters. Tuning is easily accomplished with the large meter on the top of the unit. Pick up a cheap scope at the next hamfest, and you'll be able to plug it into the 2050 and tune even more accurately.

For those of us who like to leave our equipment on all of the time and tuned to a specific frequency, autostart is included. Both mark and space tones must be present for 3.5 seconds before anything will appear on the screen, effectively preventing garbage from being printed. You'll need a standard teleprinter with loop keying for hard copy if you don't want to miss anything!

Keeping track of the status of all the functions is rather important. The top line of the screen serves as a status indicator, and I find myself looking at it frequently to make sure I'm using the right code, speed, and transmit mode. Unfortunately, one of the two things I don't like about the 2050 involves the status line. It is bumped off when the screen fills with text, and to get it back, you must enter a control code. The status line will disappear again as soon as another line of text is started. No doubt this was done to allow as much text as possible to appear on the screen at one time, but I suspect most of us would gladly sacrifice a line of text to see the status line there all the time.

The other thing I would like to see changed is the number of options we have for keying a transmitter. Currently, you can transmit RTTY anyway you like as long as it is AFSK. Adding TTL- and RS232-level FSK is an easy modification since both are present on the demodulator board. Pick up the signal your rig needs off the board, bring it out to a phono jack on the back panel, and you'll be enjoying the benefits of direct FSK. Considering the large number of transceivers that include an FSK circuit, it would be nice if HAL made FSKing more accessible in future evolutions of the box.

RTTY equipment manuals have generally been better than those supplied with other amateur equipment, and the 57-page tome packed with the DS2050 is no exception. It could easily serve as a textbook for those who know absolutely nothing about RTTY. The instructions for the terminal itself are very complete, but HAL goes on to explain the theory behind RTTY, how to choose a transmitter and receiver for RTTY, how to tune signals, and even how to interface your standard TV set to the terminal.

On The Air

The DS2050 looks pretty good on paper, but it does even better in actual use. It's amazing how annoying even minor glitches can be in a piece of ham gear, but my blood pressure has stayed at normal levels throughout the months I've had the HAL. The keyboard has a satisfying feel and there is absolutely no keybounce. The RFI that has plagued some of the computer/interface combinations I have used is completely absent. If you have never tried sending CW on a keyboard, you owe yourself a session on this machine. You type at any speed you like, and out comes perfectly-spaced CW. Hard to beat! We didn't test the CW-receive option, but for those who are interested, it's available.

Turning to RTTY, the phrase that immediately comes to mind is "rock-solid." The demodulator that HAL included may not be the fanciest board available, but it has never let me down, and the various control functions are so easy to use that you don't even need a cheat sheet to re-

member what does what.

The DS2050 is tailor-made for the ham who wants a high-performance RTTY/CW terminal at a reasonable price. Best of all, the circuitry is straightforward enough to allow us compulsive hardware hackers to enjoy ourselves without getting into too much trouble. If you are looking for SELCAL, message buffers, mailbox operation, or WRU, you'll want to look at one of the more expensive stand-alone units, or a computer/interface combination. For good basic performance that doesn't require a lot of fussing and cussing, you won't find a better deal than the HAL DS2050. For more information, contact *HAL Communications Corp., Box 365, Urbana IL 61801*. Reader Service number 477. ■

FRG-7700 *from page 30*

sufficient to fire the imagination of all but the most jaded ham or SWL. Separate terminals are provided for shortwave and medium-wave antennas, as well an an SO-239 connector for shortwave antennas fed with 50-Ohm coaxial cable. Unfortunately, the shortwave and medium-wave antennas cannot be connected at the same time, so you have to mess around behind the rig every time you want to do a bit of broadcast-band DXing. Not to be neglected is the mute terminal, allowing the rig to be used easily with a transmitter.

Relay outputs from the clock are provided in phono-jack form, one with normally-open contacts, the other with normally-closed. Timer control of a tape recorder is a snap, banishing the usual kludge of control wires and relays forever. A DIN-plug accessory socket allows access to agc voltage, ground, mute output, and 11 V dc. There are no suggestions for the use of this socket in the instruction manual, but you can surmise that it might be used with an accessory preamp or converter. The receiver is equipped with a hefty three-wire line cord, and travelers will appreciate the four-position ac voltage selector. It is with great sadness that I report the lack of a dc power input. A cursory examination of the schematic offers little hope for a simple mod to allow operation from a 12-V dc power source. If, like me, you dream of having a general-coverage receiver bouncing around beneath the dashboard of your automobile, you'll have to look elsewhere. The final two items of interest on the rear panel are the external speaker jack and a switched front-end attenuator.

In Use

The proof of the pudding is, of course, not what goes into the dish, but how well it fares on the table. The Yaesu FRG-7700 does very well, thank you! How such a radio turns out depends to a great extent on the design philosophy of its engineer(s), and whoever is responsible for this receiver generally made all the right decisions. For example, many general-coverage receivers are designed to be used with minimal antennas. When faced with a real antenna, they often manifest an embarrassing array of overload-related problems. Connected to the 30-foot length of wire supplied with the set, the 7700 performed far better than my Sony ICF-5900W, but it really comes into its own with a longwire or dipole attached. Sensitivity in the SSB mode is rated at 0.5 μV between 2 and 30 MHz, and operation gave no reason to question this figure.

The choice of three levels of AM selectivity is extremely helpful. When listening to strong stations like the BBC, the medium level seems just right. The narrow mode removes the various whistles and splatter that threaten to overcome weaker stations like Radio Cairo or Radio Free Grenada, but with a noticeable restriction of audio response. The wide mode was too wide for use in the shortwave spectrum, although domestic broadcast listeners should find it useful. Audio quality in general is good—a reasonable compromise between a desire for high fidelity and the need for intelligibility in a shortwave receiver. The tone control is of the high-cut variety, rolling off treble as it is turned counterclockwise.

For those hams who operate more phone than CW, the 7700 could serve as a very passable backup receiver. As mentioned earlier, a mute terminal is provided, allowing interface with most transmitters and transceivers. Four 1N60 diodes are used as a diode-ring product detector for SSB and CW demodulation. True, its 2.7-kHz selectivity in these modes will keep the 7700 from endangering sales of anyone's ham-bands-only equipment, but it is nice to know that the 7700 can be pressed into service in an emergency. As expected from a synthesized receiver, mechanical and electronic frequency stability was excellent. Minor earthquakes should cause no instability in this radio, and radioteletype aficionados won't be frustrated by tones that mysteriously drift out of the passband of their demodulators.

Certainly the most unusual feature of the FRG-7700 is its memory option. At first, I had some qualms about an accessory that cost more than the entire receiver I used previous to the 7700's arrival, but after using it, the digital memory feature has proved to be extremely useful. I program the first six memories with shortwave broadcast stations that I listen to in the morning, and the other six with stations I like to hear at night. I am a confirmed BBC addict, so four of the 12 memories contain BBC frequencies, which allows me to instantly select the one that suffers the least interference and has the best path to my part of the country at any particular time. Broadcast DXers looking for a rare and hard-to-hear station might program a couple of frequencies where the station should appear, and check back frequently to see if it is readable. Best of all, these memories are retained if you unplug the radio to move it or the power fails, as long as you install three penlight cells in the holder accessed through a port in the bottom of the radio.

While the memory unit is an extremely useful accessory, it could stand some improvement. An annoyingly loud transient occurs whenever the Memory switch is rotated or the MR button is pushed. Moreover, alignment of the circuitry is rather critical—after using the receiver for a while, it no longer memorized the exact frequency I wanted. It would be either 100 Hz high or 100 Hz low. Resolution of the problem involves a simple adjustment inside the rig, but it would be nice if it weren't necessary at all. Even with these shortcomings, the digital memory option is an extremely useful feature, and for many it will

✓See List of Advertisers on page 114

be worth the extra cash demanded for it.

The noise blanker performed as expected, with time constants designed for suppression of ignition noise, rather than the woodpecker. The agc action was just right, without the extremely long hang times found on certain competitive receivers. The attenuator is a variable control with most of its action at the beginning of its travel. The control quickly arrives at an unusably high level of attenuation, and it would be nice to see the range of control expanded a bit, even if it does lessen the ultimate attenuation somewhat.

While it may be a small loss, the function of the analog dial is mostly cosmetic. It is easily knocked out of calibration while tuning and, consequently, is of questionable value. About the only use I could think up for it is keeping rough track of where the main dial is when the digital readout is displaying a memory frequency. Happily, the digital dial works beautifully, and when I use the 7700 as a clock radio, its warm brown glow doesn't keep me awake like some of the blue displays I have seen.

One little-known accessory that I find extremely useful is the FRT-7700 antenna tuner, designed specifically for use with the 7700 receiver. The 7700 is very sensitive to antenna impedance, and the tuner can peak up the signal from a mismatched antenna by several S-units. Unless you have cut a dipole for every band that you listen to, the tuner is good to have in-line. For those of us with overload problems, there is a zero-to-60-dB attenuator, and the separate 150-to-500-kHz antenna input has a two-section low-pass filter to reject shortwave broadcast signals. Beyond such practical considerations, the tuner is a very attractive box of parts, and its price tag is low enough to assuage any guilt over the slight self-indulgence.

If you frequently read the reviews in this magazine, you will know that we complain about the quality of a lot of the manuals that are provided with the ham equipment we see. Yaesu's manuals have been steadily improving and the one packed with the 7700 is excellent. The installation and use section is well written, and the novice ham or beginning shortwave listener will appreciate the section on the basics of radio propagation. Large foldout schematics are printed on heavy paper, and there are circuit descriptions, maintenance and alignment procedures, and a complete parts list.

Conclusion

The FRG-7700 is a receiver that I can easily recommend to anyone who is looking for a competent shortwave receiver for general use. It is as free from quirks and idiosyncrasies as one can hope for, comparing favorably with receivers that cost considerably more. For shortwave listening, broadcast DXing, and back-up use in the ham shack, this receiver is at the top of its class! For further information, contact *Yaesu Electronics Corp., 6851 Walthall Way, Paramount CA 90723.* Reader Service number 476.■

Reprinted from the Federal Register

Frequency Allocations and Radio Treaty Matters; Amateur Radio Service; Rules To Revise Power Limitations in a Specific Frequency Band

AGENCY: Federal Communications Commission.

ACTION: Final rule.

SUMMARY: This document amends the Commission's rules to revise power and geographic restrictions for amateur radio stations operating in the 1800–2000 kHz band. This action was taken to relieve unnecessary operation restrictions.

EFFECTIVE DATES: June 10, 1981.

ADDRESS: Federal Communications Commission, Washington, D.C. 20554.

FOR FURTHER INFORMATION CONTACT: Nancy A. Krieger, Private Radio Bureau, Washington, D.C. 20554, (202) 632-4964—Room 5202(H).

SUPPLEMENTARY INFORMATION:

Order

Adopted: May 21, 1981.
Released: June 1, 1981.

By the Commission: Chairman Fowler abstaining from voting; Commissioner Jones absent.

In the Matter of Amendment of Rule Sections 97.61(a) and (b)(2) of the amateur radio service rules to revise power limitations in the 1800–2000 kHz band; amendment of § 2.106, table of frequency allocations; FCC 81-251.

1. On July 17, 1980, the Commission received a *Request for Agency Action* from the American Radio Relay League, Inc. (ARRL). The ARRL, in its Request, asked the Commission to delete § 97.61 (b)(1) and (b)(2) of the Amateur Radio Service Rules by Issuance of an Order. The ARRL believes that such an Order would greatly benefit the Amateur Radio Service community by encouraging innovation and experimentation in the 1800–2000 kHz band (also known at the 160 meter band). Also, the ARRL states that these rule sections currently provide protection to long-range aid to radio navigation (LORAN-A) systems from amateur radio interference. Since LORAN-A is being terminated, the League feels there is no longer a need for § 97.61 (b)(1) and (b)(2). The Amateur Radio Service shares the 160 meter band on a secondary basis. § 97.61(b) places transmitter power and geographic restrictions on amateur radio operations in the 160 meter band to prevent interference to LORAN-A. The ARRL states that the Commission can amend its rules by Order because "Footnote NG15(b) . . . empowers the Commission to terminate the restrictions of Section 97.61 (b)(1) and (b)(2) . . . without the necessity of rulemaking or other procedural steps prescribed by the Administrative Procedures Act."

2. On November 26, 1980, the United States Coast Guard sent a Memorandum to the Secretary for the Interdepartment Radio Advisory Committee (IRAC) stating that the Coast Guard planned to cease LORAN-A operations in the United States by the end of 1980.

PART 2—FREQUENCY ALLOCATIONS AND TREATY MATTERS; GENERAL RULES AND REGULATIONS

Appendix

A. Part 2 of Chapter I of Title 47 of the Code of Federal Regulations is amended, as follows:

In Section 2.106, under the heading NG Footnotes, amend Footnote NG 15 subparagraph (a)(4) by the existing Table and adding the following Table:

§ 2.106 Table of frequency allocations.

* * * * *

NG Footnotes

* * * * *

* * * * *

PART 97—AMATEUR RADIO SERVICE

B. Part 97 of Chapter I of Title 47 of the Code of Federal Regulations is amended, as follows:

1. In Section 97.61 paragraph (a) is amended by removing the first line of the Table and replacing it with the following two lines:

§ 97.61 Authorized frequencies and emissions.

(a) * * *

Frequency band	Emissions	Limitations (see paragraph (b))
1800 to 1900	A1, A3	
1900 to 2000	A1, A3	1, 2

2. In Section 97.61 subparagraph (b)(2) is amended by removing the existing Table and replacing it with the following Table:

§ 97.61 Authorized frequencies and emissions.

* * * * *

(b) * * *
(1) * * *
(2) * * *

State(s)	Maximum DC plate input power in watts (kilohertz)			
	1900 to 1925	1925 to 1950	1950 to 1975	1975 to 2000
	Day/night	Day/night	Day/night	Day/night
Maine, Massachusetts, New Hampshire, Rhode Island	100/25	0	0	100/25
Connecticut, Delaware, Maryland, New Jersey, New York, Pennsylvania, Vermont	200/50	0	0	200/50
Kentucky, North Carolina, Ohio, South Carolina, Tennessee, Virginia, West Virginia	500/100	0	0	500/100
Florida, Georgia, Illinois, Indiana, Michigan, Wisconsin	500/100	100/25	100/25	500/100
Alabama, Arkansas, Iowa, Minnesota, Mississippi, Missouri	1000/200	200/50	200/50	1000/200
The remainder of the States and territories	1000/200	1000/200	1000/200	1000/200

However, LORAN-A operations by other countries may continue until December 31, 1982.[1] The Coast Guard recommended changes to Section 97.61 (b)(1) and (b)(2) of the Commission's Rules. The IRAC approved the Coast Guard plan and forwarded it to the Commission in December, 1980. The Commission can incorporate the Coast Guard recommendations for § 97.61(b)(2) into its Rules. However, we must retain Rule Section 97.61(b)(1) since protection should still be provided for LORAN-A stations operated by Canada.

3. Therefore, by this Order, Rule Section 97.61(a) is revised to reflect a reduction in the restrictions on amateur radio operation in the 160 meter band. Rule Section 97.61(b)(1) remains because amateur radio stations should not interfere with the remaining LORAN-A operations. The Table in Rule Section 97.61(b)(2) is revised to reflect the new power limitations for amateur radio operation in the 160 meter band. In addition, we are amending Rule Section 2.106, Table of Frequency Allocations, Footnote NG15(a)(4) to reflect the new power limitations for amateur radio operation in the 160 meter band.

4. The 1979 World Administrative Radio Conference (WARC) in Geneva, decided that Loran-A operations in the 160 meter band in Region 2 (the Americas) would terminate by December 31, 1982. It made an exclusive allocation to the amateur radio service at 1800-1850 kHz and a shared allocation to the service as one of five primary services at 1850-2000 kHz. However, the Final Acts of the Conference are not scheduled to become effective until January, 1982 for those countries who have ratified the treaty. Further, after the United States does ratify the treaty, public consultation may be necessary through the rulemaking process before specific provisions can be incorporated into the domestic Rules. Therefore, the rule amendments adopted in this Order may be effective only for a short interim period.[2] Consequently, Amateur radio operators are cautioned not to invest heavily in equipment which can only be used for this frequency band because there is no guarantee as to the final provisions for the Amateur Radio Service in the 160 meter band.

5. The specific rule amendments that we are adopting are set forth in the Appendix. Authority for the amendments is contained in Sections 4(i) and 303(r) of the Communications Act of 1934, as amended. We are dispensing with the prior notice and public procedures provisions of the Administrative Procedures Act as impracticable (see 5 U.S.C. 553(b)(3)(B) in view of the short period of time that these frequencies are likely to be available.

6. Accordingly, it is ordered effective June 10, 1981 that Parts 2 and 97 of the Commission's Rules are amended as set forth in the attached Appendix.

7. It is *further* ordered that this proceeding is terminated.

8. Information concerning these rule changes may be obtained from John B. Johnston, (202) 632-4964.

(Secs. 4, 303, 307, 48 Stat., as amended, 1066, 1082, 1083; 47 U.S.C. 154, 303, 307)

Federal Communications Commission.
William J. Tricarico,
Secretary.

[1] See discussion of results of 1979 World Administrative Radio Conference in paragraph 4.

[2] The First Notice of Inquiry in Docket No. 80-739, Implementation of the Final Acts of the World Administrative Radio Conference, proposed an exclusive allocation to the amateur service at 1800-1900 kHz and an exclusive allocation to the radiolocation service at 1800-2000 kHz, along with suppression of the footnote NG15.

AWARDS

Bill Gosney KE7C
Micro-80, Inc.
2665 North Busby Road
Oak Harbor WA 98277

It is hard to believe, but two years have passed since our initial announcement of the famous *73 Magazine* Awards Portfolio. During this period, we've seen the program grow significantly to become one of the most sought-after challenges facing amateurs today.

Consisting of six domestic incentives and five DX achievement programs, the awards portfolio has captured the interest of almost everyone on the bands, whether you are a rag chewer or a big-time contester.

In the paragraphs to follow, I am listing the awards individually. Read through the rules with caution. The requirements are not as easy as one might first imagine. We want our award recipients to realize they had to *earn* their recognition, and therefore have designed each award to be somewhat of a challenge. Here are the five DX awards.

73 DX COUNTRY CLUB AWARD

1. Sponsored by the editors of *73 Magazine*, the 73 DX Country Club Award is available to licensed amateurs throughout the world.

2. To be valid, all contacts claimed must be made in a *single calendar year* (January 1 through December 31), beginning January 1, 1979.

3. This award is issued for All Phone, All CW, and Mixed Modes. Should the applicant wish to recognize a single-band or mixed-band accomplishment, merely state your request when submitting your application.

4. To qualify for any of the 73 DX Country Club Awards, a minimum of 73 DX countries must be worked and confirmed from the *73 Magazine* WTW (Work the World) DX Listing which appears elsewhere in this column. Once again, all contacts must be made in the same calendar year for which application is made.

5. Annual endorsement stickers are available for each succeeding year in which application is made and showing a minimum of 73 countries worked.

6. To apply, prepare a list of claimed contacts in prefix order. Include each station's callsign, date and time in GMT, mode, and band of operation.

7. Do not send QSL cards! Have your list of contacts verified by two amateurs, a local club secretary, or by a notary public.

8. Award fee is $4.00 or 12 IRCs for each award. Endorsements are granted for a fee of $2.00 or 6 IRCs.

9. For All 73 award applications: Enclose your verified list and award fee(s) to: Bill Gosney KE7C, 73 Awards Editor, 2665 North Busby Road, Oak Harbor, Whidbey Island, Washington 98277 USA.

DX CAPITALS OF THE WORLD AWARD

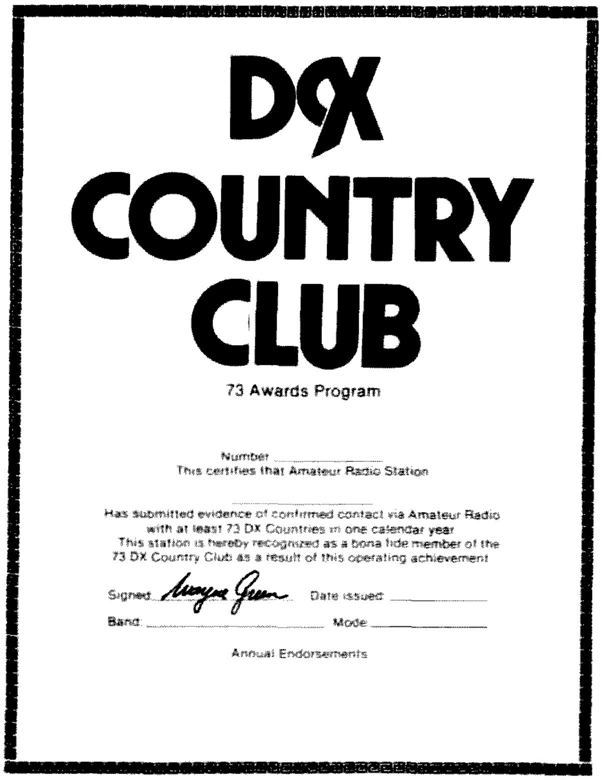
1. Sponsored by the editors of *73 Magazine*, the DX Capitals of the World Award is made available to licensed amateurs the world over.

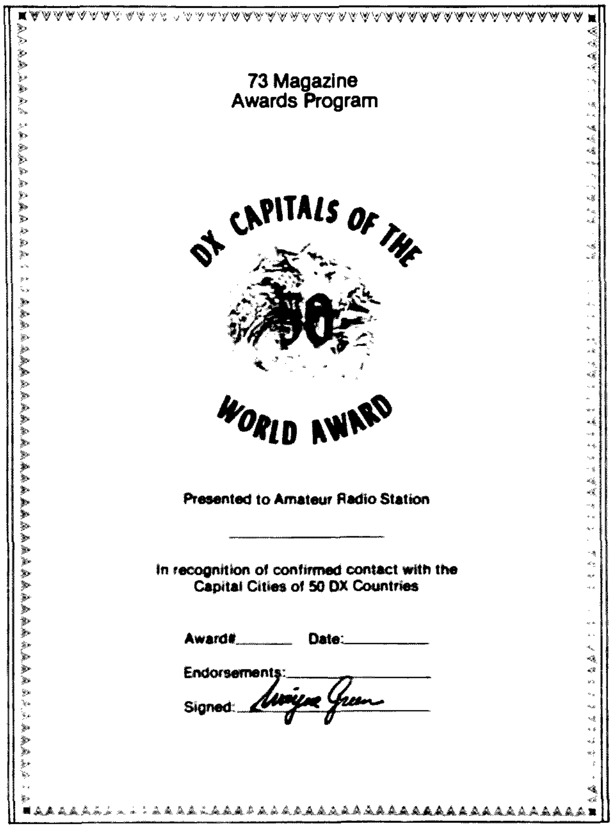
2. To be valid, all claimed contacts must be made on or after January 1, 1979. There are no band or mode restrictions, but special recognition will be given for single band or mode accomplishments if requested in the application.

3. To qualify, applicants must work and confirm fifty (50) different capital cities of the world. Only capitals of those countries which appear on the WTW DX Listing qualify. Should a country be contacted and its capital city is not commonly known, you may list it on your application and the awards editor reserves the right to make a final determination as to its acceptance for award credit.

4. To apply, make a list of contacts made in prefix order. Indicate the station callsign, date and time in GMT, band and mode of operation, the name of the capital city, and the DX country.

5. Do not send QSL cards! Have your list of contacts verified by two amateurs, a radio





club secretary, or a notary public. The award fee is $4.00 or 12 IRCs.

TEN-METER DX DECADE AWARD

1. Sponsored by the editors of *73 Magazine*, the Ten-Meter DX Decade Award is available to licensed amateurs worldwide.

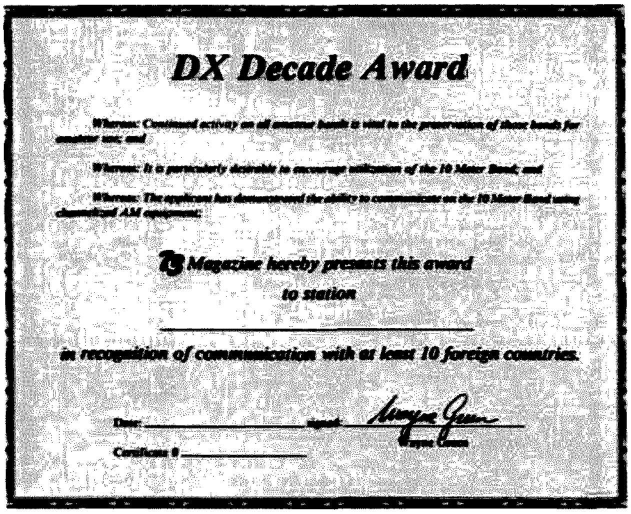
2. All contacts must be made on the 10-meter band using only channelized converted Citizen-Band equipment or similar type commercial units operating a maximum of 15-Watts PEP output. External amplifiers may not be used.

3. To be eligible for this award, all contacts must be made on or after October 1, 1978. Contacts may be claimed for all AM, SSB, CW, or FM. Mixed-mode accomplishments are not valid for this award.

4. To qualify, the applicant must work and confirm at least ten DX countries from the WTW (Work the World) Listing. Endorsements will be given for 25, 50, 75, and 100 countries confirmed.

5. To apply, make a list of contacts claimed, giving the callsign of each station worked in prefix order. Include the date and time in GMT, band, mode, and a brief description of the equipment used in making each contact. Special recognition will be given for QRP mobile achievements.

6. Do not send QSL cards! Have your list of contacts verified by two amateurs, a local radio club secretary, or by a notary public. The award fee is $4.00 or 12 IRCs.



SPECIALTY COMMUNICATIONS ACHIEVEMENT AWARD—CLASS A-1

1. Sponsored by the editors of *73 Magazine*, this award is dedicated to amateurs worldwide who take pride in active participation in the field of specialty communications.

2. To be eligible for this award, some very rigid requirements must be met. All contacts must be made on or after January 1, 1980. Only communications via SSTV, RTTY, EME (Earth-moon-Earth), and/or OSCAR will be recognized for award credit. Contacts between stations on OSCAR and EME may be made using any mode authorized in your country. Applicants must be cautioned, however, that mixed-mode contacts are not valid.

3. To qualify, applicants must work a minimum of 10 DX countries from the WTW DX Listing. Special recognition will be made for those exceeding the 10-country minimum.

4. To apply, the applicant must prepare a list of claimed contacts in callsign prefix order. Include the date and time in GMT, the band and mode of operation, and a signed declaration as to the type and description of equipment and antenna system utilized to make your contacts.

5. Do not send QSL cards! Have your list verified by two amateurs, a local club secretary, or a notary public.

6. The award fee is $4.00 or 12 IRCs.

SPECIALTY COMMUNICATIONS ACHIEVEMENT AWARD—CLASS A

A significant number of amateurs throughout the world find their primary interest in the operation and development of specialty-type communications. It is the efforts of these many pioneers in their respective fields which have created many state-of-the-art improvements in technology today. The editors of *73* wish to recognize those amateurs who make positive steps toward expanding the use of their respective mode or type of amateur operation. As a result, in the paragraphs to follow, learn of our latest communications award, dedicated to "communicator specialists."

To be eligible for the award, all contacts must be made on or after January 1, 1980. In addition, only communications via SSTV, RTTY, EME (Earth-moon-Earth) and/or OSCAR satellite will be recognized for this award. Contacts between stations on OSCAR or EME may be made using any authorized mode allowed in your country. Applicants are cautioned however, that mixed-mode contacts are not valid.

To qualify, applicants must work and confirm contact with each of the 50 US states. There

are no band requirements, but specific band accomplishments will be recognized if requested at the time of application.

To apply, applicant must prepare a list of claimed contacts in alphabetical order by state. Include the date and time in GMT, the band and mode of operation, and a signed declaration of the type and description of equipment and antenna system utilized.

Do not send QSL cards! Have your list verified by two amateurs, a local radio club, or a notary public. Enclose with your application a $4.00 award fee or 12 IRCs.

WORK THE WORLD DX AWARD

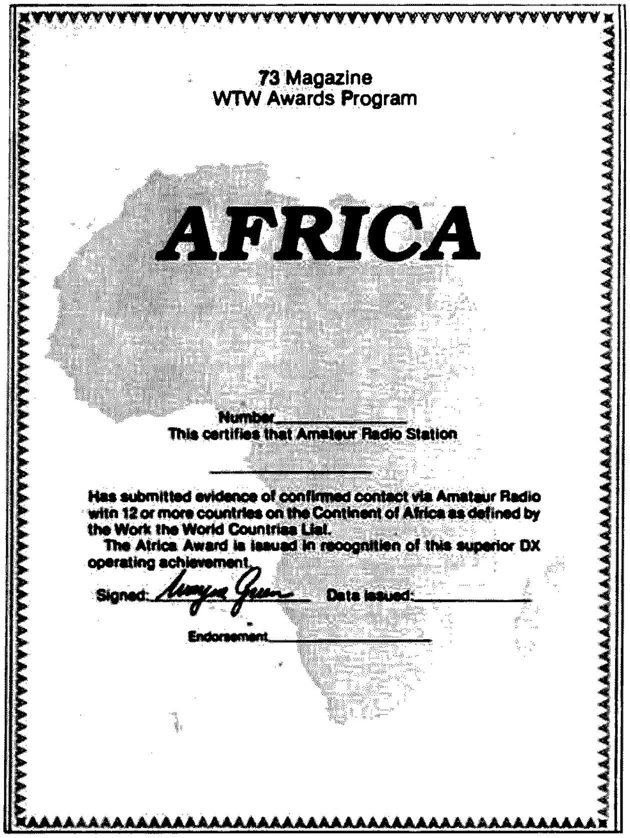
To enhance the enjoyment of working DX, the editors of *73 Magazine* take special pleasure in introducing the most complex and probably the most sought-after award in existence today—the Work the World DX Award.

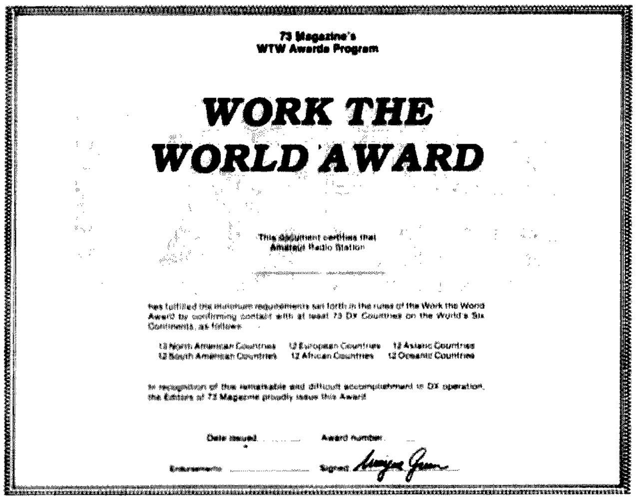
1. The WTW Award is available to licensed amateurs the world over.

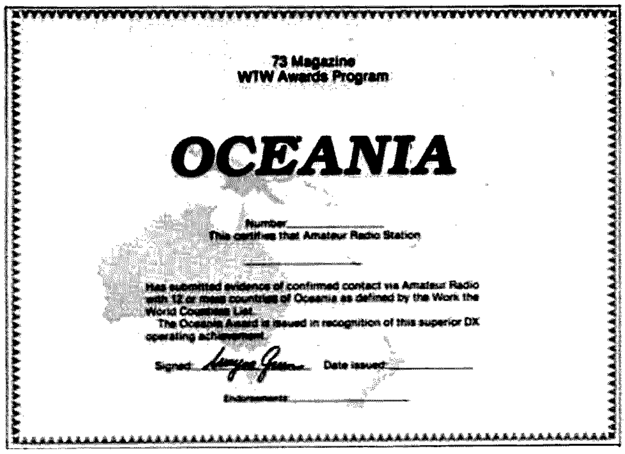
2. To be valid, all contacts must be made on or after January 1, 1979. There are no band or mode restrictions, but applicants will be given recognition for single-band or -mode achievements upon their request. Only DX countries shown on the WTW DX Listing qualify.

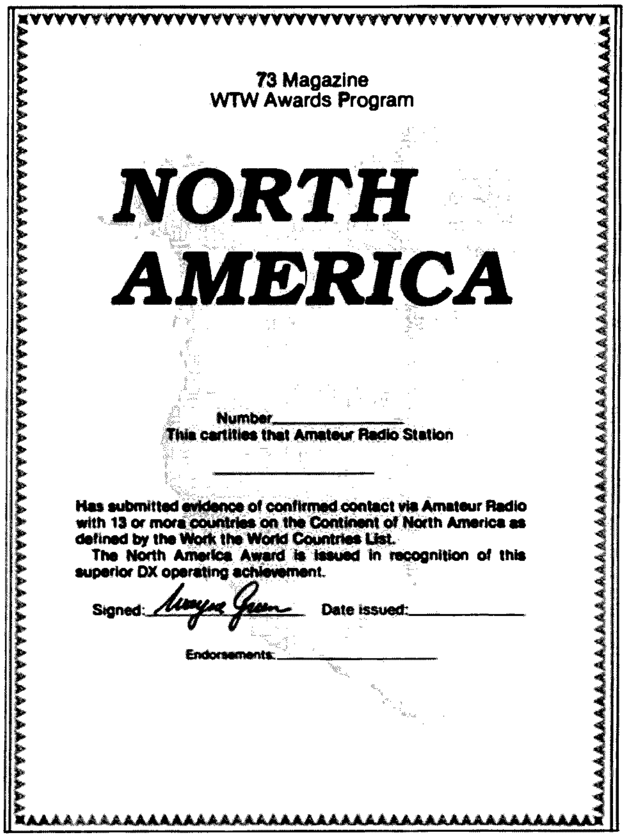
3. The Work the World program consists of six continental awards (North American, South American, European, Oceanic, Asian, and African), each of which is a worthy accomplishment on its own. Once application has been made for all six, the ultimate award, the Work the World DX Award, will be issued automatically without charge. The operator who earns WTW recognition has truly "worked the world."

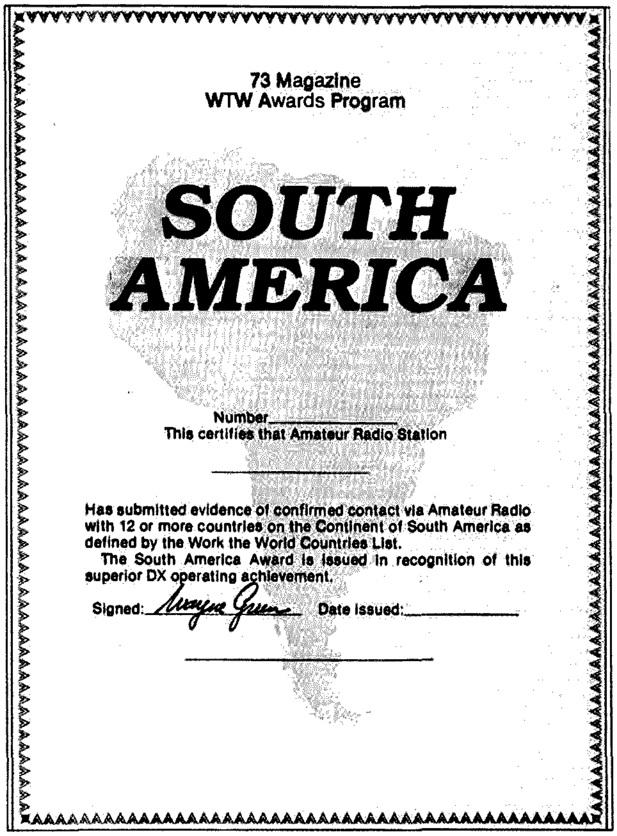
4. Requirements for the individual Continental awards: North American Award—work 13 North American countries; South American Award—work 12 South American countries; European Award—work 12 European countries; Oceanic Award—work 12 Oceanic countries; Asian Award—work 12 Asian countries; African Award—work 12 African countries.











73 Magazine
WTW Awards Program

SOUTH AMERICA

Number____________
This certifies that Amateur Radio Station

____

Has submitted evidence of confirmed contact via Amateur Radio with 12 or more countries on the Continent of South America as defined by the Work the World Countries List.
The South America Award is issued in recognition of this superior DX operating achievement.

Signed:____________ Date Issued:____________

5. To apply for any of these awards, prepare a list of claimed contacts for each continent, listing all callsigns in prefix order. Include date and time in GMT, and the band and mode of operation.

6. If you are submitting the sixth award application, please emphasize this fact to speed processing of your WTW Award.

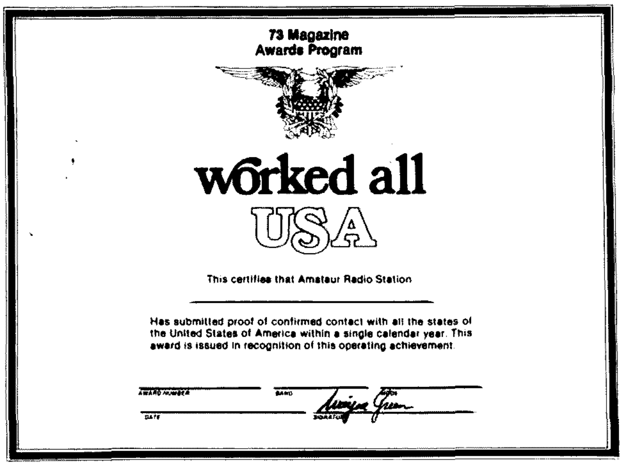
7. Do not send QSL cards! Have your list(s) verified by two amateurs, a radio club secretary, or by a notary public.

8. Each Continental Award has an award fee of $4.00 or 12 IRCs.

Now here are the six domestic awards, also being sought after by award seekers the world over. These awards were not meant to be an overnight venture nor were they designed to duplicate any in existence today. Each offers its own degree of difficulty and creates a sense of accomplishment in those who are happy recipients.

WORKED ALL USA AWARD

Sponsored by the editors of *73 Magazine*, the Worked All USA Award is available to licensed amateurs throughout the world. To be valid, all con-



73 Magazine
Awards Program

worked all USA

This certifies that Amateur Radio Station

Has submitted proof of confirmed contact with all the states of the United States of America within a single calendar year. This award is issued in recognition of this operating achievement.

tacts must be made on or after January 1, 1979. There are no band or mode restrictions, but single-band and single-mode accomplishments will be recognized.

If you're looking for an award with challenge, this definitely is one. To qualify, applicants must work *each of the 50 US states within the same calendar year* (January 1 through December 31). Annual endorsements will be awarded applicants who can verify their claim.

To apply, prepare a list of claimed contacts in alphabetical order by state, beginning with Alabama. List the state, the callsign of the station worked, the date and time in GMT, and the band and mode of operation.

Do not send QSL cards! Have your list of contacts verified by two amateurs, a local radio club secretary, or by a notary public.

The fee for the basic award is $4.00 or 12 IRCs; endorsements are $2.00 or 6 IRCs.

The Worked All USA Award, with its 12-month limitation, separates the men from the boys! To date, only a few have mastered the 80-meter band, while 10, 15, and 20 have been more popular. Only a few applicants have mastered all states on 6 meters, and 160 meters has been conquered only once. Does your station have what it takes to Work All USA in a calendar year?

THE Q-5 AWARD OF EXCELLENCE

If you frequent the American Novice bands, you will be pleased to hear of an exclusive award for these bands. Sponsored by the editors of *73 Magazine*, the Q-5 Award of Excellence is available to amateurs worldwide who meet the requirements.

To be valid, all contacts must be made on or after January 1, 1979. All contacts must be made operating the CW mode on those frequencies assigned the American Novice. Applicants are cautioned that power limitations are 250 Watts input. There are no band restrictions, but applicants may request special band endorsement on the award

if the request is made at the time of application.

To qualify, applicants must work all ten US call districts and receive no less than a Q-5 report. A valid RST might be 559, 539, 579, etc., while an RST of 449, 349, or 479 would not qualify.

This award is not meant to be an overnight accomplishment. Stations meeting the challenge of these requirements will be proud to display this unique award depicting the excellence and superiority of the station's transmitted signal.

To apply, prepare a list of claimed contacts, logging each contact in order of the US call district. Include the station callsign, date and time in GMT, the frequency utilized, and, most important, the RST as noted on your confirmation card. Also required is a brief description of the station equipment and antenna system utilized to complete this award.

Do not send QSL cards! Have your list verified by two amateurs, a local radio club secretary, or a notary public. Enclose with your application the fee of $4.00 or 12 IRCs.

DISTRICT ENDURANCE AWARD

If any of our readers feel our awards are too soft for you, take a hard look at our next award! This one was designed to appear fairly simple at first glance, but it will drive you right up the wall with frustration as it is pursued. Known as the District Endurance Award, you'll need to find yourself an accurate timepiece, as you'll have exactly sixty (60) minutes to work all ten (10) US Call Districts! Simple, huh? Can you beat the best time to date—eight (8) minutes?

Sponsored by the *73 Magazine* editors, the District Endurance Award is offered licensed amateurs throughout the world. To be valid, all contacts must be made on or after January 1, 1979. There will be no band or mode restrictions, but if you are fortunate enough to work these requirements on a single band, we will be happy to recognize this feat when processing your award.

One of the most important rules applicable to this award is that all contacts must be made independent of nets, any net-type operation, or while any contest is underway.

To qualify, applicants must work all ten US call districts in one hour or less. The time will commence the moment the first contact is established and end with the time logged for the last district required.

To apply, applicants must prepare a signed declaration that all contacts were independent of net or contest operation. Applications must include a list of stations worked in callsign order by district, the date and time worked in GMT, the band and mode of operation, and the state.

Do not send QSL cards! Have your list of contacts verified by two amateurs, a local radio club secretary, or by a notary public. Accompanying your application should be a $4.00 award fee or 12 IRCs.

TEN-METER 10-40 AWARD

What would an awards program be like without a QRP incentive? With 10 meters at an all-time high, the editors of *73 Magazine* take pride in announcing the Ten-Meter 10-40 Award. Designed specifically for owners of converted Citizens-Band equipment, the Ten-Forty Award is probably the roughest worked-all-states award program in existence. Ask those who have tried numerous times and failed!

Available to licensed amateurs the world over, the award offers a challenge second to none. To be valid, all contacts must be made on the ten-meter band using only "channelized" Citizens-Band equipment or similar commercial units. Power is limited to 15-Watts PEP output. External amplifiers are prohibited.

To be eligible, all contacts must be made on or after October 1, 1978, on AM, SSB, CW, or FM modes. Mixed-mode contacts are not valid.

To qualify for this award, the applicant must work and confirm at least forty of the 50 US states. (An endorsement will be issued if all 50 states are worked.)

To apply, make a list of contacts in alphabetical order by US state beginning with Alabama. Include the call of the station worked, the date and time in GMT, the band and mode of operation, and a brief description of the equipment and antenna system utilized.

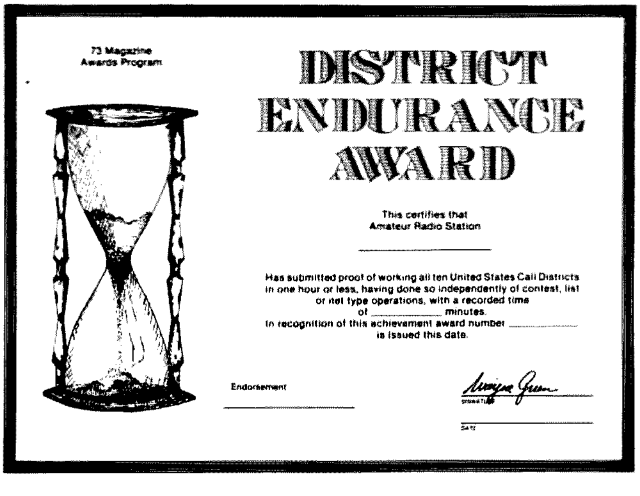
Do not send QSL cards! Have your list verified by two amateurs, a radio club secretary, or by a notary public. The award fee is $4.00 or 12 IRCs.

CENTURY CITIES AWARD

Designed as a Dual-Worked-All-USA effort, the editors present the Century Cities Award to the most demanding of amateur operators. The applicant who applies for this achievement realizes he has accomplished what is probably the greatest feat available in award programs today.

As with all *73*-sponsored awards (with the exception of the ten-meter incentives) all contacts must be made on or after January 1, 1979, to be valid.

To qualify, the applicant must work and confirm a minimum of two cities or towns in each of



the fifty US states, for a total of 100.

To apply, prepare a list of claimed contacts in alphabetical order, by state. As shown below, include the full callsign of the station worked, the date, the band, and the city. Beginning with Alabama, your list will look something like the following: Alabama—W4ZZZ, March 31, 1979, 14 MHz, Decatur; N4XXY, February 1, 1979, 21 MHz, Mobile; Alaska—KL7AB, January 22, 1979, 7 MHz, Anchorage; WL7WW, May 19, 1979, 28 MHz, Fairbanks; and so on.

Do not send QSL cards! Have your list of claimed contacts verified by two amateurs, a radio club secretary, or by a notary public. Enclose this list along with your award fee of $4.00 or 12 IRCs.

For applicants of the awards offered by *73 Magazine*: I would like to give you some insight on how we process the paperwork. Upon receipt of an application, each award requirement is carefully scrutinized to see that the applicant has met each one to the letter. If approved, an award work sheet is prepared. The original copy of this and applicable award fee is mailed to Peterborough NH for the *73* Art Department to process. It is there that your award is given a personal touch and later mailed to your door. A copy of the award work sheet is mailed to the applicant to acknowledge receipt of the application. (Should the applicant feel it necessary to follow up, he or she should write a letter to the Assistant Publisher, *73 Magazine*, Peterborough NH 03458. Writing directly to *73* headquarters will speed things up since the Awards Editor does

not retain your paperwork once the request for Issuance is mailed.)

We hope you enjoy the challenges of the *73* Awards Program and will share its rules with your amateur friends. While we hope you all will pursue the objectives these awards have to offer, we also hope you will send any information you might have on other award programs which have never appeared between the covers of this magazine. Looking through my files, I see where we have gone many many months without duplicating information on a single award. Our files are getting bare, however, and it is the input of readers that keeps the image of this column original and creative. If your club has an award it sponsors, why not share it with our thousands of readers?

JERSEY DEVIL STATION W2JUG TO OPERATE HALLOWEEN

The West Jersey Radio Amateurs (WJRA) will man a special operation from the South Jersey Pine Barrens, the haunt of the feared Jersey Devil. Beginning and ending at midnight, the courageous WJRA group will attempt to operate the entire 24 hours of Halloween, October 31st. A certificate engraved with a countenance of the Jersey Devil will be sent to all stations worked who send an SASE to WJRA, PO Box 62, Burlington NJ 08016. Frequencies to be used are 15 kHz from the bottom of each General phone band, 80 through 2 meters. Novice operation also will be 15 kHz up.

The Jersey Devil was born in 1735, a 13th child, in a place called Leeds Point. Not long after its birth, on a foggy and dreary night so usual in the Pine Barrens, the child assumed a serpent-like body, cloven hoofs, the head of a horse, wings of a bat, and the forked tail of a dragon. With loud, raucous cries, it flew up the chimney and into the heart of the Pinelands. Appearances and sightings occur even today. On Halloween, the WJRA will maintain a radio vigil, trying to capture a glimpse of the Devil. Will they see him? Give them a call (W2JUG) and get a first-hand report. (Oh, yes. If the answer is a loud, raucous, cry...) If you have any questions, call (609)-386-5906 or write Frank Huminski K2SQS, 307 Monroe Street, Edgewater Park NJ 08010.

CEDAR ISLAND DXPEDITION

The McHenry County Wireless Association announces a DXpedition to Cedar Island for September 19 and 20, 1981. No ham radio activity has ever taken place from this island in Pistakee Lake, McHenry County, Illinois. The call used will be KB9I, with expected frequencies of 21365 and/or 7265.

WARWICK RI 50th

On September 12th and 13th, the Warwick Amateur Radio operators are sponsoring a special event. The City Of Warwick, Rhode Island, will be celebrating its 50th anniversary. To commemorate this event, any amateur contacting a participating Warwick amateur will be awarded a certificate signed by the mayor of the city. QSL information: mail with three first-class stamps to Pat Mancini K1COI, 11 Amherst Dr., Warwick RI 02889.

GMT times: 1300Z to 2200Z September 12 and 13. Frequencies: Phone—28750, 21380, 14300, 7275,and 3950; Novice—21175, and 7125; CW—28075, 21075, 14075, 7075, and 3575. For further information, contact Robert A. Weigner KB1C, 61 Kirby Ave., Warwick RI 02889, (401)-738-2021.

OMAR BRADLEY

The Tri-County ARC of north-central Missouri is planning a special-events station from Clark, Missouri, birthplace of the late five-star General, Omar N. Bradley, from 10 am to 6 pm on Labor Day, September 7, 1981. Anyone contacting the special-events station will receive a commemorative certificate honoring General Bradley. Operation will be in the general portion of 40, 20, and 15 meters. Send QSL with SASE to Tri-County ARC, 601 McKinley, Moberly MO 65270

RR SESQUICENTENNIAL

The Schenectady Amateur Radio Association will operate a special-event station, K2AE, to commemorate the sesquicentennial (150th) anniversary of the opening of the Mohawk & Hudson Railroad. The railroad was the first to operate in New York State, the first to operate north of the Mason-Dixon line, and the third to run in the United States. Listen for K2AE the weekend of September 26 from 1600Z Saturday to 1700Z Sunday on the following frequencies plus or minus QRM: 7235, 14285, and 21360. Amateurs who work K2AE and desire a QSL card showing a likeness of the historic train should send an SASE to K2AE.

FORD MUSEUM

America's newest Presidential museum, the Gerald R. Ford Museum, will be dedicated this September in Grand Rapids, Michigan, during a week-long celebration that also will call attention to the multimillion dollar revitalization of the city's downtown area.

To commemorate the event, the Woodland Amateur Radio Club is planning to establish a radio station at one of the main locations of the celebration, operating under the callsign of W8FM. Amateur operators who contact W8FM during the celebration will receive a certificate with the official Ford Museum Dedication seal and Gerald R. Ford's signature. Operations will be on September 17 and 18 from 1600 to 0000 UTC. On September 19, the station will operate from 1300 to 0100 UTC. Plans call for operation on frequencies on or near 28.650, 21.410, and 14.310 MHz.

To receive one of these certificates, send a QSL card to W8FM, Post Office Box 6102, Station C, Grand Rapids MI 49506. Do not send IRCs or self-addressed envelopes.

K2BSA

Those who worked K2BSA/4 from the 1981 National Scout Jamboree and wish a special commemorative QSL should QSL with a business-sized SASE to K2BSA/4 Jamboree, c/o ARRL, 225 Main St., Newington, CT 06111.

FUN!

Glendale NY 11385

CB RADIO

Citizens Band and amateur radio have had a curious relationship over the years. Like two rival siblings, they vie with each other for Daddy FCC's affection.

Amateurs are like the brother who went to college. Hams are worldly, cultivated—with all the latest conveniences at their disposal. CBers, however, have the tough life. They've garnered the reputation of the black-sheep brother who hangs around the local bar, caging drinks from fellow barflies.

A CBer is opinionated and crass—rough on the ears—but never pretending to be something he isn't. There's no mistaking where he's from. He's a dope, and you know it. Hams, on the other hand, put on airs. Many are educated dopes, but they try to cover it.

Actually, it's not a case of who is better. Hams and CBers are dif-

ferent, the use of radios being our only family tie. There's been a long-felt animosity between members of the two camps, but when you consider that many hams are CBers (and in some cases vice versa), it's a peculiar enmity. As we said, it's like a sibling rivalry.

Acknowledging our "brotherly" relationship, this month's FUN! salutes CB.

ELEMENT 1—CROSSWORD PUZZLE
(Illustration 1)

Across

1) CB frequency slots
5) Good CW can be a work of this
8) Never satisfied DXer wants...
11) What the ARRL does to CBers
12) Plenty of this on CB channels
13) Never say this
14) A logic (abbr.)
16) One who spends $5,000 on CB gear
17) CBer's personal "ball"
18) California city (abbr.)
19) Data transmission (abbr.)
20) New GMT (abbr.)
22) Soggy reaction of dealers stuck with 23-channel rigs
23) What we all call the FCC monitor
24) Symbol: aluminum
25) _____ and feather jammers (abbr.)
27) Old amateur Industry group (abbr.)
29) What this is all about (abbr.)
31) Sidewinder's mode (abbr.)
32) FCC never has to say this
33) Atomic (abbr.)
34) Popular rig prefix
35) CBer's signal verification (2 words)

Down

1) CB cretins
2) Old Advanced hams
3) FCC _____ pressure on all
4) Mentioned
6) Original number of CB channels
7) Lids
9) Fellow ham (abbr.)
10) Decay
15) Below MF (abbr.)
19) Affectionate DX ham expression (abbr.)
21) "Regular" CB
22) R/C CB
24) Most popular CB mode (abbr.)
26) Light beam
28) Radio bearing (abbr.)
29) Usual CB mobile
30) Morse double-dash
34) Time-out (abbr.)

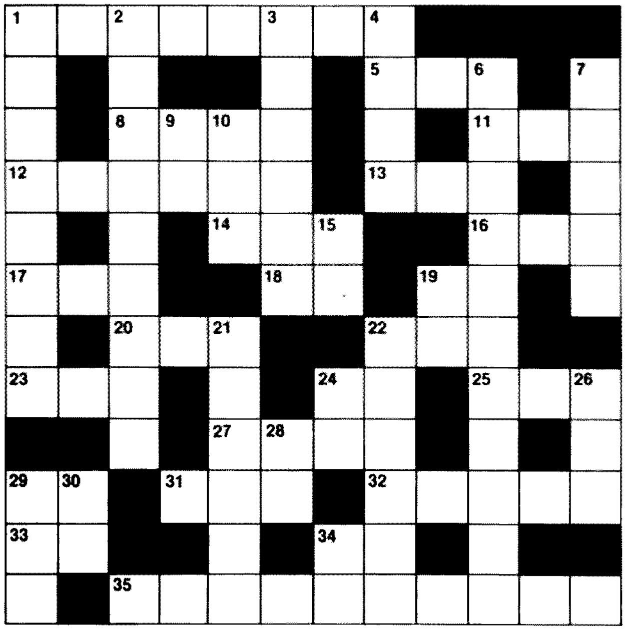

Illustration 1.

ELEMENT 2—MULTIPLE CHOICE

1) How many CBers were active in 1959?
 1) 3,000
 2) 6,000
 3) 50,000
 4) 250,000

2) What famous World War II tank commander used 11 meters to coordinate his maneuvers?
 1) Patton
 2) Rommel
 3) Montgomery
 4) Swirsky

3) What FCC commissioner first proposed the idea of CB radio in a *Saturday Evening Post* article entitled, "Phone Me By the Air"?
 1) Herbert Hoover
 2) Charles Ferris
 3) E. K. Jett
 4) Arnold Jackson

4) In an incredible plan designed to ruin CB, in 1969 the FCC decided to raise CB license fees from $8 to a ridiculously high level. How much did the "new" CB ticket cost?
 1) $10
 2) $15
 3) $20
 4) $50

5) In 1948, the FCC authorized the Firestone Tire and Rubber Company to conduct the first commercial tests using small, three-Watt transceivers on what is now channel 23. What was the first CB callsign issued by the FCC to Firestone?
 1) KBX-8669
 2) KAA-0001
 3) W10XXD
 4) W2XR

ELEMENT 3—MATCHING

Remember CB slang? Sure you do, and if you have an IQ larger than your hat size, you hated it. Nevertheless, the media loved it, and for about 12 minutes this "language" was worked into all types of movies, TV shows, and country music records.

Now, CB slang has been dumped into that great nostalgia warehouse up in the sky, up there with Davy Crockett hats, hula-hoops, and disco leisure suits. But FUN! never forgets. So slip your brain into neutral for a moment and try to match the CB slang listed below with its correct meaning.

Column A	*Column B*
1) Smokey	A) Small car
2) Invitation	B) Slippery road
3) Cotton picker	C) Motel
4) Tijuana taxi	D) Police ticket
5) Bottle popper	E) FCC license
6) Rollerskate	F) Highway cloverleaf
7) Twister	G) Police officer
8) Nap trap	H) Beer truck
9) Skating rink	I) Reckless driver
10) Harvey Wallbanger	J) Police car
	K) An expletive

ELEMENT 4—FILL IN THE BLANK

1) CB rules and regulations are detailed in FCC Part _____.
2) The frequency tolerance for a CB transmitter is _____%.
3) Up until about 10 years ago, units of the same station could use all 23 channels, but station-to-station contacts could only take place on ____ different channels.
4) __________ was the organizer of the "Save 11" campaign.
5) Application for a CB license is made on FCC Form _____.
6) CB beams are ________ polarized.
7) A full-length CB mobile antenna is _______ Inches long.
8) _______ Watts PEP is the maximum SSB CB power.

9) Ham radio _____ still occupy 11 meters In Australia.
10) The Radio Emergency Associated Citizens Team is better known as _________.

ELEMENT 5—HAM ACROSTIC

Guess the words defined and write them over the numbered dashes. Next, place each letter in the correct square in the puzzle. The black squares show word endings. The completed puzzle will form a statement relating to this month's topic.
(illustration 2)

A) CBer's "code"................. ___ ___ ___ (30 52 41)
B) 27.605 MHz..................... ___ ___ ___ ___ (15 8 39 3)
C) Disgust........................ ___ ___ ___ (7 48 18)
D) Class of commercial license needed to repair CBs............ ___ ___ ___ ___ ___ ___ (29 34 5 31 38 17)
E) Present number of channels..... ___ ___ ___ ___ ___ (47 12 28 56 51)
F) Slang for transceiver............ ___ ___ ___ (9 40 54)
G) 10-90............................ ___ ___ ___ (11 21 37)
H) "CBers" above channel 40....... ___ ___ ___ ___ ___ (2 49 27 35 10)
I) "Highway Emergency Locating Plan".......................... ___ ___ ___ ___ (55 44 19 13)
J) Band for converted CBs.......... ___ ___ ___ (1 42 46)
K) Broadcast network............... ___ ___ ___ (32 33 36)
L) Designs rigs..................... ___ ___ (25 45)
M) Tower anchor material........... ___ ___ ___ ___ ___ ___ (6 16 24 14 23 43)
N) Transistor type.................. ___ ___ ___ (4 20 26)
O) Cable bundle joiner.............. ___ ___ ___ (50 53 22)

FUN! MAILBOX

I've been in radio since 1963 using CW, AM, FM, and RTTY—all in the military. I finally came into ham radio as my interests are all leaning that way. I suspect you lean too far towards the Green way of thinking. Why? Employer-employee relationship? Ego? We have too many inflated egos on the air also. The above is my opinion and I also respect yours. Tnx. P.S. How long you been a member of the ARRL? You seem to have lots to say about that, too. I think your April column stank—cheap shot. Why?

Robert E. Cregar WD8NKT
Bay City MI

I've been a League member since the first year I became a ham, and I'm too poor to afford expensive shots.—JE

Illustration 2.

THE ANSWERS

Element 1:
See illustration 1A.

Element 2:
1-2 Vacant territory.
2-2 During World War II, a Rhode Island amateur heard some strange transmissions on what is now channel 14. After contacting the FCC, it was determined that the transmissions were coming from Field Marshal Erwin Rommel commanding his Afrika Korps. The information was passed to British and U.S. forces and later played a significant role in Rommel's defeat. Thus, Rommel may have been the first man snagged by the FCC for working skip.
3-3 It sounded like a great idea in July, 1945. But, then, America had just won a world war; who could have predicted that the FCC wouldn't be able to regulate a bunch of low-powered radios?
4-3 If you make licenses expensive, people won't get them; hence, no CBers. With logic like that...
5-3 The first of many.

Element 3:
1—G, 2—D, 3—K, 4—J, 5—H, 6—A, 7—F, 8—C, 9—B, 10—I.

Element 4:
1—95, 2—.005, 3—7, 4—Wayne Green, 5—505, 6—vertically, 7—108 including spring, 102 without, 8—12, 9—does, 10—REACT.

Element 5:
See illustration 2A.

SCORING

Element 1:
Twenty points for the complete puzzle, or 1/2 point for each question correctly answered.

Element 2:
Four points for each correct answer.

Element 3:
Each slang word correctly matched nets you two points.

Element 4:
Two points for each blank filled.

Element 5:
Two points for each correct answer. Give yourself 20 extra points if you unscrambled the message.

Rate yourself:

1-20 points—No buddy
21-40 points—Poor buddy
41-60 points—Fair buddy
61-80 points—Good buddy
81-100+ points—Great buddy

W2NSD/1 NEVER SAY DIE

editorial by Wayne Green

from page 8

they were not speeding, but were victims of interference to the police radar unit.

My first response is to suggest that perhaps it is about time to invest in a radar detector so that in the future they will know when a police radar unit is in the area and stop transmitting until safely out of radar range. The modern superheterodyne models will give you more than adequate warning to get *off the air.* I'm using both the Escort from Cincinnati Microwave and the Whistler Q-1000 with success. I've been promised test models from other firms, so I may be able to add to that list. The $245 for the Escort is cheap enough insurance when you consider the trauma of the ticket and court appearance. Further, beating a ticket is tough, even when you are completely innocent, so you have insurance increases to look forward to as well.

If you are interested in fighting a ticket, you might want to contact Electrolert, the makers of the Fuzzbuster. They sell legal kits which will help both you and your lawyer through the situation. Fuzzbuster, incidentally, at long last has a superhet receiver available...though I have not yet tested it. Electrolert, 4949 South 25A, Troy OH 45373. Phone (513)-667-2461.

A recent release from Electrolert explained about a franchise of legal firms called The Ticket Clinic. This started in Lubbock, Texas, and is spreading around the country. For $45 you can have your ticket defended by experts...with an 80% success rate. This is a great development.

Cincinnati Microwave was started by some hams who had worked at Drake. I like their unit because I've found none that works better...at any price... and it has an S-meter, which tells me just how close the radar really is. This also helps separate the 10-GHz security systems from the police radar units, once you get the hang of it. These can be a nuisance, but they are also comforting in that you get used to their locations and they let you know your detector is working right. Cincinnati can be reached at (513)-772-3700. They sell direct only, not through stores. Tell 'em Wayne sent you. They know me. As a ham and *73* reader, you might just get a receiver which is extra hot.

DXCC PROBLEMS

The massive forging of QSL cards for DXCC, an industry located, naturally, in California (the land of entrepreneurs) gives us a lot of possibilities. My first reaction (knee-jerk) was that a group of amateurs had done a terrible thing. Imagine! Desecrating one of our most treasured idols, the DX Century Club, with a cheap plot to debase its virtue! Tsk.

But then the iconoclast in me began to emerge and I got to thinking about the other side of the coin. DXCC and the accompanying Honor Roll listings have brought about the building of a cult of several hundred hams who have, as a result, devoted their lives to working every country in the world. This, in turn, has made life absolutely miserable for new hams in rare spots, often driving them off the air in hours...permanently.

Though I've never felt the need for public recognition as a super DXer and thus have not ...at least in recent years... messed with the ARRL and their amusing award record-keeping system, I have enjoyed tackling the goal of working a lot of countries. After I moved to New Hampshire and discovered that I would have to start all over again...yoiks, my XU cards were no longer valid!...I went at it with relish. In the first week on the air, I passed the 100-country mark on 20m phone (my favorite). By the end of the first month, I had passed 200 countries, and I arrived at 300 before the end of the year. I stopped counting then.

I remember spending a whole weekend working 100 countries *on 20m*...just to prove that *it* could be done. Now I admit that not all of the contacts were meaningful (it was during a contest) but I managed it...and got the cards to prove it.

A few years ago, fed up with some of the ridiculous rules set up for DXCC credits, I started an award...Worked the World. This one used country lists from national ham organizations instead of from our own internal committee. Thus, if RSGB recognized an island as a country...it *was* a country by us. Ditto the DARC and all other recognized national groups. This went well until we began to notice some strange DX cards appearing in the bundles from a Texas ham. Hmm. Some of the cards were from rare stations I'd worked and they were *not* the regular cards. We looked into it and found that our Texan was working with a printer to make up special cards...all *for our* award. Sigh.

Okay, here's my idea. Since *73* has one of the largest QSL printeries in the country, why not come up with a *series of* special DX cards...one for each country of the world. Then, for a modest price, we could arrange to have these mailed to a DXer from each of those countries, all filled out with his call and a great signal report. We have subscribers in over 200 countries now, so we should be able to make arrangements from most countries. The rare ones would be more expensive because we would have to send someone out a couple times a year to make the mailings. Hey, how about *me for* that job...I love to travel. The cost of the cards would pay for the trip, just as it did for Don Miller. In fact, he bragged to several people that he was clearing over $50,000 a year...and that was back when $50,000 was worth a whole lot more than it is today.

Carpers who beef about the cards not being honest should face some brutal facts. Quite a lot of the cards I have...all acceptable for DXCC...are not honest. We don't really know where Miller was for many of his DXpeditions...we only know he wasn't anywhere near where he said he was. The cards are all okay by the ARRL...even my Spratley and Burma cards. I love it.

We can't seriously come down on Miller in this situation because he was just following in the footsteps of even more famous DXers, all of whom had left a trail of DX operations from places other than they claimed. I personally have had cards from at least 30 countries which are fraudulent, but they are acceptable to the DXCC team. No, I don't put a lot of stock in awards...or cards. As soon as you start an award, people will get right to work to cheat on it...so why not make the cheating part of the business and help people enjoy their cheating? That, obviously, is also a part of amateur radio...just like jamming.

I figure that a 100-country package of cards might go for $250. Cheap enough when you consider the saving in postage stamps, reply coupons, and aggravation. The 300-country package will have to cost a bit more...perhaps $1,000. After all, you don't want to have me stay in a cheap hotel in Rarotonga, do you? The biggo, #1 on the Honor Roll, means getting into places like Iraq to mail cards, so we'll have to research that one more. Would $3,000 be reasonable?

Specialized awards such as all on SSTV or RTTY would only cost a little extra...just enough to keep away the browsers and keep the award clean...just for the more serious hams. We could have a One-Watt Special Award *for 100* countries with only one Watt of power input...or should it be output? Mobile fans could have their own special awards. If you can pay, you can play...and have one of the most impressive ham shacks in town. Remember that the neighbors and family won't know any better...and the ARRL doesn't care. Our cards would all be legitimate, sent direct from the actual country...complete with postage stamp. The only thing lacking would be the contact.

Now of what real importance is a contact? You know as well as I that a DX station anywhere in the world can be worked if you hang in there. It's a matter of spending the time. If you want to be one of the first with the contact...thus giving you time to jam the hell out of the DX station

later to keep others from making the contact...you need high power and a good beam system. No, you can eventually make it even with low power, if the DX station stays on the air long enough. W2QHH proved that years ago with his massive awards collection...all worked with around 100 Watts. Howie is still listed in the *Callbook*, so I assume he is working on certificate number 8,000 by now.

We may just have something here. With this system of getting awards, we might encourage amateurs in rare countries to get on the air and make normal ham contacts instead of contest-type operation every time they appear. Further, we might eventually get rid of pileups. Suppose DX stations stopped QSLing direct, leaving that to us professionals? It would be much more efficient and would save them a fortune. No more "green QSLs" (five dollar bills), no more wasting days filling out cards just because a DX op wanted to get on the air for a few hours of fun. It has benefits for everyone.

There's no reason to just cover DXCC when there are many more awards to be achieved... WAC for $10, right? WAS for $50...an October special. WAE might run $100 since that is harder. WAZ won't be any less, calling for me to get up to Ulan Bator a couple times a year. Maybe $200 would be right for that one.

You all set?

NIAC TESTIMONY

In the July issue, I discussed briefly the National Industry Advisory Committee (NIAC) which has been set up to advise the FCC on amateur matters, with particular emphasis on emergency communications. I think you may be interested in part of my testimony before that committee, so I'll reprint it here verbatim.

With the change in administrations there may be an opportunity for NIAC to provide a valuable service to the amateur radio community, to the FCC, and perhaps in the long run, to our country. We amateurs have arrived at our present situation via a long and complex route, so I can't offer suggestions on ways to bring about what I feel are needed changes without laying the groundwork by tracing some of the events which brought us to where we are.

It does not take any keen perception to see that amateur radio is stagnant. Our growth is minimal. It has been over 10 years since the last major technology change: repeaters, FM. Our clubs are falling apart. Our manufacturers are failing, as are our ham dealers. Virtually all the technological advances in amateur equipment have been coming from Japan, such as synthesized transceivers and synthesized hand transceivers.

Speaking of technology, it is not only amateur equipment in which the Japanese are leading us. If you are familiar with virtually any other branch of electronics, you will find a similar situation. The innovative calculators, which I hear ringing around us, are all coming from Japan. Ditto the cassette and stereo equipment. I am sorry to say, though the U.S. originated the microcomputer industry only five years ago, Japan is already ahead of us in the design of these low-cost computers.

In many electronic fields, as I read the technical journals, I find that the U.S. is now having to import technology from Japan. There have been several articles on this subject, on the loss of our technical eminence, and they all bring up the lack of growth of engineers in our country over the last 20 years. With zero growth in engineers and presumably technicians since they go hand in hand, while there has been a virtual explosion of engineers and technicians in Japan, it is little wonder that there has been a shift in the frontiers of technology in electronics.

If we look back on our own history to see what conditions brought about our present situation, we see one event emerging very clearly.

During the late 1940s, after the war, and through the 1950s, amateur radio was growing at a steady rate of 11 percent a year. This was brought to a sudden halt in 1963 by two events, both of which involved the FCC. One was the four-dollar license fee, which I view primarily as an event which tended to weed out the inactive hams who had been keeping their licenses because they cost nothing. The second and far more catastrophic event was the so-called incentive licensing proposal. If the license fees had been the main culprit, we would have seen a temporary drop in licensees as the inactive hams dropped out. But our input of new hams would have remained constant, and we would soon have been back into a growth mode.

The fact is that it took 11 years before we again saw growth. Having been involved with the licensing proposal, I can testify as to the depths of the emotions it stirred. The prospect of losing virtually all phone privileges dismayed the 90 percent of the hams so threatened. And the prospects of having to go through to an Extra class license before much in the way of DX phone bands would be available turned away hundreds of thousands of prospective hams.

The eventual rules which took away only half of the phone bands instead of all of them did not help matters a lot. This denied the contacting of DX stations to a very high percentage of the hams and denied them experimenting with slow-scan television.

It was this rulemaking situation which I feel was largely responsible for amateur radio stagnating for 11 years. Since that time, we have managed to get back into a growth mode, but only a slow one.

The surveys of amateurs which I have taken via my publication show clearly that the main body of newcomers to amateur radio are teenagers. Indeed, ARRL studies have shown this same fact, with one such survey showing that 50 percent of the newly-licensed amateurs are either 14 or 15 years old. Further surveys show that over 80 percent of these teenagers then go on to develop careers in electronics or communications.

In my talks with R&D firms, there is no question but that the radio amateur who has pursued an electronics career is usually far more valuable when it comes to innovative technology than his non-ham counterpart. The ham is often almost totally immersed in electronics, reading about it at every opportunity and talking about it at work and over the air with friends. He usually has his own lab at home, as well as his ham shack.

If we then project the growth we could have expected from amateur radio, had it not been brought to a halt in 1963, we find that we might have had about one and three-quarter million licensed hams today. That would have resulted in there being at least one million more engineers and technicians than we have today, and that is quite a lot.

Remember, too, that at the same time we were stopping ham growth, the Japanese instituted their no-code license. Further, they actively recruited hams in high schools through clubs. These clubs engage in expeditions, field-day outings, mountaintop VHF trips, hidden transmitter hunts, and so on. Even a casual glance at the Japanese ham magazines will show you that there are hundreds of pictures monthly of these club activities.

The latest issue of *CQ Ham Radio*, the Japanese magazine, had 46 pages of pictures of clubs doing things. So while amateur radio was crumbling in the U.S., the Japanese went from a few thousand hams to over 500,000, with virtually all of them active. Yes, Japan has about half again as many licensed hams as we do, and perhaps three times as many active ones.

I believe that this is where their technological superiority has its foundation. Well, no matter what the case, there is no denying that amateur radio in the U.S. is growing very slowly. I believe that if we could get amateur radio growing again, we might eventually be able to regain the technological superiority we had a few years ago. Most of the loss has occurred in the last five years, as the Japanese caught up and passed us in technical people.

By the way, in case there are any questions about the ability of amateur radio to accommodate two million U.S. hams, I think we could. And it would be a blessing in many ways. There are so many possible ways for us to cope with vastly more active hams, with new technologies, that I wish we had that pressure to get us going with some of them.

Now if we are going to meet the challenge, we need to do every thing we can to get amateur radio into a very strong growth mode. This means we should take a close look at our regulations and see what might be changed with them which might help in our growth. We might look to our clubs as a resource in promoting growth. Perhaps a new technology would help. It would spark interest and growth. The emergence of FM and repeaters ten years ago was the catalyst which got amateur radio moving for a while. The interest of this new mode, together with a supply of pre-interested people from CB, gave us a spurt of growth in the mid-seventies. The FCC's CB 40-channel disaster, which virtually killed Citizens Band, cut off our supply of enthusiasts from that source. It may be time to seriously consider some sort of no-code license.

I have heard every argument pro and con on code. Indeed, it has been perhaps 20 years since I have heard anything new on this. Just the same old arguments. Taking all of this into consideration, we may want to come up with a different approach to licensing, one which will remove the skill aspect of the code test and substitute operating knowledge, as the Japanese have done. There is much that we can learn from the Japanese system, which is working quite well.

And I might just say that any of you who have worked with Japanese amateurs know that you will not find any finer operators in the world.

If we are going to be able to get our older amateurs enthusiastic again, I think we will need some sort of technological development. It is most unfortunate that the FCC for many years made such developments virtually impossible.

As an enthusiast in radioteleype in the late forties, I found it exceedingly difficult to pursue the need for technical developments because the FCC stopped me at every turn. When we wanted to experiment with radioteletype on the low bands, we found that the FCC would not permit it because their monitoring stations were not yet equipped with teletype equipment.

Since it takes years before these monitors finally get new equipment, this approach to our rules meant that amateur experimenting and development would always have to lag commercial developments by 10 to 20 years. And that was the way it was through the fifties and to date. We are still forbidden from unrestricted experimenting because the FCC won't let us use a mode until they can monitor it. One of the first rules that the FCC has on its books for amateur radio, Part 97.1c, is aimed at the Commission, not at amateurs. It is a rule that the Commission must encourage and improve the Amateur Service "through rules which provide for advancing skills in both the communication and technical phases of the art."

The Commission has not been responsive to that, the only amateur regulation guiding them in their job. The FCC rules should be either made or interpreted so that amateurs are not just permitted, but encouraged, to experiment and pioneer new ideas. With the development of large-scale integration and digital electronics, the horizon for the development of new techniques and modes of communication are almost limitless.

We should remember that it was amateurs who historically invented most of the communication modes which are in common use today. It was the development of practical sideband circuits by Don Noregaard in the forties which made sideband possible for military, commercial, and amateur uses. It was the pioneering of amateurs which brought FM mobile uses, and then in 1946 narrowband FM. Slow scan was developed by amateurs, as were parametric amplifiers, helical antennas, and so on. Much of the early television experimentation was done by amateur radio, with the early industry people coming from one particular ham project in Astoria, New York.

Amateurs could, with encouragement from the FCC, be experimenting with many digital techniques. We have plans for setting up dictionaries on IC chips, which would enable us to communicate via ASCII, but at 5,000 words or more a minute with instant translation into any language in the world. Immediately any ham in the world would be able to converse with any other with few translation problems. A two-byte message sent at 1200 baud would give us the possibility of 32,000 words. A one-byte message would give us the use of 256 moat-used words, which represents about 75% of the normal messages. 1200 baud is narrow enough so it is practical over ordinary phone circuits, so it should not be difficult to accommodate on the ham bands.

The words would be typed into a small microcomputer. This would look up each word in the dictionary and store the appropriate byte or two bytes of information for each word. When the message is ready to go, it would be sent in a second or two, thus leaving the radio spectrum available

for hundreds of similar contacts on the same channel without interference.

When received, the bytes would be looked up in the dictionary on the other end, which could be in any language. The resultant message would then be displayed on the microcomputer at that end.

What about voice? As computer circuits and ICs improve, we are getting better and better at translating voice into digital information and then back again. We even have reasonably well-sounding talking clocks which fit into a shirt pocket, with a voice entirely synthesized and digitalized. The work is done by a single silicon chip.

We need rules encouraging experiments with these techniques. We have plenty more in prospect. Spread-spectrum communications have enormous possibilities. Double-sideband stereo transmission should be investigated as a possible method of increasing our density of spectrum use by a factor of 100 or more.

Digital audio without synthesizers may have possibilities for compression and expansion for the time-slicing techniques where we could have half a dozen or more contacts taking place on one channel with no interference between stations. We might even be able to get back to full duplex operation with all on one channel with time-slicing. That could bring about enormous changes in amateur radio communications.

With the space shuttle coming soon, we may be able to put up a great many more amateur satellites or even get spectrum for ham use on some of the commercial satellites.

With this resource, we could set up emergency communications, an emergency communication network, far beyond anything ever imagined before.

With our repeaters able to interconnect via satellite relay, handie-talkie to handie-talkie contact anywhere in the world is a possibility. Indeed, commercial services are going to be working hard on satellite uses, with the possibility of phone and digital communications between cars or even people on foot very likely.

As each of these possibilities is opened up, they in turn bring us new ideas which can be tackled with the use of VLSI circuits. In many ways we are presently just at the beginnings of amateur radio development if the FCC can be persuaded to encourage amateur experimentation. If there is any question about this being a problem, just ask the Commission how many hundreds of applications for Special Temporary Authority for experimenting with ASCII were turned down in the last few years. This was not a small problem. It was one of major proportions. At a time when our technical journals are citing more and more cases where we are importing electronic technology from Japan, it may be time for us to seriously consider tackling the problem in as many ways as we can. There is much that NIAC can do to help spur the growth of amateur radio.

It could be working with the Commission to try to work out approaches to free amateurs for experimentation and study possible changes in the rules which might encourage the substantially greater growth which is needed. Indeed, is there a better group than NIAC for tackling this important problem?

And I might ask that those of you who are going to discuss the new rules notice that one major change has not been made, and that is in the emission mode allocation. They tell you what is permitted, and therefore anything else is not permitted. And it should be the other way around.

The general interpretation of the amateur rule is that if it is not specifically prohibited, it is permitted. And that is the type of freedom that we need. I hope we will remember that when we discuss these rules.

I thank you all very much for your time.

Though the proposed new plain language rules do not include the providing of service in emergencies as a goal of amateur radio, I think we should keep that purpose in mind and always work in the direction of being able to provide emergency help.

In line with this, the better our amateur radio communications systems, the more help we will be able to provide in emergencies. There is nothing so useless as an emergency system which is for use only during emergencies. The equipment won't work...and the operators will be unfamiliar with it and with procedures. If we are going to be able to provide truly valuable emergency communications, we need to have the system up and running on a daily basis. In that way, we encourage the investment in time and equipment which is needed. Who wants to buy a bunch of gear which they can't use until an emergency? Or do we expect the government to buy it for us?

Last year the worst hurricane in over a hundred years hit the tiny island of St. Lucia in the Caribbean. All telephones and commercial communications were demolished. Planes couldn't even land at the airports because they had no radio to talk them down.

I recently visited St. Lucia and talked with the hams there... and with the Prime Minister. From every side I heard nothing but lavish praise for the way the amateurs stepped in and got things running again. *73* sent down Tim Daniel N8RK with four trunks full of ham gear and commercial HTs. The HTs were immediately used to reestablish the airport-to-plane communications. The ham gear, along with that of the local amateurs, provided about the only dependable communications the government had with its people for a week or so. Tim worked hard and did wonders, but the real load was on the locals...and they did a monumental job of getting things going again.

The island was hard hit, with many buildings being demolished and most of the banana plantations destroyed. Now, a year later, most of the serious damage has been repaired and the banana crop is one of the largest in their history. Banana plants grow new with each crop, so knocking them down only put them out of business for one season.

When disasters hit our country, it is amateur radio which takes over. For the first few days after the Alaska earthquake, even the Pentagon had to rely on amateur radio for all of its communications with its SAC base there. Military communications are concentrated and thus vulnerable. Other than that, what have we in long-range *and* short-range coverage? Only amateur radio can provide *all* kinds of communications...and even connect short-range with long-range if the need arises.

Police have short-range capabilities...as do most of the other mobile services. Even these various services have a relatively small contingent for each service and no way to interconnect with other services. When there was a big fire in Boston, the amateurs stepped in and provided the communications between the fire, police, and other agencies. None of them had any way to coordinate except via amateur radio.

Our country has a vested interest, I believe, in amateur radio being strong and developing a really powerful communications network...one where via digital switching any amateur with an HT or mobile unit will be able to talk with any other. I see no serious technical problems holding us back, only the access to a satellite...and I think that can be surmounted.

I've rattled on enough for now.

FOR A BAUDY TIME, CALL...

Now that we are permitted to use ASCII, perhaps it is time that we started taking advantage of it.

Assuming that you may not be exactly sure of what is involved in ASCII or why it presents any advantages for us, let me bring you up to speed. It all started an eon ago (1946) when W2BFD (John Williams) got some Model 12 Teletype™ machines that were being replaced by the then-new Model 15 systems. Rather than junk these noisy, dirty old klunkers, he talked Teletype Corporation into making them available for hams to use and experiment with.

John, being a crotchety genius, made a modest living out of reselling these units and servicing radios out of a tiny storefront in Queens, New York. His main interest was in designing circuits, so many of the hams who sent for equipment found themselves waiting a rather long time for equipment. Some never got their orders.

Oh, well, I'll write more about him one of these months. Getting back to those teletype systems...they used a five-bit code to print all of the letters of the alphabet, plus the numbers and some other special characters. This was in the early days of digital communications. If you figure two to the fifth power, you'll see that this gives you 32 possible combinations. That's enough for the 26 letters and six more characters.

A chap named Murray came up with a scheme to make this work. He set up a five-unit code for each of the letters, plus the space bar, carriage return, line feed, figures (uppercase), letters (back to lowercase)...and a blank. A gent named Baudot invented a somewhat similar, but quite different code, with the result that Murray's code is known as Baudot. It isn't and never has been.

Not only did we get Baudot substituted for Murray, but also we have the *baud* as a result instead of, perhaps, the *murr*. The baud rate of a transmission is the number of bits per second being sent. Thus, at 300 baud, our 11-bit ASCII code would give us a net of about 27 characters per second. With a word being defined as 6.1 characters, this is about 4-1/2 words per second, about reading speed for a slow reader.

With 9600 baud being possible (using some compression and expansion techniques) over ordinary telephone lines, the restriction of amateur radio ASCII to 300 baud seems ridiculous to me. We are still in the need to be deregulated so we can experiment with 1200 baud and higher speeds. There is no question we can go 9600 baud and stay within phone bandwidths, so let's get the FCC off our backs.

At 9600 baud, one character takes about 1.1 milliseconds. This piece of information, coupled with a recent study of amateur operating practices, gave me an idea.

Our ASCII character is made up of eleven bits. This breaks down to seven bits being used to actually indicate the character being sent. If you can whip out seven fingers and multiply by two, you'll find that this results in a possible 128 different characters which can be represented. This allows an ASCII character for each of our letters in both uppercase and lowercase, the numbers, plus a bunch of special characters and punctuation. Even so, there are quite a few unused ASCII characters which can be user defined.

What about the other four bits in our ASCII character? Well, number one is a "start" bit which tells you that hey, a new character is coming, get ready. Then we have the seven bits to indicate the exact character being sent. Bit nine is a parity bit. Thus, if we are using even parity, an extra bit would be used in this slot to even up the number of bits sent in the preceding seven. When you are using even parity, your system will set off an alarm if you get a character with an odd number of bits... telling you that something is wrong somewhere. The last two bits tell the system that it is time to stop.

Now, if we were to define one of these unused characters as an indication that the following characters actually represent a special ham message, we'd be ready for the next thought... which I hope is becoming obvious.

Since over 91% of the average ham contacts consist almost entirely of a recitation of the equipment in use, a request for a QSL card, a signal report, and such, why not encode this important information so each element can be sent as a single ASCII character? All we need is a simple lookup table and we have a way to save enormous amounts of air time. In 1.1 ms we could tell someone that we are using a 520 transceiver. One more 1.1 ms for the three-element beam. Since the request for the QSL is unchanging, we wouldn't even need to send that at all, thus saving 1.1 ms. With your increased ability to make contacts rapidly, every millisecond saved is a millisecond earned. Perhaps we could eliminate that 1.1 ms for the signal report, too, since anything under a 5-9 + + + is a downer and could affect that QSL card. You don't want to take chances unneccessarily... and the assumption of 5-9 + + + in lieu of any other information will take care of that problem, saving you an extra 1.1 ms.

Of course, about now I expect some fruitcake to suggest that when it comes down to it, we don't really give one damn what rig the other chap is using, so we could just as well save that 1.1 ms, too. Thinking like this could lead to further disintegration of amateur radio, with questions being raised about swapping antenna type (who really cares?), the weather (hey, we've got to talk about *something*!), and the name and location (what's the matter, are you too cheap to buy a *Callbook*?).

If you really want to get rid of the chaff, you're down to call letters and one single ASCII character...a 15-ms contact, including both calls and the single friendly all-purpose ham contact ASCII character. At that speed, we might be able to step up our ham contacts, setting new records for WAS, WAC, DXCC, and others of our worshipped awards.

At 15 ms per transmission, two being the minimum for any award-acceptable contact, we would not be able to do much better than 30 contacts per minute...no, I dropped a decimal point, make that 30 contacts per second. Whew! I thought we weren't going to gain much for a moment, since many of us are able to whip off 30 contacts per minute already.

Think of the benefits to contest addictees! We would be able to run contests in perhaps one hour instead of over a whole weekend. Or we might let contest ops operate during the first two minutes of each hour so they would get a lot of different propagation conditions during the contest. In one hour, if they are diligent, they would be able to make at least 108,000 contacts. This would result in a good score. If we extended the contest to four hours, they might be able to WAA...work *all* amateurs.

Actually, I'm sure that with a little thought we will be able to improve our encoding of ham calls and get them down to only three characters total. This could cut our contacts in length enough so we could whip out at least 60 per second, or over 200,000 an hour. DXCC in less than two seconds? Why not? Think of the fun it would be to work one hundred countries while you are sneezing.

Of course, there would be some problems involved with this, but nothing serious. It would take a fast printer to whack out the QSL cards to keep up with your rig. You might want to hook that onto the end of a small printing press so you could print them as you need them, thus saving on QSL storage. Or you might just want the printer to do the whole card and not use printed cards.

You could have your system sort out the contacts and print the cards in zip code order for bundling and shipping to the bureau. The League would have to set up automated systems to sort and forward cards...or possibly just the computer data on the contacts could be forwarded by radio to the QSL centers. In that way, the League would be able to have a computer tell them each day the winners of their awards and perhaps pass along to other organizations the calls of stations winning other awards such as WAE, WAZ, and so on. Then we wouldn't have to clutter our walls with QSL cards. We could stick computer printouts of our DX lists on the wall...all confirmed by the ARRL.

Are you ready?

RTTY LOOP

Marc I. Leavey, M.D. WA3AJR
4006 Winlee Road
Randallstown MD 21133

It's September, and, pause for a drum roll, another RTTY Art Contest is about to begin! Every year, the Southern Counties Amateur Teleprinter Society (SCATS) of southern California sponsors this worldwide contest, and this year is no exception. Last year's winner of first prize was Bill Skipper, whose work is shown in Fig. 1. Other winners included Winky Merk AD4M, Klaus Zielski DF7FB, and John Burnside N3ATH.

Winners receive engraved plaques in recognition of their efforts and the satisfaction of a job well done. Interested in entering the contest yourself? Write to SCATS, in care of Mae Washburn WA6LNH, 5772 Garden Grove Blvd. #415, Westminster CA 92683 for rules. Who knows, maybe next year I'll be running your creation as the winner!

Every once in a while, a reader writes with a question about an old issue of *73*. Such is the case this month. N. L. Ferguson WB5VIY sends in the March, 1979, "RTTY Loop" column, and asks two questions about it. First, with regard to a simple UART-based scheme to send single characters, reproduced here as Fig. 2., N. L. asks how the "Push-to-Send" button on pin 23 works.

Once the Murray (nee Baudot) data is set into the UART, on pins 26 to 30, a pulse is needed to initiate data transmission. In this simple scheme, the "ground-to-send-" input, pin 23, is manually brought to ground by the push-button. This transition, high to low to high again, or press and release, generates the pulse that starts the UART. In a practical circuit, this pulse is normally produced by gating logic since the normal "noise" in a push-button would, in fact, produce many rapid fluctuations as the contacts settled. However, in this demonstration circuit, the function is adequate.

The other question regards several buffers used for isolating and/or inverting the TTL-level signal produced. Originally Fig. 4, this is reproduced here as Fig. 3. The buffer in "A" was originally mislabeled; it is a 7407, as correctly identified in the text. The 7407 is an open collector buffer, useful in isolation. The figure originally branded this as a 7402 which is a NOR gate—quite a different animal.

Along the lines of old publications, Kevin Carey of Rush, New

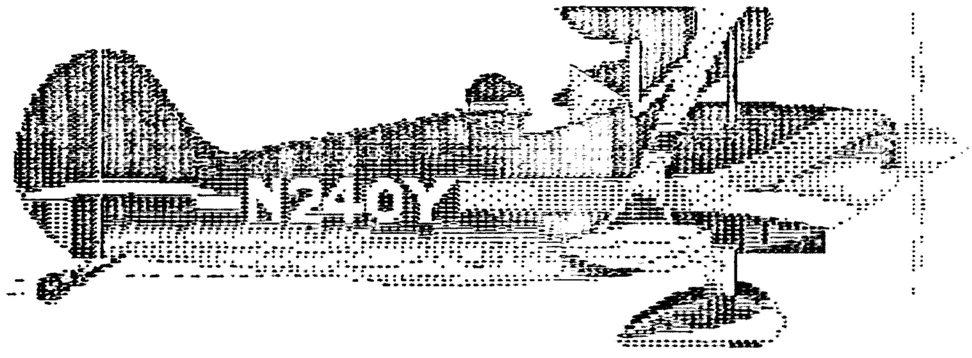

Fig. 1. SCATS 1980 1st-prize winner.

York, is trying to build an old tube-type converter out of the old *RTTY Handbook*, published by *73* in 1972. This circuit used TV sweep coils, about 30 mH, as mark and space filters. Kevin writes that the value of the parallel capacitor for the 2975-Hz filter is given as 0.07 uF, but that the capacitor for the 2125-Hz filter has no value stated.

Kevin, these coils are adjustable, and I used some in a converter I built about fifteen years ago. The value of the capacitors really is not that critical. You might try 0.1 uF for the 2125 Hz and 0.15 uF for the 2975 Hz and trim if you have to, remembering that disk capacitors may be off by 20% or more from what they are marked.

Kevin also wanted a basing diagram for the mixer resistors—these are 100k. As far as where to get these coils, try a local TV service shop, preferably one that has been around a while and might have a stock of "junk" sets to pull from. It never hurts to ask.

Before you hustle along to build this converter, though, let me add a word or two of caution. This is a basic converter of an earlier age. Similar performance may be obtained with simple circuits based on more modern devices such as transistors and phase-locked loops. Although I feel that building a tube-type converter may be a valuable learning experience, it also can be frustrating as the devil. This is more true today with the proliferation of solid-state devices. You may want to wait for a bit for *73's* new *RTTY Handbook*, due out in the near future, and look through that for some other ideas.

This same piece of advice is directed to Bill DeVore WB3DLO, and the many others who have written about their search for RTTY publications. Bill is trying to rewire a Model 19, a subject we talked about in this column several years ago, and needs a diagram to follow. While it is too much to include here in RTTY Loop, that is just the kind of information you will find in the new edition of the *Handbook*. New information on computerized RTTY also will be included, along with modern circuits and ideas. Look for an announcement in the *73* Bookshop section of the magazine, I hope before the end of the year!

I received a letter from a Canadian ham who is a CW and phone operator who greets RTTY signals with less than enthusiasm. He states that "we made great progress in eliminating AM carriers by using SSB and supplying the carrier [in the receiver]. Do you think something similar to SSB could be done for RTTY? A steady tone supplied by the receiver, and the incoming marks alone used to key a Schmitt trigger and shift the receiver's tone oscillator 170 Hz. Many advantages all along the line could come from this system on low bands."

Unfortunately, this question reveals a lack of understanding of how RTTY works. Putting aside for the moment the fact that on-off keying, what the writer is requesting, is illegal, let's examine that mode of transmission. While idling, a steady mark is generated in both FSK and on-off keying. They are, on the air, identical. Transmission of a character pulses the mark carrier, again identically. However, with FSK, an inverse signal (the space) moves a carrier a fixed distance (typically 170 Hz) away from the mark. When the mark is present the space is not, and vice versa. They are never present together, thus presenting the image of a single carrier being moved (shifted) in frequency: frequency-shift keying.

The advantage of this scheme is, among other things, the built-in redundancy of the system. Interfering signals would have to obliterate both the mark and space in order to destroy information. With on-off keying, a single carrier sitting on the mark frequency would render communication impossible. While such a carrier is annoying with SSB, it is devastating with on-off RTTY. Using modern reception techniques, an FSK signal would not even be bothered.

Looking at it from the other side, I cannot see how a good CW signal (RTTY is normally not found in SSB segments) could be copied better through an on-off-keyed RTTY signal than an FSKed one. On-off-keyed RTTY would sound like high speed CW, certainly confusing nearby Morse transmissions. Narrow receiver filters at the CW station should be able to eliminate nearby RTTY signals just as they notch out nearby CW ones.

I'm sorry that I don't agree with you, but I hope you understand why. You may benefit from some reading on RTTY; who knows, you may join us!

Several questions have been received about current VHF RTTY possibilities. Along those lines, allow me to plug the two-meter repeater of AMRAD, located in the Washington, DC, area. Although well known for its work with OSCAR satellites, AMRAD also is on the forefront of digital communications, as typified by its repeater on 147.21/147.81 MHz. I am told that a packet radio beacon is currently on, using Bell 202 standard tones. Also, Sunday night bulletins are transmitted at 6 pm local time. If you're in the area, have a listen.

Some more from these keys next month. Tell me what you'd like to see, then look for it here, in "RTTY Loop"!

LETTERS

WAIN WHEEL?

What year did you invent the wheel?

You're responsible for every new development that has ever taken place in ham radio, if you do say so yourself.

You can be sure that many, many hams are sympathizing with and feeling very sorry for you because of your severe psychotic condition.

Bill Libman KA1JE
West Hartford CT

It's not as bad as you think. Aspirin does the trick... don't worry.—Wayne.

UNTRUSTWORTHY?

Can we be trusted?

Docket HR2203 seeks to reaffirm the FCC's current practice of allowing licensed hams to conduct the tests that lead to the Novice certificate. But clearly, too many of us have shown ourselves to be untrustworthy in this area. As proof, witness the dreadful CW on the Novice band. Some of it drags along at 2 to 3 wpm, with awful format and spacing, long pauses, and repeated errors. These people came nowhere near passing the 5-wpm code test that the FCC entrusted us to conduct.

You can almost see the nodding, grinning, and winking that went on between the hopelessly under-qualified would-be Novice and his licensed buddy who faked the results. This is a serious accusation, but the resulting shameful performance on-the-air proves it. The Novice test is the only area in which we have been allowed to demonstrate our ability to police ourselves. We have betrayed this trust many times. Again I say, listen to the Novice band for proof.

Therefore, I recommend that this self-policing privilege be withdrawn from us. Alternatively, I recommend the following: The section of HR2203 that will allow hams to monitor violations of the Act should be expanded to include monitoring of Novices who violate standards so badly that clearly they could never have passed a legitimate test. If a dishonest licensed ham knows that he could receive a letter from the FCC asking about the incompetence of his Novice friend, he will never be tempted to betray the trust placed by the FCC in him—and therefore in all of us.

Peter Vaughan KC4PX
St. Petersburg FL

Peter, I think you are being very harsh. Perhaps you don't realize just what is involved in being a Novice. This is an introductory license where hams can learn. Yes, some Novices make mistakes (I know I did)—yes, many Novices have abominable fists (so do many Extra class licensees)—but the Novices you hear on the air are communicating, and in the process are learning to be better operators.

The poor fists you hear are largely a result of the FCC's way of handling Novice exams. There is usually a 12-week wait between passing the code test and receiving a license. In the meantime, our new hams are getting rusty if they are not practicing.

We need more seasoned hams to take the time to help Novices get good fists and set up their stations. After all, we aren't born with these skills. Six years of teaching new hams has taught me that Novices are among the most enthusiastic, honest, and friendly hams you will ever meet.—N8RK.

OL' SOGGY

After a hard day at work, I rushed home to my DX300 for the latest news of the Whiskey Jack Rescue Net. I am happy to report that Old Soggybottoms has been found. There came a flash a short while ago that 6605 was in tow by a French naval vessel.

Here comes the fly in the soup. One operator, a sandbagger something or another, was saying that it should have been *our* Navy or Coast Guard to save Soggybottoms, not the French. Gee, I thought the whole purpose to this Mayday Net was to help find Soggy 6605, not to designate who! The way this lid was carrying on, one would think that a French naval vessel was a French ship with a cargo of belly-button lint!

Now, to answer the question of why the French ship was there first, that's because our Navy has landed on Greenland —yes, Greenland. Let me explain. Five kHz up, there were three high-powered WJ stations planning their rescue strategy. The head Jack of this group proposed to wait till 6605 transmits again, then with their beams *"tripodulate"* on him. He suggested that they pool all their readings together and plot his position.

Down 5, commands Capt. Jack, and the three are off to tripodulate. (Makes me think of Tinman, Scarecrow, and the Cowardly Lion, for some reason—oh well.) Out of the QRM comes the long-awaited transmission and the three get cranking. Now, remember that these masterminds are many states apart, so one takes the long path, one takes the short path, and the other takes a standby for Mother Nature. The all-important transmission over, they plot 6605 at 70° north by 45° west.

Where's that, asks the nature boy? I'll be darned if I know, replies Capt. Jack, but let's get it off to the Navy quick! Has it come to light yet? No? Then read on.

The Navy receives this valuable information, and they're on the way to Greenland taking along a few Marines in case Soggybottom is beached. Where's the Coast Guard, you ask? They're busy keeping our shores safe from unfriendly powers while the Navy is on this life-saving mission. While all of this was happening, a French naval vessel (whose captain was oblivious to the past 5 days of radio lunacy) is patrolling the Atlantic shipping lanes. And who do you think he happens to come across? Right. 6605.

I hear Ol' Soggy was going to stay with his boat while being towed, but one fellow WJ suggested that he take the cat and pass it up to the French ship, and *then* his boys, wife, and himself should follow. (Makes you wonder about this guy's priorities, huh?)

For those of you who like a happy ending, 6605 and family are home safe and sound, and the Whiskey Jacks are congratulating each other for doing such a fine job—over and over and over again.

In closing, I ask—How can anybody say the 10½-meter boys don't perform a valuable service? It is said that laughter is a very potent drug, and after 5 days of complete confusion, power battles, and radiomanship that bordered on incompetence, I am well medicated!

The 10½-Meter Reader
New Jersey

BOTSWANA BOOSTER

The March, 1981, edition of *73 Magazine* has just reached the bookshop here in Gaborone, and your editorial has prompted me to write to you about amateur radio in Botswana.

The Government of Botswana has no fear of personal communications. Both ham radio and CB are permitted here. The support for ham radio by Botswana delegates at WARC '79 was welcomed and commented upon by several other countries. The Government is aware of the benefits that can be gained from ham radio in the training of technicians.

However, sympathy on the part of the Government and visits by influential people such as yourself or Bruce Johnson (whose visit here was reported in the September, 1979, *QST*) are not enough. There must be a core of already-licensed hams in the country who are willing to foster interest in the hobby amongst the emerging technicians and engineers and who appreciate that this process may take many years.

What must be overcome is not hostility but indifference. One of the problems we encounter here is that ham radio is regarded as a rich expatriates' hobby. Young Batswana see little point in becoming interested in what appears to them to be an expensive indulgence. Please remember that hobbies are, in any case, a concept foreign to Africa. Also, it must not be forgotten that the majority of

people here do not have electricity in their homes and that components and surplus equipment are virtually unobtainable even in the capital city. In addition to these drawbacks, a large proportion of young people receives no secondary education whatsoever, although that situation is improving. Thus, ham radio can be expected to appeal to only a very small minority of the population at present.

In spite of all these difficulties, the expatriate hams here are doing their best to interest Batswana in the hobby. There are at present three Batswana with ham licenses. A further one has passed the Radio Amateurs' Examination and has only to pass his Morse test to obtain a license; three more retook the RAE on May 11th and await the results. A further three are studying for the examination. It also is hoped that a Novice license will be introduced, as there are about 30 school students who are eagerly awaiting this development. This Novice license would be similar to the American one.

The Botswana Amateur Radio Society was formed in 1976 and has been really active for about two years now. Virtually every ham resident in Botswana is a member of the Society, a total of about 20, and a number of interested Batswana who do not yet hold licenses are associate members. The Society has just managed to buy premises to use as a club room in Gaborone. This will not be of much immediate help to those outside the capital, but it is felt that a club station would do much to encourage interest here and that a really interested and active membership in Gaborone could then encourage activity in the other main centers.

A further point: In our more depressed moments it frequently seems that the main reason for external encouragement of ham radio in Africa is the generation of support at ITU conferences and additional DXCC fodder. It is difficult to demonstrate the ham spirit behind a DX pileup when you are on the receiving end of it.

(Mrs.) Pru Harris A22PH
Gaborone,
Republic of Botswana

The situation you describe is a familiar one... and is repeated in most Third-World countries. It has a solution. Even in Jordan, which is a wealthy country as compared with some of those in Africa, it is beyond most youngsters to aspire to a home station. This is why club stations were put in by King Hussein in every city in Jordan. These were set up in the youth clubs. Although there was some criticism of the CIA for furnishing Hussein with funds, I happen to know that many if not all of these ham club stations came from this fund... well spent, to my way of thinking.

The next stop is an inexpensive one. The government needs to have a person who can get to these club stations about once a week to give classes in amateur radio. Jordan had one chap who did this... and did a fantastic job of it. He taught the fundamentals of theory and code. The students eagerly learned and got familiar with hamming through operation of the club stations.

If any country is interested in this concept, I would like to talk with them about it. I believe that I can get US amateurs to donate the money to set up club stations if the donors are promised a later visit to see their club station and to meet the amateurs who have resulted from their generosity. I think we can put together excellent club stations for about $2,000 each, with rigs, beams, towers, rotors, and so on. I've asked many groups about this and have always had plenty of volunteers to come up with the needed funds.

Thus, there is no problem with a lack of ham gear for personal stations... or power. The youth clubs have power and a person to be in charge of the club station.

The youth quickly are attracted to the wonders of talking all around the world via the club station... and tackle the theory and code programs with enthusiasm. For the long run, they are now on the path toward most rewarding careers as technicians and perhaps even engineers. These Third-World countries need technicians desperately. The main problem facing them is motivation... and amateur radio sure can provide that.

A few days ago I met with the Prime Minister of a small country in the Caribbean and I outlined my plan. He was most enthusiastic. I will be pursuing this, and it if works out I'll be after you, the readers, for some donations to get ham club stations set up. I'd like to see this scheme tried out in a hundred small countries. Amateur radio needs it... and so does the world.

The pileups are another problem.—Wayne.

AFRICAN CLASSES

We noted your comments re license classes with interest (April, 1981). The Johannesburg Branch of the South African Radio League offers every six months three different courses leading to the radio amateur operator certificate examination. All lectures are coordinated, advertised, and run by the SARL-Johannesburg for the benefit of intending amateurs and the club and its members.

There are no "hidden" charges, and the fee of R45 includes the lecture material. All the student has to buy is a pocket calculator at about US$12. No company is involved, and the venues are private colleges with the exception of our special course in Soweto, where courses *are* offered at Molapo Technical Centre to save the students the long travel time. This course is free of charge.

Lectures are selected to bring the students in the shortest possible time up to exam level. The lecturers are selected to have the right psychological profile to enable the students to gain the right attitude to his/her future fellow hams.

The lecturers are paid a fee of US$18 to US$22 per each two-hour lecture, and are expected to check the students' homework.

Our lectures start each year in late January and end in July or early August. The exact date depends on the school holidays. Our club has been offering courses now for over 7 years. The tremendous growth of ham radio, in particular in the greater Johannesburg area, speaks for itself.

Peter Strauss ZR6MI
Johannesburg, South Africa

ARRL OK, BUT...

Attached is a letter which I sent to Robert York Chapman W1QV, President of the ARRL foundation, in response to his appeal for contributions for OSCAR. I think OSCAR is great. I will contribute. Also, I would like to see our house cleaned up. When Dannals and Metzger resign, the fog should abate somewhat. *I urge all ARRL members to write to their directors demanding the resignations of Dannals and Metzger.* The League is a great institution for continuing ham radio as we like it. We don't need "rubber stamp" directors, "closed-door" forced "kick-outs," and uncounted "vote shredding." Let's end dictatorship and return to some kind of decent ethics.

[The letter to Mr. Chapman supported Don Miller and said that the $17 contribution for OSCAR suggested for ARRL Life Members would be exceeded and mailed in as soon as "Mr. Metzger and Mr. Dannals have resigned."]

Ronald C. Williams
W9JVF/ZB2CS
Indianapolis IN

Troublemaker.—Wayne.

JOBS OUT THERE

I hope it's not too late to reply to a letter in your issue of May, 1981. I'm referring to John Townsend's letter (Getting A Job).

I don't know where he is looking, but the man is certainly not including broadcast stations in his definition of "an industrial outfit who needed a competent electronics man." I have had, for almost a month now, an opening for an engineering assistant. The requirements aren't severe: just the knowledge to do the job and an FCC First Class Phone. No experience? Not to worry; I'll train you.

In my search (believe me, there just aren't enough people out there to meet even my minimum requirements), I found many stations which also were looking for engineers... just within a 150-mile radius of Dayton. Part of my search consisted of calling these stations, hoping that maybe they had had a recent applicant that they could point my way.

Our starting salary (typical) for this job is $250 to $300 per week (higher scale for someone who *does* have experience)—somewhere between Townsend's experienced political

technician and the Phi-Beta-Kappa Double E. . . *and* neither applicant need either have minored in politics or worked 15 hours a day in Nome. I make over $400 per week, and I am not related to the boss nor am I one of his buddies. *I* also can move under my own steam and motivation. His secretary and I are not having an affair, and I am not a member of a minority.

Age? No problem. One of my applicants is 63. He is highly qualified. . . but, when I tried to call him back for an interview, he was never in and wouldn't return my calls. I would have hired him in a minute!

There is nothing wrong with feeling sorry for oneself, but, Uncle Wayne, when things have been going wrong for a long, long time, why don't people stop, look at themselves, and think that's perhaps where they should be pointing the finger?

Would I hire John Townsend? With that attitude? Would you?

Patrick J. Shirley
Chief Engineer, WONE/WTUE
Dayton OH

FREE TOROIDS

The public services performed by radio amateurs are recognized by the Chesapeake and Potomac Telephone Company of Maryland, which has donated a large number of 88-mH toroidal inductors for their use.

Superior passive CW filters using these coils have been described by Ed Wetherhold W3NQN in *HR* (April, 1981) and *QST* (December, 1980). He is a filter design and applications engineer with Honeywell, Inc.

Ed is giving generously of his time in packing and handling the eleven toroids per carton. Your only cost is the shipping. Send an SASE for instructions to: Ed Wetherhold, 102 Archwood Avenue, Annapolis MD 21401.

Gene Brizendine W4ATE
Huntsville AL

CABLE QRM

For those of you who thought that your TVI problems would *go* away when your neighbors went on cable TV—'taint necessarily so! I recently ran into an unusual TVI problem here in San Jose that involves a local cable company and its channel assignments. This TVI problem will create a serious situation for amateurs if action is not taken now.

The cable companies have a group of channel frequencies between TV channels 6 (88 MHz) and 7 (174 MHz) which they normally designate as channels A,B,C, etc. These channel frequencies are more or less standardized throughout the cable TV industry. The cable companies use these channel frequencies for their premium offerings such as HBO, Show Time, etc. There seems to be no industry standard as to what offering goes on what channel. The cable companies use downconverters at the subscriber locations to pick off the desired channel and downconvert it to TV channel 3.

My problem is with cable channel E which is used for the "Movie Channel" here in San Jose. (On other cable systems, channel E may be used for any premium offering, as mentioned above.) The problem is—believe it or not—channel E's video is on 145.25 MHz and the audio is on 149.75 MHz! This means that the downconverter's front end is tuned across the entire two-meter band. Tests indicate that 1 Watt will wipe out E to 100 feet, 35 Watts to two blocks, and 130 Watts to five blocks. (This is true with *any* two-meter frequency.) These tests were made with my neighbor after the local cable company had replaced all its coax and checked all its grounds. I wonder how bad the results would have been had we made the tests before the coax and grounds had been restored to like-new conditions. By the way, tests at locations with underground coax systems produced about the same results.

In order to get something done here, I had to set up a conference call between the local cable company and the FCC. The end result was that the FCC told the cable company to correct the problem. I don't know their plans after conducting tests at my QTH other than the fact that they want my neighbor to switch to another offering to get away from the interference.

There is no way that this channel E and two meters can coexist. We don't want another 6-meter and TV-channel 2 situation. So—what I'm asking is that if you have this problem, or know someone who does, please notify the local cable company. If necessary, mention FCC Rule 76.55A1 which pertains to this problem. They need to know just how bad this problem is. Also, please notify the FCC and the ARRL.

We need to face this problem now. Cable is the coming thing, and we need to establish the ground rules now before additional channels are created on the other ham frequencies.

Bill Rinker W6OAV
San Jose CA

Not only are some cable systems very susceptible to interference, but many of them radiate harmonics that interrupt amateur communications. Any suggestions?—N8RK.

BOO TO HOME BREW

I'd like to say a few words in defense of store-bought ham gear.

It seems kind of fashionable these days to heap scorn on so-called "appliance operators," who offend the old guard by not personally building all their transmitters and receivers. At one time, everybody built everything, because that was the only way to get hold of the stuff at a price within the average ham's budget. It was more a necessity than a virtue. The practice had several undesirable side effects.

First, it limited the sophistication of a piece of equipment to the amount of time the owner could spend on designing and building it. The entire cost of development was spent on one single piece of hardware; there was no way to amortize part of the cost over a large run of units, except for the occasional club group project. Guess why things like bandpass i-f filters never caught on until the late 50s?

Second, it limited the amount of testing that could be done to whatever was within the capabilities of the test gear the owner could afford to buy, build, or borrow. Guess what? Spurs all over the place, and mediocre audio.

Third, it slowed the building of equipment enormously, because each assembly job was cut-to-fit using the simplest hand tools. There was no opportunity to tool up for a design and build up some speed. So, a damn sight less equipment got built, and fewer people were willing to bother in the first place.

And where are the virtues of home brewing what can be bought? How does the world benefit from having yet another Novice design and build a CW transmitter whose circuit is essentially the same as the thousands that have been made since 1925? Does anyone seriously think that this kind of project teaches anything applicable to keeping the real workhorse gear—synthesized FM rigs and broadbanded sideband transceivers—working right?

Home brewing was a stage ham radio had to pass through in order to get off the ground, but it never could have grown up to be a serious, reliable, useful form of communication if it hadn't grown out of that stage. Today's gear would be neither adequate nor affordable if there weren't a way of concentrating more effort on its development and construction than a single individual can bring to bear, nor would there be enough hams to supply an adequate response when a disaster strikes.

There's still home brewing, of course, and for good reasons. Ham technology continues to advance, and at the cutting edge the market is small and commercial equipment doesn't exist. When a piece of gear is needed, either for a test or for regular use, and it can't be found, that's the time to get out the reference library, the desktop computer, and the scope. But to build *everything*? We'd never get anything done! Sure, ham technical talent is capable of equaling any professional talent on any task, but let's concentrate that kind of effort where it's needed instead of trying to lay guilt trips on people who are really bringing the strength of diversity to our hobby.

John A. Carroll AB1Z
Bedford MA

Right on, John! Although I truly enjoy home brewing accessories and other small projects, I have no interest whatever in designing and building my next HF rig. I'd rather concentrate on the human side of our hobby, which is every bit as important as the

technical side. Hams are still doing plenty to advance the state of the art. Satellites, microwaves, spread spectrum, moonbounce...there is no shortage of challenging frontiers.—WB8BTH.

SCOUTING HELPS HAMS

Your May editorial calls for clubs to entice young people into the ranks of amateur radio operators. You listed a number of activities for young people which you regard as distractions from ham radio. One of the activities listed was Boy Scouts. Rather than being a distraction from ham radio interest, Scouting can become a tool in developing new hams.

Radio clubs which wish to actively pursue new young operators should encourage their members to become certified with their local Boy Scout Council as Communication Merit Badge counselors, or the club should sponsor an amateur radio special-interest Explorer Post. Boy Scouts are young men from age 11 to 18, and Explorers are young men *and* women from age 14 to 21.

My experience with Scouting as a leader encouraged me to earn my ticket at the age of 33. Please don't put Scouting down; encourage the ham radio community to get involved in Scouting.

John C. Mullan KA2MKU
District Commissioner
Fuertes-Frontenac District
Baden-Powell Council, B.S.A.
Ithaca NY

On my honor, I will do my best...—N8RK.

LOOKING WEST

Bill Pasternak WA6ITF
c/o The Westlink Radio Network
Suite 718
7046 Hollywood Blvd.
Hollywood CA 90028

Dedication: I wish to dedicate this month's column to the memory of my friend and writing colleague, Ray Thill WA9EXP, who died tragically on Sunday, May 31, 1981. Ray was a very special person to many of us. We loved him and we will miss him very much.

In last month's column, I mentioned that I had heard the audiotapes of Dr. Dave Gardner's ill-fated Palmyra DXpedition in 1979. In fact, I spent a little over 50 working hours editing them into a form that Dr. Gardner could use in talks he was planning at that time.

The tapes were recorded by another amateur here in Los Angeles, Bernie Abrahamson W6PJX. Bernie used 2400' mylar™ reel-to-reel tape which ran at a speed of 3-3/4 IPS. He captured much of what transpired during that time including most of the emergency communication between Palmyra and the US mainland.

Editing the tapes into usable form meant first transferring or "dubbing" them from 1/4 track to full track; I upped the speed to something workable for editing purposes, grouping emergency contacts with one another, DXpedition contacts together, etc. This was done by listening to the tape and hand-cutting pertinent sections together on separate reels.

The next step was the most time consuming: removing parts which contained nothing but dead air, totally unintelligible communications, and material not really pertinent to the operation. The equipment used consisted of a Tandberg Model 6 for playback, a Sony TC-250 (full-track converted) for recording, and a modified Sony TC-155A with an Edit-All S-2 block for assembly. (By the way, for those of you outside the broadcast industry, this is called "Assembly Editing," aptly enough.)

The final work was to transfer the many completed open-reel tapes onto standard audiocassettes. For this, the Sony 250 was played through my Vanco Port-A-Board mixer into a Panasonic RS-260-US stereo cassette deck which was parallel-channel connected for monaural recording. As you can tell, this was quite a chore. In fact, over 600 splices were involved in making the raw original into a form usable for discussion and evaluation purposes. Obviously, over this 50-hour period, I became intimately aware of much of the DXpedition's experiences and the problems it faced.

Two things that stand out in my mind were the numerous instances of interference to DXpedition emergency communications—interference that was obviously of the intentional kind—and other instances where amateurs seemed far more concerned about when DXpedition operation would commence than about the welfare of those who were stuck on that isolated rock. The thought of a contact to that rare location seemed to cause many amateurs to lose all common sense. The 5-second contact and hoped-for QSL seemed to replace all sense of reason for many.

I was really appalled by some of what I heard. I find it hard to believe that human beings, hams like myself, would value a lousy piece of paper over the lives of a group of fellow amateurs. Nor were these the only instances of disregard. Some of the disregard was for the amateur rules themselves, such as calling the operation *on frequency* for a contact while operation was below the US phone band. Also, the sometimes downright nasty comments by those who committed the same regulatory violation in order to get the original offender off the frequency.

Since the bogus QSL card story broke, I have spoken with many hams about it. Opinions vary from "How could they possibly have done this to the DXCC program?" to a simple "Right on...it's about time someone cleaned up this ARRL-created mess." Most comments have fallen somewhere in the middle, like, "Now that it's all in the open, maybe we have a chance to revamp things a bit to make it less competitive and more in line with the basis and purpose of amateur radio."

I think these are the people who are on target. I see nothing wrong with having a sport in amateur radio—a sport called DXing. But when this sport becomes an obsession and causes so many to lose all sense of propriety, then the rules by which the game is played must be changed.

Most of those into DXing with whom I have spoken feel that two changes are needed. The DX Advisory Committee rather than the General Manager must be the entity to decide on the validity of a country or place for DXCC credit, and the DXCC Honor Roll must be eliminated. This, they say, would keep the sport, make it even more democratic in the judgment aspect, and take away the razor edge from the competitiveness.

They are the experts in this one, not I. If I ever get back into DXing it won't be from this QTH because of antenna restrictions. It will be on my old friendly 6-meter band only. As I wrote once before, the HF DXer could learn a lot from his VHF/UHF brethren with regard to cooperation. Many VHF/UHF DX records attest to this. Ask people like WB6NMT or N6NB if you don't believe me. Cooperation is how the records are set. That's how everyone gets his slice of the pie.

SECOND-CLASS CITIZENS

Some three years ago, a friend of mine decided to run for the ARRL Vice Directorship in his division. He went through the nominating process only to be declared ineligible because he held a Technician-class, not a General-class, license. He thought he was eligible to run for that office because, according to the ARRL, there are only two classes of membership: full members, who are any licensed amateurs, and associated members, who are unlicensed and therefore cannot vote for either Director or Vice Director.

(By the way, Newington, in case you have never read your own paperwork, nowhere can I find anything regarding SCM elections. Does this mean that an associate member can vote for SCM?)

My buddy was, and still is, very active in local amateur radio affairs. He spent years working in AREC (now ARES), organized communications for walkathons and other civic events, has been active with many radio clubs, and is currently the presi-

dent of one. He is a person who gets things done and he felt he could do even more. So, when he was rebuked by Newington only because he did not hold a General-class license, he was rather upset and planned legal action on what he felt was an obvious contradiction between the League's corporate charter and their operating rules. The cost of such litigation caused him to decide against it, so we will never know if he would have been elected or not. He was popular, but so was the incumbent. Both were good men. But this has caused many amateurs to wonder if the ARRL isn't guilty of something called "License-Class Bigotry," discriminating against an individual because he or she does not meet certain arbitrary criteria set forth by the League hierarchy.

I must ask: How many Novices and Technician-class operators are there who would gladly serve in an elective post if not for this restriction? (A restriction enacted by the Executive Board, and not one that appears in the ARRL's corporate charter!) One of the excuses often uttered in defense of this policy is that Novices and Techs cannot operate on certain bands where League-function networks are held. That may be true today, but we are entering a new era, one of amateur communication by geosynchronous satellite. It won't be too many years before the 80-meter nets are a thing of the past, having been replaced by similar on-the-air conclaves via satellite. The entire future of the Amateur Service really lies in space communications, and these are frequencies that the Tech can and does operate.

Believe it or not, there are people who have no interest whatsoever in operating on any band below 50 MHz. They view HF as a zoo, a place to be avoided at all costs. Hence, they see no need to upgrade. Many never will. Yet these very same people are ready, willing, and able to lead. They want to lead. They have the ability to lead.

I can only wonder what excuse the ARRL will have for keeping these people as second-class citizens some 10 or 20 years down the pike. As I and many others see it, another change needed in the ARRL is for an end to this type of license-class discrimination. People must never be judged on their ability to copy 13 words per minute as is now the case. If you are going to set some criteria, then they must be overall, and the most important point is willingness to serve.

My buddy didn't have the financial wherewithal to make it stick, but one of these days a Novice or Tech will come along who will. It may take such action if HQ doesn't wake up to the realization that we are in a new era. The 1980s. An era of split-second communication. A time in which amateurs are attuned to what's happening around them. Many of today's amateurs, regardless of license class, are politically active. They want and demand to have their voices heard, and if the ARRL doesn't attune itself to this, then one of these days there may be a "court ordered Novice in Newington," with everyone else up there wondering how it happened. The electoral process needs drastic revision. Ending the license class requirement to hold office would be a major step. I can only hope it's a voluntary one initiated in Newington, and not one that is eventually court ordered. There are better ways to see my dues spent than on protracted court battles.

By the way, I have no interest in becoming an ARRL official, nor am I eligible under Rule 11, with which I agree for the most part. Those of us who make a living, even in part, from amateur radio, should not run for such offices.

There are some exceptions I would like to see made even here, however. A few months ago, Wayne alluded to the true story behind the 1980 Southwest Division Vice Director's race which saw Gordon West WB6NOA disqualified from candidacy that time. I don't have the time this month to go into it extensively, but I will in the near future. Suffice it to say that Gordon was disqualified because, as editor of *CB Magazine*, he decided to use that vehicle as a way of helping CBers who wanted to get their amateur tickets. To that end, he began publishing a license-training course using training material from the League itself. It was in part because of this that he was disqualified. There's more, but we'll get into it later on.

I'd like to invite you, the reader, to voice your feelings about the ARRL and what direction you feel it should take in the decades to come. What changes are needed, if any? I have my views. I invite yours and will be happy to print them in this column as space permits. It's your League and mine. Let's tear down the "codfish curtain" together and make the ARRL play.

KAHANER REPORT

Larry Kahaner WB2NEL
PO Box 39103
Washington DC 20016

PLAIN LANGUAGE REVISITED

The first time that I read through the plain language rules' comments in February, the red vinyl FCC binder was thin. I checked again in late June, and it took four, fat looseleafs to hold it all. A torrent of letters arrived at the last minute even though hams had since December (theoretically, at least) to comment. That's not unusual, however; most petitioners wait until the cut-off date. But in this case, hams largely ignored the plain language proposal until recently.

Several amateurs asked for a six-month extension for comments, saying that they couldn't get their hands on the *Federal Register* issue in which the rules were published until March. In addition, some said their clubs got bogged down printing and distributing the 50-page document to members because of the rule's bulk.

The FCC denied all extension requests. They said the rules were out for public comment for nine months (again, theoretically), much longer than other proposals and that the amateur community wouldn't be served by further delays.

However, Carlos Roberts, Private Radio Bureau chief, showed compassion. When the ARRL asked him to reconsider their petition for extension—this time they only asked for two extra months—he agreed. By the time you read this, that extension will have expired (August 21), and the "replies to comments" period begun.

With so many comments to wade through, I couldn't get an accurate count on the definite yeas and nays. Most comments seemed somewhere in between, with hams liking some parts, despising others. Some just wanted to trash the whole thing.

One objection stood out, though. Overwhelmingly, hams took exception to the text's beginning in which the commission dropped the traditional principles and reasons for amateur radio spelled out in Part 97: promotion of international goodwill, public service, perfection of communications technology, and so forth. The new rules just leave it this way: for the satisfaction of the operator.

Many commenters deemed that to be too simple a statement for such an important facet of the service. They believed the FCC's new approach too basic, that it lowered the Amateur Service's stature to that of the CB Service, noted several hams. Their pride hurt. Their egos ached.

In a more practical vein, however, other hams pointed out that when the time comes for amateurs to defend their frequencies—as they must often do when another service believes it can make better use of the ham bands—intruders will look at the given official reason for amateur radio, and then use it to show the frivolous and self-serving nature of the service. Also, they added, to those who know absolutely nothing about amateur radio, the statement of purpose doesn't say anything substantial, doesn't teach an outsider anything.

I talked with Roberts about the plain language rules, and he assured me that the commission staff remains open-minded. "That's why we put the rules out

for comment," he said. He emphasized that the proposal isn't etched in stone—not by any means—and that before the rulemaking period ends, he expects changes, both in wording and in substance, based on comments.

What the FCC really looks for in comments is not "I hate any change; I hate the new rules" kind of letters, but the "I hate the new rules because..." types. Or, "I like the new rules except for ..." So, keep those cards and letters coming in. And be specific.

And a word on comments. It's a rich-man's game. The FCC doesn't make it easy for private citizens to read filed comments so interested parties can reply. The only place dockets are kept is in Washington, DC, at Commission headquarters. If you live in Seattle, you're out of luck unless you maintain counsel here. And that's precisely what broadcast stations, common carriers, and others do. It's spawned a whole new industry. Lawyers make their living just following rulemaking for their clients, duplicating letters, and mailing them out. (Actually, lawyers often hire college students at cut-rate prices to do the legwork.)

One trick attorneys use to make life easier is to intervene in a rulemaking—make a comment, any comment. Then, following the rules of professional etiquette among attorneys, you become part of the "service" list and anyone who comments afterwards automatically sends you his filings.

Well, what started this whole plain language thing? Why did the FCC decide to rewrite the amateur radio rules in the first place? The stock answer that Commission staffers give inquirers is that it stemmed from an executive order. That's Washington talk for "the President told us to do it."

In this case, that's quite true, and when I jog your memory you'll recall it. The Carter administration was hot on the idea that legalese was becoming too foreign a language for government documents that affected the public. Carter declared that federal agencies should begin programs to rewrite rules in plain English. The FCC took that edict to heart (other agencies, unfortunately, didn't) and started work on the CB Part 97 rules and those governing maritime radio operation. They did such a good job on the CB rules that the President held it up as a model for other agencies to follow.

So, the commission, reeling from all the executive attention, decided to expand the project to the next logical area: amateur radio. Because of its strong general public interest, it seemed the next likely candidate.

FCC staffers took the President's order seriously and attacked Part 97 like it was part of an etymological holy war. They can't turn back now even if they wanted.

With budget cuts keeping people running scared, afraid to even hint that they were wasting public monies, stopping the plain language rulemaking now would be embarrassing. Too much time, effort, and money have been invested already. Also, a large number of FCC staffers still loyal to the Carter administration intend to carry out his order. In addition, the FCC boasts that they rewrite better than anyone else and vow to keep it that way, pal.

No matter how strongly you ask the FCC to stop the rulemaking, no matter how much you yell and scream, chances are slim on dropping the matter. My guess is that it's going to happen whether you like it or not. So, again, keep those cards and letters coming in. It's your only chance for a fair shake.

NO CODE, NO WAY—ALMOST

It comes in cycles. For some reason, the amateur community is once again talking about a no-code ham license. It could be because of the '79 WARC decision which allows dropping the code requirement for licensees transmitting above 10 meters. That International rule takes effect in 1982, and the FCC can, if it wants, follow it. However, WARC doesn't allow no-code for 10 meters and below. According to the agreement, code below 30-MHz still reigns. As an aside, the US Senate has yet to ratify the WARC treaty.

The no-code proposal has been floating around the commission for about 10 years, but contrary to some reports, the FCC harbors no immediate plans to drop the code requirement.

However, highly-placed FCC sources told us they favor a no-code ticket designed with VHF, UHF, and microwave experimenters in mind. It's not necessary, the thinking goes, for operators to understand International Morse just to tinker with the new technology. In fact, very little if any futuristic radio techniques will employ International Morse, and the FCC knows it. The commission still looks to hams as prime movers for expanding radio technology, and it doesn't want to hinder the state-of-the-art because someone can't master the dit-dahs.

Instead of the code, though, FCC officials say they would substitute a very difficult written test—with emphasis on the word "difficult." Even though commission officials seem to agree with this concept, it's still a long way off. If it were implemented tomorrow, it still couldn't take effect until 1982.

NEW PRODUCTS

MCM's Automatic Antenna Tuner.

AUTOMATIC ANTENNA TUNER

The Daiwa CNA-2002 marks a major advancement in antenna tuner technology with a compact, economical, and automatic 2.5-kW antenna tuner. The relatively small size of the CNA-2002 is made possible by a Daiwa breakthrough in high-voltage variable capacitor design. The large, old-style, variable capacitors have been replaced by small, rugged, encapsulated units. The CNA-2002 makes it possible to achieve an optimum antenna match in a minimum amount of time.

The matching function of the tuner becomes automatic whenever the operate button is pressed (5 to 50 Watts of rf must be applied to the tuner). The internal detection circuitry detects forward and reflected power and the resultant proportional dc voltage is applied to the motor control amplifier, which in turn drives the tuning motor. The tuning motor is connected to two variable tuning capacitors through a gear train using a 30:1 gear ratio. Automatic operation ceases when the swr dips below 1.5:1. Two fine-tuning controls on the right-hand side of the CNA-2002 can be used to quickly lower the swr to 1:1. The CNA-2002 performs its automatic tuning function in less than 45 seconds!

The tuner section of the unit can be switched out to permit the swr metering function to be used independently. The CNA-2002 incorporates the unique Daiwa cross-needle meter. It allows forward power, reflected power, and swr to be read simultaneously without sensitivity adjustments! The CNA-2002 also features a built-in 100-Watt dummy load, two switchable antenna outputs (SO-239 connec-

tors), and a linear amplifier remote-control terminal.

For more information, contact *MCM Communications, 858 E. Congress Park Dr., Centerville OH 45459; (513)-434-0031.* Reader Service number 486.

BEARCAT 100 HAND-HELD SYNTHESIZED SCANNER

Electra Company has announced a breakthrough in scanning radios with their new Bearcat® 100 hand-held portable, which they will manufacture here in the US. Fully synthesized, it requires no crystals. Compressed into a 3" × 7" × 1¼" case is more scanning power than many base or mobile units. The unit has a full 16 channels with extended frequency coverage. Power consumption is kept extremely low by using a liquid-crystal display and several low-power integrated circuits which are new to the industry.

The Bearcat 100 produces an audio power output of 500 milliwatts and a hefty one Watt when used in conjunction with the accessory ac adapter included in the package. The unit has patented Track Tuning, high selectivity, and sensitivity of less than a microvolt on all bands and all channels.

The unit operates on 6 AA batteries and has a battery-low LED indicator to signal when to recharge. A special internal circuit protects against overcharging while also preventing excess drain on the batteries. The unit's wide frequency coverage includes all public service bands (low, high, UHF, and "T" bands), both 2-meter and 70-centimeter amateur bands, plus military and federal land mobile frequencies. The unit has direct channel access and a built in automatic scan delay. The package includes a sturdy carrying case, earphone, and battery charger/ac adapter.

Complete details are available from Bearcat scanner suppliers, or by writing to *Electra Company, 300 East County Line Road, Cumberland IN 46229.* Reader Service number 480.

VOICE CONTROLLER

Remote control by voice via radio or telephone is now possible with the Covox Model I voice controller. Low in cost and fully self-contained, this noise- and click-resistant system extracts the voicing component of speech from low-grade voice communication circuits in the manner of a human listener.

The primary measure of voicing duration is modified and corrected through cross correlation, with vowel sounds characterized by the spoken words "dih" and "dah". Spoken Morse, binary, or RTTY codes are reliably recognized with considerable tolerance of the particular speaker and voice-channel quality.

A 16-word vocabulary controls anything that can be switched: garage doors, wheelchairs, etc. Use the fundamental pitch output for proportional control tasks, such as varying motor speed or dimming lights. Low power requirements make it ideal for portable systems using mobile, marine, aircraft, amateur, or CB radio.

The system is flexible, with applications to such diverse tasks as driving external vibrators for aiding the deaf through the sense of touch, or working in conjunction with a host computer to achieve a high degree of security in telephone or radio identification. The system comes complete with ac adapter, microphone, and user's manual. For more information, contact *Covox Company, PO Box 2342, Santa Maria CA 93455; (805)-937-9545 or 928-4818.* Reader Service number 483.

INSTANT-TUNING WEATHERADIO®

Radio Shack, a division of Tandy Corporation, has announced a new three-channel VHF-FM weather broadcast receiver. This latest addition to the company's line of Weatheradio® receivers features crystal control of tuning for instant station selection with a simple three-position switch, eliminating the problem of off-channel tuning and drift.

The crystal-controlled Weatheradio (12-152) receives NOAA/National Weather Service broadcasts on any of the three channels used: 162.550, 162.475, or 162.400 MHz. Because of the precise frequency selection possible with crystal control, stations can be accurately selected with a three-position switch instead of the usual manual tuning knob.

An rf amp brings in NOAA VHF weather stations at a range of up to 50 miles, making this receiver effective virtually anywhere in the United States.

The crystal-controlled Weatheradio is housed in a low-profile design with a simulated rosewood finish. It measures just 1-1/2" × 5-1/4" × 3-1/4" (H × W × D). The convenient top-mounted play-bar turns the unit on and off; the channel selector and volume control are hidden beneath the unit, since these settings are seldom changed in actual use. A 2-1/4" (diameter) speaker is top-mounted for excellent clarity.

Signals are captured by an attached antenna, which can be telescoped down and folded behind the unit for easy storage, if desired. Power is provided either from a 9-volt battery (not supplied) or an optional ac adapter (not included, available separately).

The Model 12-152 crystal-controlled Weatheradio and ac

Bearcat's hand-held synthesized scanner.

The Realistic crystal-controlled Weatheradio.

adapter are available at Radio Shack stores and participating dealers. Reader Service number 485.

DATAK FLEXY-MARKER

The Datak Corporation has developed a novel wiremarker. Called Flexy-Marker™, it is claimed to be the first major design improvement in 30 years.

The new marker breaks with tradition by using no cloth. It is made instead from a dead-soft vinyl plastisol film that clings and conforms to all wires. The adhesive adheres especially well to vinyl and will not loosen when the marker is flexed or exposed to heat and hydraulic and lubricating oils. The recommended upper temperature limit is 125° C, but when samples of the new marker were exposed continuously to 150° C, they showed no loosening and only a slight cosmetic discoloration.

While ordinary marker legends have a tendency to wear off when roughly handled, Flexy-Marker legends are heat-fused into the plastisol film so that they remain legible under the most severe working conditions. They are unaffected by most solvents and easily withstand the abrasion encountered from fishing wires through conduit and raceways.

If a standard wiremarker is hand-applied, it is difficult, if not impossible, to avoid contaminating the adhesive at the end of the marker. The result, after a few days, can be a loose or dangling marker. Flexy-Markers avoid this problem with a 3/8" tear-off tab that serves to both apply the marker and to seal down the end in one continuous motion. Flexy-Markers are perforated so that they can be used on one large diameter wire (0.35" diameter) or on a terminal strip and two smaller wires.

The new markers are supplied in sets of 24 identical sheets bound into a handy 3-1/4" × 5-1/2" pocket pad. The pads all contain a set of 1056 1- and 2-figure markers. The marker range initially includes identical and sequential numbers to 520 as well as the alphabet, supply-voltage designations, and miscellaneous machine-wiring designations. For more information, contact *The Datak Corporation, 65 71st Street, Guttenberg NJ 07093; (201)-869-2200.* Reader Service number 489.

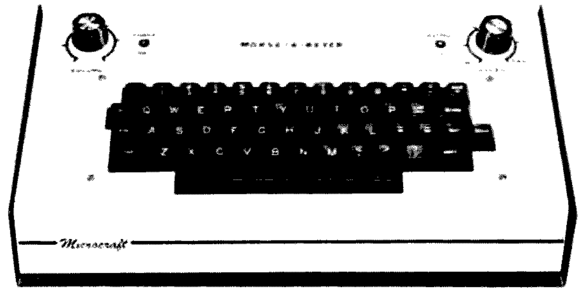
MORSE-A-KEYER CW KEYBOARD

A low-cost, dependable CW keyboard is now available from Microcraft. It features an industrial-quality keyboard, a rugged steel case, and a 16-character first-in, first-out buffer which allows you to type slightly ahead of the text being sent. Also included are an internal speaker, a sidetone monitor, and a "buffer-full" LED warning.

The speed range is 5 to 45 wpm, standard, but can be easily increased by changing one resistor. A reed relay is used to key your transmitter and to provide isolation between the keyboard and associated equipment.

The Morse-A-Keyer is available as a partial kit, complete kit, or factory wired and tested. The partial kit consists of a PC board, construction manual, and board parts. The builder must supply an ASCII-coded keyboard, a 5-V at 120-mA supply, and miscellaneous hardware.

Shipments are made worldwide and requests for quotes are invited. Contact *Microcraft Corporation, PO Box 513, Thiensville WI 53092; (414)-241-8144.* Reader Service number 481.



The Microcraft Corporation Morse-A-Keyer.

TUBULAR PLYWOOD

Molded tubular plywood, a unique product with multiple uses, has recently been developed for industrial applications. Known as Plytube, it is a tough, versatile, and economical tubing, yet retains the warmth and beauty of natural wood. Stronger than steel, weight for weight, it is nonconductive, noncorrosive, waterproof, lightweight, and easy to cut and handle. In large diameters, it can be a low-cost replacement for fiberglass, metal, or plastic tubing.

Plytube is bonded under heat and high pressures with specially developed resins. This chemical impregnation gives the material unusual hardness and impermeability. It resists fungi, flame, and salt air and can be treated for underground installations. For special purposes, one or two of the wood plies can be replaced by metal, wire mesh, or synthetic laminates.

In the electronics field, Plytube offers unlimited uses. It is ideal for low-cost, easy-to-erect antenna masts. It can be used as coil forms for transformers, bobbins for coils, insulators, for lightweight housings, loudspeaker enclosures, and packaging of fragile or valuable instruments.

Plytube is available in any thickness from 3 to 46 plies and up to 84" in diameter. While circular in shape, it also can be formed in square, oval, and rectangular configurations. It can be extended to any length by internal or external sleeves. By using various types of wood and construction techniques, it can be adapted to a wide variety of weight and strength characteristics. For more information, write *Plytube Corporation of America, 39 S. Canal Street, Lawrence MA 01843.* Reader Service number 482.

Molded tubular plywood from Plytube Corporation.

TRAILERED TOWERS

Trailer-mounted antenna towers can be erected by a single person in record time as was

Indiana Quick Charge's QC500 charger.

recently demonstrated at Telex/Hy-Gain. From the time the trailer was parked to the full extension of the tower, only 15 minutes had passed. The company also demonstrated that these self-supporting crank-up steel towers are easily trailered even by passenger cars. According to the manufacturers, the trailer towers are exceptionally well suited to microwave tower surveys, their construction or repair, for site evaluation of repeaters, and for emergency field communications.

Towers are mounted on the trailer by a method which requires only one winch to tilt and erect the tower to its full height. Single-axle trailers, complete with legal running lights, accommodate medium to heavy-duty towers to 52 feet (15.85m). Two-axle, heavy-duty trailers with towers to 70 feet (21.3m) are also available.

For full information, contact Clyde Blyleven, *Hy-Gain, Division of Telex Communications, Inc., 8601 N. E. Highway Six, Lincoln NE 68505; (402)-467-5321.* Reader Service number 487.

INDIANA QUICK CHARGE QC500 CHARGER

Indiana Quick Charge, Inc., has announced the development of their newest product, the QC500 nicad fast charger. The QC500 is a combination home fast charger and mobile battery eliminator for nicad-powered portable hand-held transceivers.

The QC500 offers a quality constructed housing of die-cast metal that measures 2-1/2" × 4-1/4" × 1-1/4" and is covered with a gray baked-enamel finish that resists marring from constant use. Also featured are indicator lights that show input voltage, short-circuit condition, and output voltage, allowing the user to be assured of correct operation at a glance. Enclosed accessories include a UL-approved 1-Amp wall transformer (for home use), a mobile eliminator cord (which plugs into automobile cigarette lighter sockets), two replacement fuses, and a complete instruction manual. A warranty covers parts and service on the unit for a period of one year from date of purchase.

The QC500 is designed with heavy use and durability in mind. The charging unit is virtually indestructible physically and electrically. The unit can survive shorted output conditions and improper polarity connection. Both the input and output are fused to protect the charging unit and the user's equipment.

When used with the supplied wall transformer, the charger typically supplies 300 mA to the battery pack, gradually tapering down to 40 mA in about 4 hours. Extensive filtering of the charging current will allow normal operation with most equipment while the charging unit is in operation. When used with the mobile cigarette-lighter cord, the charging unit will allow operation of the user's radio equipment while in motion. Models are in stock for most popular hand-held units and the QC500 is readily adaptable to virtually any nicad-powered device with a 4- to 9-cell battery pack.

For more information, write *Indiana Quick Charge, Inc., 367 West Main Street, Danville IN 46122.* Reader Service number 488.

NEW HAMTRONICS® CATALOG

Hamtronics, Inc., has announced publication of a new expanded catalog crammed full of goodies for the VHF/UHF/OSCAR enthusiast.

The 40-page two-color catalog features a new 5-channel, 10-Watt VHF FM transceiver, new COR and CW ID modules for repeater builders, and new accessories, such as rf-tight enclosures for repeaters and power supplies. Also featured are the new T51 (VHF) and T451 (UHF) FM exciter modules. Many new ranges of transmitting and receiving converters have been added, as well as a series of receiving converters to extend the frequency coverage of scanners to new military, satellite, and commercial bands. The catalog also includes the full line of Cushcraft and Larsen VHF and UHF antennas.

For your free copy of this new catalog, write to *Hamtronics, Inc., 65F Moul Rd, Hilton NY 14468; (716)-392-9430.* (For overseas mailing, please send $2.00 or 5 IRCs.) Reader Service number 484.

SP-300 *from page 46*

sensors, and everything else are shielded from both each other and the outside world. Swr sensors? Yup. This meter has three, and they are switch-selectable from the front panel. Three different rigs and antennas can be connected to the meter at the same time. Each sensor has its own input and output connectors, and if there is any crosstalk between them, I couldn't detect it.

The first sensor covers 1.8 to 200 MHz, with a maximum power input of 200 Watts. The second covers the same frequency range, at a maximum level of 1 kW. These two sensors are fed with UHF connectors. The third sensor covers 130 to 500 MHz at a maximum of 150 Watts, and wonder of wonders, it's fitted with N-type connectors!

The SP-300 offers both relative and absolute power measurement using the procedures outlined earlier. Accuracy is rated at 10 percent, but should be much better than that under normal circumstances. Recalibration to a laboratory standard is possible, but as the instruction sheet says, "This SP-300 was perfectly tuned and adjusted by us, so don't try to remove the cover of this set and touch the inside." Cute.

I only found one thing on this meter to worry me, much less complain about. There are three LEDs on the front panel to indicate which sensor is in use. Other meters using the same scheme have had some problems with the LEDs rectifying the signal, causing radiation of harmonics. I didn't experience this unwelcome phenomenon, but if you should, or if you want to be careful, it is a simple matter to clip the LEDs out of the circuit.

All things considered, this is a surperb piece of equipment that outclasses most of the competition in looks, features, and performance. It isn't cheap, but what is these days? For further information, contact *NCG Company, 1275 N. Grove Street, Anaheim CA 92806,* and pray he has a few left. Enjoy! Reader Service number 479. ■

OSCAR ORBITS

Courtesy of AMSAT

The OSCAR satellites are subject to atmospheric drag, of course, and the present period of intense solar activity has accentuated the problem. During this period, our sun has been expelling huge numbers of charged particles, some of which find their way into the Earth's upper atmosphere, increasing the density (and thus the drag) there. It is through this region that the OSCARs must pass. OSCAR 8, in a lower orbit than OSCAR 7, is the more seriously affected of the two.

If the drag factor is not considered when OSCAR calculations are performed, long-range orbital projections will be in error. For example, by the end of 1979, OSCAR 8 was more than 20 minutes ahead of some published schedules. The nature of orbital mechanics is such that extra drag on a satellite causes it to move into a lower orbit, resulting in a shorter orbital period. Thus, the satellite arrives above a given Earthbound location earlier than predicted.

Using data supplied to us by Dr. Thomas A. Clark W3IWI of AMSAT, the equatorial crossing tables shown here were generated with the aid of a TRS-80™ microcomputer. The tables take into account the effects of atmospheric drag and should be in error by a few seconds at most.

The listed data tells you the time and place that OSCAR 7 and OSCAR 8 cross the equator in an ascending orbit for the first time each day. To calculate successive OSCAR 7 orbits, make a list of the first orbit number and the next twelve orbits for that day. List the time of the first orbit. Each successive orbit is 115 minutes later (two hours less five minutes). The chart gives the longitude of the day's first ascending (northbound) equatorial crossing. Add 29° for each succeeding orbit. When OSCAR is ascending on the other side of the world from you, it will descend over you. To find the equatorial descending longitude, subtract 166° from the ascending longitude. To find the time OSCAR 7 passes the North Pole, add 29 minutes to the time it passes the equator. You should be able to hear OSCAR 7 when it is within 45 degrees of you. The easiest way to determine if OSCAR is above the horizon (and thus within range) at your location is to take a globe and draw a circle with a radius of 2450 miles (4000 kilometers) from your QTH. If OSCAR passes above that circle, you should be able to hear it. If it passes right overhead, you should hear it for about 24 minutes total. OSCAR 7 will pass an imaginary line drawn from San Francisco to Norfolk about 12 minutes after passing the equator. Add about a minute for each 200 miles that you live north of this line. If OSCAR passes 15° east or west of you, add another minute; at 30°, three minutes; at 45°, ten minutes. Mode A: 145.85-.95 MHz uplink, 29.4-29.5 MHz downlink, beacon at 29.502 MHz. Mode B: 432.125-.175 MHz uplink, 145.975-.925 MHz downlink, beacon at 145.972 MHz.

At press time, OSCAR 7 was scheduled to be in Mode A on odd numbered days of the year and in Mode B on even numbered days. Monday is QRP day on OSCAR 7, while Wednesdays are set aside for experiments and are not available for use.

OSCAR 8 calculations are similar to those for OSCAR 7, with some important exceptions. Instead of making 13 orbits each day, OSCAR 8 makes 14 orbits during each 24-hour period. The orbital period of OSCAR 8 is therefore somewhat shorter: 103 minutes.

To calculate successive OSCAR 8 orbits, make a list of the first orbit number (from the OSCAR 8 chart) and the next thirteen orbits for that day. List the time of the first orbit. Each successive orbit is then 103 minutes later. The chart gives the longitude of the day's first ascending equatorial crossing. Add 26° for each succeeding orbit. To find the time OSCAR 8 passes the North Pole, add 26 minutes to the time it crosses the equator. OSCAR 8 will cross the imaginary San Francisco-to-Norfolk line about 11 minutes after crossing the equator. Mode A: 145.85-.95 MHz uplink, 29.4-29.50 MHz downlink, beacon at 29.40 MHz. Mode J: 145.90-146.00 MHz uplink, 435.20-435.10 MHz downlink, beacon on 435.090 MHz.

OSCAR 8 is in Mode A on Mondays and Thursdays, Mode J on Saturdays and Sundays, and both modes simultaneously on Tuesdays and Fridays. As with OSCAR 7, Wednesdays are reserved for experiments.

● IMPORTANT NOTE: At press time, it appears that OSCAR 7 has finally expired after more than six years of service. We continue to publish the orbital parameters, based on the slim hope that the satellite can be brought back to life. For further details on the demise of OSCAR 7, see "Death of a Satellite" on page 97.

HAM HELP

I need a schematic and any possible information on a Model 305 Stewart-Warner radio made about 1928. I will pay any reasonable price.

Charles D. Simmons W6PDH
PO Box 6238
Buena Park CA 90622

I need a supply source for a solid-state HV rectifier diode (25 kV) for a TV CRT.

Joseph A. Kramer WA9DJR
Box 246
Earlville IL 60518

I need a replacement cabinet back for a Hallicrafters Model S-38B shortwave receiver. If anyone can supply one, please quote price.

C. D. Prewitt K4ZCD
129 N. Maysville St.
Mt. Sterling KY 40353

I am in need of Collins equipment, either for parts or units which can be repaired.

H. F. Shnur
115 Intercept Ave.
North Charleston SC 29405

I need a schematic and/or service manual for a Tennalec MS-2 crystal-less scanner. If you have either, please send a postcard and let me know what you have. Thanks.

R. Latini
Box 6109
Hamden CT 06517

I would gladly pay copying cost for schematic and parts lists for a Boonton 260-A Q-meter and a Muzak STR-100 SCA receiver.

Dave Overton
1709 W. 30th St.
Austin TX 78703

Can anyone help me find info and schematics on an RCA Berkshire multiband (.5-22 MHz) AM/FM auto-tune receiver? It's part of a radio and projection TV system available in Secretary or Regency (contemporary and modern) cabinets. It is similar to the Army AR-T8 system. The auto-tune won't work and the factory has been no help. I will pay for any info.

Larry A. Rickard WB2BIS
23 Campbell Ave.
Jamestown NY 14701

Help is needed in keeping "pulses" generated by a Bearcat 210 scanner from interfering with nearby two-meter receivers. If you have a cure, please contact me.

Charles L. Kelsey WB2EDV
RD #2, Elmwood Avenue
Mayville NY 14757

DEALER DIRECTORY

Phoenix AZ

The Southwest's most progressive communications company stocking Kenwood, Icom, Yaesu, MFJ, B&W, Astron, Larsen, Cushcraft, Hy-Gain, Bearcat, and more. Would like to serve you! **Power Communications Corp., 1640 West Camelback Rd., Phoenix AZ 85015, 241-Watt.**

Culver City CA

Jun's Electronics, 3919 Sepulveda Blvd., Culver City CA 90230, 390-8003. Trades 463-1886 San Diego. Call us for a low quote.

Fontana CA

Complete lines ICOM, DenTron, Ten-Tec, Mirage, Cubic, Lunar, over 4000 electronic products for hobbyist, technician, experimenter. Also CB radio, landmobile. **Fontana Electronics, 8628 Sierra Ave., Fontana CA 92335, 822-7710.**

San Jose CA
SAN FRANCISCO BAY AREA

Homebrewers' haven; tons of new and used Ham/Computer gear and components. Serving Hams since 1958. We specialize in ICOM, KLM, Mirage, Comptronix. We ship worldwide. **Tele-Com Electronics, 15460 Union Avenue, San Jose CA 95124, 377-4479.**

San Jose CA

Bay area's newest Amateur Radio store. New & used Amateur Radio sales & service. We feature Kenwood, ICOM, Azden, Yaesu, Ten-Tec, Santec & many more. **Shaver Radio, Inc., 1378 So. Bascom Ave., San Jose CA 95128, 990-1103.**

Aurora CO

Electronic parts, surplus, used ham gear and test equipment, catering to radio amateurs, electronic hobbyists and small manufacturers. Low prices, growing selection. Come see us! **Electronic Bits 'n Pieces, Inc., 9717 E. Colfax, Aurora CO 00010, 361-6530.**

Denver CO

Experimenter's paradise! Electronic and mechanical components for computer people, audio people, hams, robot builders, experimenters. Open six days a week. **Gateway Electronics Corp., 2839 W. 44th Ave., Denver CO 00211, 458-5444.**

Miami FL

Amateur Radio Center, Inc. "Everything for the Amateur" Since 1960, **2805 N.E. 2nd Avenue, Miami, Florida 33137, 573-8338, TWX 522835.**

Columbus GA

KENWOOD—YAESU—DRAKE

The world's most fantastic amateur showroom! You gotta see it to believe it! **Radio Wholesale, 2012 Auburn Avenue, Columbus GA 31906, 561-7000.**

Smyrna GA

For your Kenwood, Yaesu, ICOM, Drake and other amateur needs, come to see us. **Britt's Two-Way Radio, 2506 N. Atlanta Rd., Smyrna GA 30000, 432-8006.**

Preston ID

Ross WB7BYZ, has the Largest Stock of Amateur Gear in the Intermountain West and the Best Prices. Call me for all your ham needs. **Ross Distributing, 78 So. State, Preston ID 83263, 852-0830.**

Terre Haute IN

Your ham headquarters located in the heart of the midwest. **Hoosier Electronics, Inc., #9 Meadows Center, P.O. Box 3300, Terre Haute IN 478003, 238-1456.**

Littleton MA

The ham store of N.E. you can rely on. Kenwood, ICOM, Wilson, Yaesu, DenTron, KLM amps, B&W switches & wattmeters, Whistler radar detectors, Bearcat, Regency, antennas by Larsen, Wilson, Hustler, GAM. **TEL-COM Inc. Communications & Electronics, 675 Great Rd., Rt. 119, Littleton MA 01460, 486-3040.**

Medford MA

New England's Distributor and Authorized Service Center for all Major Amateur Lines. Located Just North of Boston at Exit 5 on I-93. **Tufts Radio Electronics, Inc., 206 Mystic Ave., Medford MA 02155, 391-3200.**

Ann Arbor MI

See us for products like Ten-Tec, R. L. Drake, Dentron and many more. Open Monday through Saturday, 0830 to 1730. WB8VGR, WB8UXO, WD8OKN and W8RP behind the counter. **Purchase Radio Supply, 327 E. Hoover Ave., Ann Arbor, Michigan 48104, 668-8696.**

St. Louis MO

Experimenter's paradise! Electronic and mechanical components for computer people, audio people, hams, robot builders, experimenters. Open six days a week. **Gateway Electronics Corp., 8123-25 Page Blvd., St. Louis MO 63130, 427-6116.**

Phila. PA/Camden NJ

Waveguide & coaxial microwave components & equipment. Laboratory grade test instruments, power supplies. Buy, sell & trade all popular makes, HP, GR, FXR, ESI, Sorensen, Singer, etc. **Lectronic Research Labs., 1423 Ferry Ave., Camden NJ 08104, 541-4200.**

Somerset NJ

New Jersey's only factory-authorized ICOM and YAESU distributor. Large inventory of new and used specials. Most major brands in stock. Complete service and facilities. **Radios Unlimited, 1760 Easton Avenue, P.O. Box 347, Somerset NJ 08873, 469-4599.**

Amsterdam NY
UPSTATE NEW YORK

Kenwood, ICOM, Drake, plus many other lines. Amateur Dealer for over 35 years. **Adirondack Radio Supply, Inc., 185 West Main Street, Amsterdam NY 12010, 842-8350.**

Syracuse–Rome–Utica NY

Featuring: Kenwood, Yaesu, ICOM, Drake, Ten-Tec, Swan, DenTron, Alpha, Robot, MFJ, Tempo, Astron, KLM, Hy Gain, Mosley, Larsen, Cushcraft, Hustler, Mini Products. You won't be disappointed with equipment/service. **Radio World, Oneida County Airport-Terminal Building, Oriskany NY 13424, 337-0203.**

Columbus OH

All major brands featured in the biggest and best ham store for miles around. Come in and twist the knobs before you buy. **Universal Amateur Radio, Inc., 1280 Aida Dr., Reynoldsburg (Columbus) OH 43068, 866-4267.**

Scranton PA

ICOM, Bird, CushCraft, Beckman, Fluke, Larsen, Hustler, Antenna Specialists, Astron, Avanti, Belden, W2AU/W2VS, CDE, AEA, Vibroplex, Ham-Key, CES, Amphenol, Sony, Fanon/Courier, B&W, Ameco, Shure. **LaRue Electronics, 1112 Grandview St., Scranton PA 18509, 343-2124.**

Houston TX

Experimenter's paradise! Electronic and mechanical components for computer people, audio people, hams, robot builders, experimenters. Open six days a week. **Gateway Electronics Inc., 8932 Clarkcrest, Houston TX 77063, 978-6575.**

San Antonio TX

Complete 2 way service shop. Call Dee, W5FSP. Selling Antenna Specialists, Avanti, Azden, Bird, Hy-gain, Standard, Vibroplex, Midland, Henry, CushCraft, Dielectric, Hustler, ICOM, MFJ, Nye, Shure, Cubic, Tempo, Ten-Tec and others. **Appliance & Equipment Co., Inc., 2317 Vance Jackson Road, San Antonio TX 78213, 734-7793.**

Tacoma WA

Tacoma area dealer for Kenwood, Cubic, Cushcraft Antennas, Hustler Antennas, all amateur marine and commercial two-way radio supply. See our used radio dept. **Northwest Radio Supply, 5240 South Puget Sound, Tacoma WA 98409, 475-2619.**

Yakima WA

Central Washington's newest Amateur Radio Store. New and used amateur radio sales and service. Ham Radio Equipment—All Brands—Buy—Sell—Trade. **The Radio Store, 1505 Fruitvale Blvd., Yakima, WA 98902. 248-4777.**

DEALERS

Your company name and message can contain up to 25 words for as little as $150 yearly (prepaid), or $15 per month (prepaid quarterly). No mention of mail-order business or area code permitted. Directory text and payment must reach us 60 days in advance of publication. For example, advertising for the November issue must be in our hands by September 1st. Mail to 73 Magazine, Peterborough NH 03458. ATTN: Nancy Ciampa.

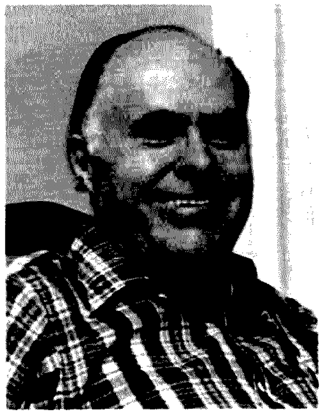
W2NSD/1 NEVER SAY DIE

editorial by Wayne Green



THE OLD OLD-TIMERS

While talking with someone about the sudden stopping of growth of amateur radio in 1963, when the "incentive licensing" proposal was put to the FCC, I was able to put this situation in better perspective by making a simple calculation.

From the period of 1946 to 1963, a seventeen-year period, amateur radio grew at the rate of 11% per year. This was fairly steady growth. Then it instantly stopped, with a net loss in hams over the next ten years. Since then, it has been growing again, but very slowly. Today, 18 years after incentive licensing was proposed, our growth is only where it would have been by 1965, two years later. We've lost almost a whole generation of hams. . . sixteen years worth!

Let's put that further into perspective. This means that on the average, hams have gotten sixteen years older. Well, I think we see that at clubs and hamfests. We have a huge proportion of retired hams these days. I think this has a lot to do with the drop in the buying of ham equipment, since retired people are for the most part trying to eke out an existence from Social Security and are in no position to spend a thousand dollars or more for a new station.

We see it also in the drop in the inventiveness of hams. Most retired hams are not up with the latest in technology and are not able to do much to keep up the ham reputation for inventiveness and pioneering. . . which is a young man's game. We shut the young men out for a sixteen year period, so we don't have many of them any more. No wonder amateur radio has produced so little in the way of innovation in the last 20 years.

The ham inventors and pioneers were, for the most part, youngsters. I was 26 when I got going strong on NBFM and RTTY, running beacons on 6m and so on. Copthorne McDonald was a young chap when he developed slow-scan television. Oh, a few old-timers hang in there, working away. A recent article on Reinhart told about his inventions. . . well, he was still going strong right up until he died. He wrote articles for *73* in the early 60s. And Bill Hoisington did tremendous UHF developmental work in his 60s and is still going strong in the Philippines. But these up-to-date old-timers are few and far between. Most older hams are still thinking tubes and kc instead of ICs and GHz.

With over one million electronics engineers and technicians kept out of the American work force because they never got into amateur radio, it is no wonder that our country is getting further and further behind Japan in electronic technology. Our hobby and our country are paying the price for that loss of a generation of hams.

If we just want to try to catch up with the growth that we would have had were it not for the incentive licensing disaster, we will have to grow at the rate of 33% per year for the rest of this decade. If we can figure out how to do that, I think that American technology could catch up with Japan. Other than that, I see no serious hope of our country ever regaining our ground.

Should we just shrug our shoulders and give up? Or is this something worth fighting for? This is something which I can't do alone. . . and which no one of you can do alone. But it is something which all of us together, if we really want to, could tackle and win.

I am not going to butt my head against the wall trying to do something which most hams don't care about. We *can* get amateur radio growing again. We can even get it into a 33% growth pattern. . . if we really want to. It will mean cooperation and a dedication of purpose which we have not seen in amateur radio in many years. It seems to me that we're going to need to have every ham possible join a club, and see that we get every high-school student we can into our license classes.

In a recent talk with the FCC, I brought up this situation and I believe that our fight may be helped from the highest office. . . the White House.

My own preference is to tackle the problem with new ideas. I realize that by far most hams are opposed to a no-code ham license, no matter how fantastic this has been for the Japanese. . . and what great operators they are. . . and how much this has packed their research labs with enthusiastic ham engineers who are pushing their country ahead of ours. Okay, if you don't want to even think about that. . . what *do* you propose which could get us growing?

Could we help the FCC by taking over both the teaching and the granting of ham licenses as a function of our ham clubs? This would cut FCC expenses enormously and might bring new life to ham clubs. Hams have always shown that they can be responsible and self-governing. Well, perhaps it is time to take that next step.

What are *your* ideas? Is it worth the bother?

W2NSD/1 ON-THE-AIR SCHEDULE OCTOBER, 1981

1	15-20 Phone
13	20m RTTY
20	20-40 Phone
27	15-20 CW

Response to our 15- and 20-meter phone sessions has been especially strong, so we have scheduled additional time on these two bands. On both phone and CW nights, look for us in the first 25 kHz of the General portion of each band. We'll be on the higher frequency band first, from 7:00-10:00 pm eastern time.

DF BREAKTHROUGH

Readers should be aware that construction or use of the direction-finding system described in the article "DF Breakthrough" which appeared in the June, 1981, issue of *73* may possibly be an infringement of US Patent #4,041,496, issued to Paul Norris.

Any unauthorized construction or use for commercial purposes of a patented invention is an infringement of that patent. Construction of a single unit for the experimental or personal use of the constructor is not considered commercial use.

ST. LUCIA

Against my better judgment, we took off a few days and zipped down to St. Lucia. No negatives as far as the island is concerned; it was mostly worry about keeping up with the work load brought on by the introduction of a new magazine: *Desktop Computing.* When a new magazine is being started, there is al-

most an infinite number of details which have to be cared for. There are the subscription letters, the advertising brochures, the mailing lists, the letters to authors (looking for articles), the quick trips to shows to rustle up more articles and more advertising, the hiring of editors, writers, more graphic arts people, the expansion of our buildings, new typesetting equipment, new presses for the in-house printing, more ad sales people, and so on. Add to that trying to cope with the growth of Instant Software, where ever more people, equipment, and space are needed, plus two very healthy computer magazines which are growing, and the boss, me, has his hands full.

We went to St. Lucia anyway, and it was worth the trip. It was worth it many times over. Firstly, there is no way that I will ever be able to thank the St. Lucian hams enough for their attention, their help, and their interest in making the visit enjoyable. In addition to Sherry, Tim Daniel N8RK of the *73* staff went along, as did Chuck Martin WA1KPS of Tufts Electronics. The ham business was slack in June, so Chuck said what the heck and joined us on the trip.

Though we arrived late at night, we were met by a bunch of the local hams, complete with a cooler full of beer, champagne, and even some soft drinks. It was warm, so the refreshments were a great beginning for our visit. When they offered to drive us to the hotel, that seemed like a good idea... and it sure was. We had no idea that the hotel was on the other end of the island, an hour and a quarter drive over a twisty, narrow potholed road. It was like driving a high-speed obstacle course at night, whipping around deep holes in the pavement every four hundred yards. Fortunately, there is little traffic on the St. Lucia turnpike, which is just two cars wide and goes through mountains just about all the way.

Our hotel, recommended by Eastern Airlines, was a bit of a disappointment. It was wonderfully located, right on a gorgeous sandy beach with palm trees. But the meals were uninspiring. There we were in the middle of a tropical paradise, with fruit at every turn, and the hotel couldn't manage a banana or any other fruit for breakfast. Canned orange juice.

The rooms were clean and some of the air conditioners worked, so I had no complaint about that... nor the ocean

Contesting from VP5

—the other end of the pileup and how to get there

It began as a fantasy in August, 1980, and ended seven months and 8,100 QSOs later as a contester's dream-come-true. Tim N8RK had just returned from a week in the Caribbean, where he'd been working with other hams to assist the devastated island nation of St. Lucia to recover from the effects of Hurricane Allen (See "Hams vs. Hurricane Allen," *73 Magazine*, November, 1980). We were examining a detailed map of the Caribbean, discussing his trip, when one of us turned to the other and said, "I wonder which of these islands is rare enough to be a good spot for a DXpedition?" It was just idle chatter, or so we thought. As it turned out, none of the easily-accessible islands could be considered really rare. However, a couple of places, notably the Turks and Caicos Islands (VP5), were heard less often than most of the others. An idea began to grow. What if we did an expedition? Pretty heady stuff, that! After all, weren't DXpeditions the business of such DX luminaries as Don Miller, Gus Browning, and the Colvins? We set out to prove that a couple of average guys could do it, too.

Our first view of the Turks and Caicos—the tiny island of Grand Turk. Note the airport runway, which runs from shore to shore.

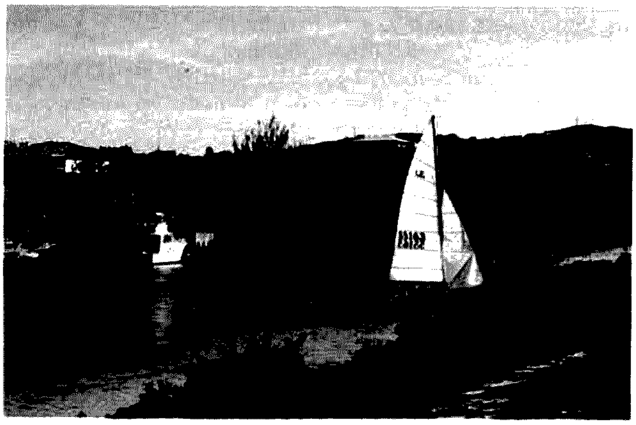
Getting Organized

As with any complex project, proper planning became the key to success. In order to give ourselves sufficient time to bring together the hundreds of details, we selected the first week of March, 1981, as the departure date, giving us a full seven months to organize our trip. This date also coincided with the phone weekend of the annual ARRL DX Competition, in which we planned to enter the multi-operator, single-transmitter category. We still didn't know for sure where we were going, but at least we knew when!

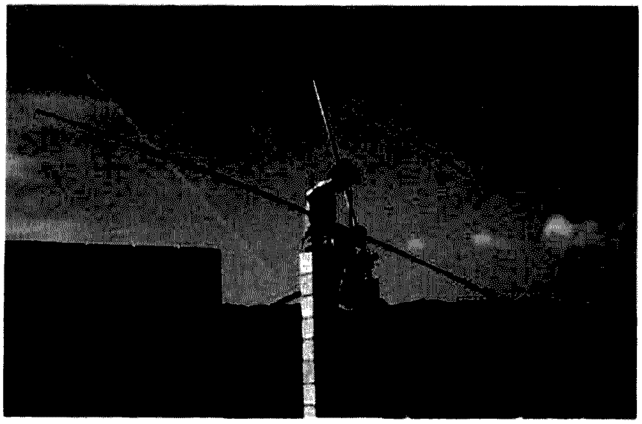
From the outset, planning the trip was an unwieldy exercise in long-distance communication. Tim returned to Terre Haute, Indiana, in late August to continue the pursuit of a degree in electrical engineering, while I remained in New Hampshire. We would not see each other again until March 1st, two days before leaving for VP5-land.

The following seven months were busy, punctuated by long QSOs on 20 meters, lengthy letters, and late-night telephone calls. Tim's acquaintances in the midwest and mine in New England thought our remote-control organizing of such a trip was more than a little unusual, especially since neither of us had ever before been involved in any sort of expedition.

Tim set to work researching the licensing procedures for VP5 and several other countries, while I investigated travel and accommodations throughout the Caribbean. At this juncture, a chance conversation with Joe WB4OSN saved us weeks of work. Joe had visited the Turks and Caicos Islands several times, and he heartily recommended this tiny British possession as an ideal destination for our DXpedition. He spoke with special favor of a place called the Third Turtle Inn, on Providenciales Island (forever after known as "Provo"), one of the largest islands in the Turks and Caicos group. As if this weren't enough, Joe even provided information on air connections to Provo, which was handy, since the commercial airlines do not yet fly there directly from the U.S.A. After educating our



The Third Turtle Inn on Grace Bay, site of our VP5TDX/VP5JDT operation. Built into the side of a cliff, the inn is a popular spot for DXpeditions. We stayed in the small building at upper left.



A partially-completed cinder-block wall provided a sturdy support for our tribander. Here, Tim prepares to hoist the antenna into place on a protruding piece of reinforcing rod.

travel agent on the whereabouts of the islands and getting his assurances that rooms were indeed available at the Third Turtle, the die was cast... we were going to VP5!

We soon learned that the Turks and Caicos in general, and Provo in particular, were the home of some of the world's very best snorkling and scuba diving. Throughout the winter of 1980-81, first one and then another skin-diving magazine sang the praises of Provo and the Third Turtle Inn. We decided we had picked the right place.

Meanwhile, Tim was discovering conflicting information on the best route for obtaining our reciprocal operating permits. In fact, we came up with no less than three plausible ways of getting a VP5 license. Fortunately, while Tim's first attempt failed to bring a VP5 license, it did bring the correct information from the Magistrate's office in Grand Turk, the capital city. It was a tight squeeze, however, with our licenses eventually arriving less than three weeks before D-Day. Having these precious documents in hand was a tremendous relief.

It appears that, in the absence of any special request, the Magistrate issues callsigns based on the applicant's initials. Thus I received VP5JDT, while Tim came away with VP5TDX. Applicants who ask for particular suffixes seem to get them, as long as they have not been issued previously.

Details, Details

From the first, every bit of advice that came our way emphasized the importance of careful equipment selection and organization. Coming up short on something as simple as PL-259s could completely ruin an otherwise well-planned trip. The list of required items, from transceivers to suntan lotion, grew almost daily for six months. It eventually occupied seven pages in the small notebook that became my constant companion. In many ways, it was like planning a large Field Day effort, except that the nearest junk box or ham store was 750 miles away.

Early on, we decided to take along a pair of transceivers from the same manufacturer. We reasoned that this would allow us to exchange components in the event of rig failure. It also made all microphones, headsets, keyers, etc., interchangeable without rewiring connectors when going from one rig to another.

In the end, we chose Kenwood gear: a TS-520 loaned to us by good friend Bill W1HCS and an 830S from the OM himself, W2NSD/1. Antennas would be a trap vertical (again courtesy of HCS) and a Cushcraft A3 triband beam. Telex ProComm 200 headset/boom mikes, an MFJ antenna tuner, and a remote vfo for the 520 completed the inventory of major gear.

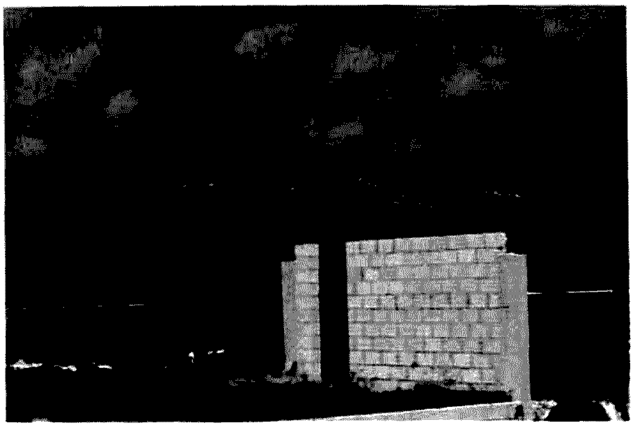
W1HCS also volunteered his address as the mail drop for the many incoming QSL cards that were certain to follow our trip. Both Tim and I had changed our mailing addresses so often in the past few years that our *Callbook* listings were accurate only in the most recent editions. It may seem like a very minor detail, but the use of a long-established address such as Bill's greatly simplified our on-the-air response to requests for QSL information. Bill's lovely wife, Lynn, accepted this imposition with extraordinarily good grace.

As planned seven months beforehand, Tim arrived in New Hampshire just two days before departure for VP5. Those last 48 hours were spent carefully packing the four suitcases and two antenna bundles which comprised our gear. A fifth bag held all our personal items. The trap vertical and most of the beam were stowed in a red, white, and blue ski bag. Aside from getting us a lot of strange looks in the sunny Caribbean, this proved to be an efficient way to carry those dozens of aluminum tubes. It also had the advantage of sticking out like a sore thumb amongst the piles of baggage at the airports through which we passed; no chance of losing that one. Just in case, however, we decided to carry a minimal station with us aboard the aircraft. On Monday afternoon, March 2, we dashed through our several-hundred-item checklist one last time. Then, it was off to Boston's Logan Airport for a night flight to Miami.

Slowly, Slowly

After seven months of anticipation and a frantic last two days, Tim and I were on a natural high as we flew first to Miami, and the next day, on to Grand Turk, the only place in the Turks and Caicos served by jets from the U.S. We had booked reservations on the Turks and Caicos National Airlines (TCNA) for a connecting flight to Provo, our final destination.

Although the runway at Grand Turk spans the entire width of the island, it's still a short one. Our small 737



Once atop the wall, the antenna was tied off to prevent the ever-present tropical breezes from tearing it to pieces. Kansas is dead ahead.

jetliner used all but the last 100 feet or so in making a smooth landing. After clearing customs and immigration, a task made easier when we showed officials our reciprocal licenses, the first order of business was to check the status of our TCNA flight to Provo. On this matter, there was bad news and good news. The bad news was that the TCNA plane had already departed . . . without us. The good news was that it had been filled to capacity anyway, so we really hadn't missed anything. Oh, well!

It was quickly obvious that both life and business in the Turks and Caicos ran at a somewhat more relaxed and informal pace than we were accustomed to. We began to explore alternative transportation to Provo and encountered a pilot, an American, who offered to fly us to Provo at no charge, since he lived on the island. The only hitch was that his single-engine plane refused to start, even when jumped from a truck battery. Three hours later, no apparent progress had been made, although our erstwhile pilot was still trying. His only comment was, "Slowly, slowly." We began to wonder if we'd ever see Provo.

The sun was setting behind the Grand Turk control tower when opportunity knocked in the form of charter pilot Howard Hamilton and his beautiful twin-engined Cessna. Howard was bound for Provo and announced his willingness to take passengers if we could leave immediately. Leaving the bulk of our ham gear in the hands of an airport official, Tim and I grabbed the 520, the antenna tuner, some wire, and our cameras and jumped aboard Howard's plane in the failing light. More than an hour later, we arrived over Provo in almost total darkness, at which time Howard executed a near perfect landing without benefit of runway lights or any sort of traffic control. We'd made it.

Faster, Faster

The Third Turtle Inn has played host to a number of visiting hams over the years and has one room which is ideally situated for amateur radio operations. This cliffside QTH was to be our home for the next seven days. Shortly after our arrival, Tim wandered among the bushes and small trees at the cliff's edge, rigging a very-random wire antenna. The wire tuned up just fine on 15 meters, and we were on the air within minutes.

We had decided to use Tim's VP5TDX callsign during the contest and my own VP5JDT before and after the big weekend. Since the contest was still three days away, it was VP5JDT (with Tim at the mike) which called CQ and worked W2JLO for QSO #1 of our week in paradise. A handful of contacts were made that first night prior to a wonderful seafood dinner and some much needed sleep.

By 1:30 the following afternoon (Wednesday), TCNA had managed to ship the remainder of our ham gear from Grand Turk to the Third Turtle Inn. In between excursions to the beach, we managed to get the vertical on the air, and the pace began to quicken. We settled in for some serious precontest operation that continued until 2:00 am, and whichever one of us wasn't working the pileups was bolting together pieces of the beam. We spent time on both modes and found 20-meter CW especially productive.

Things really began to hop when the beam went up Thursday afternoon. The pileups became enormous. As our proficiency grew, so did our contact rate—from 60 to 90 to 150 contacts per hour. Our beam was fixed on the center of the United States, since that's the area we'd be working in the contest. Despite this, a number of Japanese and European stations were worked, mostly as a result of superb operating on their part, especially on CW. About 1500 contacts were made by VP5JDT in the days preceding the contest weekend.

Not that we spent all our time operating. Are you kidding? This was our vacation, too, and we took full advantage of the superb beaches, fine swimming, and delicious food served up by the Third Turtle. When Friday evening rolled around, we were warmed up, rested up, and eager to have at it. At 0000 UTC, we switched callsigns to VP5TDX and plunged headlong into the fray, with KBØPR as the first of 6,300 contest contacts.

The vast majority of the contest is a blur of QRZs, signal reports, and callsigns. However, several highlights, both good and bad, do stand out.

- We made 200 QSOs during the first hour of the contest. Suddenly, we knew we'd be competitive.
- Saturday found us running 10 meters for 8 consecutive hours, averaging 189 QSOs per hour for the duration. The 10-meter propagation was superb, resulting in 2,700 contest QSOs on this band alone.
- Our initial goal of 3,000 QSOs was exceeded with more than half the contest still to go.
- With our adrenalin really pumping, neither one of us did much sleeping during the entire first night of the contest. As a result, we made a lot of mistakes on Sunday morning, and we each fell asleep at the mike at least once.
- We managed 27 contacts on 160 meters, despite the world's worst antenna—a 75′ random wire just five feet above the ground.
- Chaos reigned when the 830S gave up the ghost on Sunday morning, blowing a filter capacitor in response to an overvoltage on the power line.
- Only five minutes after the last contact (with KC4IW), our remaining rig, the TS-520, also went down for the count, popping an FET on the rf board. Fortunately, the contest was over, with 6,300 QSOs in the log. We'd averaged 130 QSOs per hour for 48 hours!

The Aftermath

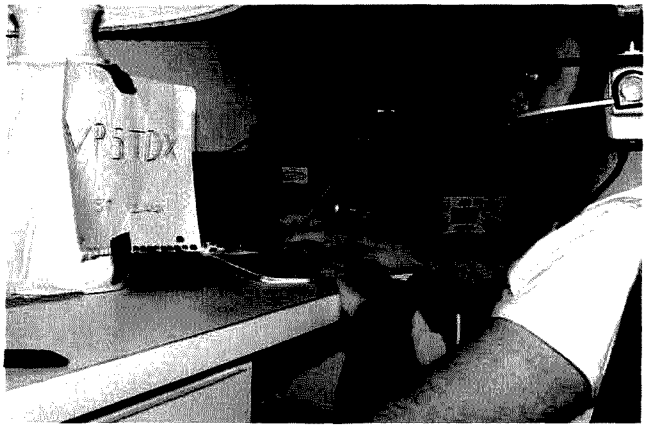
Monday morning found us hard at it, scavenging parts from the 520 to get the 830S back on the air. We succeeded and made 325 more contacts before closing down for good late

Monday night. WB2RWW was the last of some 8,100 contacts made during our one week sojourn in the Turks and Caicos Islands. All too soon, it was back to reality, and reality was a cold March night in New Hampshire, with a temperature of 35 degrees, about 50 degrees lower than in the islands.

The two of us spent three weeks duping our logs, finding about 300 stations that had worked us unnecessarily. The duping chore was greatly eased by the use of two TRS-80 microcomputers. Our final tally of 5991 QSOs and 4,924,602 points broke no records, but compared quite favorably to the high scores turned in after past contests. We should at least win the certificate for VP5!

QSLing has proved to be a very time-consuming chore. In fact, answering our mountain of cards has required the most time of any single aspect of the whole project. And lest you think DXpeditions always receive envelopes stuffed to bursting with green stamps, be advised that our income so far hasn't even paid for the extra stamps we've had to buy as a result of last spring's 3¢ postage increase. And cards are still arriving, six months later.

It's been debated whether a trip to a pleasant and not-so-rare place like VP5 should be called a DXpedition. Some prefer to reserve that term for visits to more exotic and extremely rare spots such as Spratly Island and Clipperton. But whether you call it a DXpedition, a DX vacation, or something else again, it's a fact that many of the cards we have received bear the inscription, "Thanks for the new country." As we all know, any country is rare if you haven't worked it yet.



A very frazzled WB8BTH near the end of the contest. At this stage, one rig was dead and we had run out of contest log sheets. The sign on the lamp became an increasingly-needed aid to remembering our callsign.

From our viewpoint, the thrill was in being on the other end of the pileup at least once in our lives. It means calling CQ and always getting an answer. It means a QSO rate limited only by how fast you can send or talk. It means finding out just how courteous most hams really are. It means being a celebrity, if only for a little while.

Would we do it again? In a minute! Would we do it differently? Of course; it's always easy to spot your mistakes using 20-20 hindsight. Should you give it a try? By all means! If we can do it, so can you.■

In Profile: Ted Gamlin, A Contester

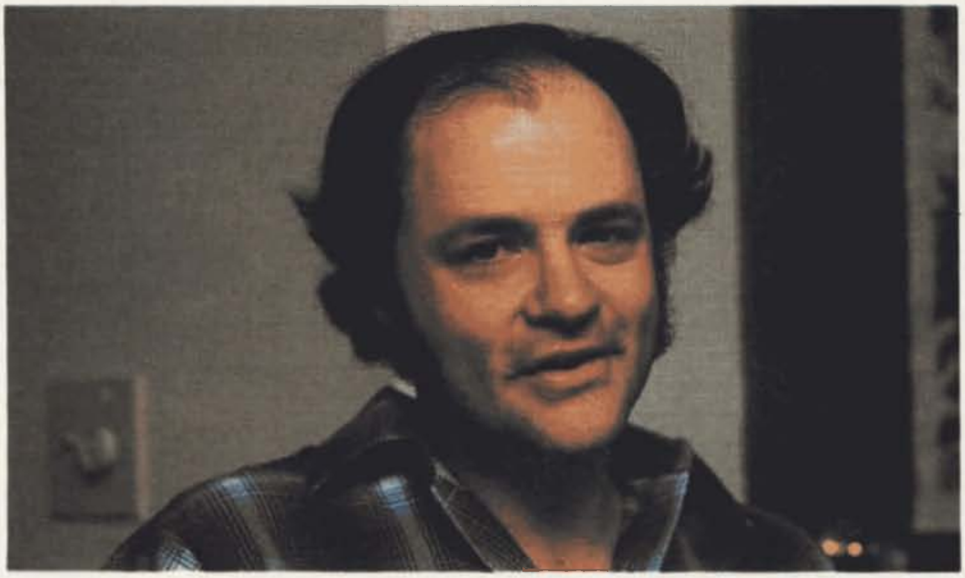
Chris Brown KA1D
73 Magazine Staff

In a darkened farmhouse on the crest of a windswept New England hill, conventional time has stopped for 13 men. For them, the hours of the day hold no importance, other than that of marking the approach of sunrise and sunset and the attendant shifts in propagation. This weekend, time is a 48-hour continuum for these men within which they must contact as many DX countries as possible, amass as many QSOs as possible, and do so on as many HF bands as possible. They measure time in the hours of the contest, not of the day.

In their kitchen, dirty dishes, scattered silverware, coffee-stained mugs and half-eaten casseroles litter the countertops like the aftermath of some great feast, but there has been no feasting. Most meals have been gulped in silence and eaten alone. In serious ham radio contesting, there are no communal suppers.

In another part of the house, the contest wing, lights brighten, then dim again, as six Alpha linears bang on and off line. Haggard operators, their voices hinting hoarseness, drive on through the night with their incessant message—CQ CONTEST, CQ CONTEST, CQ CONTEST. The refrain is always the same at Kay One Ocean X-Ray.

K1OX is both man and machine. The man, Ted Gamlin, is an affable and outgoing medical equipment salesman with an extremely competitive nature. The machine is one of the top multi-operator/multi-transmitter contest stations in America and, possibly, the world.



Ted Camlin K1OX: like a general on the battlefield.

The machine is in high gear this weekend for the phone portion of the 1981 ARRL International DX Contest. With its staff of 13, the big multi/multi contest juggernaut is bullying its way through this contest with a vengeance.

The man has a migraine that won't quit.

Stakes are high, but not in terms of dollars (though Ted Gamlin has spent quite a few in the course of adding five skylight-equipped rooms to his house for the sole purpose of contesting, and has raised six towers and twenty antennas in his backyard). The stakes are high in terms of pride. Put simply, Ted Gamlin and the K1OX machine want to kick

everyone's butt in this contest for the simple pleasure of being the best: the best in America, the best in the world.

Sitting in his darkened kitchen on Saturday night, 28 hours into the ARRL International DX Contest, Ted is putting the finishing touches on an intercom signaling system that will tie the six operating positions of his station together.

Amid the chaos that is big-time contesting, he shares his thoughts with *73 Magazine*.

73: This place is a zoo, Ted! Halfway through the contest and you're still building the station.

Gamlin: Yeah, I might finish it someday, too. It's getting to be a full-time job.

73: Speaking of jobs, what do you do for a living?

Gamlin: I'm in the medical field. I sell blood-chemistry analyzers for a New Jersey-based company called Electro-Nucleonics. And, I've been doing this for about eight years now. Man, time flies!

73: Always been in sales?

Gamlin: No. I started out in field engineering. My background is in electronics and I've got an associate degree. But, when the opportunity came up to go into sales, I just couldn't pass it up. It has worked out pretty well.

I like sales. It's a lot of aggression. I guess that's what life is now. Here we are multi/multi contesting . . . aggression at its best, in ham radio, anyway.

73: Do you do any other aggressive kinds of things . . . play sports for instance?

Gamlin: Yes, I enjoy sports. I play ice hockey in the winter, softball in the summer, and I played football and baseball in school. I generally like aggressive things.

73: Were you into hamming as a kid?

Gamlin: Yeah, I got my license in November of 1961, when I was twelve years old.

Diet Pepsi and visual aides help keep K1OX's ten-meter rate high during a morning JA run.

73: And how did you get into contesting?

Gamlin: It's kind of funny. It seemed to happen the way most things do in life: One thing led to another. I was living in an apartment, hiding all sorts of wire antennas in the woods next door, and got the urge to get a house of my own on top of a high hill. I had bolted 40 feet of Rohn 25 to my balcony without bothering to ask the landlord—when you ask, they always say no—and it was time to move. I searched for a house and finally found one. Within eight months of moving in, I was contesting. At first I just wanted to chase DX, but friends talked me into contesting because the site was so good.

"I never do anything halfway."

I never do anything halfway. Towers began going up out in the backyard, and soon I had four. We started contesting and found that we were really competitive. In the first contest we were in, CQ World Wide DX, 1976, we used the call W1RR and took third. The next time out we took second place in the ARRL contest. That was in the old house before I added the contest wing. Everything was in two rooms and halfway through most contests the well would run dry. There was always lots of yellow snow around the house in those days. I'm amazed I could get anyone to operate.

73: How about other ham activities? Do you get into traffic-handling or DXing, etc.?

Gamlin: It's funny; I'm seasonal. At certain times of the year, I chase DX like mad and at other times I could care less. It's really odd; my interests are seasonal. In the summer, I don't think much about HF. I play around with VHF on six and two.

73: Have you got any other hobbies besides contesting and playing sports?

Gamlin: One of my hobbies is body-building. I've got a full weight set in the basement and I lift heavy weights. I do the general kinds of things to stay thin and alive and healthy and happy, that's all.

73: And ready to go up towers at a moment's notice?

Gamlin: Well, you know, that's why I started body-building. In the summer, I'm always active. In the winter, I play hockey but don't do any really heavy work. So, for carrying things up towers in the winter, I wasn't always prepared the way I should have been. That's why I started lifting weights in the off-season . . . the off-contest and off-tower-climbing season.

73: What dedication!

Gamlin: Well, I lift my share of weights in the winter and when summer comes I'm ready. It works out very nicely. I think tower-climbing is one of the best exercises in the world. When you climb up, say, 100 or 160 feet straight in the air, it's amazing what it does to the thigh muscles.

73: Sounds like you're one of the few hams who enjoys tower work.

Gamlin: I do. But I try to pace myself. I climb so that I always have enough energy left to get myself out of a pickle should anything go wrong. Nothing ever has yet, although I've been in my share of binds.

Janice Gamlin: a wife who has learned to live with ham radio contesting.

73: So I understand. There is an anecdote I've heard about the assembly of your 160 footer that's pretty scary.

Gamlin: That's for sure. I built all my towers myself, including the 160-foot Rohn 45. One day, I had climbed up about 130 feet with a 70-pound section hooked to my belt. I was putting on the last few sections without a gin-pole and I said to myself, "Man this thing seems heavy!" I looked down, and the rope left on the ground had looped around another section. I was climbing with 150 pounds of tower sections hanging on my belt. I couldn't let go and I couldn't hang on much longer. The old "What do I do now?" routine.

73: You're crazy!

Gamlin: You're right. Many people have said that, too, including my wife. I've been up these towers in windstorms, total blackness, rain, you name it. I've got stories about what's happened to me on those towers that you wouldn't believe, like the time I got a wrench stuck to my tongue.

73: To your tongue?

Gamlin: Yes, on last Christmas Day. It was about 20 below zero with a wind chill of minus 60. Unbelievable! My lower 20-meter monobander in the stacked array had broken loose in the high winds and was hanging by its truss lines. Before it beat itself to death, I had to go up and secure it. That is the coldest day I've ever been up a tower. I got up to it and just ran out of hands. I put the wrench in my teeth knowing I couldn't touch it with my tongue. But, it wobbled, caught my tongue, and froze to it instantly. There I was, hanging off the tower, freezing to death, trying to pry this wrench off my tongue without giving up too much skin.

73: Speaking of towers, Ted, I've noticed a few around the house. Could you fill me in on the antenna farm?

Gamlin: OK. On 160 meters, we're using a full-size inverted vee. The apex is at 160 feet and the ends are at 90 feet.

On 80 meters, I have a pair a full-wave delta loops in phase. The apex of those is at 160 feet and the bottom legs are about 72 feet off the ground. They are horizontally fed and are on a 42-foot cross-boom. I also have a full-size, 1/4-wave vertical with 98 radials underneath it. It's a Rohn 25 tower on an insulated base. There also is a simple dipole hanging flat-top at about 54 feet and two beverages.

73: That's quite a setup. How about on 40?

Gamlin: On 40 meters, I have a four-element KLM monobander at 95 feet. I also have a two-element monobander at 75 feet which has not been performing very well.

73: And on 20 . . . ?

Gamlin: On 20, I've got a rotatable, five-element monobander at 160 feet. Fixed in the European direction, on the same tower, there is a four-over-four array made up of two four-element monobanders. There also is a four-element monobander fixed on the Caribbean on the 20-meter tower. By the way, all these antennas are switched by Transco low-loss remote relays and fed with RG-9/BU, a silver-plated, double-shielded coax.

73: I see. And on 15 . . . ?

Gamlin: On 15, basically the same situation. A six-element monobander at 105 feet, a fixed four-over-four array to Europe, and a single four-element monobander on the Caribbean.

73: And, finally, ten?

Gamlin: On 10, the top antenna is a seven-element, wide-spaced, home-brew monobander at 95 feet. Then a four-over-four array to Europe at 60 and 30 feet and in the middle of that a four-element monobander on the Caribbean.

73: Are most of the yagis home-brewed?

Gamlin: No. The fixed arrays are all Cushcraft Skywalkers and on 20 and 15 the rotatable beams are both KLMs. Only the 10-meter beam is home-brewed.

73: How about the operating positions? Does each have two transceivers and a third, spotting, receiver?

Gamlin: Yes, except for 160. Right now, I'm a victim of everyone else's equipment. Trying to set everything up in three or four hours before a contest is just murder. Surprisingly, we've had relatively few problems so far.

73: About the station, did you build it all yourself?

Gamlin: Mostly. I had a contractor do the big stuff on the new wing I've added and I'm doing most of the wiring and finish work.

73: How about the station engineering? That, too?

Gamlin: Yes. That's the hard part. Inter-station interference can be very tough to get rid of.

On all bands, you have to have suck-out filters that null the second harmonic of each transmitter, plus bandpass filters all over the place. We've found that the Japanese equipment is very susceptible to overload. Great pains must be taken to keep the level of all that garbage down, and especially no broadbanded transmitters. They are the worst.

I'm really happy with the way everything has turned out, though. It's funny. This

thing has sort of evolved. I never had a complete plan from day one. Once the addition was underway, I realized that there was going to be lots of extra room. It was then that I decided to use it for a massive multi/multi. So, I had five separate rooms framed, lots of sound-deadening insulation put into the walls, solid-core doors hung for each room. Did everything to keep ambient noise down. Ambient noise is the enemy of every multi/multi. It kills them.

With the spiral staircase I put in, I'll never be able to take queen-size beds up to the contest wing so I guess they won't make great guest rooms. They sure make good contest rooms, though.

73: Ted, you seem to have the ultimate setup here in terms of the facilities and equipment. At what point does the human take over and make the difference between winning and losing?

Gamlin: At this level, you have to have the best of both, men and machines. As far as the ultimate setup goes, I'm not quite there, yet. I'd like to have all the equipment in place so that the guys could just come in and operate. My objective here is to keep the people operating under optimum conditions, to keep it enjoyable.

Unfortunately, the building drained me financially to the point where I couldn't provide all the equipment needed. In time, I hope to have good quality radios of my own up there in all the positions. Slowly but surely, I'll get everything set up.

73: So, most of the rigs are now brought in by the operators?

Gamlin: Yes.

73: I thought that you had five Kenwood TS-830s ordered for the station.

Gamlin: I did. But, as I say, the building drained me financially and I couldn't supply an 830 at each operating position.

73: Are you pretty well sold on the 830 as the best contest rig?

Gamlin: More or less. I've looked at lots of rigs, and we have lots of different ones here this weekend, and the 830 seems to have the best receiver in it of any Japanese rig I've ever used. In all cases, we run an outboard receiver anyway so Kenwood's problem of receiver overload is minimized. I also prefer tube-type transmitters. They tend to have cleaner audio and seem more able to take the abuse we give them in a contest. At some point in the future, I'll probably have the five Kenwoods.

73: Ted, I must admit I find it a little strange that after all your effort and expense you don't operate.

Gamlin: If I did, I would be constantly interrupted. I would never be able to sit down, uninhibited, and operate because there always would be people saying "Where's this," "I need that," "What's happened, here," "This went dead."

73: Don't you ever miss operating in these big contests?

Gamlin: Not really. I think I feel more pressure on me than all of these guys. Typically, in every contest

CONTESTER'S WIFE—JANICE GAMLIN

73: As we sit here, you've got a house full of contesters. Do you think your husband is a bit crazy for inflicting these madmen on you several weekends a year?

Janice: **Not at all. I think it's a lot of fun... a lot of good constructive fun. They have all worked very hard this weekend and some are so punchy from lack of sleep they can't see straight. But I don't see it as crazy at all. They are having too much fun for it to be crazy.**

73: Ted tells me that you are studying for your Novice license. Is that true?

Janice: **Yes, I'm trying to, anyway. I go to class two nights a week and I hope to take the test soon.**

73: Any plans to get into contesting?

Janice: **Well, maybe. I probably would try it if I thought I wouldn't get in their way. They get a little... uh, excited up there during a contest.**

73: How long have you and Ted been married?

Janice: **A year this past June.**

73: And you knew about this contest business before the ceremony?

Janice: **Oh, yes. I remember when I first came over to the house, though. I looked at what turned out to be the antenna farm and said, "You've gotta be kidding! Those aren't clotheslines out there."**

Ted said, "No, dear, they're not," and then explained it all to me. I never thought that anyone could be so enthusiastic about anything. I had heard of hobbies, but never anything like this. He has it in his blood.

73: I thought it rather unusual that you had a wing added to the house for the purpose of contesting. Ted mentioned something about always having plenty of room for guests. Any comments on that?

Janice: **He told me at first that we would have five guest rooms above the new family room and two-car garage. Truthfully, I knew from day one that there was something funny about that, especially when I saw the skylights go in.**

Then, Ted told me about the wonderful spotlights he was going to put around the house. He said that they would be pointing up in the air, though, and I asked myself "Why do we want spotlights around the house that point up in the air?" Then it dawned on me: So the contest operators in our guest rooms could see their antennas at night through the skylights!

I went along with the guest-room story until he installed the operating tables, intercom units, and 220-volt wiring. I finally asked him where the guest beds were going, but I knew all along, really.

73: Do you usually have lots of guests around here?

Janice: **I mean how many guests can you have at one time? After all, we're not running a motel. Now that I think of it, most of our guests arrive at contest time.**

73: Have you met any of the other wives or girl friends of these contesters?

Janice: **Well, I have met a couple of wives. That's a problem that I'm up against. The wives of most hams that I've met do not like the hobby; they don't like the people associated with the hobby, either.**

Most wives think that because ham radio doesn't bother me and that I'm happy for Ted, that there is something wrong. They look at me like I'm on their (the hams') side. That's a difficult thing, because I sometimes don't know where I fit in. I have felt that animosity and it's no fun.

73: What do you think the problem is? Why don't wives like their husbands' hamming?

Janice: **It competes with them for their husbands' time. We have 13 guys here this weekend who are not at home with their wives and families. Ted has been working on his station every night for the past two weeks. That kind of commitment can get to you.**

73: But it hasn't gotten to you?

Janice: **If I were the type of person who got upset about things like that, I probably wouldn't have married Ted.**

Band	W2PV, 8.43M points QSOs	Multi-pliers	K1OX, 7.8M points QSOs	Multi-pliers	K2UA, 6.94M points QSOs	Multi-pliers

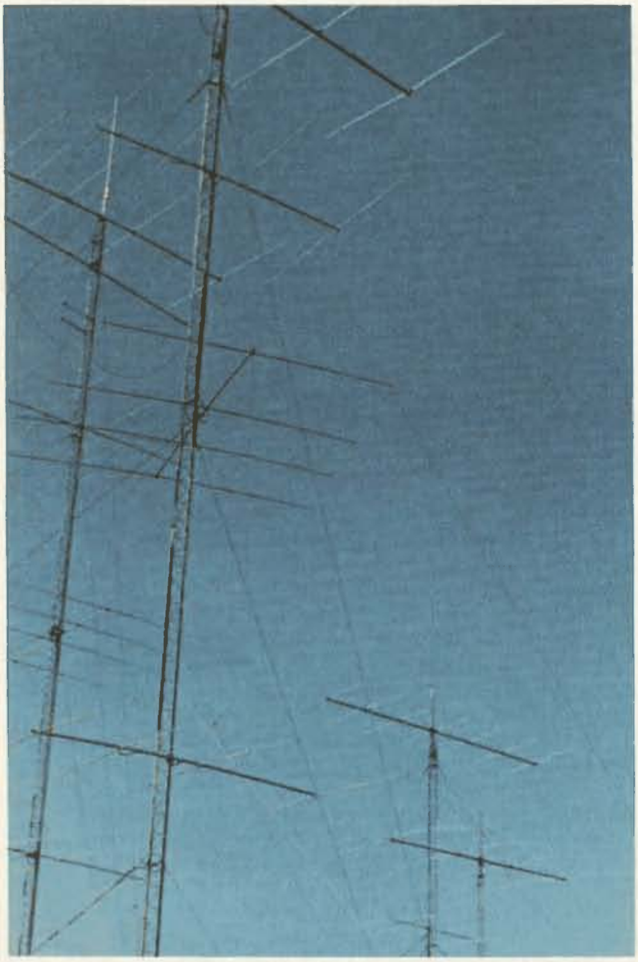
Fig. 1. Some claimed multi/multi raw scores from the 1981 ARRL International DX Contest.

from Friday night right through Saturday night, I develop a massive migraine headache from the tension. I feel the tension and excitement of running six stations, not just one. I never could sit down and actually operate because I'd be worrying about all the problems that might occur in the other operating positions. I just couldn't give my full attention to what I was doing.

73: You do seem to enjoy being the general on the battlefield, don't you?
Gamlin: You know, it's funny you should mention that. Have you noticed the skylights in the ceilings of the operating rooms? My wife saw me looking out of one the other day and told me that I looked like Patton riding in a tank. I had never thought of that before but it came to mind again when I looked out behind the house at the heavy artillery in the backyard, all those towers and antennas. What a trip!

We'll soon find out if we can win with it. I have put together the best facility I could and I've tried to get the best operators available. Now, it's up to them.



Aluminum, copper, and blue sky over K1OX.

73: Do you have trouble finding operators worthy of the station?
Gamlin: Well, I've got to be choosy, and I import ringers when I can. I try to recruit the best operators I know. It takes special kinds of skills to operate different bands, and the ones necessary on 40 or 80 are much different from those needed on 10 or 20, or even 160. Low-band contesting demands lots of endurance. It really can get tedious after a while.

73: So staffing is a problem?
Gamlin: Not really. Lots of guys want to operate from a big multi/multi. It's the highest category and demands a tremendous effort. But, it takes a special kind of operator for each band.

The 10-, 15-, and 20-meter operators have to be able to handle those high morning rates, to be able to pick calls out the first time and ask for a minimum number of repeats to run them as fast as possible. Those early-morning runs to Europe and Asia are wicked.

73: I noticed that you've got a 10-meter operator who speaks Japanese.
Gamlin: Oh, A1 W1FJ. Yes, he was stationed over there at one point. Those JA runs are another thing. You need someone who isn't intimidated by the little S2 mash of Japanese fellows calling, all running 5 and 10 Watts each. It kills you 'cause you're 20 over 9 to them and they are barely creaking through the noise. It takes guys with ears and stamina who can maintain concentration and handle it for hours and hours. Speaking their language doesn't hurt, either.

73: So you are choosy?
Gamlin: Yes. This station is only as good as the operators behind it, and these guys are great.

73: I'm curious, Ted. What are your goals in contesting, both short- and long-term? What do you want from it?
Gamlin: Obviously, I want to win. I think we have all the artillery here: I think we've got some of the best operators around, the facility is convenient, and the inter-station interference is down to nil. I've covered a lot of ground very quickly and now I want to win.

73: Fine, but in terms of competition, are you looking at domestic stations or are you looking internationally?
Gamlin: Internationally is where I enjoy competing but there are some situations, like NP4A who sits just off the coast and racks up some outrageous scores, that are tough to compete against. He's in a different situation than I and, in a way, a different league.

73: And, domestically . . . ?
Gamlin: Domestically, my goal is to beat everyone else in the states. A guy like W2PV has been at it for years. For me to beat him my second time out with this station would be a phenomenal achievement. Whatever happens in this contest, I'm sure it won't be a runaway. If he beats me this time, it's gonna be a squeak-through and he knows it.

At 9:00 pm on Saturday evening, about half-way through the contest, the

running scores are tabulated. Since each operating position at K1OX keeps a constantly-updated multiplier check sheet for its particular band, interim scores are always available. In addition, each operator keeps track of a "need list" for bands other than his own and arranges skeds for the K1OX operation on other bands with as many multiplier stations as possible. An intercom system ties all the operating positions together.

Though Ted's big multi/multi is doing well, it is running slightly behind its chief rival, W2PV. Ted has arranged to exchange scores with W2PV via a two-meter repeater and, as the numbers come in, it becomes obvious that K1OX is not performing up to snuff on 10 and 15 meters. Behind in multipliers (DX countries), K1OX hopes to make up the deficit in Qs (QSOs).

73: Do you normally exchange scores halfway through contests?

Gamlin: No, this is the first time we've been linked by the repeater. It can be very helpful in picking up multipliers, but not enough guys have been using the machine to its full advantage. We should be hearing about more multipliers on it. I'm going to plunk myself on that mother through the last half. I'll tell you that.

73: Would you rather be ahead or behind at this point?

Gamlin: Obviously, I'd rather be ahead. I always want to be ahead. This is only our second time out, though, and while we've got most of the bugs out, it's still a matter of making the operation efficient, flawless. The station which has the most flawless operation, coupled, of course, with the propagation, is going to win.

73: I guess I was thinking in terms of strategy down the stretch. When they might tend to slack off due to fatigue, is it good for your guys to know that W2PV's numbers were a little better than K1OX's so that they will push harder in the last half?

Gamlin: I took great pains to go into each room and show these guys that we are behind, so there is some psychology involved. I hope it will fire them up.

73: Of course, the competition reports the real numbers . . . you don't think he's using some psych of his own do you?

Gamlin: No, no. He's telling it like it is. There's no doubt in my mind.

73: Where is the difference in scores coming from?

Gamlin: 10 and 15 are the biggies. We have had problems with one of the radios on 15 throughout the contest which have hurt us. We would be doing a lot better if it weren't for that.

73: How about strategy, Ted? Do you have a scenario which you are trying to follow during this contest?

Gamlin: A strategy sheet would be important in a single-op or multi/single situation. These operators have got to know when to change bands in order to follow the propagation. In a multi/multi, we are on all bands at all times, so it isn't a matter of puzzling out when to be where. Our key is to monitor the propagation on a given band and get a jump on where to have the antennas pointed to take advantage of shifts.

"In every contest . . . I develop a massive migraine headache. I feel the pressure of operating six stations, not just one."

73: So a multi/multi operation is simpler in terms of strategy than a multi/single or single-operator effort.

Gamlin: Well, in a multi/multi, there is some strategy to consider, but my guys are chosen for their operating strengths on each band.

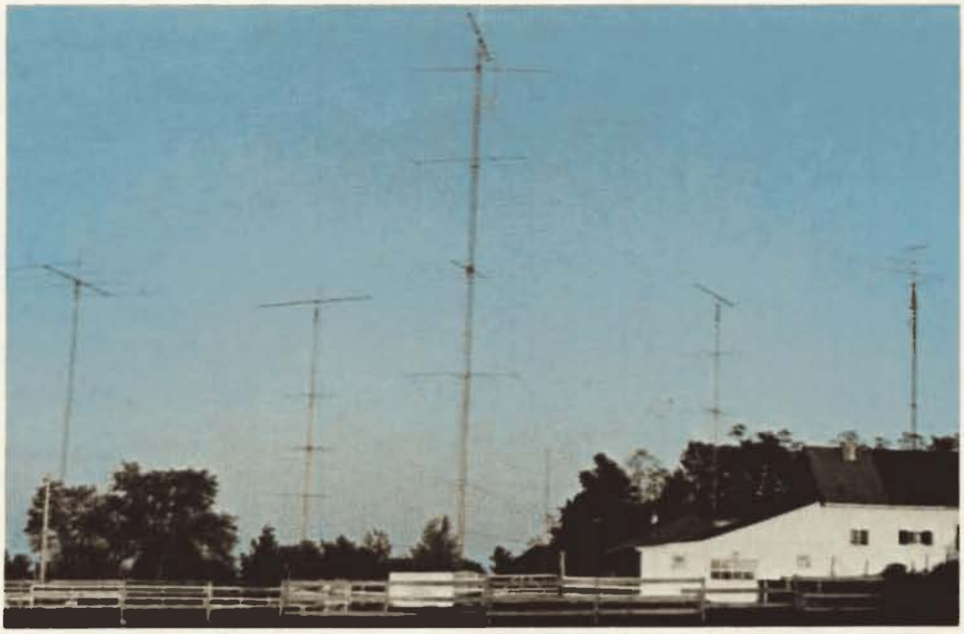
For instance, Jeff Briggs K1ZM, who is on 20 meters, always has won 20 for me in the past. He's just a great 20-meter operator. He's extremely aggressive, one of the most aggressive of the bunch, though I have some close contenders. I've nicknamed him "Animal."

He's great at holding the frequency and driving other stations off it when necessary. He goes 48 hours straight and never seems to get tired. He always amazes me. I don't know how he does it but, I'll tell you one thing, I'm sure glad he's on my team and he better remain on it in the future.

73: About the future—any big plans for K1OX?

Gamlin: As far as antennas, I could go to longer booms, but the severe weather on this hilltop would cause problems and, in the long run, I don't think it would be worth the grief.

Right now, I have no plans. Well, maybe a seventh tower will go up or another 40-meter beam, I'm not sure. I really can't improve much on what I've got. I'm kind of catching my breath financially, too. I'd like to get some carpets on the floor—that kind of



What a multi/multi needs in order to be heard in the world of big-time contesting.

thing. In general, get everything I already have working right. Oh, yes, and finish these blasted intercom signaling units.

73: I get the impression you're going to stay with contesting.

Gamlin: After every contest, I'd say "Never again." But, every year when contest time rolled around, the fever would strike. It's hopeless, I love it.

73: Does you wife have the fever, too?

Gamlin: Would you believe that Janice is working on her Novice ticket? She goes to class two nights a week.

73: Really?

Gamlin: Oh, yeah, I don't think she'll ever be an avid contester, she's much too nice for that. She does get a kick out of it, though. She loves to entertain and to feed everybody. She is a very special lady. Every day I realize how lucky I was to have stumbled upon her.

Ted Gamlin and the K1OX machine did not realize their goal of winning it all the second time out. As the raw scores accumulated on an 80-meter, postmortem contest net (see Fig. 1), it became obvious that K1OX had not been able to regain the half-million point deficit it had amassed early in the contest.

Ted Gamlin was stoic in his appraisal of the outcome. He simply said, "We'll be better prepared next year."■

The Kenwood TS-530S HF Transceiver

—sophisticated performance at a not-so-sophisticated price

Paul Grupp KA1LR
73 Magazine Staff

When Kenwood announced that the TS-520S was about to be discontinued and replaced with a new model, I was somewhat apprehensive. For many of us, the venerable 520 was an old friend, a perfect example of what an economical transceiver should be—short on bells and whistles, but long on dependability and performance. Would the TS-530S be a worthy replacement? I had to find out, and you just might be interested in what I discovered.

Kenwood's TS-530S.

For those who are not compulsive ad watchers, here is a brief description of the basic features of the new 530. As expected, all amateur bands (160-10 meters) are included. The output stages conform to the *de facto* industry standard for transceivers with tube finals—two 6146Bs and a 12BY7 driver. Both analog and digital frequency readout are provided. The digital readout is the traditional Kenwood blue and displays to 100 Hz; the analog dial is accurate to within a couple kHz. Speech processor, VOX, semi-break-in CW, XIT (transmitter incremental tuning), and full metering are all standard. The receiver section boasts a noise blanker with a variable level control, fast or slow agc, an rf gain control and attenuator, i-f shift, RIT, and a 25-kHz crystal calibrator. Not a bad inventory! The manual is typical of those packed with recent Ken-

wood equipment—good operating instructions and enough schematics and block diagrams to get you into trouble. A complete service manual is also available.

Our 530 arrived in perfect working order, which is somewhat unusual for equipment from almost any manufacturer these days. We immediately installed it in the *73* shack alongside its more expensive brother, the TS-830S. The first thing that strikes you about these two rigs is their similarity. They are built on exactly the same chassis and housed in the same cabinet. Even the rear panel holes are punched in the same place, so the 530 has a few empty spaces where the 830 has jacks.

The similarities between the 530 and the 830 are more than skin deep, however. They share identical final sections, power supplies, vfo, digital readout, and rf boards. Almost all accessories are completely interchangeable, making the 530 a logical choice for a backup rig in an 830-equipped station. Moreover, most of these accessories will also mate with the diminutive TS-130S. Such interchangeability throughout their entire line of HF transceivers is a thoughtful step which might cost Kenwood a few sales of accessories to owners of two or more of their rigs. It will pay off because Kenwood will earn the loyalty of customers who don't wish to replace the entire station each time they upgrade to a new transceiver. Another blow against planned obsolescence!

The 530 is not quite a carbon copy of the 830. In the bells-and-whistles department, it has an audio rather than an rf speech processor, and it lacks the transverter jacks, VBT, tone control, notch filter, and digital hold switch of the 830. On the positive side, the 530 allows both CW and SSB filters to be switched in and out at will. Its big brother only accepts one or the other. Performance? Kenwood rates the 530 receiver's i-f rejection and the transmitter's sideband suppression each 10 dB worse than the 830. All other specifications are the same.

How important these differences are depends entirely on individual operating habits and tastes. Some may miss the extra features of the 830 sorely, but others will balk at spending the approximately 125 dollars more that the 830 costs to get them. One thing's for sure—the 530 has a lot more to offer than the 520 did!

On the Air

We could talk about features and performance until I ran out of paper and you ran out of patience, but it would all be meaningless if the radio in question didn't "play." The 530 plays! The 530S held a position of honor (front and center on the operating desk) for its entire stay at the *73 Magazine* ham station. One of the things that makes it so successful is the sensible layout of the front panel. Every control has its own knob—there are no concentric controls to fumble with. If you adjust the carrier control, you don't run the risk of messing up the setting of the mic gain control. Nor will you go through an operating session where the band appears to be dead, only to discover that you inadvertently turned down the rf gain control while adjusting the volume! This clean front panel layout should make the 530 an excellent choice for a contest station. Our test was in the summer activity doldrums, so the only contest we could run it in was the Field Day weekend. The QRM, pressure, and excitement were all there, and it performed admirably.

Receiver audio bears the distinctive Kenwood trademark of wide frequency response with a broad midrange peak for added presence, with or without a good external speaker. Hams with good ears who have done a lot of listening to different transceivers could probably pick out the Kenwood every time in a blindfold comparison test.

I was very pleased at how easy the 530 is to tune up. I generally prefer solid-state finals, but the 530 is so easy to tune that I didn't mind a bit. Complaints? A particularly rabid CW operator (AG9V/1) felt that the 500-Hz filter didn't have enough ultimate rejection. On the other hand, it is well known that he is hopelessly attached to the 250-Hz filter installed in his S-line at home!

Conclusions

What constantly surprised everyone here who used the 530 is how well it fares in comparison to Kenwood's top-dollar flagship, even though they are not necessarily designed to compete. The TS-520S would not compare as favorably, even though a digital-readout-equipped version retailed for quite a bit more than the 530 does! Kenwood has a worthy successor for the venerable TS-520S, a successor that has a lot to offer at a reasonable price. For more information, contact *Trio-Kenwood Communications, Inc., 1111 West Walnut, Compton CA 90220.* ■

Folded Unipole for 160

—Top-banders, take notice! Here's a top-loaded radiator with the government's seal of approval.

The more you consider and study antenna phenomena, the more you become fascinated with the flow of ideas about radiation devices and their possibilities. Here is just one such interesting antenna type along with its development, which occurred step by step using a lot of published antenna information and much on-the-air discussion and revelation.

This is an uncommon but very effective antenna type that could interest most low-frequency hams. Zoning height restrictions are admittedly something else, though this antenna idea works well at even a 35′ height restriction. It works somewhat better at 70′ to 130′—and even to 200′ if you can arrange it. And, conveniently, it fits most real estate situations. So, it isn't necessary to miss out on the fun of 160-meter operation because you don't have room for a full-sized horizontal antenna.

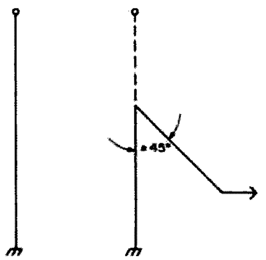

Fig. 1. Basic folded vertical.

Now, short antennas have been proven less efficient than full-size resonant antennas even though the former often provide fair to good communications on occasion. The top-loaded folded unipole (TLU) is a form of shortened antenna that is constructed by folding down the vertical portion to achieve low resonance (because of some height limitation), while increasing resistance and bandwidth and retaining most of the properties and benefits of a high radiator (see Fig. 1).

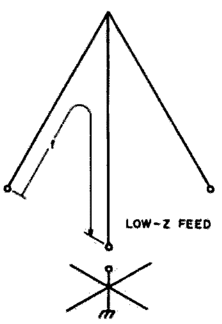

Fig. 2. Series umbrella.

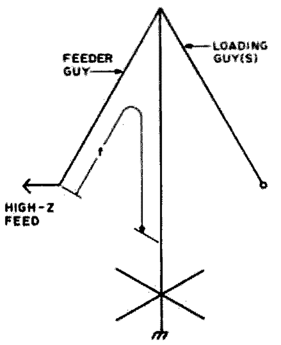

Fig. 3. Grounded umbrella.

Lots of hams have existing towers, poles, trees, or buildings from which to hang this efficient, effective, broadband, and easy-to-use-and-adjust antenna. And, happily, this is a low-cost way of getting up a really good low-band radiator—a real problem for most hams on city-size lots; a 30′ to 50′ TV push-up mast works well in this configuration.

The TLU is just one of many types of vertical antennas. It uses top feed and loading, which gets the antenna current up in the air where it belongs for maximum radiation efficiency. It differs from the series-fed vertical (Fig. 2) that is fed at the bottom, and is coil-loaded at the bottom, center, or top. The TLU is similar to the "umbrella" vertical that is grounded (Fig 3), then fed at the top via the sloping guy wires which come down near to the ground adding length to the system and thus lowering the resonant frequency while simultaneously feeding the antenna. This TLU gives considerably higher impedance to the antenna structure than does the series- or gamma-fed vertical (Fig. 4), a most important consideration. The TLU is a grounded vertical structure (Fig. 5) that is simple, follows the basic engineering principle that simplest is best, and easiest. This antenna is remarkably free of bugs.

This article covers my application of the radiator designed by the U.S. Navy at the Corona, California, antenna range for ship and shore use. Navy Captain Paul Lee (ex-K6TS) describes the principle of the antenna type in his book, *Vertical Antenna Handbook*, pp. 28-31, published by CQ.

It is a very low-angle and broadband vertical. Mine has a 400-kHz bandwidth and I have worked the world with it on 160. It also performs very well on 40 and 80 at a 70′ height. On 160, this vertical (at 70′) tunes with either just a series variable capacitor (when the resonant frequency of the entire structure is 3/8-wave, 160′ to 200′ total) or by adding a coil to ground the feedwire with a ceramic rotary switch, forming an L network. This may be necessary with various antenna heights, volumes, grounding systems, etc., and is required on 40 and 80 to resonate the structure.

The structural basis for this TLU vertical is a grounded metal tower, tree, pole, building, or wood tower of from 30′ to 200′ in height for the 160-meter band, but should be as high as possible to reduce losses and to lower radiated wave angles. We can't always have a tower of optimum height for one reason or another, but a most effective radiator can be achieved with this TLU principle.

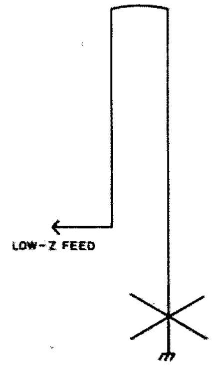

Fig. 4. Gamma feed.

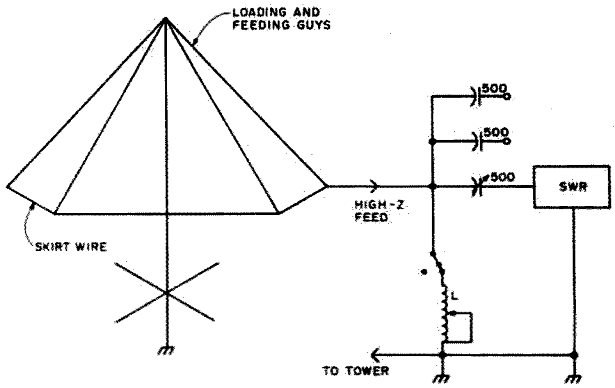

Fig. 5. High-Z umbrella (top-loaded folded unipole, or TLU).

Height, tuning, and loading can vary considerably with a TLU for efficient, effective performance and ease of adjustment. This radiator is simply a big, grounded, closed-loop, similar to any folded antenna, of up to a full wavelength in circumference, much like a grounded quad or triangle. The sloping (and loading) feeder and top guys descend at just under a 45° angle. The sloping line thus becomes part of the radiating portion of the antenna itself, much like the (higher-impedance) "umbrella" vertical that is fed at the bottom (series feed). In both cases, the top guy(s) bonded to the tower top increase the radiator's length and lower the antenna's resonant frequency.

The feedline (and any top-loading guys) descend to guy posts (trees or other guy anchors) at about ten feet above ground. Any guy angle higher than 45° introduces horizontal components into the radiated signal. The higher angle may better suit the purposes of those hams seeking higher-angle coverage for close-in contacts of under about 1000 miles. For serious DX work (low-angle radiation) a less-than-45° angle is a must. Further, the TLU has a considerably higher impedance than the series-fed vertical. Top-loading guys, long used by commercial and military stations, raise the impedance to over 50 Ohms, a highly important and desirable factor. Resonating the antenna of course increases radiation efficiency. Q of the TLU is low—the bandwidth is about 200 kHz with only one feeder-guy. With 4 or 5 such loading guys, bandwidth is near to 400 kHz on 160.

The vertical portion of the antenna (a tower) can be simulated by hanging a grounded wire from any of a variety of structures (trees, buildings, etc.) and the feeder wire brought down at the 45° angle. A tower with beam atop simply becomes a more top-loaded vertical, the beam(s) increasing "top-hat" capacitance loading and further lowering resonant frequency. All this, in combination with some sort of ground system, has proven to be a top performer on all three of the low bands.

Vertical polarization has consistently proved to be optimum over the years under all sorts of propagation conditions on frequencies below about 8 MHz for more than, say, about 3000 miles. Any horizontal antenna on 160 meters would have to be about 130′ up (1/4-wave) for consistent, effective DX work beyond about 3000 miles. This is obviously not an easy height to attain in urban areas, consequently, the desirability and need to go vertically. This TLU is not only a top performer on the lower frequencies but is a very uncomplicated structure.

Inasmuch as the high-current portion of an antenna does most of the radiating, get current up at the vertical's top. In the TLU, the drooping and radiating guys do this current raising well even when the vertical tower is not very high, but, of course, the higher the better (up to 5/8-wave high). A top-loading coil in a coil-loaded vertical is a lossy device and acts like an rf choke, though the coil-loaded and series-fed vertical can be very effective within its narrow bandwidth of 15 to 18 kHz on 160 meters.

It is, of course, a bit of a chore to have to run out in the back yard to adjust the base-matcher in the cold, wind, rain, sleet, snow, and maybe trip over lawn furniture, etc., or fall into the swimming pool in the dark (160 being a nighttime band), not to mention mosquitoes, stray dogs, etc. This, to me, seems to be the hard way to QSY beyond that 15 to 18 kHz and still keep your solid-state finals happy (low swr). Besides, by the time all this has happened, any DX pileup has gotten bigger and deeper. Imagine operating in a contest this way, all over the band—all night.

This TLU is a real convenience and can be adjusted right beside you in the shack. While any artificially loaded antenna is a compromise, this wire-loading using folded-down sloping and radiating guys is a least-lossy compromise. This configuration becomes a sort of multiple-sloper, and acts as a 2-element driven array with maximum radiation (and some gain) along the tower-to-guy axis.

These guys descend to a point about ten feet above ground to where they are secured to guy posts, trees, etc. These guys are bonded to the tower top, and continued down the tower, bonded to the tower every few feet, down to ground level to be bonded into the grounding system—fencing, metal well-casing, etc. Connect these to the shack ground, radials, screen, etc., to complete the circuit and minimize losses which will make the system more broadbanded. These guy wires and/or feeder are tied together at the guy posts' level by a skirt wire which further adds capacity to the structure and feeds directly into a matching network. See Fig. 5.

I feed this antenna not from a gamma match device at the tower top as recommended by the developers, but from the skirt wire as it passes near the shack window about ten feet above ground. It is fed directly using an swr bridge through a series-variable capacitor (about 500 pF)

with three 500-pF fixed capacitors added as required by a ceramic rotary switch.

All this has raised my signal by three S units on local and long DX contacts. The swr bridge is grounded to the station ground system and is connected by heavy cable to the grounded tower, all of which forms that big grounded loop. Spacing of the tuning capacitor plates of the matcher can be of the receiving type for power up to 200 Watts dc input. The higher impedance of the antenna makes it more flexible and easier to adjust.

The grounding system of a vertical radiator performs like the other half of a balanced antenna. As with most vertical radiators, the ground system is indispensable in balancing the system properly, fully grounding the vertical, and increasing conductivity of the soil or ground plane as much as possible to reduce losses

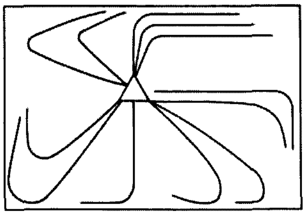

Fig. 6. Radial installation.

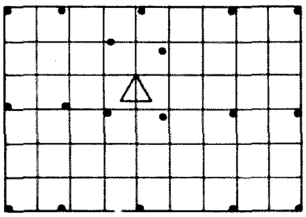

Fig. 7. Ground screen and ground rod installation.

and to bring down the angle of radiation. The grounding system may consist of only one ground rod, particularly in circumstances where there is not access to even a tiny patch of soil ground, but the grounding system should be as extensive as possible.

The first step in establishing a ground system is usually to install one or more ground rods, then add as many quarter-wave radials as possible to the tower, up to about 120. Some antenna experts claim that radials do not have to be any longer than the physical height of the tower, and do not necessarily (and ideally) need to be laid out symmetrically similarly to a fan or uniformly-spoked wheel. Also, that it is better in the case of a less than 1/4-wave vertical to have, say, 20 1/8-wave radials than to have 10 1/4-wave radials.

I am on a city lot, 50′ × 100′, with the tower in the exact center of the lot. I've "copper-plated" the entire lot with 51 82′ radials (0.15λ on 160) spread out as symmetrically as possible and curved around clockwise to fit onto my lot (Fig. 6) Then, covering the entire lot, is a 3′ mesh ground screen laid down over the buried radials—under the house, garden, and unpaved driveway! Oh, what a job! But the results make it all worthwhile to the striving, resourceful, dedicated ham.

The wires become invisible when they sink down in the earth from the original burial depth of 1″ to 2″ to more than 6″ after the first rains of the season. All of this was secured to the ground by 14 ground rods strategically placed (Fig. 7). Four more rods were put down around the tower ten feet from each other and from the tower. Old iron pipe (4′ lengths) will be quite adequate.

To extend this ground plane as much as possible within my circumstances, I even stapled four 135′ radials to the side of my wood-frame house. I put them just a few inches above where the cement foundation joins the wooden house siding, a few inches above ground, and spaced them about 2″ apart. These also could be put up under the house eaves. The idea is to make that ground plane as extensive and dense as possible. All this means longer DX paths and contacts for your signal. The rig will load and perform better, too.

There are those experts who claim that an extensive ground system will add nothing to the receiving capabilities. But it has been my experience that after the ninth radial was put down I suddenly began hearing DX that I had not been able to hear before and that DX which had been regularly heard before became clearer (less "watery"), more distinct, and stronger.

Some have even buried large masses of metal like old car bodies, copper tubs, tubing, pipe, metal mats, fencing, etc., obtained from a junkyard. And, of course, connect to your lawn sprinkler system (and maybe that of an obliging neighbor), metal water pipes, and fences. I have worked hams with radials laid in their swimming pools or put down a well casing who get top results even though the antenna theorists belittle such ground systems.

Try studying your situation at length, be adventuresome and imaginative, and you may well surprise and delight yourself with the results, as many of us old-timers have. So in spite of what the experts say about grounding systems, just get down whatever metal you can. There is a great deal of testimony and evidence about the validity of these grounding ideas. Every little bit of buried metal will pay off.

My "loop" is approximately 3/8λ wave in circumference, tuning fully with only a series capacitor of 1500 pF total. For larger or smaller "loops," an L network may have to be formed by switching in a coil from feeder wire to ground as shown in Fig. 5.

This also will have to be done on 40 and 80 meters to resonate the TLU to those bands. The coil should be tappable, mine is 50 turns of #16, 2″ diameter × 5″ long. Or, try using your commercial tuner of whatever type. I have successfully used pi and parallel networks as well. This will give a 1:1 swr across the entire band. With my feeder plus four top-loading guys and skirt wire, the bandwidth is excellent, as shown in Fig. 8.

I have tried various gamma-feed systems with this TLU with only fair results. The on-the-air reports were materially increased (3 S-units) both locally and on far DX by feeding the skirt wire rather than using a gamma-feed. The bandwidth becomes more than doubled with the same structure, which gives still better overall performance.

Even though an antenna can be properly matched and loaded, that antenna may or may not radiate the rf at desired angles. By folding down and, in a sense, diminishing by about half the vertical structure, this TLU method does not seem to materially degrade low-angle performance of a vertical antenna. Further data

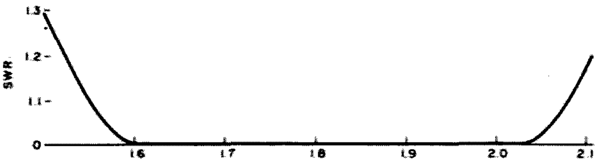

Fig. 8. System bandwidth.

may confirm this.

I keep large maps of the northern hemisphere and of the great circle on the shack wall beside me, and place colored-headed dressmaker's pins on the maps when contacts are made on 160 to record and check performance of my radiated signals. Interestingly, it became very evident that in the directions along the tower-to-radiating guy axes the transmitted signal is maximum, with various diminished reports from between those axes. Consequently, it would no doubt be a more uniform signal pattern if up to 12 nearly equally-spaced top-radiating guys were installed in order to better cover the entire 360°. I have yet to try this.

Utilizing wood towers, poles, buildings, trees, etc. (Fig. 9), from which to hang a TLU, makes for an unobtrusive antenna, especially when a tree is used, which larglv hides a TLU. This antenna also can be hung from a building of suitable height or between buildings if necessary. This TLU has proved over the years by many to be a flexible and most worthwhile antenna, and its only limitations have occurred whenever the band is not open (long skip) to my area.

It is an effective DX-getter when the top band is open. Further, this is not a noisy receiving antenna as are most solely-vertical antenna structures. This is probably because of the 40° slanting guys, which pick up less noise (which generally is vertically polarized, thus readily flooding into a vertical.)

Whatever remnants of noise do get picked up are cut out with audio filters plugged into the output jack of the transceiver. So, I am hardly even aware of QRN. (See my article in *73 Magazine* for February, 1980.) Besides, I like to use this TLU structure for receiving because there is 900′ of wire and metal surface up there in the air which seems to capture more wave-front energy than do the low receiving antennas of several types in use here. QSB does not seem to be as critical, either, as when using those low receiving antennas, perhaps also for the same reason (sloping feeder and guys).

In considering antenna performance in the case of 160 meters, there is the tendency to pass judgment quickly after only a short trial, giving a false or incomplete impression of actual performance potential, particularly under "closed" band conditions, and not being mindful of the variations—highs and lows of propagation conditions. Receiving and radiating phenomena should be observed over a sufficient period—a week or month—to allow for the inevitable change in propagation

At times I have wondered if any of my rf was going anywhere, but because I waited to make structural changes for some reason (weather, no time, or being just lazy), propagation conditions would change, the 160 band would suddenly open, long-skip DX would come roaring in as occasionally happens on 160, and my calls were answered with big signal reports. The antenna would thus be vindicated and saved from unwarranted changes.

So, do yourself a big favor and be slow of antenna judgment on 160, a band of continual amazement, confoundment, and strong personal reactions. And another thing: On 160, those "openings" can be greatly selective, occurring only in some areas of any given state or region. There is also the "pipeline" phenomenon to be considered.

After more than 50 years of ham radio and watching variations of band conditions on 160, it becomes apparent that conditions vary very widely even during a single hour of nighttime consideration. This type of grounded antenna (TLU) has been a fine if not outstanding performer, and is well worth trying.■

The VIZ WD-747 Digital Multimeter

—low cost plus high performance equals success

Although the name VIZ may seem to many readers a rather recent addition to the list of manufacturers of test equipment, it is not. For many years, this company maintained a low profile as a test equipment contractor for RCA. Now on their own, VIZ has announced a complete line of low-cost, technician-oriented test instruments.

The new WD-747 digital multimeter is an example. An innovative feature is the inclusion of a transistor hfe (Beta) tester. The DMM is housed in a rugged, bright orange Cycolac™ case. It is intended for one-hand operation, equipped with a line of squeeze buttons along the side, much like the popular Fluke instruments. The large (half-inch), 3½-digit LCD exhibits outstanding contrast, even in dim light. Settling-down time on all ranges is quite rapid.

The circuit is built around the ubiquitous Intersil ICL7106 chip, and features auto polarity and auto decimal (not autoranging, however). Power is derived from an internal 9-volt battery (supplied) or from an external ac adapter (optional).

Dc current consumption is very low—only 15 mW—and 200 hours of continuous operation may be expected from a conventional zinc-carbon battery. Even longer life should be forthcoming from an alkaline replacement.

Sampling rate under test conditions is 2.5 times per second. If an overload condition appears at the terminals, all digits blank except an initial "1" and the decimal point.

Direct current voltages may be selected from the following ranges: 200 mV, 2 V, 20 V, 200 V, and 1000 V. Accuracy is ±0.8% plus one digit. Full overload protection is present on all ranges, and input resistance is 100 megohms.

Alternating current ranges of 200 V and 1000 V, each with a resolution of 0.1% and accuracy to 1.2% of reading + 10 digits, is claimed (40-500 Hz). Full overload protection is also provided on this scale, and input impedance is 5 megohms.

Five resistance ranges—200, 2k, 20k, 200k, and 2M—feature resolution to 0.05% and accuracy to ±1% of the reading plus 2 digits. Current across the resistive circuit under test is extremely small (a fraction of a milliampere on most ranges), with open-circuit voltage less than one volt (except 2.3 volts on 200-Ohm scale).

Direct current measurements are also divided into five ranges: 200 uA, 2 mA, 20 mA, 200 mA, and 10 A. Resolution is 0.1% and accuracy is ±1.2% of reading plus two digits. The current scale is fuse-protected from accidental voltage applications, and a spare fuse is included.

Either PNP or NPN transistors may be measured for current gain (hfe) static forward current transfer ratio. Direct readout is provided on the digital display.

Three distinct features of the VIZ WD-747 made the greatest impression to this reviewer: the crisp, contrasty LCD display, the rapid settling time on all ranges, and the wide selection of measurement ranges, all neatly grouped and color-coded for rapid, goof-proof selection.

At $89.95 suggested retail, the VIZ WD-747 is a serious contender in the field of low-cost, high-performance test instruments. For more information, contact *VIZ Manufacturing Co., 335 E. Price St., Philadelphia PA 19144*. Reader Service number 486. ■

The Winning

—days in the life of a contester

The contester is one of ham radio's most intriguing characters. For the better part of the year, he mostly lies dormant, occasioning a few club meetings and every once in a long while idly tuning the bands, looking for some hint of lost excitement.

The contest weekend hits. The resultant flurry of activity is of such a contrasting nature to his normal laconic presence that a casual observer would probably write the contester off as some sort of weirdo.

I've been what I thought was a contester for the past two years, only to learn—by way of a meeting with the Potomac Valley Radio Club, almost all the members of which are contest fanatics—that I was a mere piker. Shortly thereafter, my curiosity became aroused and I decided to investigate the experience of dedicated contesting.

"Experience" somehow falls short of expressing what actually happened. When you enter a contest for the purpose of winning, you have to assume a new being. You have to become . . . *The Contester*! Da-dum! The Contester, as such, gets *Psyched Up* for each and every point in each and every contest. Hypnotism is preferable, but a mite expensive. Zen is cheaper, but *very* deep and, as a result, more than a trifle difficult. So, the Contester usually musters the old standbys: power of concentration and physical conditioning.

Taking this in the literal sense, I decided that for the contest I chose, I was going to be Psyched Up *and* In Shape. What followed was a rigorous schedule of fitness-engineering designed to impress Muhammed Ali. For a month prior to the contest, it was up every morning at five, run several miles, eat a big breakfast, work out in the gym, rest, and lunch around noon.

In the afternoon, it was a daily session of meditation, mentally chanting the mantra, WIN . . . WIINN . . . WIIINNN! Later in the day, more working out and speech lessons (for the phone portion). Dinner was followed by CW work optimistically designed to improve my code speed to 40 wpm. By the end of the month I was a physical marvel. Well, almost.

The mental portion of my training, including the meditation, wasn't quite as easy. As I have mentioned, I would engage in my meditative session right after lunch. Aside from an occasional burp, there shouldn't have been much to distract my attention (especially with such an absorbing mantra). But, alas, I was to be foiled (for a while) in terms of one of the most crucial aspects of contesting: power of concentration.

Now, don't get me wrong. Contesters are very dedicated people, but most have one major flaw—they're dreamers. If they aren't dreaming about how nice that plaque would look just above the homebrew 4-1000, then they're dreaming about getting new and better equipment.

These comments are typical of what one might expect to hear at a contest-oriented club meeting: "Get an automatic CW machine, boy. You'll work 'em faster and log 'em easier. And while you're at it, get yourself a new speech processor. Ya need more punch. You'll cause more excitement, get more contacts, and *make more points!*"

Ah, yes, I remember it well. My mind was wandering terribly during those first few meditation sessions. I was constantly dreaming of mortgaging the house so I could get a surplus 350-foot tower topped by 5-element monobanders for 40 through 10 meters (only 4 elements for 75). I also considered coaxing the Contest Advisory Committee to allow for a new operator/station category: single operator, multi-transmitter. Just think! I could have two programmable CW machines going at once, with a tape recorder taking all the calls. On phone, I could run pretaped reports by using cassette recorders remotely controlled and coordinated by computer. Wow! Wow! Woowww!

See what I mean? Finally, through sheer willpower, I began to channel my mind toward constructive thoughts of winning. I was just beginning to get my head straightened out when the big day was upon me.

I spent all of contest eve tuning and retuning my station to a fine pitch. I still have scars on my legs from

shinnying up and down the trees in my yard in a last-ditch attempt to get the swr for my entire antenna farm down to a dB-encouraging 1:1. Now, before the state-of-the-art crowd protests that I was chasing the ghost of an old wives' tale, let me say that, with *this* Contester, old ideas die *very* hard. If nothing else, I was determined.

For a full hour before the contest was to begin, a well-rested, well-fed Contester-to-be sat in a lotus position, chanting and concentrating on making points. Finally, I leaped up, and screaming, *"I'm psyched!"*, ran into the shack. Immediately I began to throw switches with such ferocity that I almost ruined forever the front panels of my precision-tuned Vehicles-to-contest-Victory equipment. Notice the capitalization of the Vs. Man, I was ready!

Since this contest was a one-weekend, one-shot, DX affair, I had to cram hundreds (preferably thousands) of contacts into 48 hours of living. Operation on all HF bands on both CW and phone was allowed. I decided to tear into the CW portion first and was pleased that my code speed was up to par as I racked up contacts left and right.

After a few hours of dah-ditting my way into contest history, I decided to switch to phone and, in my most mellow, pious voice, began calling "CQ Contest."

Twelve hours and a gallon of coffee later, I knew I had to take a break. I could feel the weariness creeping in rapidly and was beginning to have problems with my CW fist. I had planned two two-hour breaks so as to unwind from each fourteen-hour operating period (or spasm, as the case may be). I immediately hit the sack, but due to all the excitement and coffee, was unable to get to sleep. It seemed like two minutes later when the alarm went off and I rolled out knowing I should have had more sleep and less coffee. Of course, it wasn't long before I rationalized that sleeping wasn't important, but points *points*, POINTS were! Back to the coffee urn. The XYL was graciously cooking some wing-dinger meals that could be consumed in 5 minutes or less without indigestion.

As I began my second period of operation, I noticed that the band conditions were kind of flat and, consequently, my QSO rate was pretty slow, at best. Later, as evening brought better propagation and more operation, things began to pick up. But by now I was beginning to feel the effects of my lack of sleep. My QSO rate seemed to be rocketing along at a snail's pace. Time was dragging so badly that I began to wonder if I was in a radio contest or a tractor-pulling event. Ten hours into my second period of operation, my dupe sheets began to send bad vibrations to my brain. With every call I heard I thought to myself, "I *know* I've worked him before. That call sounds so familiar." Then I'd furiously scan the dupe sheet with a disbelieving attitude. If the guy's call wasn't on the sheet, I'd think to myself, "I must've left it off when I worked him before." *POOF!* went my mental state.

At last my second "spasm" was over. Only one more to go. I cursed myself all the way to the bedroom, berating that insane man who not more than a month ago decided that he wanted to be "The Contester." Where was he now?! Why, the little beggar crawled off into a hole somewhere and was sleeping regular hours, eating regular meals, and watching the boob tube! Left in his place was an empty 4-1000A of a man. A glass bottle that you could see clear through. Man, did I need sleep!

Two hours later, I groggily switched off the alarm and, feeling as though I'd managed to collect only one or two or my marbles, flopped out of the sack and into the dining room. The XYL timidly served my meal (was it breakfast or dinner?), not too sure of what my mood would be. I was courteous, but quiet. After eating, it was back to the shack for the last grueling episode in this very strange "experience."

My senses began to function just long enough for me to realize that it was around 8 am, Sunday. Most people on the east coast would be on their way to church, so maybe my competition won't be too bad. Fat chance! I'd forgotten all the other people in this contest were maniacs just like me, and church was out of the question.

My memory of what happened for the next 12-13 hours is very blurry. About the only thing that comes back to me is the feeling that my fist and mouth were molded from solid lead—very hard, very heavy, and quite immovable. Looking back on my logs, what I can read of them, I see that I managed to run a respectable QSO rate, considering my condition. I didn't even work too many people that I'd worked before.

However, my XYL's memory and description of the events during and after the third period of operation were a lot sharper. Apparently, I occasionally stumbled in and out of the shack with glazed eyes, mumbling something she was afraid to listen to. She claims my voice sounded like the buzzsaw at the local lumber yard, and there were times when she would look in and see me sitting at the desk going through the motions of speaking and sending CW at the same time, but actually doing neither. The keyer wasn't in my hand, I wasn't near the mike, and I wasn't saying anything! WOW!

At last the contest was over and, according to her, I got up, turned on my heel with military drill-team precision and proceeded to walk straight into the wall. She then quietly led me down the hall and tucked me into bed. All the while I was quietly saying, "dah-dit-dah-dit dah-dah-dit-dah," over and over again.

I can now say for the first time in my life, that I fully appreciate what it means to "crash." The youth of our nation are to be praised for coining such a descriptive term. I crashed so hard that it took me 18 hours to wake up and another 24 hours of very peaceful surroundings to come fully to grips with myself.

It's been months since the contest and I haven't dreamed of the "single-operator, multi-transmitter" category for a long time. In fact, I haven't really been on the air since the contest. Even so, I've occasionally gone into the recreation room, looked at the weight-lifting equipment that I had worked on so hard, remembered those hours of meditation, and smiled. Then, of course, I would turn and walk away. Until today.

When the mail arrived, the contest results were in the ham magazine that sponsored the event and, what's this? I placed third in my section? I beat out a whole raft of more experienced operators? WOW! If only I hadn't snapped out in the waning hours of the contest! Let's see, if I add another ten-foot section to the tower, how many dB of gain will that yield? When's the next contest? Only six weeks away? Oh man, here we go again! WIN . . . WIINN . . . WIIINNN! ■

The GU-1820 Ac Generator

—100 pounds of portable power from Heath

A major problem in any emergency planning or Field Day preparation always seems to be finding a generator. Most commercially-available gas generators are either too large or too expensive to be practical for most hams to own. Finding a generator to borrow or rent isn't always easy, either. Now Heathkit™ has helped to solve this problem with the introduction of the Heath-Watt portable generator.

The Heath-Watt uses a five-horsepower four-cycle engine to drive a generator capable of providing 2200 Watts of continuous ac power. This is more than ample to power, for example, a complete two-transmitter Field-Day operation if linears aren't used.

The only assembly involves mounting the engine to the main frame and assembling and mounting the generator itself to that frame. When the packages containing the kit arrived at the *73* ham shack, the question arose as to who should put it together. I am fairly handy with a soldering iron, but it is widely known that I am dangerous with a socket wrench in hand. It was therefore decided that I should be the kit builder—the others felt that if I could do it, *anyone* could!

Well, I did it. The total assembly time was about six hours, although that time included several delays for rag chews, refreshments, and snide comments from the more mechanically-adept members of the staff. This was not, however, the most enjoyable time I have had putting a Heathkit together.

I've always had a suspicion that the Heath technical writers are at their best when describing electronic assembly and not so hot on mechanical steps. This kit seems to prove that hunch correct. Don't get me wrong—if you follow the manual, you will end up with a working generator, but I feel the instructions are not as clear and straightforward as I've come to expect from Heath. Part of the problem is that the terminology of generators is not as familiar to most of us as is the language of electronic construction. I found that frequent reference to the pictorials both for parts identification and for an understanding of what each step entailed was necessary.

Construction of the Heath-Watt itself presented few problems. The only real difficulty encountered was in forcing a bearing into the end casing of the generator. Heath provides a wooden dowel to use with a hammer to drive in the bearing, and the instructions note that "it may be necessary to strike the wood bearing driver with considerable force to seat the bearing properly." The instructions are correct on that point. It took such "considerable force" to drive the bearing in that the wood dowel split in half long before it was seated properly.

In fact, we never could get the bearing in flush with the end casing and, as a result, a plastic bracket that mounts over the bearing ended up with a slight bow. This problem caused us some concern, but did not appear to affect the perfor-

Radio Rehab

—how ham radio helps young offenders

Robert Stuart Zamalin WA6VIP
7012 Newlin Avenue
Whittier CA 90602

Can ham radio be used as a means of rehabilitating young offenders? Attorney Steve Stevens KD6BS believes that it can. He belongs to the Volunteers in Parole, a variation of the Big Brother organization, which pairs young parolees from the California Youth Authority and volunteer attorneys. The goal of the VIP is to help parolees to adjust to the outside world and become productive citizens after being released from the custody of the California Youth Authority.

Attorney Steve Stevens KD6BS in his shack.

Steve, who has been involved in radio since 1953, believes that ham radio is an excellent means of diverting the young parolee's interest from criminal activities into something constructive. He believes that the various activities in ham radio can help the parolee to associate with individuals outside his own peer group. Because of the fact that the hobby cuts across income, occupational, and ethnic boundaries, it is an excellent way of mainstreaming the parolee into the world outside a correctional institution.

The Volunteers in Parole grew out of the suggestion of Supreme Court Chief

Justice Warren E. Burger that lawyers get involved in the correctional system and help it become something other than a revolving-door process. The first VIP programs were set up in Los Angeles and Santa Clara in 1972, and since then, San Diego, Sacramento, and San Francisco have started VIP programs.

The parolees are matched up with volunteer attorneys who have the same basic interests in similar hobbies and sports. The attorneys are asked to spend at least five hours per month with their parolees over a period of six months. In reality, they often spend more time than that with their charges, absorbing a lot of the expenses out of their own pockets.

Motivating the parolee is not difficult if you try to set up a positive role model, claims Steve. "If you get a relationship with the kid and if the kid is trying to emulate you, it is not difficult to motivate him. With the right type of relationship, he wants to try what he sees you doing."

Currently, Steve is working with a parolee named Kelvin, helping him to get his Novice license. This is the first parolee he has gotten involved in ham radio. He brings Kelvin to his house so that he can see firsthand what ham radio is all about. Steve is also considering setting up a Novice class at two of the juvenile detention facilities in California's Santa Clara County, locally known as the Boys' Ranch and the Girls' Ranch.

As much as he feels ham radio is good for diverting young people from criminal activity, he has serious reservations about using ham radio in rehabilitating adult offenders. "Most of the adult offenders would probably see it as a way of communicating with each other as to whether or not the cops were coming—or something like that," he cautioned. "I don't want to run that risk."

Elaborating further, he indicated that "statistics show that normally 25 years of age becomes a turning point in life. An individual either gives up a life of crime altogether or he becomes a criminal for the rest of his life. What I am concerned with primarily, therefore, is catching those youngsters before they get to the big time."

Steve is well qualified for this sort of activity. He received his communications training in the Air Force in 1953. He has been teaching a Novice class for the past year, and he runs a 10-10 net. He is very active on two meters. His many pieces of equipment include a KLM Multi-2000 which is his all-mode base station, a Tempo VHF/One Plus which serves as his mobile rig, a Santec handheld that he uses when traveling, and a old Polycom that he uses when monitoring his favorite DX repeater. His interests also branch out to microcomputers, and he plans to purchase one to interface with his gear and so keep home accounts.

It is very important for young people who have been involved in criminal activity, especially those who have served time, to keep busy with constructive activities so they don't have time to revert back to their old behavior patterns and make the "big time." Fortunately, there are people like Steve who care enough to help young parolees coming out of the system and divert them from criminal pursuits to other, more worthwhile, activities like ham radio.■

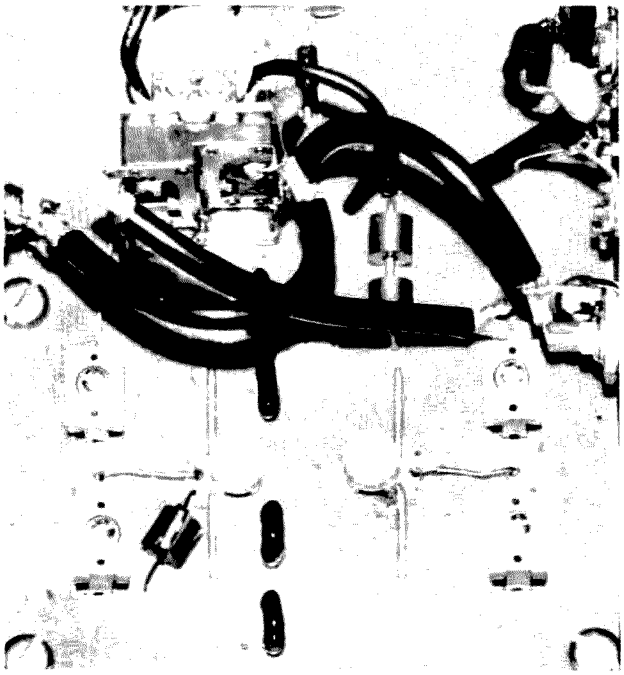
Heath's HA-202 Goes to 220 MHz

—power up with this simple mod

Kent Britain WA5VJB
5809 Stageline
Arlington TX 76017

Do you enjoy 220-MHz operation but find you don't have the power to access those few-and-far-between 220-MHz repeaters? I did, and since I couldn't afford a new amplifier, I decided to experiment.

This is an easy modification to an inexpensive piece of equipment and will give you what you need in those fringe areas. More time will be spent taking off and putting on the case than on the changes themselves!



The completed modifications for 220 MHz.

The HA-202 two-meter amplifier can be turned up at swapfests for about $40. The more recent HA-202A uses a different output circuit and requires a more extensive modification which is not covered by this article. The HA-202 is used because its 2N5591s are usable to 250 MHz.

Before this modification can begin, the PC board must be exposed. To do this, perform the following steps in order!

1) Remove the C-shaped cover.
2) Remove the two nuts securing the power transistors to the heat sink.
3) Remove the six bolts securing the heat sink, sides, and the PC board.

To begin the modification, refer to Fig. 1. Remove L1, C3, C6, and C8 from the input circuit. On the output circuit, remove L9, C11, and C12. Save C12 for later use.

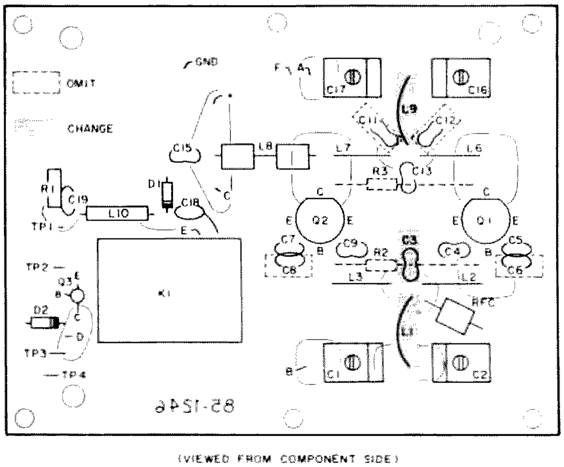


Fig. 1. Component location.

Now replace L1 and L9 with a 3/4" piece of straight wire (similar to L2 and L3). Next, use a 22-pF capacitor you just removed from C11 or C12 to replace C3.

Since the case is already off, now's your chance to install a disaster-preventing reverse-polarity protection diode from B+ to ground just inside the case (see Fig. 2). Just about any silicon diode rated three Amps or larger will work. Be sure that the cathode band is connected to B+.

If you're like me and have just got to get that extra Watt out of an amplifier, then use a 5-to-30-pF ceramic trimmer is place of C3 and C13.

Now reinstall the PC board, but do not replace the C-shaped cover. Tune your HA-202 for maximum output starting with the output section. Typically, the HA-202 produced 40 Watts out with 10 Watts of drive on two meters. On 220 MHz there is a slight reduction in output power, but you can still expect 30+ Watts out.

My thanks to WB5WRR for confirming that this modification is an easy, inexpensive way to generate some power on 220 MHz. Also, my thanks to KA5GWL for knowing how to put words together. ■

The Mirage B1016 Two-Meter Linear Amplifier

—for those times when you have to be heard

When I moved to New Hampshire from the midwest a year ago, the repeaters out here really took me by surprise. The coverage is phenomenal by any standard I am accustomed to, but so are the dead spots when a mountain gets between you and the repeater! Clearly, 10 Watts of power is not enough for reliable communications. The final straw came when I became interested in 2m SSB—I had to have an amplifier, and preferably one that included a receive preamplifier. After pricing the market, I decided that I might as well go for something really "loud," and one of the most powerful amplifiers this side of a homebrew 4CX-250 is the Mirage B1016. For the uninitiated, this particular model is capable of putting out 160 Watts with only 10 Watts drive and is an extremely compact package measuring 12" × 3" × 5.5". It appears to be very conservatively designed and is covered by a five-year warranty on everything but the rf power transistors (which are covered by a one-year warranty).

When the B1016 arrived, I immediately installed it in my car. An amplifier that produces this much power is not to be taken lightly, so I took the precaution of installing a short, heavy run of #10 wire directly to the battery. RG-58/U is not really designed to handle 160 Watts at two meters, so I fitted my Larsen roof-mount antenna with a good grade of RG-8/X. All front-panel switches may be remoted using an optional control box, permitting the amplifier to be installed in an out-of-the-way location, with a remote-control box conveniently at hand.

The Mirage B1016 two-meter linear amplifier.

It should have come as no surprise, but it was nevertheless exciting to discover that 160 Watts allows me to talk through repeaters I couldn't even kerchunk before. I had grown accustomed to losing contact with my favorite repeater along certain stretches of highway—from these same spots I was now into the machine with a reasonable level of quieting! Importantly, the B1016 is fitted with a very good 10-dB gain receive preamplifier. Switching it in kicks up the S-meter several units and quiets the received signal noticeably. The preamplifier does its best work on SSB. It never made a totally indecipherable FM signal readable, but it frequently allowed me to communicate with SSB stations that I couldn't otherwise copy. I have yet to encounter a multi-mode two-meter transceiver that won't benefit from the Mirage preamplifier.

How Do I Key This Thing?

You'll notice from the photograph that there is an FM/SSB switch on the front panel. Since the amplifier is biased for linear operation in both the SSB and FM modes, this has absolutely nothing to do with the linearity of the amplifier. It merely selects no delay rf-sense switching in the FM mode and adds some delay in the SSB mode. Rf switching is convenient but is really an unsatisfactory compromise. If you set the hang time long enough so that the amp doesn't cut in and out between words, it takes an uncomfortably long time to switch to receive after you let up on the PTT. Moreover, the Mirage has separate relays for the preamp and amplifier sections so that everyone has to listen to two relays chattering away. Do yourself a favor and wire up for direct keying when you install the amplifier. In only takes a moment, and think of the fun you'll have scaring your know-it-all friends every

time you operate SSB with the delay switch in the FM position!

The B1016 can draw over 20 Amps of power (it's fused for 35) at 13.6 volts dc, so care should be taken in choosing a power supply. For a VHF contest weekend, I used a hefty Astron RS-35M supply, rated at 20 Amps continuous duty, and it barely got warm. The heat sink on the amplifier itself gets pretty hot after three or four hours of screaming "CQ contest" into the microphone, but at no time did I cause the temperature-sensing protective circuitry to cycle. At 170° F., a thermostat shuts the amplifier off, and doesn't return it to normal operation until the temperature drops to 140° F.

Who Needs 160 Watts?

Even in the flatlands of the midwest, a powerful amplifier is useful for FM operation. It is comforting to know you have an extra margin of power when mobiling at the fringe of a repeater's coverage area, and it's a pleasure to carry on simplex conversations over distances that would normally require a repeater. Nevertheless, two-meter SSB is where the B1016 really shines. You haven't lived until you've worked some two-meter SSB DX, and the B1016 will allow you to do it on a regular basis! For more information, contact *Mirage Communications Equipment, Inc., PO Box 1393, Gilroy CA 95020.* Reader Service number 488.■

GU-1820 *from page 42*

mance of the generator. A suggestion to Heath: Either manufacture the metal parts with slightly greater tolerances or provide the bearing already pressed into place.

After assembly and fueling, the gang stood back and held its collective breath while the starter cord was pulled for the first time. The engine started beautifully, and the light bulb connected to the output lit just as Heath said it would. After letting the engine run long enough to make reasonably sure that the mechanical parts were working correctly, we hooked the output (through a step-down transformer) to an oscilloscope to have a look at the waveform. It definitely wasn't as clean as the mains, but the frequency was very close to 60 Hz and the line voltage was right on the money at 117.

After ensuring that it was safe to connect equipment to the output, we hooked up a transceiver to see how the Heath-Watt would do at providing useful power. It did very well. The TS-530S ran just as it did when connected to New Hampshire Public Service. The nicest news of all was that the receiver suffered no interference at all from the generator—it was just as quiet as when running from the mains.

The generator's first real test came a few weeks later at the *73* gang's Field-Day site, where it was the sole source of power for our class 2A station. The Heath-Watt ran flawlessly for well over 24 hours and, although it was possible to tell by the sound of the engine when a rig was keyed, it handled the load of two transceivers, assorted keyers, lights, and rotors with no trouble whatsoever.

As generators go, the Heath-Watt was rather quiet. We set it up about one hundred feet from the operating tent behind a large boulder and had no noise problems at all. The hundred foot hike through the brush for refueling did make that part of Field Day more exciting than usual. Heath says that the generator's half-gallon gas tank will provide about 1¾ hours of operation at 50% load. That estimate seems conservative, and there were times when it seemed as though the gas would last forever (those were usually the times an operator was waiting anxiously in front of a battery-powered rig to take over when the generator died). It would be nice if a still-larger gas tank were available—a generator should not really have to be fed every couple of hours during an emergency. A tank twice the size would produce half the aggravation.

The Heath-Watt seems to be the ideal answer for an individual or group wanting to have emergency power capability at a reasonable cost. This generator is relatively inexpensive for the amount of power it produces and is small and light enough so that storage and transportation are not a real problem; one man can easily move it if necessary.

For more information, contact *Heath Company, Benton Harbor MI 49022.* Reader Service number 487.■

More Punch for the Hot Water 101

Steve Eigsti K5SE
Menlo Park CA 94025

The Heathkit SB/HW-100 series of transceivers is one of the most popular lines in the ham market. Unfortunately, the SB-100 line has been discontinued, but the HW-101, with the identical circuit minus some bells and whistles, lives on. Having owned an SB-101 for a dozen years, I found that the transmit audio was just barely adequate, and if a mike with low output was used, it was downright weak. External preamps are handy but involve extra batteries or power supplies, and are generally a nuisance.

After examining the SB-101 schematic, I noticed that I had an auxiliary crystal oscillator which I never used. The circuit uses half of V5, a 6EA8. With a few modifications—wiring and not cosmetic—the triode section of the 6EA8 can be used as an audio preamplifier. When I looked at the schematic of an HW-101, I discovered that it did not have the auxiliary crystal circuit. In fact, the triode half of V5B is not even used! It's sitting there waiting for you to add three resistors and capacitors to make it an audio preamp.

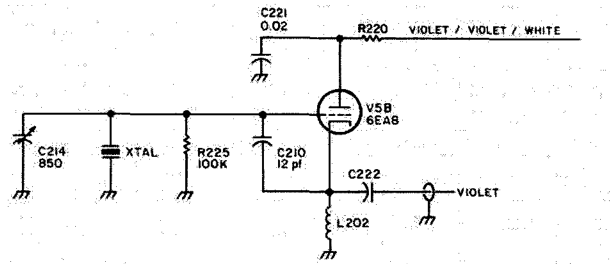

Fig. 1. Original SB-101/102 circuit.

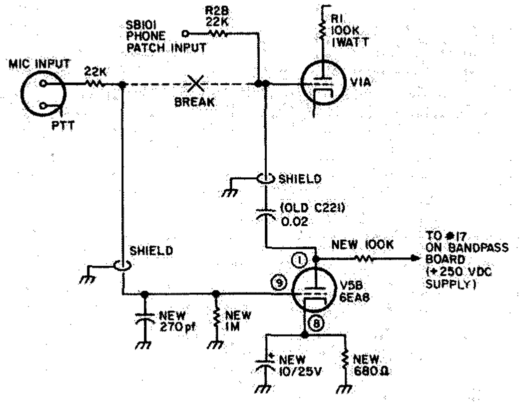

Fig. 2. Preamp circuit for HW/SB-101 using V5B.

Preparing the SB-101

If you have an HW-101, skip this step. If you have an SB-100 series rig, you must first remove the oscillator circuit parts. Carefully unsolder resistors R225 and R220 along with L202 and capacitors C214, C222, and C221. (See Fig. 1.) Save C221 as it will be used for the coupling capacitor in the preamp. The violet cable and violet/violet/white wire should be disconnected and taped carefully out of the way.

Wiring the HW/SB-101

Fig. 2 shows the new circuit. There are three resistors to install and three capacitors (one is C221 from the SB-101). Some of these parts can be installed in the available circuit board holes. The 100k plate resistor is connected to a wire which is soldered to the number 17 hole (+250 V dc) on the bandpass board.

The lead from the mike connector to V1A is broken and routed to the preamp, as per the diagram. Use shielded cable (and I installed a ferrite bead on V5B's grid lead to prevent rf pickup). The SB-101 has a phone-patch input paralleled with the mike input. Break the lead and install the preamp before the phone patch, unless your phone patch has a low-level output.

While you are inside the rig, I recommend changing R1, the plate resistor on V1A, to a 1-Watt resistor. The half-Watt original does not dissipate enough heat and may change value. I found that mine rose to 300k and cut the audio even further.

The modification is simple and can easily be removed if necessary. I have had this circuit in my transceiver (SB-101) for a number of years and get consistently good audio reports. Be careful that you do not overdrive the rig, as there will be substantial gain. I run the mike level at about 9 o'clock, one-fourth of the way up. ■

Gunnplexer Cookbook

Why aren't you operating on 10 GHz? Surely, you have heard of the Gunnplexer, a Microwave Associates' product aimed at making the average ham a master of microwave magic. Despite its availability, reasonable price, and simplicity, the Gunnplexer is about as popular as an AM signal on 20 meters. Now there is new hope for discovering life on 10 gigs. The *Gunnplexer Cookbook* blows the top off the subject, eliminating the problem of finding information and applications.

Authored by Bob Richardson W4UCH, the book goes beyond the whys of Gunn diode theory and delves into the hows of putting this technology to use. The sixteen chapters start with the basics and end with the design and construction of a computer or TV video link. Along the way, you'll learn about range, bandwidth, i-f amplifiers, antennas, and anything else that has to do with the practical aspects of life on 10 GHz.

The joy of W4UCH's book is that you can duplicate the projects. There are detailed plans for building frequency and power meters, power supplies, waterproof enclosures, parabolic reflectors, and temperature controls. These building blocks can be combined into a Level 1 or a Level 2 communications system. The author worked alone, at home, so he was forced to devise inexpensive and readily-available substitutes for exotic microwave gear. The text is supplemented by photos, diagrams, printed circuit layouts, and even information about suppliers.

If you have mastered the easy applications and are ready for experimentation, check out the *Cookbook's* discussion about making the Gunnplexer sing on single sideband. The proposed phase-locked-loop "crystalmatic" scheme has attracted some skeptical comments from other microwave aficionados. But the critics are sorely lacking when it comes to suggesting alternatives. Another one of Richardson's ideas calls for using a conventional AM television to receive FM video signals. Common sense dictates that this cheap and dirty approach won't work, but the proof is in the viewing.

Still not convinced that 10 GHz is the place to be? Then maybe you should dust off that old AM rig. All jokes aside, The *Gunnplexer Cookbook* is the definitive source for information and inspiration for aspiring microwavers. It costs $9.95 and is available from The Ham Radio Publishing Group, Greenville NH 03048. ■

The Green Gallon

—an HW-101 look-alike (except for those four 811As)

This article describes a project which evolved into a 1-kW linear amplifier. The unit has been several months in the making. The effort put forth in building this project is dedicated to the amateur who enjoys the satisfaction of creating, building, and operating his own professional equipment.

The parts and subassemblies required to fabricate the amplifier were obtained from local hamfests or were reluctantly surrendered from junk boxes by fellow amateurs. It is intended that the theme of this article shall emphasize layout rather than circuit design.

The housing of four 811As, with filament, relay, and bias supplies into an HW-101 cabinet was preceded by many hours of planning. The power supply is housed in a separate box and connects to the linear via the control cable.

The Green Gallon linear amplifier is designed to be packaged into a Heathkit® HW-101 cabinet. The new assembly thereby creates a tabletop twin for my HW-101 transceiver.

Prior to building this amplifier, it was necessary to send a shopping list in the form of an order blank to Benton Harbor, Michigan. The Heath Company is very accommodating about selling piece parts. The top and bottom cabinet sections for the HW-101, three large, and two small skirted knobs were major items purchased. Minor items included four rubber feet and two plastic risers; all items added up to a cost of $35.00. Other front-panel parts such as the 1-1/4"-square panel meter, rotary bandswitch, and power on/off switch were purchased at local hamfests.

After surveying the available tubes, the 811A was chosen for this design. The reasons for the selection were twofold: (1) The tubes are relatively inexpensive and readily available, and (2) They can be operated at a relatively low plate voltage of 1500 volts, thereby making the power supply components less expensive. The disadvantage of using the tube is that four are required for full legal input power.

With this major decision out of the way, consideration was given to the tank-circuit components

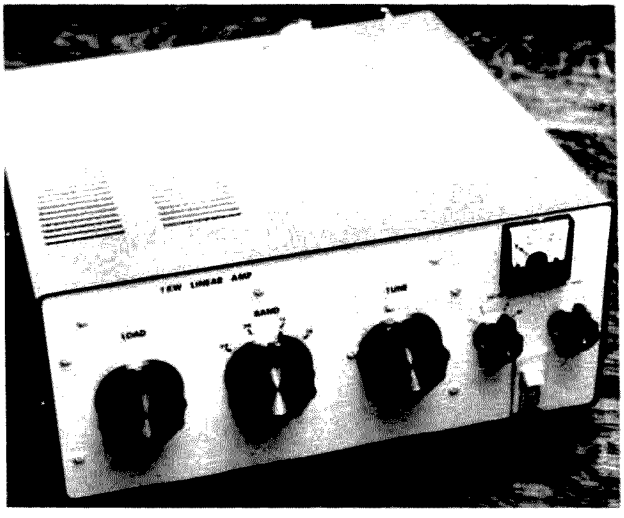

Photo A. Front view of amplifier showing all controls and taped top louvers.

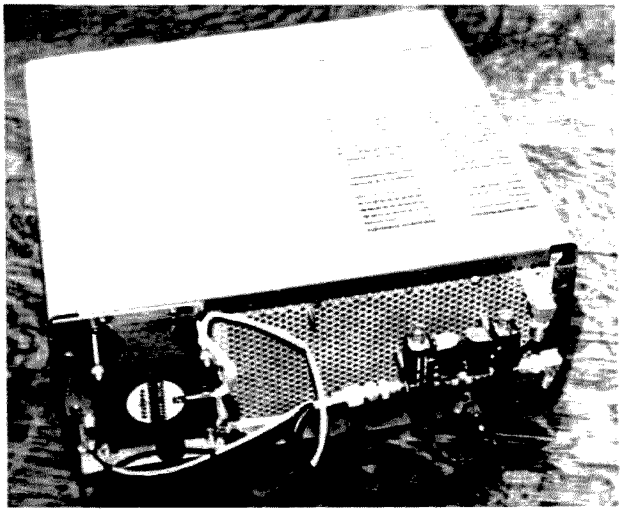

Photo B. Back view of amplifier showing cooling fan and dual coaxial relays.

because their physical size would dictate the entire layout. The tuning capacitor, a Cardwell, was purchased for $8.00, along with the large four-contact bandswitch for $1.00. The capacitor is a large unit with counterbalance weight, rated at 220 pF at 3-kV spacing. The four-position switch was part of a US Navy tuning unit and may be undesirable to some, but it did not cause any great problem in my shack because 40 through 10 are my prime bands of operation. For different bands, the tank could be modified easily to suit the individual's needs. The output loading capacitor is a conventional broadcast type with the three gangs wired in parallel, giving 1500 pF.

I constructed the main chassis using a sheet of 3/32" aluminum mounted on three angled pieces having dimensions of 1" on a side. Considerable thought was given to the layout and shielding of the rf input and output compartments. As shown in the photos, the four tubes were staggered horizontally in order to conserve space.

Orientation of the 811As is very critical due to their internal grid-support structure. The tubes must be placed with the grid-support posts aligned atop each other to prevent grid sagging and possible shorting when the tube is hot. The *ceramic* tube sockets are mounted to a piece of formed sheet aluminum.

The rf input circuit is completely enclosed, using a modified aluminum chassis and perforated aluminum sheet. A 10" × 5" × 3" standard chassis was cut lengthwise to make a 10" × 5" × 1-1/2" open shell. Next, the bottom side was removed so that a U-shaped shell remained which could be pop-riveted using L-brackets to the tube support. Although this may sound complicated, it is hoped that the photos reveal its simplicity.

The rear of the amplifier consists of a modified chassis box used as an rf input compartment, in which the 811A tube sockets were mounted. This chassis is covered with a perforated aluminum shield to complete the input enclosure. Input switching and tuned cathode circuits were eliminated because of space limitations. The decision was made knowing full well the risk of increased intermodulation distortion and high swr between exciter and amplifier. Prior to mounting the rear shield, the two Dow-Key coaxial relays were bolted to it with spacers.

The 6.3-V ac, 20-Ampere filament transformer was mounted toward the rear of the amplifier, providing its large secondary wires a short connection directly to the filament feedthroughs on the inner side of the rf shield. The feedthroughs were constructed using #6 machine screws and nuts, solder lugs, and insulating washers.

The bias and relay power

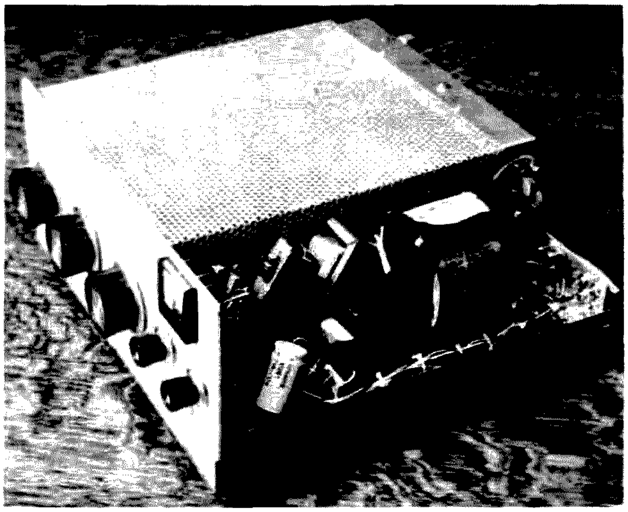

Photo C. Side view with top cover removed showing filament bias, and relay supplies.

transformers with their associated components were mounted directly in front of the filament transformer. The bias-supply uses a 6.3 V ac, 1-Ampere standard filament transformer in a reversed hookup, and feeds a simple half-wave filtered section. Components for the two supplies are mounted to lugged terminal strips. For simplicity, I pop-riveted the strips to the inner final rf cage.

The front panel was made from a piece of 1/8" aluminum obtained through the courtesy of a fellow ham with a free junk box at the local fest. The piece was cut to 14-1/2" × 6-1/4", and its corners were filed round to match the HW-101's front panel. Now, the panel must match the color of the 101, so I searched at the local automobile parts outlet for one of those spray cans of touch-up paint. An acceptable green was found at $1.00 a can (GM part #DS-GM 283). One can will supply several coats with some left over. Before spraying, remove all grease

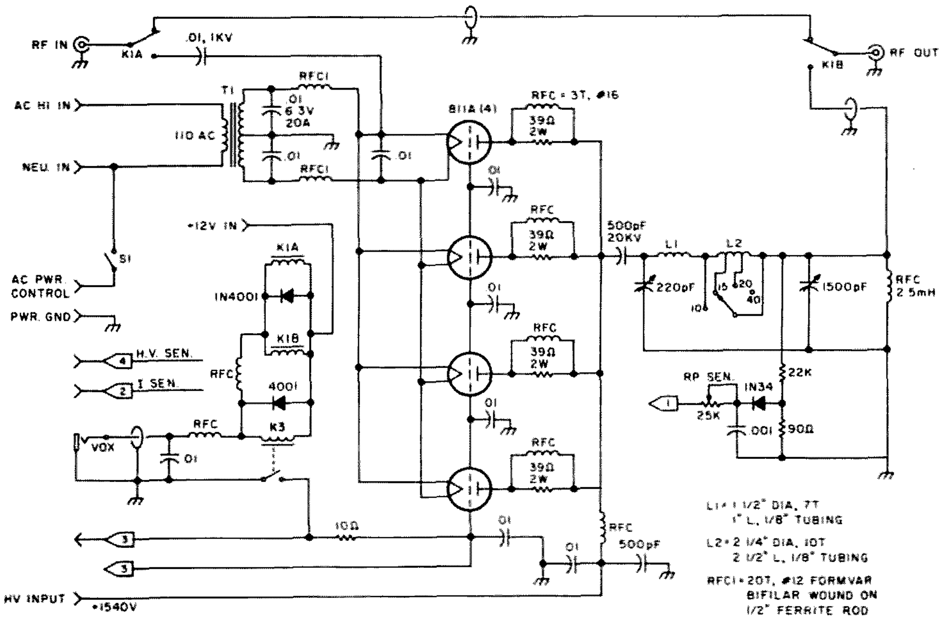

Fig. 1. 1-kW linear amplifier.

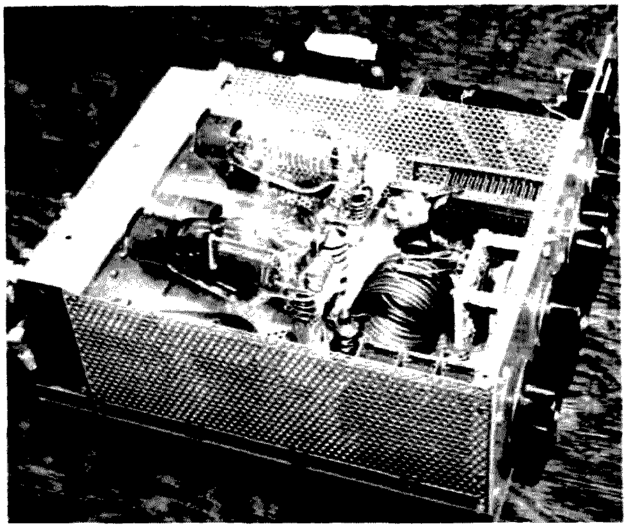

Photo D. Side/top view with top of rf cage removed showing 811As and final tank circuit.

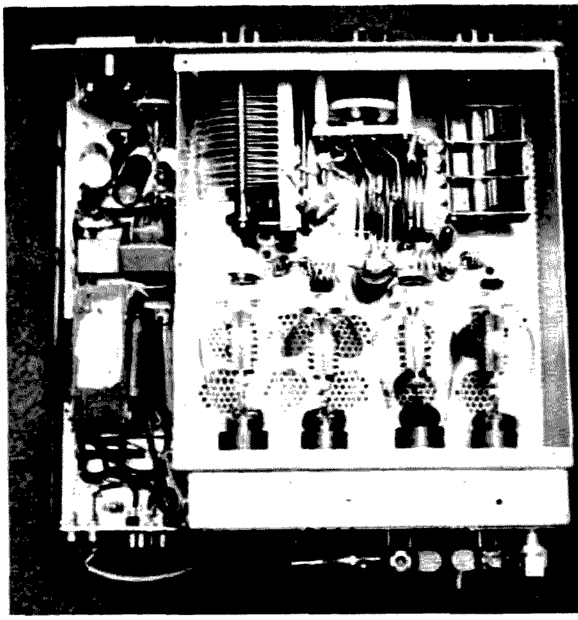

Photo E. Top view with rf cage removed, showing placement of rf tank components plus power supplies.

with a suitable solvent and then apply two coats of a suitable primer.

Like the HW-101 but unlike the SB-220 or SB-200, the power supply is housed in a separate box with a power control cable plus HV cable running between it and the amplifier. The heart of the power supply is the Berkshire 6181 transformer—all 30 lbs of it. This transformer has a dual primary to accommodate 120- or 220-V ac input and a single secondary rated at 1100 V and 550 mA. The unit was purchased directly from the manufacturer at a cost of $58.00 including postage and handling.

The rectification is handled by twelve 3-Ampere, at 1-kV diodes with 1/2-Watt carbon resistors in parallel with spike-preventing capacitors. A series of four capacitors, with bleeder/equalizing resistors, filters and increases the 1100 volts to 1540 volts. This level will drop about 100 volts when the amplifier is pulling its full plate current of 600 mA. Incidentally, I bench-tested the power transformer at 1100 V with a 1-Ampere load with no apparent heating. The power supply is energized via a control relay in the power supply and a power switch located on the amplifier's front panel.

Surge protection for the bridge diodes is assured by relay K2, with its contacts and a series resistor in the transformer's primary circuit. Time delay is about six seconds with 250 Ohms and 110 V ac on the primary. Sense resistors for the plate current and voltage are located in the bleeder-resistor string.

All metering is handled by a 100-uA meter. The meter function switch is a five-position ceramic type with the center position grounded. This gives a convenient meter-disable position between two active positions on each side. If a different meter movement is used, the calibration resistors will have to be altered accordingly. The meter face was re-scaled with 0-2 and 0-1 markings. The grid current and plate voltage use the 0-2 scale which provide 200-mA and 2000-volts full scale readings. The plate current and relative power output use the 0-1 scale, with 1000 mA and 1000 Watts, respectively.

When the power switch is activated, the grid bias supply immediately applies −125 V ac to all grids,

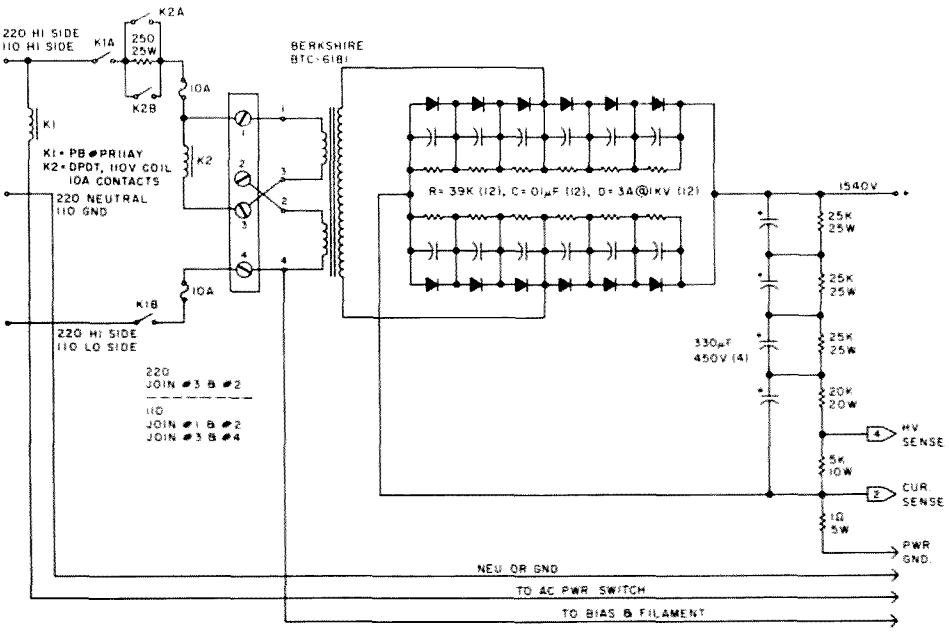

Fig. 2. Power supply.

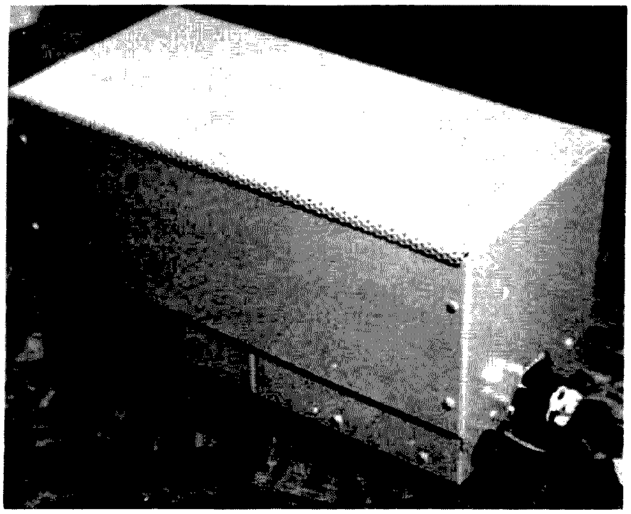

Photo F. High-voltage power supply with cables.

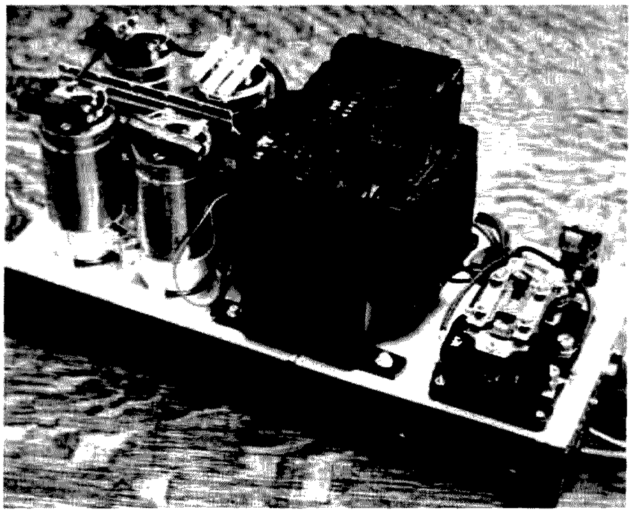

Photo G. Layout of high-voltage power supply. Rectifiers are on PC board mounted between the filter capacitors.

thereby cutting off all plate current flow during tube warm-up. The bias is controlled by a 12-V relay, K3, located in the rf input enclosure. Notice that both sides of the coil have rf chokes and disc capacitors ahead of the side wall feedthroughs. When the transceiver is operated, its auxiliary relay contacts are wired so that a contact closure to ground is generated thereby grounding one side of the bias relay coil and the two coax relays.

Cooling of the amplifier is achieved by using one miniature, high-speed muffin fan. The fan is mounted externally on the rear, fixed to the top cover. Direction of air flow is out of the amplifier, with the input path controlled. To gain maximum benefit from the fan, the louvers were taped closed on the inside of the top cover. Specifically, the right side and top right half were sealed. This action forces most of the input air to be pulled through the left-hand louvers into the rf output cage, picking up heat from the 811As and exiting it through the opposite side of the rf cage. The fan's motor cable was equipped with a male two-prong plug for easy removal. Incidentally, the amplifier can be operated with the top removed (hence no cooling) for short periods of time. With the cover removed, full rf input and output shielding is maintained making very easy the *dummy load* adjustments in the metering; bias, relay circuits, etc.

Tune-up and placing the linear on the air is made quite simple with the aid of the built-in relative-power meter. After allowing a nominal tube warm-up of, say, 15 minutes, key the transceiver with the mike gain at a minimum setting. The meter function switch should be placed in the plate current position. Increase the mike gain until plate current reaches about 200 mA.

Do not keep the transceiver keyed for periods longer than 10 to 20 seconds at a time due to the heat generated by the 811As.

After a brief period, turn the function switch to the relative-power position while alternately adjusting the tank circuit and loading capacitors to peak the relative-power output. Now switch back to plate current and increase this value to about 600 mA, which is about the 860-Watt input level with 1440 volts on the plates. This allows for an additional 100 Watts of driving power, keeping the total dc input power slightly less then 1 kW. A retouch of the tank controls may be required at this time using the relative-power position. Typical CW operation on 20 meters shows a plate current of 600 mA with a grid current of about 40 mA.

The amplifier has been in use for several months on both CW and SSB. Although the rig is mostly used for CW, its linearity is acceptable for SSB operation. As with all grounded-grid linear amplifiers, the loading is a bit critical, but after you get the hang of it, operating becomes a pleasure. ■

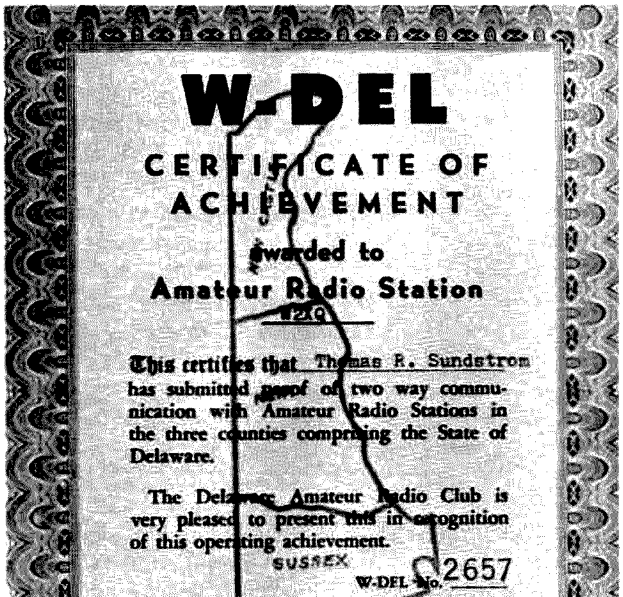
Controlled Chaos

—getting the most out of state QSO parties

How would you like to be a sought-after station on the low bands? How would you handle a pileup when you, a stateside station in W2- or W4-land, call CQ?

Often the situation is reversed. A rare DX station has probably worked thousands of US stations in all 50 states, so why should he work another W2, W4, or W6? But, once or twice a year, it can be your turn to be the hunted and have the choice of all who call you!



W-DEL
CERTIFICATE OF ACHIEVEMENT
awarded to
Amateur Radio Station
W2XQ
This certifies that Thomas R. Sundstrom has submitted proof of two way communication with Amateur Radio Stations in the three counties comprising the State of Delaware.
The Delaware Amateur Radio Club is very pleased to present this in recognition of this operating achievement.
SUSSEX
W-DEL No. 2657
Date 19 June 1978
Certified:
K3JL
President

One of many certificates available for participating in state QSO parties.

A controlled-fun kind of chaos, not quite as intense as the worldwide DX contests, is found in the state QSO parties. You, in the sponsoring state, are the station being sought by others. It's especially fun if you are in the county that has a small radio amateur population.

State QSO parties occupy relatively little spectrum space. Unlike the big DX contests or Field Day where every band disappears under a barrage of CQs, the state QSO parties tend to cluster around preannounced frequencies in the phone and CW subbands. Unlike the big contests, there is plenty of room for those who choose not to contest.

Table 1 lists all 50 states. Only 32 states have separate QSO party contests, but another 16 are represented in regional QSO parties listed in Table 2. The data listed is obviously subject to change (about 6 contests changed weekends this past year); detailed rules are publicized well ahead of time in *73* and most other amateur radio publications.

Weekend Activity

All QSO party contests are conducted on the weekends. The data shows state and regional QSO parties in every month of the year except April. May has six contests, September and March have five, and February has four. State QSO parties will not compete with the major international and national contests such as CQ Worldwide or ARRL Sweepstakes.

The hours of operation are *usually* very convenient for those who have worked parts of Saturday or Sunday. Most contests do not begin until midday Saturday, have a rest period from late Saturday evening to late Sunday morning, and end around dinner time Sunday evening. There are, however, some contests that run the full 48 hours and some others that do not have the Saturday night-Sunday morning rest period, so be sure to check.

The Exchange

The contest exchange

varies from contest to contest. Tables 1 and 2 summarize the exchanges.

Elements include a signal report, a serial number, county, state or ARRL section (see page 8 of any *QST*), or country.

An amateur in a sponsoring state would send a signal report and county, plus a serial number if required. On CW, for example, in the New Jersey QSO party, I would send:

CQ NJ CQ NJ DE W2XQ K
W2XQ DE W2NSD/1 K
W2NSD/1 DE W2XQ
599010 BURLINGTON BK
W2XQ DE W2NSD/1
599001 NH BK
QSL QRZ DE W2XQ K

In this example, 10 is my QSO number; for W2NSD/1, it's number 1. Regardless of band changes, QSO serial numbers continue consecutively and increment by one of each QSO.

Object of the Contest

The object is for in-state amateurs to contact as many other stations as possible, with an emphasis on out-of-state and DX stations. Not all contests permit in-state-to-in-state QSOs. Out-of-state amaeurs look only for amaeurs in the sponsoring tate.

Due to the relatively low umber of stations particiating (100 or more is a lot), good deal of comradeship evelops. For example, in he 1980 New York QSO arty, six New York stations n six different counties ran roundtable first on 75 meers and then on 40 meters ver several hours. Anyone who wandered into the QSO could work W2TU, WB2SJG, WB2KEX, KB2DE, WB2IVX, and WB2IPX within two minutes flat! During slow periods, stations tend to cluster onto a few freuencies and call CQ in turn; as a newcomer answers, all those on the freuency can take turns in working the newcomer.

Contest Scoring

Most QSO party contests are scored by multiplying the number of QSOs times the number of multipliers. For an in-state contester, a multiplier is each different state, or ARRL section, and DX country. If in-state-to-in-state QSOs are permitted, then each county is also a multiplier. For out-of-state contesters, each county worked is a multiplier.

Most contests count multipliers once regardless of the number of bands they are worked on.

For those intending to submit a contest entry to the sponsoring organization, you can see why a rare county is very popular, especially if that station comes on the air in the later hours of the contest and the county has not been previously heard from. The out-of-state stations create one pileup and, if in-state QSOs are allowed, the stack of calling stations grows even larger. That could be you in that rare county picking through the pileup. It's a fun experience.

Other Rules

Most contests permit one station to contact another station once per band per mode. Continuing with the example above, W2NSD/1 and I could work each other on phone and CW on each band from 160 to 10 meters for a total of 12 QSOs. For multipliers, however, I can count New Hampshire only once; W2NSD/1 could count Burlington county only once.

Florida's QSO party is one notable exception to this. The phone and CW entries are compiled separately; the scores are not added together if one station submits two logs.

Another standard rule is that the same in-state station may be worked more than once per band per mode if the in-state station changes counties. For example, in the 1979 New Jersey QSO party, K2NJ/mobile operated on 40 CW from all 21 counties in the course of the weekend; an out-of-state station could have worked K2NJ 21 times. In the 1980 Florida QSO party, I managed to work WD4INQ/mobile on 20 CW in six of the more-than-20 counties he ran through.

*Table 1. State QSO parties. All amateurs send a signal report and amateurs in the sponsoring state send the county. *Some states have both individual and regional or district QSO party contests—see Table 2.*

Operating Strategies

For those wishing to submit contest entries, a high QSOs-per-hour rate is desirable, without forgetting about multipliers. Some contests also award 2 or 3 points per CW QSO, but only 1 point for phone; others award 2 or 3 points per DX QSO. Given those factors, time is probably most effectively spent on 20, 40, or

80/75 meters. With a decline in the MUF, 10 and 15 probably won't be as profitable in the QSO rate.

The frequencies used in the QSO parties generally are in the sections of the bands where General class licensees are permitted. Some of the larger contests also specify frequencies in the Novice bands for Novice/Technician participants and allow 5 points per QSO to encourage participation.

Obviously, the choice of bands will depend upon the distance between the sponsoring state(s) and the out-of-state participant and the time of day. The season also will have some bearing on the choice. For example, the 1980 Florida QSO party was held in May, and that weekend had very high static levels, rendering 40 and 80/75 meters useless for me in New Jersey; most of my operating time was spent on 20 CW. In the 1979 New Jersey QSO party, 40 meters gave me the highest QSOs-per-hour rate, but 20 meters gave me the most multipliers in other states and countries.

Many more stations seem to be around at the beginning of a contest than at the end. As a strategy, I suggest picking a band and mode to work on multipliers and pick up the distant states early in the contest, then pick up the nearby stations on the lower bands later.

It should be emphasized that power amplifiers and large antennas are not always necessary to "play the game." Properly constructed wire antennas or verticals and a barefoot transceiver can be competitive. Don't forget that most stations only have wire antennas on 40 and 80/75 meters, and compared to 20 are great equalizers. The large antennas and amplifiers probably help in marginal conditions, but then you are probably better off on a lower band with a higher QSO rate anyway.

In Closing

Some of the contest sponsors have a number of good ideas I'd like to see others adopt. More contests should encourage participation by Novices and Technicians. Most sponsors award certificates to first-place finishers in each county and state, section or country, but some combine multi-operator entries with single-operator entries. That's not really fair to the single operators, and separate awards should be given.

Another "nice" idea used by the Tennessee QSO party sponsors is sending a reminder message about the upcoming QSO party to each participant of the previous year's contest. A book of messages is put into the ARRL National Traffic System timed to be delivered about a month before the upcoming contest. The Florida sponsors also use the ARRL NTS to send the book of messages acknowledging receipt of contest entries.

In most cases, an entry consists of nothing more than sending a photocopy of your logbook, as long as all the required data is recorded. Attach a summary sheet showing the calculation of the score, your name, call, and address. Most sponsors also require a checksheet if more than 100 QSOs are made, to ensure that duplicate QSOs have been eliminated from the score calculation.

As a general rule, it also is suggested that you send along a No. 10 business-size SASE for contest results and your certificate, if you qualify.

If you don't feel like submitting an entry, that's OK, too. Just come in for the fun of it. If you are in the sponsoring state, your participation—even if for 10 or 15 minutes—will be appreciated. Figure out what the contest exchange is and jump in for a few minutes whenever you have the time at the beginning, middle, or end of the QSO party. QSO party contesters and county hunters will appreciate it.

See you in the New Jersey QSO party! ■

The General Electric Programmable Clock Radio

—sweet dreams for the broadcast DXer

What, you say, a mere clock radio reviewed in the pages of one of America's foremost communications magazines? Yes, since GE's intriguing, frequency-synthesized Model 7-4885, creatively dubbed the "Great Awakening" by the manufacturer, represents a very positive step in filling a need: that of a *bedside* communications receiver with a built-in clock function. As an avid hobbyist who's a "softie" for *anything* programmable and digital, I knew I had to have one of these gems when the ads first appeared.

A few communications-quality receivers boast clock features. For example, a number of the fine 1950s and 1960s-vintage Hammarlund receivers had built-in clocks, and recent offerings such as the Yaesu FRG-7000, FRG-7700, and Kenwood R-1000 all contain digital clocks which provide some degree of receiver and accessory control, such as turning on the receiver, and an external tape recorder for unattended, late-night DX recording.

To date, however, the author isn't aware of any communications receiver that's also a true clock radio suitable for bedroom use. But the GE offering comes very, very close, and should be of definite interest to the sophisticated AM broadcast band (BCB) DXer and FM-skip listener, as well as to the ham who would like to own a clock radio that's got practically every imaginable feature.

The Model 7-4885 replaces an earlier, but littl known GE programmabl unit that has been aroun since about 1977, the model 7-4880. The earlier se was similar, but was channelized to accommodat only the present 10-kHz A BCB channel splits. The newer version, in addition to incorporating more complex microprocessor-control circuitry, allows th user to instantly adapt the set for the possible adoption of 9-kHz channel spacings by the FCC in the not-too-distant future (more on this later). In a nutshell, th new GE radio is a dream t program and operate, and it especially appeals to individuals such as myself who are fascinated by microprocessor-controlled radio equipment.

The most prominent feature of the GE radio is a easy-to-use calculator-typ

General Electric programmable clock radio features precision and convenience not usually found in consumer-electronics products. Microprocessor-based circuitry affords direct keyboard entry of time and radio frequency, memory for six radio stations, multiple sleep/wake-up settability, and fluorescent digital display of AM/FM frequency and time. (Photo courtesy General Electric Company)

touch keyboard used to program the digital timekeeping functions and frequency readouts for AM and FM tuning; there is no tuning knob to be found. Other features include direct digital readout of AM and FM frequencies, updown scanning (search) of both AM and FM bands, direct keyboard entry of exact time and PLL-controlled radio station frequency, six programmable channel memories, two separately programmable memory "wake-up" circuits, automatic panel brightness control, and dual audible and visible power failure indications.

Essentially, the GE set does everything a conventional clock radio does, plus a lot more. It boasts some unusually sophisticated "fun" features including provisions for going to sleep listening to one radio station and waking up to another, having "his" wakeup alarm set to a certain time and station and "hers" to another time and station, punching-in your own desired interval between the wake-up start of music and the time the alarm jolts you to consciousness, and the ability to program the "snooze interval."

An even more important feature is that once set, all these complicated functions are retained, even through a power failure. Two user-supplied, standard 9-volt transistor-radio-type alkaline batteries provide power for the memory-holding system. This allows the radio to be unplugged and moved around yet keep track of time and maintain programmed radio stations and alarm times. Hold time is good for up to 8 hours using fresh batteries, according to the manufacturer. Should the batteries fail, the automatic power failure indicators will come online when power is restored, helping to prevent a late wakeup.

Although this is a sophisticated consumer-oriented radio rather than a true communications receiver, there obviously was some thought given in the design to more than casual use. For example, there is provision for an outside FM antenna for reception in fringe areas, as well as a ground connection. However, there is no provision for connecting an outside AM antenna, though this probably could be done by inductive coupling to the set's internal antenna. A rear-apron headphone jack is provided, a real convenience for late-night DXing. Selectivity, especially on the AM band, is particularly good, with stations standing out with little or no apparent crosstalk when the radio is scanned (stepped) through the band in the preprogrammed 10-kHz intervals. Selectivity is better than is presently required since the radio is designed to accommodate the narrower 9-kHz spacing mentioned earlier, which would place an added demand on good channel separation and "9-kHz whistle" suppression. A slight bit of RFI from the microcomputer circuit was noticeable, especially when scanning through quiet channels, though it was not objectionable.

Perhaps the most forward-looking feature is the user-selectable 9/10-kHz channelization. By sliding a small, screwdriver-accessible switch on the cabinet bottom, the user can adapt the radio to the possible new standard broadcast format. Doing so will alter the spacing increment as the radio is electronically scanned or frequencies programmed in, from the usual run of frequencies from 530 to 1610 kHz, to 531 to 1611 kHz. Under the existing allocations, all AM stations in the US (and most of North and South America, but not the rest of the world) currently broadcast on frequencies with 10-kHz spacing, such as 540, 550, 560, 570, and 580 kHz, and so on. Under the proposed new arrangement using 9-kHz spacing, stations would operate on frequencies such as 540, 549, 558, 567, and 576 kHz, etc.

The compressed channelization scheme could allow as many as 1400 new stations to operate on the standard broadcast band, in addition to the 4000-odd now operating. However, many of the 450 million radios now in homes across the country would be rendered at least partially obsolete since their selectivity would be inadequate to handle the narrowed spacing. Many station owners claim that they would have to spend huge sums to retool their equipment for the new standards. Interestingly, the proposed change by the US may be welcomed by many foreign governments, particularly if other nations in the hemisphere go along, since we are now "at odds" with the 9-kHz spacing used in most other areas of the world. This disparity results in annoying inter-station heterodyning and beating, being most noticeable in coastal areas where transoceanic medium wave (MW) signals are most frequently received.

Living some distance from both the east and west coasts, I didn't try this, but the intrepid MW listener might want to experiment using the radio in the 9-kHz mode to try to snag overseas stations operating on what are presently odd-split channels to us in the US. For example, the radio would be a natural to attempt to receive such DX catches as the 1.5 megawatt, 657-kHz station at Kangnam, North Korea, the 135-kW, 666-kHz outlet in Lisbon, Portugal, Japan's 500-kW powerhouses on 747 and 774 kHz, Istanbul's 1.2 megawatt station on 1017 kHz; or the West German 800-kW outlet on 1593 kHz. The set's stability and sensitivity (although not measured by the author) were found to be quite acceptable and thus suitable for this kind of uncommon bedside DXing. No spurious signals could be detected on either the AM or FM bands. Apparently, GE's engineers thought the set might see double-duty as a DXer's bedside machine, since the radio's instructions even recommend that the user refer to *White's Radio Log*, a periodically-updated listing of all Canadian and US stations referenced by location, frequency, and call letters. The log is published as a part of *Communications World* magazine, a Davis annual.

The next and perhaps inevitable step is for GE or another enterprising manufacturer to crossbreed the programmable clock radio with a scanning programmable portable of the Sony ICF-2001 class for digital bedside shortwave and ham-band listening and wake-up. That step surely isn't far away. In the meantime, one can have a great deal of pleasure playing with GE's flexible and functional programmable, available at discount-stores for under $90. The radio will also make an excellent gift for the inveterate gadgeteer or BCB DXer, since the radio lets him both start and end his day with his favorite hobby.

Only one problem remains: How do I convince my wife to study the not-too-complex instruction manual and remove her wind-up alarm clock from atop the radio? After all, I've offered her the use of the Number 2 "hers" alarm. ■

Propagation Prophecy

—you, too, can calculate the MUF

Keith Greiner AKØQ
421 N. Pleasant Hill Blvd.
Des Moines IA 50317

One of the most fascinating attractions of HF communication is the idea that a movement of miniature electrons which we never see produces an invisible signal which travels up into the sky, bounces off some atoms at a height most of us could never hope to reach in an airplane, and then returns to a friendly ear in a distant land. Our voices, our messages, can arrive almost instantaneously, at almost any place in this giant world. Indeed, if conditions are right, it is possible that they could make their way to many distant and exotic lands at the same instant. Then, the real fascination comes when we receive a return message.

Recommended Amateur Band	Calculated MUF in MHz	Signal Destination
40	10	New Orleans
20	17	Merida, Mexico, Guatemala, or British Honduras
15	25	Panama
15	25	Maranon River, northern Peru
10	32	Lima, Peru
10	30	Caldera, Chile
10	33	Buenos Aires, Argentina
10	29	Straits of Magellan
15	22	Antarctica
15	21	Antarctica (a little deeper into the continent)

Table 1. MUFs for a southern path from Des Moines IA, September, 0000 UTC, solar flux 154.6.

This radio skip is a natural and yet unseen wonder of our world which has been the backbone of our worldwide communications. Without it, all frequencies would act much like VHF. The long-distance communications which have saved millions of lives in various world catastrophies never would have been possible. Who knows, satellites might have been invented sooner, and maybe even eleven meters might be a little more subdued.

But try to predict where your signal is going to land, and what shape it's going to be in when it gets there, and you have a fascinating problem.

When I first became interested in this propagation of our radio waves, I sought some practical knowledge I could use to make a reasonable prediction, based on all the information available on a given day. That was about 15 years ago. Then, as now, the major source of information, *The Radio Amateur's Handbook*, advised you to listen to the ARRL's predictions and explained that the topic is so complex that it cannot be covered in just a few pages. I found out that that just isn't so and will show you what I discovered in the next few pages.

One of the major pieces of advice one gets from reading the *Handbook* is that propagation is dependent on the daily solar flux indexes broadcast by WWV. Unfortunately, after they tell you that you should watch the flux, they

don't tell you how you can use that value to substantially improve the monthly predictions published in *QST* and other magazines.

Perhaps you have wondered, as I have, just what it means when the WWV announcers say that today's solar flux is 210, and yesterday they said it was an even 200. Can I use this figure to improve my estimate of the day and hour 10 meters will become useless? Can I use this to help aim my beam in the right direction to add excitement to an evening at the dial? Can I use it to help me find the best circuit to talk to that YL in Moscow, Idaho?

As you've probably guessed by now, I intend to show that predictions of communications circuits to almost any place in the world, short distance or long distance, are about as complex as getting a solid contact with the ham down the street when you both are using a kilowatt. Frankly, if you can tune your transceiver, you can predict a communications circuit MUF (maximum usable frequency) from your shack to any place in the world, for any day and any hour of any month of any year.

The first step you'll want to take, besides reading this article, will be to go back to the *Handbook* to review some of the basic terminology. You'll want to know that the D layer of the ionosphere is the primary absorber of energy, while the E and F layers provide the skip. The E layer, which is the lower of the two "skippers," provides communication links over short hops, while the higher F layer provides the major long-distance skip opportunities.

During the day, the F layer splits into the F_1 and F_2 layers, and the F_2 layer becomes the primary provider of long-distance com-

Table 2. Comparison of actual vs. predicted solar flux. Predictions are from the Institute for Telecommunication Sciences, as quoted in QST. *Actual data are for 2,800 MHz solar flux reported by the* Solar Geophysical Data Bulletin, *National Oceanic and Atmospheric Administration, Environmental Research Laboratories. Monthly data are from the 15th of the month shown to the 14th of the following month.*

munication. There are two excellent references on the subject. First, there is the National Bureau of Standards' Monograph 80 on *Ionospheric Propagation*. Unfortunately, it is no longer available through the US Government Printing Office. I discovered my copy buried among some old technical books I bought in 1965. You may be able to obtain a copy at your local library through the interlibrary loan program.

A second reference is the four-volume set called *Telecommunications Research and Engineering Report 13, Ionospheric Predictions*. Sadly, this set is also no longer available through the US Government Print-

ing Office. However, there is hope. You can buy a copy of all 1,330 pages for just $12 from the Solar Terrestrial Data Center A in Boulder, Colorado. Unfortunately, the copy is on microfiche, and you'll need to find a microfiche reader at your library or at a friend's business, or perhaps you'll want to purchase your own reader for about $150.

Don't let all those dollars worry you, because included with this article are most of the materials you'll need to get started. In fact, of those 1,330 pages, I found that the whole subject is so simple that everything is explained in the first 18 pages. The other 1,312 pages are simply maps like the ones in Figs. 5 through 7 and 10 through 12. That's 18 pages of material I'll reduce to just a few pages here.

Most discussions of propagation predictions center on predictions of MUF because that is the frequency at which your signal bounces off the highest possible portion of the ionosphere and, therefore, gets you the longest distance with the fewest number of hops. But since amateur frequencies very rarely fall on the MUF, what value is there in knowing the MUF?

The reason for our interest is that the MUF for any given circuit may change as much as 14 to 15 MHz in a very short time. Also, since most of us have only a limited amount of time to spend on the air, the primary question can be that of what stations can I expect tonight if I point the antenna south rather than what time do I need to be on the air to make it to Panama? Table 1 shows an example of this: A midwestern station in the US points his antenna south at 0000 UTC on a September evening.

The table shows ten steps of approximately equal distance between here and Antarctica. Step 1 shows that if I tune up the rig on any frequency less than 10 MHz, I should be able to make a contact in Louisana. Better try 40 meters for that one. The closest available frequency to the MUF of 17 MHz should allow an opening into Guatemala, or the

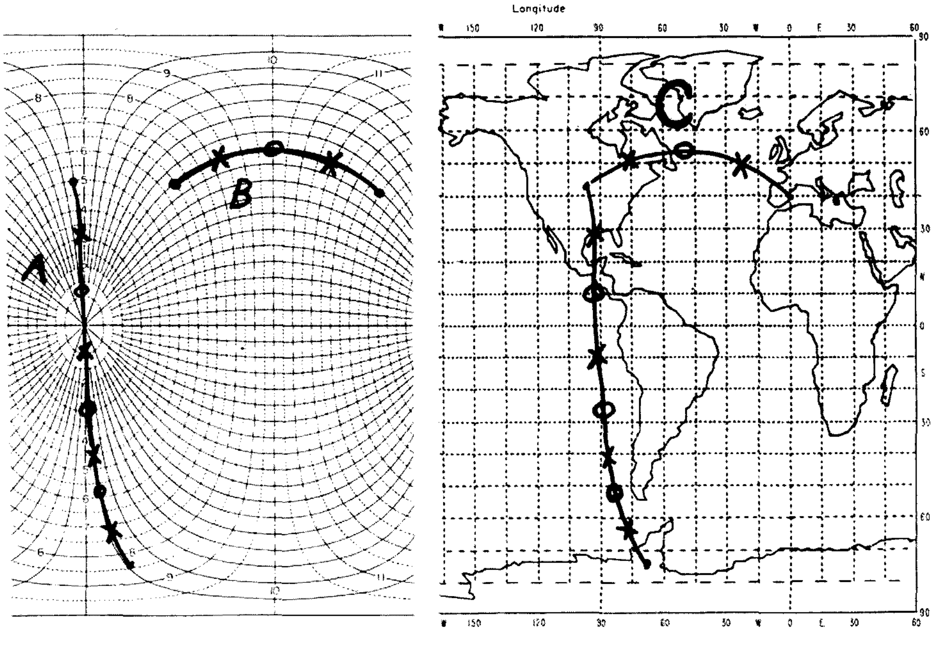

Fig. 4. Lines A and B show the great-circle projections of two paths from Des Moines, Iowa. A is a four-hop path to Antarctica, while B is a two-hop path to eastern Spain. C shows how the paths in A and B appear on a cylindrical-projection map. Source: OT/TRER 13.

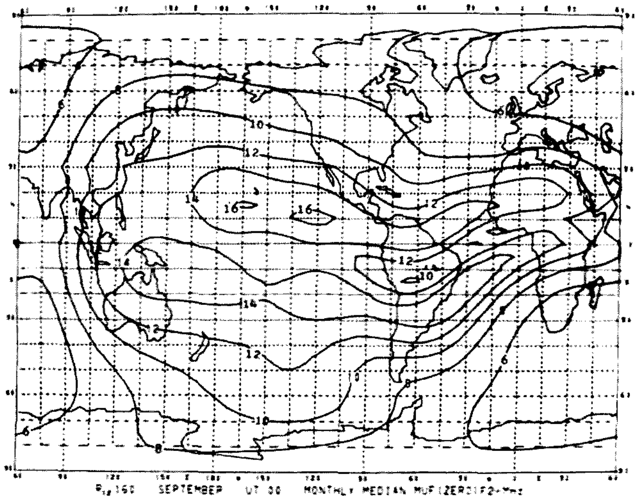

Fig. 5. Monthly median maximum usable frequencies for a signal to reach "zero" kilometers distance from the transmitter via the F_2 layer. This chart is for 0000 UTC, September, and a sunspot number of 160; a solar flux day of 203. Source: OT/TRER 13.

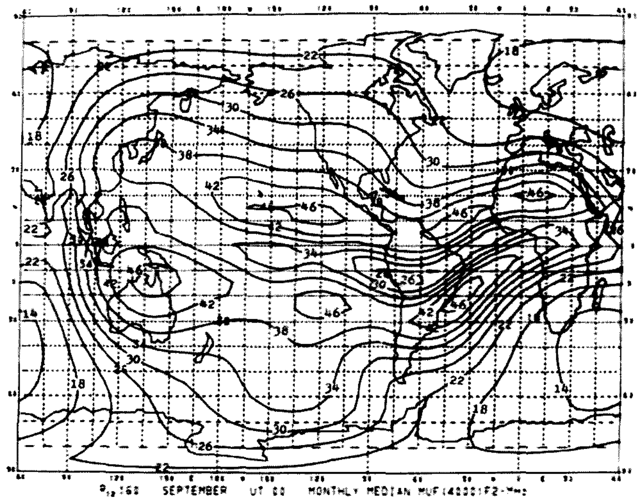

Fig. 6. Monthly median maximum usable frequencies for a signal to reach 4,000 kilometers distance from the transmitter via the F_2 layer. This chart is for 0000 UTC, September, and a sunspot number of 160; a solar flux day of 203. Use this figure along with Fig. 8. Source: OT/TRER 13.

city of Merida, Mexico. If there's a ham operator available in the mountains near Caldera, Chile, I actually might be able to make a contact on 10 meters—might be worth a try. Then, on 15 meters, I could possibly pick up the Maranon River of northern Peru or someone on the *continent* of Antarctica. That's a pretty good choice of contacts for a single antenna direction and a single hour of the day.

Checking the predictions over several hours would show about how long you can use each frequency to establish a contact to the area shown. Note that it is possible to be extremely specific about the location you may reach. At this point, you have overcome the limitation of most published predictions which show only the general area of the world you can reach and overlook many of the domestic circuits you'll want to use when trying for the closer distances, such as that YL in Moscow, Idaho, we mentioned earlier.

Another limitation of published reports is their inability to allow for an adjustment due to today's solar flux value broadcast by WWV. This can be a rather significant factor. For example, the September, 1980, predictions published in *QST* were based on a predicted median solar flux of 187. In actuality, during the period of time covered by the predictions, WWV reported daily solar flux as high as 269 and as low as 157 at 0000 UTC. This amounts to a maximum of 44% greater than the predicted median and a minimum which was 16% less than the prediction.

Table 2 shows the actual vs. predicted solar flux values sent to me by the Environmental Research Laboratories in Boulder. These daily averages also show some variation from the most currently broadcast figures you will hear on WWV. Even so, for the months shown, the flux varied upwardly about 46% and downward 30.5%. That's a considerable amount of variation from the predicted value and could have a substantial effect on some HF circuits. The procedures I'll outline will show you how to adjust for that variation.

First, there is one more concept we must briefly cover. At any given time, for any given communication link, there may be several MUF values which apply, depending on the ionospheric path you wish to use. These include a MUF for the E layer and F layers *for each* instance when the signal bounces off the ionosphere. You want to find the lowest MUF for F propagation and the highest of either the F or E MUFs. In the calculations shown in Table 1, the maximum number of hops on the signal's trip to Antarctica was four reflections off the ionosphere, and the F_2 region dominated in all cases.

The 13 steps which follow take you through the estimation process. I suggest that you may wish to read through the steps first and then go back and fol-

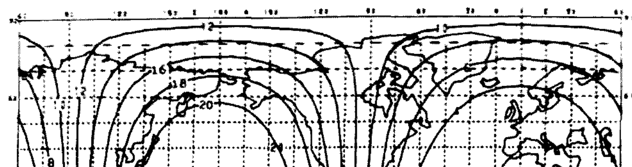

Fig. 7. Monthly median maximum usable frequency for a signal to reflect via the E layer. The chart is for 0000 UTC, September, and a sunspot number of 160; a solar flux day of 203. Use this figure with Fig. 9. Source: OT/TRER 13.

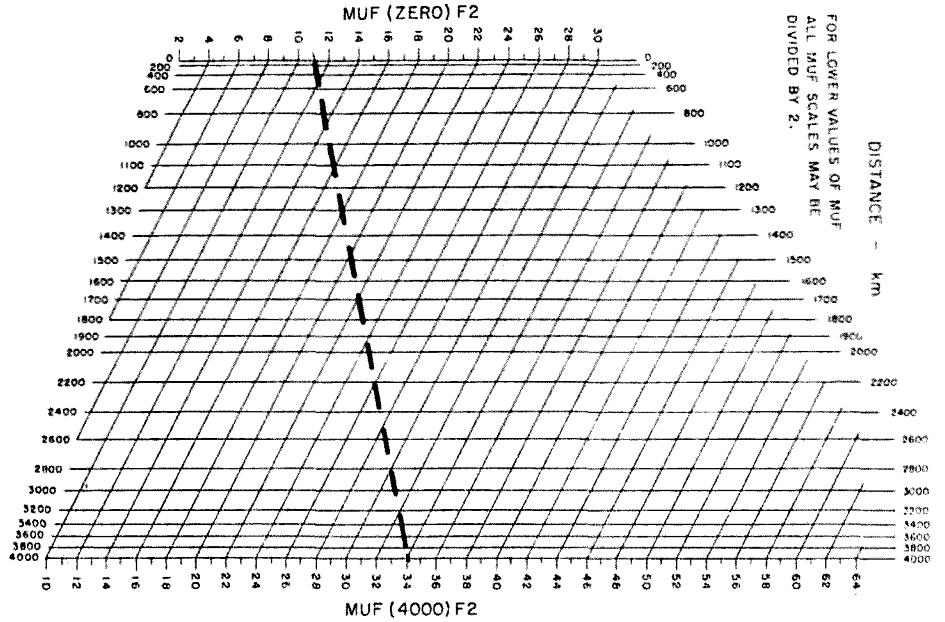

Fig. 8. Nomogram for interpolating between an MUF(0) F_2 (from Fig. 5), and an MUF(4,000)F_2 (from Fig. 6) to determine maximum usable frequencies at intermediate distances. The dashed line shows an example of a situation when the MUF(0) is 11, and the MUF(4,000) is 34. Following the line, we can see the MUF for a distance of 1,7000 kilometers is 22 MHz. Use this nomogram to find MUFS for column five of the work sheet in Fig. 1. Source: OT/TRER 13.

low along step by step. You'll be amazed at how fast you can arrive at a very accurate MUF for your communications circuit for the maps shown.

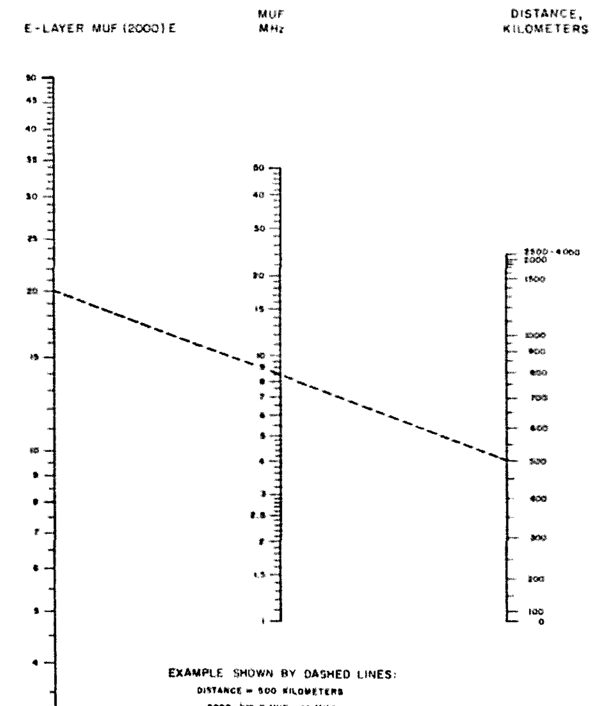

Fig. 9. Nomogram for converting the MUF(2,000)E from Fig. 7 to maximum usable frequencies at other distances. Use this nomogram to find the MUF of E-layer signals for column seven of the work sheet in Fig. 1. Source: OT/TRER 13.

1) Gather some materials together: a piece of onionskin paper or similar paper that you can see through, a ruler, a copy of the work sheet shown in Fig. 1 (I just sketch out my own sheet), and this hour's WWV solar flux value. You'll find the WWV solar flux broadcast at 18 minutes after every hour.

2) Locate your QTH and the city you wish to reach by laying the onionskin paper over the map in Fig. 2 and placing a dot on the two locations. Also draw in the equator line.

3) Move the onionskin paper down to Fig. 3 and line up the equator with the equator in the figure. Slide the onionskin paper to the left or right along the equator, until the two dots lie on the same great-circle line, similar to the east-west route in Fig. 4(B) or similar great-circle lines like the north-south route in Fig 4(A). Now, draw in the great-circle paths as shown in Fig. 4(C). If you wish, you can use one of the azimuthal maps being offered to hams in this step. It can provide an easier way to calculate distances, but may provide a problem when trying to determine the actual MUF on maps shown with this article.

4) In Fig. 3, you will notice some dashed lines and numbers. These tell you how many kilometers your dots are from the center of the chart. To find the distance between your two dots, simply count the number of dashed lines between the two dots. The lines are 500 kilometers apart, and the numbers are 1,000 kilometers apart.

5) Now you need to identify the number of reflections your signal will make off the ionosphere. I use a code here, where an "X" means the signal is reflected off the ionosphere, and an "O" shows where the signal is reflected off the Earth. To find the number of reflections, first divide the total distance by 4,000 kilometers. Then round that number up to the next largest whole number, multiply by two, and finally divide your result into the total distance. This gives you the distance traveled in either an upward path or a downward path. Mark off the upward and downward path lengths on your onionskin, beginning with an X (because your first signal must bounce off the ionosphere) and alternating Xs with Os until all reflection points are found. Note that the first and the last reflection points must always be Xs. For short hops of under 4,000 km, there is only one X at the very center of the path between the two points. Now, you can begin to fill in Fig. 1.

6) Lay your onionskin paper over Fig. 5 to find the MUF at zero kilometers for each point marked with an X. To help you through the first example, I've written the north-south values in on

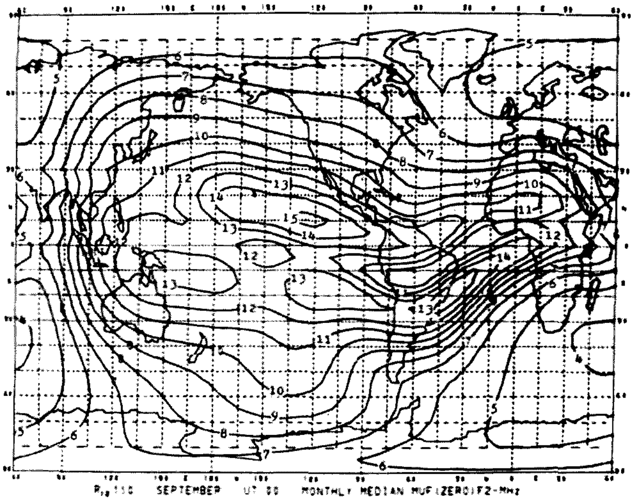

Fig. 10. Monthly median maximum usable frequencies for a signal to reach "zero" kilometers distance from the transmitter via the F_2 layer. This chart is for 0000 UTC, September, and a sunspot number of 110; a solar flux of 154.6. Source: OT/TRER 13.

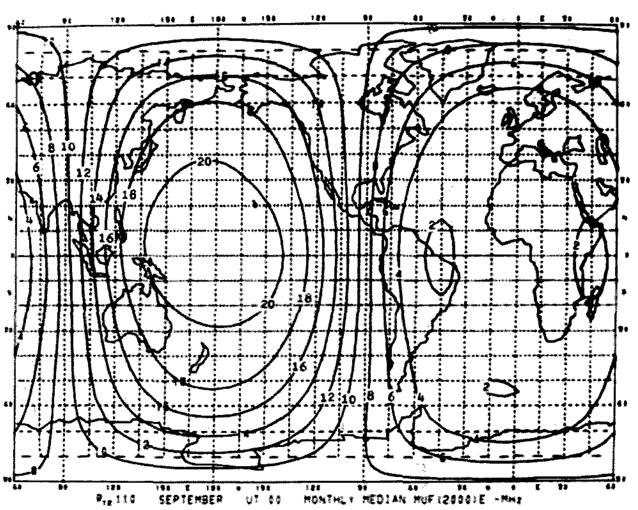

Fig. 12. Monthly median maximum usable frequency for a signal to reflect via the E layer. The chart is for 0000 UTC, September, and a sunspot number of 110; a solar flux day of 154.6. Source: OT/TRER 13.

the table in Fig. 1 under the heading, "MUF 0."

7) Using the onionskin and Fig. 6, identify the F_2 MUF values for each hop and enter them in the table in Fig. 1 under the heading, "MUF 4000."

8) Using the distance between each reflection point, go to Fig. 8 and interpolate the actual MUF you can expect on that particular hop. This interpolation between the MUF 0 and the MUF 4000 adjusts for the angle at which your signal travels to reach each of those hop points. Every reflection point in every path has a different reflection angle.

9) Finally, in your last use of the onionskin paper, lay your paper across Fig. 7 and determine the E layer MUF at each point for a 2,000-kilometer hop. Enter this value into Fig. 1. Then find the actual E layer MUF by using the nomograph in Fig. 9. Note your results in Fig. 1.

10) Now simply compare the F layer MUF value for each hop in column five of Fig. 1 with the E layer MUF in column seven of the same figure for each hop. Select the larger of the two values and put it in column eight. Then select the smallest number in column eight. Congratulations! You have just found the maximum usable frequency for a day on which there are 160 sunspots, or a solar flux of 203. Call this "MUF_{160}."

11) To interpolate the MUF values for days when sunspots are something other than 160, you first go back and do steps six through ten, using the maps for a sunspot number of 110

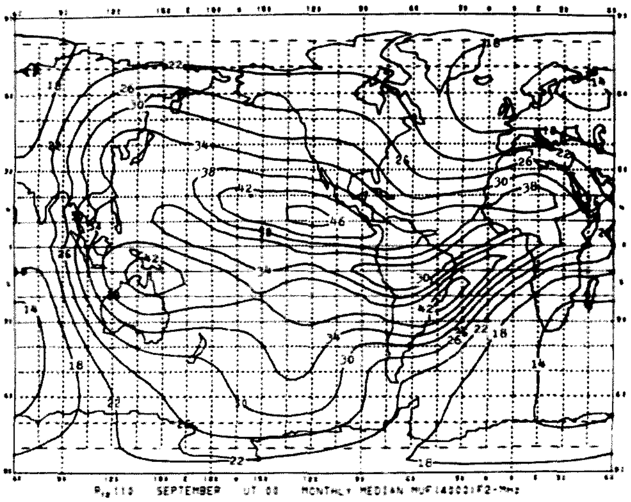

Fig. 11. Monthly median maximum usable frequencies for a signal to reach 4,000 kilometers distance from the transmitter via the F_2 layer. This chart is for 0000 UTC, September, and a sunspot number of 110; a solar flux day of 154.6. Source: OT/TRER 13.

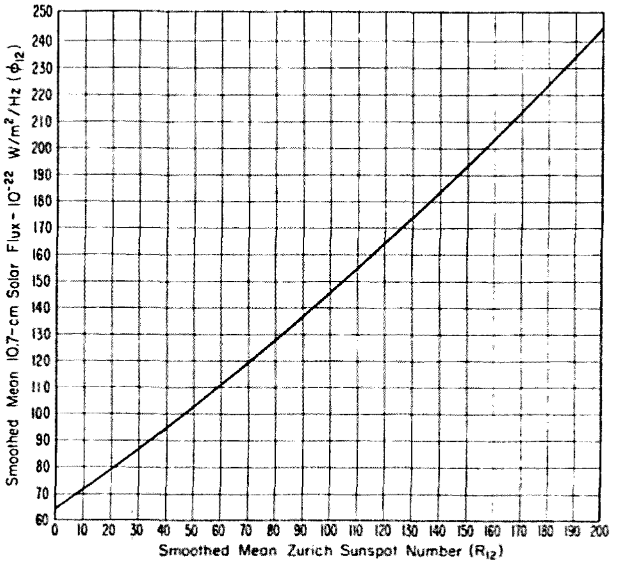

Fig. 13. Relationship between smoothed mean Zurich sunspot number and smoothed mean 10.7cm solar flux. Use this graph to convert WWV's solar flux to the daily sunspot number for use in the formula for adjusting the MUF to today's solar flux.

in Figs. 10 through 12. Call these "MUF_{110}."

12) Take today's reported WWV solar flux value and use Fig. 13 to find today's sunspot number.

13) Plug the sunspot number and your MUF values into the following formula and let your calculator or computer finish the job for you. This little calculation finally gives you the sunspot number for this hour of this day of this month, and for this part of the 11-year solar cycle. $MUF = MUF_{110} + 0.02(MUF_{160} - MUF_{110})$(today's sunspot number $- 110$).

Note: For days when the sunspot number falls below 110, you would also use maps for a sunspot number of 10, and the formula: $MUF = MUF_{10} + 0.01(MUF_{110} - MUF_{10})$(sunspot number $- 10$).

While it takes 13 complete steps to go through the process, you'll find that after two or three times, you are taking little short cuts here and there which have no effect on the outcome but make the procedure go a lot faster. It's like tuning up your radio. The first time, it goes pretty slow, while the third or fourth time takes just a short while. A good estimate with this procedure can be made within two to three minutes for a multiple-hop situation and about a minute for a single-hop situation. The maps here will get you through the month of September.

Keyer Magic

—unravel the mystery of TTL circuits

In the fall of 1979, I took a course in digital electronics at the University of Arkansas at Little Rock, where I am studying for a degree in engineering technology. During the month-long Christmas break that followed, I decided to see if I could apply what I had learned. An iambic keyer seemed like an ideal project, since the circuit would be sufficiently complicated to be a genuine challenge. Besides, it so happened that my station did not already include a keyer.

You may wonder why anyone would go to the trouble of designing a keyer circuit from scratch, when it would be far easier to build a keyer based on a single IC such as the Curtis 8044. The answer is that designing a circuit based on common, general-purpose

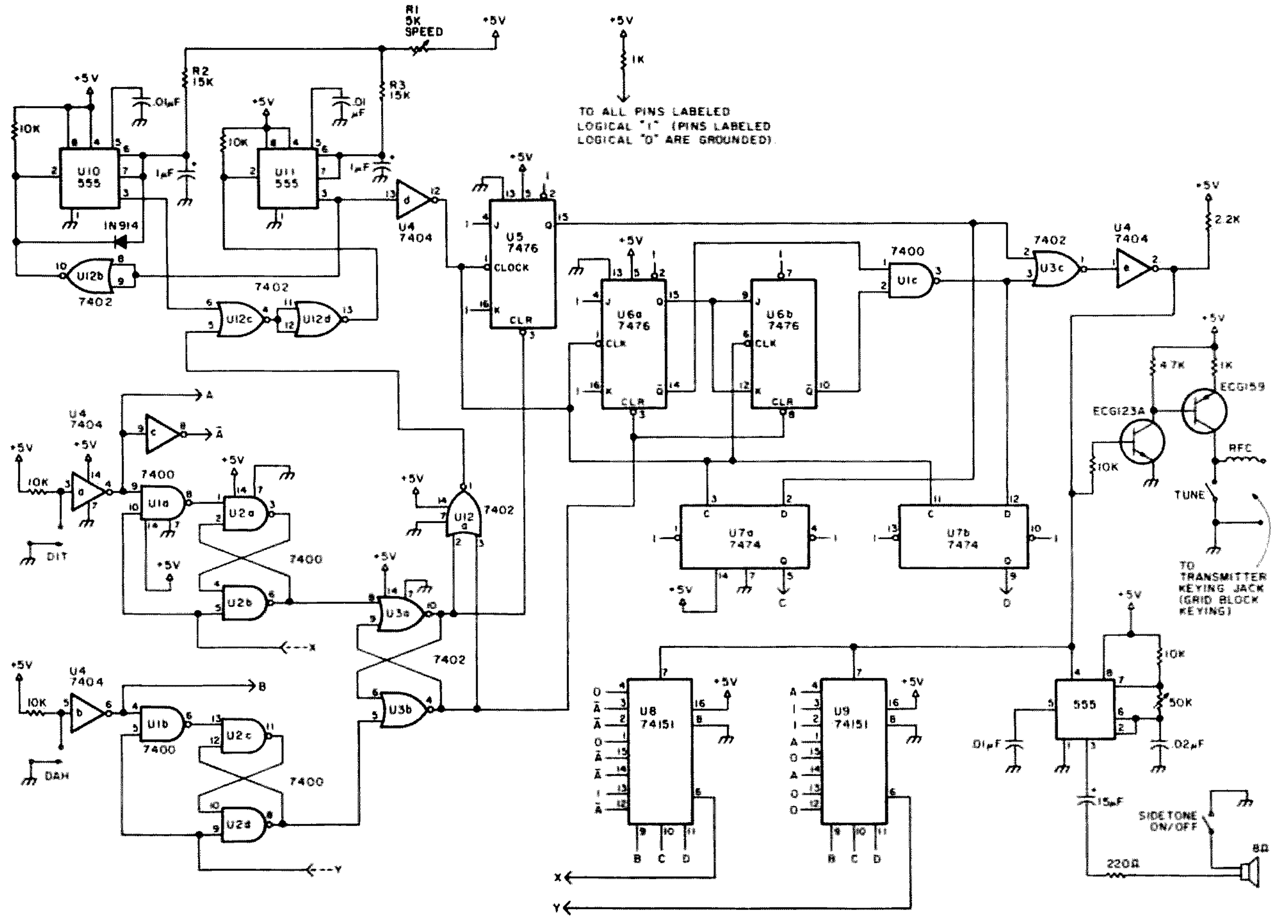

Fig. 1. Complete schematic diagram of the N5DY keyer. Pin numbers not shown are left unconnected.

digital ICs (TTL in this case) is a valuable educational experience for those who are just starting to learn something about digital electronics. I certainly don't claim that my circuit is the ultimate state-of-the-art design, but it works well. Readers who like to experiment with digital circuits may find it interesting.

Design Considerations

Let's begin by defining iambic operation in terms of what the circuit must do. At the end of each code character, a control circuit, or "decision" circuit, as I have chosen to call it, must check several circuit conditions and issue a command as follows:

1) If the dit paddle is on and the dah paddle is off, send a dit.

2) If the dit paddle is off and the dah paddle is on, send a dah.

3) If neither paddle is on, stop sending and reset parts of the circuit where necessary.

4) If both paddles are on, send a character opposite to the one just sent. For example, if the previous character sent was a dit, the keyer would then send a dah.

It is this fourth requirement, of course, that makes iambic keyer circuitry more complex than the circuitry required for a single-paddle keyer. The iambic keyer needs a memory circuit to record the last character sent, as well as control circuitry which can take command of the paddle at certain times.

In addition to the above requirements, there should be no initial startup delay between the time a paddle is depressed and the time a code character is started (other than the extremely small propagation delays in the ICs themselves), and code characters should be self-completing.

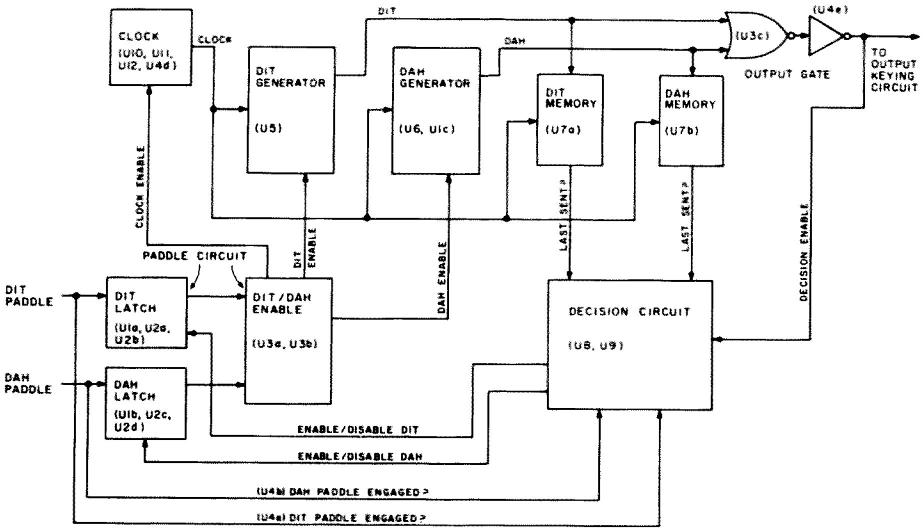

Fig. 2. Keyer block diagram.

The complete schematic diagram of the keyer is shown in Fig. 1. Fig. 2 shows the keyer in simplified block diagram form. (IC pins in the schematic diagram shown connected to "1" are actually connected to +5 volts, and pins shown connected to "0" are connected to ground. The labels "1" and "0" signify that these are logical "high" and "low" connections instead of ordinary power-supply connections. Some texts suggest that these logical "1s" should be connected to +5 V through a 1k resistor, with as many as 25 such connections sharing the same resistor; this is the procedure I have followed.)

Character Generation and Memory

There are many possible ways of generating dits and dahs. An article in the November, 1979, issue of *73* ("Son of Keycoder" by W4RNL) prompted me to start thinking about ways it could be done. In the end I chose a method that is perhaps the easiest to understand.

Let's first consider the dit generator and memory. Dits are formed by feeding a clock signal to a J-K flip-flop wired as a simple divide-by-two counter. When wired as shown in Fig. 3, the J-K flip-flop toggles whenever the clock signal goes from high to low. The output of the dit generator is monitored by a D flip-flop, which is activated by a positive-going clock pulse. Fig. 3 shows the circuit and the resulting waveforms.

Notice that the dit memory persists for half a clock cycle after each dit. The same relationship holds for a dah and the dah memory. The time between the end of a character and the subsequent clearing of its memory is the decision time, labeled t_d in Fig. 3. As will be explained in more detail later, the decision circuit will be activated whenever the keyer output goes low, such as at the end of one of the dits in Fig. 3. However, the final decision (that is, whether to send another character or stop sending) will be based on the conditions that prevail immediately before the character memory is cleared, or in other words, at the end of the decision time. The significance of this is that it gives the operator an extra half-space to get off the paddle before the keyer is committed to sending another character.

The dah generator is based on a synchronous divide-by-four counter. Two of the resulting waveforms are combined with a NAND gate to form the dah waveform, as shown in Fig. 4. (It should be noted here that in the original version of this circuit, the two J-K flip-flops were connected as a ripple counter instead of a synchronous counter, with the result that the keyer wouldn't work properly because a glitch in the dah waveform was activating the decision circuit at the wrong time. I don't intend to go into the details, but it is something that should be pointed out to those who may want to experiment with this circuit.)

The enable lines in Figs. 3 and 4 will enable the generator when high and disable it when low. The paddle circuit controls these enable lines. Whenever one of these enable lines goes high, the clock will also be enabled.

Referring to the complete schematic diagram, note that the outputs of the two generators are combined through U3c and U4e, which act as a simple OR gate.

The Clock Circuit

The clock circuit consists of two 555 monostable mul-

Definition of A, B, C, and D:

A: Dit Paddle (U4a)
B: Dah Paddle (U4b)
C: Dit Memory (U7a)
D: Dah Memory (U7b)

Initial Standby States:

Table 1. Truth tables.

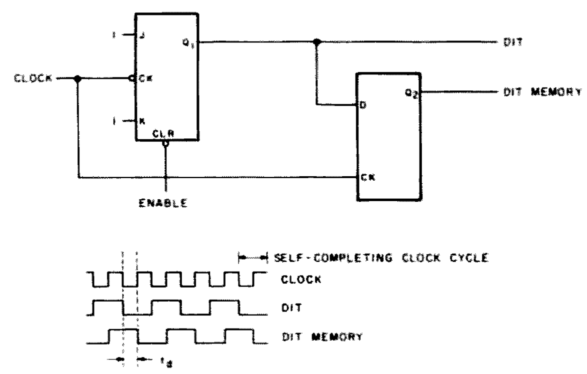

Fig. 3. Dit generator/memory circuit and waveforms.

tivibrators, wired back-to-back. It is basically an adaptation of a single-paddle, 555-timer-based keyer circuit described in *Solid State Design for the Radio Amateur* by Hayward and DeMaw, published by the ARRL. I experimented with several versions of a single 555 astable multivibrator clock circuit, but was not satisfied with any of them. With a single 555 clock circuit, the first clock pulse of a series of pulses will be longer than the pulses that follow. This is an unacceptable characteristic for my keyer circuit, since the clock is enabled and disabled along with the character generators. The twin 555 circuit described here eliminates the problem.

The complete clock circuit consists of U10, U11, U12, and U4d (see Fig. 1). Notice that the dit and dah enable lines are inputs to gate U12a. Initially, both 555 outputs (pin 3) are low, and both timing capacitors are discharged. A high signal on either enable line will trigger U11, which in turn triggers U10 through gate U12b. However, the diode in the circuit prevents the timing capacitor of U10 from starting to charge until after U11 has finished timing out. The clock circuit cannot be retriggered until after the output from U10 has returned to the low state. The result is a waveform that is entirely self-completing, with a duty cycle of approximately 50 percent with the component values shown in Fig. 1. At the end of one complete cycle, another cycle will be generated if an enable line is still high.

Readers who are unfamiliar with the 555 timer should consult *The 555 Timer Applications Sourcebook, with Experiments* by Howard M. Berlin.

The resistor and capacitor values shown will allow for code speed adjustments from approximately 15 to 35 words per minute. Readers who decide to experiment with different values should remember that the timing capacitors must be able to charge to two-thirds of the supply voltage in order to reset the timer. The safest bet would be to make R2 and R3 at least three times larger than the maximum value of R1.

The actual clock output is the inverted waveform of pin 3 of U11, which means that the clock waveform will begin with a high-to-low transition whenever an enable line goes high. This is necessary to meet the design requirement that there should be no initial startup delay between the time a paddle is depressed and the time a code character is started.

The fact that the clock waveform is self-completing means that two code characters cannot be separated by less than one space, regardless of how the paddles are manipulated. (See Figs. 3 and 4.)

Decision Circuit

The decision circuit is based on two 74151 1-of-8 data selectors (U8 and U9 in Fig. 1). Each chip has eight data-input pins and three address pins; three address pins allow for eight possible address combinations (000 to 111). There are two output pins: a data output and an inverted data output. In addition, there is a chip-enable pin (pin 7) which must be held low for normal operation.

One of the eight data inputs is selected to appear as the data output according to the address on the address pins. In Fig. 1, the data inputs to the 74151s are shown on the left side of each IC. They are arranged in order from top to bottom, starting with number 0 (for address 000) and ending with number 7 (for address 111). Note that the IC pin numbers do not correspond to this order. In this keyer circuit, the inverted data output (pin 6) is used. Pin 6 is driven high whenever pin 7 goes high, regardless of the condition of the address pins.

When the output of the keyer goes low, the decision circuit examines the following four circuit conditions, labeled A, B, C, and D:

A: Dit paddle. High if the paddle is on, low if off (from U4a).

B: Dah paddle. High if the paddle is on, low if off (from U4b).

C: Dit memory. High if the last character sent was a dit (from U7a).

D: Dah memory. High if the last character sent was a dah (from U7b).

There are sixteen possible combinations of A, B, C, and D. Four of these conditions (where C and D are both high) will not occur in normal circuit operation, but since they might turn up when power is first applied to the circuit, we must account for them to make sure the circuit doesn't get locked out when the power is applied.

Conditions B, C, and D are used to form the data-select address. Condition A, along with its complement, acts as a variable input to some of the data-input pins. There are two decision-circuit outputs, labeled X and Y, which determine what the keyer will do next. X and Y affect the state of the dit and dah latch circuits, respectively. The complete truth table for the decision circuit is included in Table 1.

The reader should refer to Don Lancaster's *TTL Cookbook* for an excellent discussion of how to design logic circuits with the 74151 IC.

Dit and Dah Latch and Enable Circuits (Paddle Circuit)

The state of the dit and dah paddles is sensed by separate dit and dah latch circuits, which also sense the state of X and Y, respectively. The dit latch consists of U1a, U2a, and U2b, with an output from pin 6 of U2b. The dah latch consists of U1b, U2c, and U2d, with an output from pin 8 of U2d (see Fig. 1). The truth table, for these latches is included in Table 1.

The outputs of the dit and dah latches serve as inputs to the dit/dah enable circuit, which consists of U3a and U3b. This circuit controls the dit and dah generator enable lines; the truth table is included in Table 1. The most important feature of the dit/dah enable circuit is that it is impossible for both enable outputs to be high at the same time.

Basically, I designed the paddle circuit to allow the X and Y decision signals to override the paddles and force the dit (or dah) latch high at critical times. When the operator is off the paddle, the X and Y signals will reset the latches to their standby states (see Table 1), which, in turn, forces both dit and dah enable lines low.

An Example of Circuit Operation

Fig. 5 shows the various logic waveforms that result when the dit and dah paddles are manipulated to create the waveforms shown for A and B. The resulting code output is the letter "F". (It should be noted that this is by no means the only way to form the letter "F".) Hopefully, Fig. 5 is a picture worth a thousand words. Table 2 is a step-by-step analysis of the waveforms at various critical times. All of the action described in Fig. 5 and Table 2 is based on the complete truth table selection of Table 1. The notes in Table 3 on the critical times noted in Fig. 5 and Table 2 should be of some help.

Additional Circuit Notes

The keyer output circuit shown in Fig. 1 is based on the circuit shown in the *Radio Amateur's Handbook* (1980 edition) for the Accu-Keyer. It is intended for use with transmitters with grid-block keying. Many variations of this circuit have appeared in ham magazines. Take your pick! The choice of transistors was dictated by what was in my junk box, but I checked the voltage rating of the PNP output transistor before I used it. My transmitter has a grid-block voltage of −55 V. The ECG159 transistor is rated for a maximum collector-to-emitter voltage of 80 V, and a maximum collector-to-base voltage of 80 V. Your transmitter may have a grid-block voltage that is too large for this transistor to handle. The safest bet would be to use a 2N5401 or equivalent. The tune switch in the output circuit is actually my old straight key.

The sidetone oscillator is a standard 555 timer circuit which has appeared in ham magazines many times. Once again, component values were dictated by my junk box. Two improvements could be made: (1) Substitute a 1k potentiometer for the 220-Ohm resistor in series with the speaker to provide for volume control, and (2) change the 50k tone control to a 100k potentiometer to provide for a greater range of tone control.

I am using a Radio Shack variable dc power supply to power the keyer, which draws nearly 200 mA of current. If I decide to build a fixed 5-V power supply for the keyer, I will make it at least a 1-Amp supply so it can power additional proj-

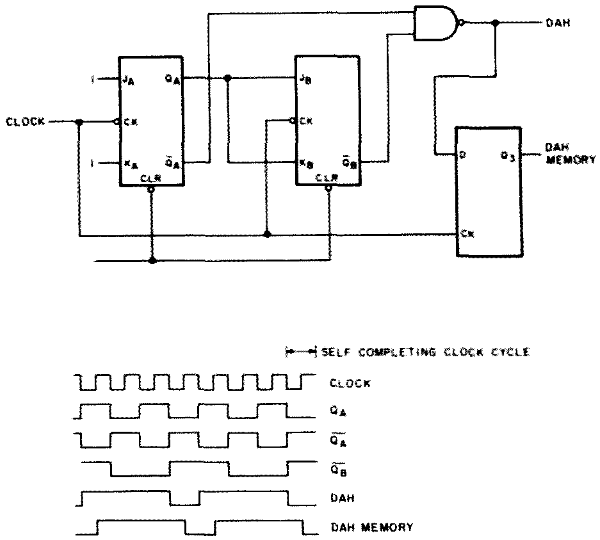

Fig. 4. Dah generator/memory circuit and waveforms.

	Circuit Conditions			Results			
Time	Keyer Output	A B C D	X Y	Dit Latch	Dah Latch	Dit Enable	Dah Enable
initial setup	0	0 0 0 0	1 1	1	1	0	0
t_1	0	1 0 0 0	1 0	0	1	1	0
immediately after t_1	1	1 0 0 0	1 1	0	1	1	0
t_2	0	1 0 1 0	1 0	0	1	1	0
t_3	0	1 0 0 0	1 0	0	1	1	0
t_4	1	1 0 0 0	1 1	0	1	1	0
t_5	1	1 1 1 0	1 1	0	0	1	0
t_6	0	1 1 1 0	0 1	1	0	0	1
t_7	0	1 1 0 0	1 1	0	0	0	1
t_8	0	1 1 0 1	1 0	0	1	1	0
t_9	0	1 1 0 0	1 1	0	0	1	0
t_{10}	1	1 0 1 0	1 1	0	0	1	0
t_{11}	0	1 0 1 0	1 0	0	1	1	0
t_{12}	0	0 0 1 0	0 0	1	1	0	0
t_{13}	0	0 0 0 0	1 1	1	1	0	0

Table 2. An aid in interpreting Fig. 5.

t_1: X and Y will always be forced high when the keyer output goes high.
t_2: End of first dit.
t_3: Clear dit memory.
t_4: See note for t_1
t_5: Operator presses dah paddle. B = 1 and Y = 1 will force the dah latch low, but since both latches are low, there will be no change in the enable lines.
t_6: Output goes low; decision circuit enabled. The decision circuits sees A = 1, B = 1, C = 1, and D = 0, resulting in X = 0 and Y = 1. This causes the dit latch to go high and the dah latch to go low. This, in turn, forces the dit enable low and the dah enable high.
t_7: Clear dit memory.
t_8: Analysis similar to that of t_6, except that this time the dit enable goes high and the dah enable goes low.
t_9: Clear dah memory.
t_{10}: Operator releases dah paddle.
t_{11}: Output goes low. Initially, the operator is still on the dit paddle, so the circuit prepares to send another dit. However, the operator has until t_{13} to get off both paddles to stop any further character generation.
t_{12}: Operator gets off the dit paddle in time to stop the keyer. The decision circuit now sees A = 0, B = 0, C = 1, and D = 0, which ends up forcing both enable lines low.
t_{13}: Clear dit memory. The circuit will now be reset to initial standby states.

Table 3. Notes on critical times.

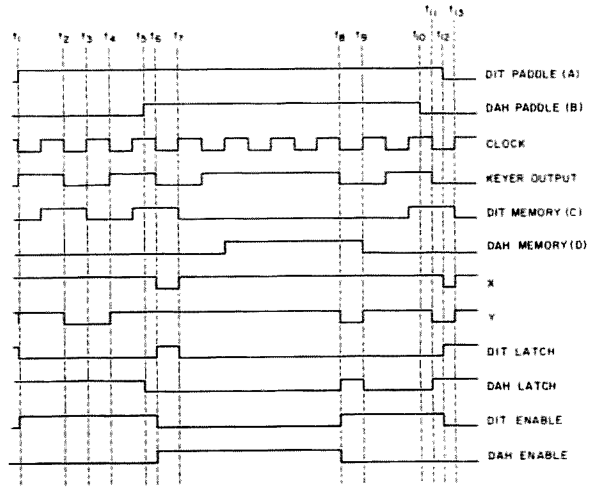

Fig. 5. An example of circuit operation.

ects. The power supply for a TTL circuit must be well-regulated, of course.

This is a good place to mention that the +5-V line in any TTL project should be bypassed to ground with small despiking capacitors distributed uniformly around the circuit board. About five 0.01-uF disc capacitors is about right for this project. Some experts recommend more stringent measures. The *TTL Cookbook* is a good source of information about this aspect of building TTL circuits.

I assembled most of the keyer on a perforated circuit board using wire-wrapping, but I designed a layout for an etched circuit board for the clock circuit.

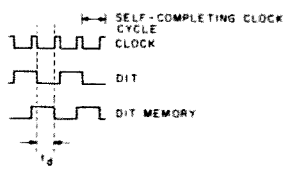

Fig. 6. Decreasing the duty cycle of the clock waveform will increase the decision time. Compare these waveforms to those of Fig. 3.

The best way to build a circuit like this one depends on your personal preference, of course. As of this writing, I have still not decided exactly what type of cabinet the keyer should be housed in. In the meantime, the assembled but exposed circuit has been set up on my operating table and connected to my Bencher paddle. I have used the keyer for many hours of off-the-air practice and am completely satisfied with its operation.

The final test was to connect the keyer to my transmitter to see if it would actually do the job. With the transmitter operating into a dummy load, the keyer worked flawlessly. With the transmitter operating into an antenna, however, the keyer would sometimes act up. Subsequent tests with a dip meter revealed that my rf-in-the-shack problem was worse than I had thought. The dip meter reacted strongly when brought near the coaxial transmission line, the rotator cable, equipment ac line cords, and the cable connecting the keyer to the transmitter.

Part of the solution to this problem was to add a small rf choke in series with the output from the keying transistor, as shown in Fig. 1. I also wrapped the power supply ac line cord around a ferrite rod from an old AM broadcast band receiver. These measures cured the problem as far as the keyer is concerned, and I am now able to use it on the air with no problems. Housing the keyer in a grounded metal cabinet might provide all the necessary shielding. Obviously, I will have to investigate my rf-in-the-shack problem further. The amount of rf-proofing you would need for this keyer circuit—or any other keyer circuit—would of course depend on how much rf is in your shack.

Final Comments

There are two books that you should definitely consider obtaining if you intend to do any experimenting with TTL ICs. The first one is the *TTL Cookbook* by Don Lancaster, which I have referred to in this article. The second one is *The TTL Data Book* by Texas Instruments. It is easy for a mistake to appear in a published circuit despite all efforts to avoid it, so anyone who intends to build such a circuit based on TTL ICs will find it helpful to have a copy of *The TTL Data Book* to check pin numbers and truth tables.

Experimenting with digital circuits such as this keyer can be a lot of fun, in addition to being educational. You ought to give it a try, if you haven't already. If this article encourages someone to get started, it has served its main purpose.

There is one more thing I would like to mention, which could probably come under the heading of second thoughts. A close look at the waveforms in Fig. 3 shows that the decision time could be increased or decreased by adjusting the duty cycle of the clock waveform. For example, Fig. 6 shows how a 25-percent duty cycle would increase t_d from half of a space to three-fourths of a space. The duty cycle can be reduced by increasing the RC time constant of U11, decreasing the RC time constant of U10, or a combination of both. Of course, these changes will also affect the speed range. I have not made any changes in my clock circuit, but since some keyer buffs may feel that a longer decision time is desirable, I thought I should point out how it could be accomplished.■

The Contest Cookbook

—basic strategy and tactics

A contest QSO differs from a regular QSO in that it is short and in that a particular message must be exchanged. The techniques of getting into a contest QSO are similar to those used to initiate a regular QSO or, especially, a DX QSO, but they are generally performed at a higher rate of speed. Thus it is not all that difficult for any active operator to join in the contest fray *once he has read and understood the contest rules.* However, to do well in a contest (and this can mean anything from surpassing your own previous best score to actually winning the contest) takes some knowledge, experience, and work.

This article will attempt to add to your knowledge by suggesting strategies and techniques which have worked for successful contesters in the past. More important, though, through your own experience you will come to know: (1) yourself (your capabilities and limitations as a contest operator); (2) your station (its capabilities and limitations in any particular contest situation), and (3) propagation (both the basic patterns in your particular geographical location and the recent fluctuations in this pattern). According to W3ZZ and others, this combination of experience and knowledge plus *practice, practice,* and more *practice* will make you the best contester you can be.

The Basic Goal of Contesting

Enough of the philosophy—though it is tried and true and should not be neglected, it makes dull reading! Let's look at the basic goals of a typical contest operator. Besides having fun, he usually tries to make the best possible score in the time available. To do this, he must make as many contacts as he can. Many contests are scored by multiplying total contacts by a "multiplier" factor (multipliers will be discussed elsewhere in this article). For now, let's focus on making contacts, the most basic goal in contesting.

Each contact consists of an exchange of some standardized message, and only a limited amount of time is available in which to make these contacts. Therefore, a basic strategy for achieving a better score is to speed up the rate of message exchange or, in other words, to improve your ability to transmit and receive rapid communications through (typically) heavy QRM. Another basic strategy is to minimize the time between contacts, to maximize the *rate* at which contacts are made.

The Exchange

Very little can be said here about improving the receiving end of the exchange other than to urge practice. Upgrading your station equipment may also help, but don't underestimate your own ability to compensate for less than ideal gear. Believe it or not, the combination of the human ear and brain is the best audio filter available today, and it is extremely sensitive as well. Practice will maximize your own amazing capabilities.

On the topic of sending, more may be said. Let's take a simple example that is known to almost everyone who has dabbled in contesting: the ARRL Field Day exchange. All one needs to get across in a Field Day contact is his call, class, and ARRL section. To do this as rapidly as possible, send each piece of information once:

CW: "W6XYZ/6 1C EB de WB6CEP/6 K."

PH: "W6XYZ portable 6, 1C East Bay from WB6CEP mobile 6, over."

Notice how clear but brief the above message is. Repeat calls or parts of the message on the first exchange only if the station you are working is very weak or if its operator does not sound as though he knows what he is doing. For most contacts, though, send each piece of information just once, and you'll be surprised how often that is all that is needed. If someone does ask for a repeat, be sure to repeat only what he is missing. In other words, if you are asked "What's your section?", just give the section (in the above example: "East Bay"). If that still doesn't get through, then repeat the section several times—plus your callsign to assure the other operator that he is listening to the correct signal. On phone, it really does help to use phonetics. The standard ICAO phonetics, or other commonly used phonetics, are highly recommended. "Whiskey 2 Fuzzy Wuzzy Gorilla" (or whatever) is an attention-getting crack-up only if W2FWG has a good signal; otherwise it's usually a waste of time.

The above method is not always best, and as you become a more experienced contester, you will gain the ability to sense how much of the exchange should be sent and how often, in any given situation. The point is that the shorter you make your messages, the more

contacts you are likely to make.

The other major comment regarding the sending of exchanges is pretty straightforward. Improve your sending ability so that you can send your exchange as fast as the person you are working can copy. Estimating just how fast the other operator can copy is a skill that comes only with experience—but if you cannot send that fast, such an estimate will be less helpful. Practice!

mproving the Contact Rate: CQ vs. Search-and-Pounce

Now let's look at the con- :ept of improving score by ncreasing rate. The easiest vay to "keep the rate up" is o call CQ and get others to nswer you. To accomplish his effectively, a loud sigal is normally required. A owerful transmitter plus ancy, high-gain antennas n big towers will give you loud signal, but this is a rohibitively expensive soition for many. However, ven a so-called "little gun" an be a big signal at cerin times, on certain ands, and into certain geo- aphical areas. When any these conditions holds d people are there to ork, by all means call CQ gardless of what kind of gnal you have at your mmand.

At the beginning of the ical contest, "big guns" ll call CQ and be an- ered by those with weak- signals. An exception is iere some types of stans are rarer than others; example, an operator in rare country may have cess calling CQ with a atively weak signal. For majority of stateside itesters in most contests, wever, the big guns will the initial CQers. As the itest wears on, the weak- signals will have worked big guns and will be king for new stations to contact. At this point, the successful little gun will search the band for a relatively clear frequency that still has some contest activity near it and try a few CQs there. If it works, he should continue to call CQ; if not, he should go back to calling others. Towards the end of the contest, the big guns will have run their pileups dry. If a little gun calls CQ then, he is very likely to attract big guns hungrily searching for that one additional contact.

As the contest progresses, band conditions will fluctuate. If the little gun who is calling others suddenly finds that he is getting answers on the first call to the stations he is working, this indicates good propagation conditions, though often to only a particular part of the US or the world (depending on what type of contest it is). If that particular part is at all heavily populated with contest-oriented amateurs, he should shift to a clear frequency and try some CQs.

Certain bands tend to be better for weak-signal CQs than others. The higher bands—fifteen and ten meters—are very good when they are open. Little guns should keep a close watch on these bands for good openings which will allow them to call CQ—and get answers!

Finally, even a little gun will be quite loud locally in a domestic contest, especially on 40 and 80 meters. An occasional CQ will often produce short "runs" or "strings" of contacts with local operators, especially when the little gun is a fresh signal on the band.

When calling CQ fails, one must answer the CQs of others or suffer a drastic drop in his contact rate. This method of making contacts is commonly referred to as "searching-and-pouncing" (S & P). One searches the band for a station he hasn't worked yet, then pounces on that station and gives a call. Very skilled operators can make QSOs almost as rapidly by searching-and-pouncing as by calling CQ, but it is a more difficult technique to master and requires greater operator effort. Again, practice is important.

Let's first consider the "search" portion of the search-and-pounce method. You want to find a station that you have not yet worked, preferably one that is just finishing a "CQ Contest" or "QRZ Contest" as you tune across it. A loud station will be easier for you to copy—but it may have more search-and-pounce types calling it, so take your choice. A fast, smooth operator will probably work you sooner than a slow and/or unsure one.

While searching, be sure to tune across the entire portion of the band in which there is contest activity. Stations on the fringes may be easier to work because the competition is less. The bug guns tend to congregate near the low end of the band in major CW contests and DX phone contests, while during major domestic phone contests, the action is heaviest near the bottom end of the General class phone band. Once you have worked some of the big guns, search more carefully up towards the higher end of the band (or in the Advanced class phone band during domestic contests) for weaker (and often slower) CQs. Constantly sweep and re-sweep across the band, as new stations will appear (and disappear) at a surprising rate.

When your search unearths a juicy new station to work, several "pounce" considerations must be examined critically. First, how heavy is your competition? If many stations are calling, or if a number of bigger stations are calling, try only 1-3 calls and move on—unless the new station is a multiplier (see the next section for a discussion of multipliers). Under most conditions, your rate will tend to drop drastically if you sit on any one station's frequency for more than a couple of minutes. A superior alternative is to try your luck elsewhere and then come back later to check if the competition has lessened and/or propagation into that area has improved for you.

Second, exactly what is the new station working? If local stations with signal strengths comparable to your own are getting answered, the chances are very good that you can get through, too. If only stations considerably louder than yours are being worked or if the stations being worked are mostly located in other geographical regions, your chances are not so hot. With experience, you will develop a feel for the probability of contacting a given station under a certain set of band and competition conditions.

Third, as was mentioned earlier, the faster, smoother operator will usually work you sooner than a poorer operator if the size of their respective pileups is about the same.

When actually answering a contest CQ, keep it short. The preferred method is to send: "de K6PU." Then send his call as part of your exchange if and when you actually do work him. If this technique causes confusion, send both his call and your call, possibly repeating your call once.

With light competition on CW, or in most instances when operating phone (the exception is split-frequency operation with a DX station), zero-beat the desired station as you would in any regular QSO. With heavy competition, more

finesse is required to break through. Time your call for a lull in average signal strength on the frequency, or try shifting slightly to either side of the desired station's frequency if operating CW.

Finally, there will be times when both calling CQ and high-rate searching-and-pouncing will no longer work. You then have three choices: change bands, take a break, or search-and-pounce at a low rate. Band changes and rest pauses will be covered in succeeding sections. Low-rate search-and-pounce requires much patience and the conviction that each new contact is worthwhile because it improves your score. The "doldrums" are among those challenges of contesting which separate the good contester from the also-ran, so hang in there—and pray for better conditions soon!

Multipliers

Scoring in a few contests is based entirely on total contacts. Field Day is a good example of this type of contest, though it does contain certain bonus factors for portable stations which we will ignore for the moment. However, most contests complicate the scoring procedure—and thereby alter contest strategy significantly—by throwing in a multiplying factor. The "multiplier" is usually the sum of the number of distinct geographical areas contacted (with the definition of what is a "distinct geographical area" varying from contest to contest).

Some examples will probably illustrate the multiplier concept most readily. In the Sweepstakes Contest, the multiplier is the sum of ARRL sections contacted. If you work a station in each of the 74 sections, your score will be:
SS Score = Total Number of QSOs × 2 × 74 sections.

In the CQ Worldwide DX Contest, the multiplier is the sum of the countries and zones worked on every band. For example:
CQ WW Multiplier = 20 countries plus 10 zones on 40 meters and 50 countries and 20 zones on 20 meters = (20 + 10)+(50 + 20)= 100 (if one operated only on 20 and 40 meters in that particular contest).

In the California QSO Party, the multiplier for non-California stations is the number of California counties worked.

So much for what a multiplier is—now let's take a look at what effects a multiplying factor has on contest strategy. In a typical contest, your contact total will be significantly larger than your multiplier factor. Thus, each additional multiplier contact is worth a lot more than each additional non-multiplier contact—often five times as much, sometimes ten times as much, and possibly twenty times as much! However, finding an additional multiplier to work, or breaking through a pileup of twenty other stations who also need him for a multiplier, may take even more time than contacting an additional five or ten "ordinary" stations. Herein lies another major challenge of contesting: to balance contact rate and multiplier total in such a way as to maximize your score.

There is no simple answer to this dilemma. The best compromise depends upon a host of factors: the contest in which you are operating, your signal strength, your operating ability (especially your ability to search-and-pounce rapidly), band conditions, your geographical location, etc. Multipliers are generally easier to come by naturally in the course of making contacts in domestic, as opposed to DX, contests. In Sweepstakes, for example, the first fifty to sixty multipliers are almost automatic for the active participant, while the remainder of the seventy-four possible multipliers become progressively tougher to accumulate.

Experience in any given contest will teach you which multipliers are relatively rare; if you hear one of these, spend a little more time trying to work him than you would on a normal contact. Beware, though, of sitting on a rare multiplier's frequency for long periods of time. Unless contacts are really coming slowly, call a multiplier several times, note his frequency if you miss him, and try again every five to ten minutes. As his pileup (and rare multipliers usually do have pileups!) dies down, and as band conditions improve, your chances of working him become better. On the other hand, if band conditions become poorer, you may never get another chance to work him.

It is difficult, at the basic level, to provide any further solid tips on multipliers which will hold for all or even most contests. This is something one really needs to develop a feel for through experience.

Changing Bands

It is clear by now that there are two major goals in most contests: making a high contact rate and collecting multipliers. Simply stated, you should change bands only when by doing so you will improve your rate and/or add some new multipliers to your total.

In contests where you may work a station once on each different band (CQ Worldwide, ARRL DX, Field Day, etc.), the best general strategy is to operate on the highest band that is open. If the opening is not a particularly good one, your rate will suffer. In that case, it may be best to grab what multipliers you can quickly and then QSY to the next band down (for example, from fifteen to twenty).

Sweepstakes is a good example of a contest in which you may contact each station only once, regardless of band. In such contests you should strive to be on the band which will produce the highest rate, and pay less attention to marginal opernings on the higher bands. However, a good high-band (15 and 10) opening can really boost a score (especially a little gun's, as noted earlier), so it is important to monitor other bands for possible openings. This involves interrupting your operating whenever your rate slows, switching your receiver to any other bands which might be open, and quickly turning across the band.

If a given band appear to be active, listen more carefully to see if the activi ty level there is higher thar that of the band on whicl you have been operating—and/or check for multiplier you still need. Choose th band likely to be the mos productive for you in term of contacts or multipliers and either stay put or QSY The importance of monitoi ing other bands is eve greater when you may wor the same station on eac band, so by all means do and your score will almo surely improve.

A cost of such monito ing is the time lost in a justing your receiver to li ten on each different ban plus the time required t tune around the band. Th technique of tuning aroun the band rapidly has a ready been discussed. R ceiver adjustment—or th even more time-consumir task of tweaking both trar mitter and receiver—something which can I speeded up tremendous through practice and o simple trick.

Place some white stic on labels (masking tape w

also work OK) on your transmitter, receiver, amplifier, etc., panels just above all controls which must be adjusted when a band change is made. Pick out a band—eighty meters, for example—and tune up. Directly opposite the pointer line or dot on each tuning knob, make a mark on the label or tape and write "80" next to it. Do the same thing for every other band you will use in the upcoming contest. Now all you have to do to change bands is turn the bandswitch and rotate each control knob until it lines up with the appropriate marker. Very few controls are so touchy that if you are off by a fraction, performance will degrade sharply; if one or two are particularly touchy, spend an extra second or two to tweak them up after the basic changes have been made. There is seldom anything to be gained by being perfectly tuned in a contest; a few Watts more or less are unlikely to make much difference. The time you save by using this technique often does make a difference, though, as band changing now can be accomplished in ten seconds or less!

A final basic consideration when changing bands is your antenna system. If some of your antennas perform better than others, a sensible strategy is to spend more time using those antennas! For example, with a collection of dipoles and a four-element 20-meter beam, you probably would do better to spend much more time on the beam than you would on the one of the dipoles. However, this may not always be the best strategy. To continue with the beam-plus-dipoles example, it is highly likely that if your station happens to be located in the Northeast and you are operating the Sweepstakes Contest, the 80-meter dipole would be your "best" antenna. Thus it is critical to determine through actual on-the-air tests which of your antennas performs best in which directions and in which types of contests (local, domestic, DX, etc.). In other words, know your station.

Rest Periods

As was the case with changing bands, the basic underlying philosophy in determining when to take a break is quite simple: Rest when your rate will be low and when you will be unlikely to collect many multipliers. Unfortunately, as was also the case with changing bands, deciding more concretely at which specific time periods such conditions will hold is not so easy. The question of when to rest is further complicated by your own physical endurance limitations, which will often supersede rate and multiplier considerations.

Propagation is a key factor is determining when to rest. When one or more bands are open to an area where other contest participants are available to be worked, it is usually best to be on the air—especially if the areas concerned are highly-populated ones. Propagation is such a complex function of type of contest, geographical locations, time of day, year, sunspot cycle, etc., that few generalizations can be made about it which will hold more-or-less true for all US contesters. However, one generalization is that propagation peaks occur at sunrise and sunset, while midday is a low point. This is particularly true in DX contests, so the middle of the day is a time when many top contesters take a several hour nap (if they need it) in a DX contest.

Most DX contests do not have required rest pauses; you may operate the entire forty-eight hours (or whatever) if you have the stamina. If you do not and require more than a nap in the middle of each day, the next best approach is to take a short break when your efficiency drops off and operating is pretty much a waste of time anyway (e.g., in the wee hours of the morning). Since the excitement of a good opening will tend to wake you up, while low levels of activity will usually have the opposite effect, this is not too bad a system for most operators. Of course, if you know from experience (or from conversations with knowledgeable locals) when to expect good openings to various parts of the world, you will do even better if you take your breaks between predicted openings.

The rest-pause strategy for domestic contests is a bit different than for DX contests. Here, everyone's day and night very nearly coincide, and the contests are generally shorter (20-30 hours). The best time to take a nap in a domestic contest is during the wee hours of the morning. A common strategy is to operate on forty and eighty until the rate drops off noticeably, then sack out until dawn. If rest pauses are required—you must, for example, operate no more than twenty-four hours out of thirty in Sweepstakes—the additional breaks are best taken in short bursts of fifteen to twenty minutes any time the rate drops off.

In any contest, if at all possible, it is not wise to take long breaks. As propagation prediction is not an exact science, the successful contester must constantly monitor any band which might be open. Most people have difficulty doing this while they are asleep! ■

The $50 Sweeper

—build this audio function generator and sweep your troubles away

One of my favorite aspects of ham radio is audio circuitry, and I am constantly constructing amplifiers, filters, and other devices which operate within the audio spectrum. In order to evaluate my projects, I built the swept function generator described here to use in conjunction with my oscilloscope.

The generator features a frequency range of .05 Hz to 300 kHz, digital frequency display, and a sweep range of 1000:1 or better. The unit produces sine, triangle, and square waves as well as left- or right-sloped ramps and pulses with an adjustable duty cycle of 1% to 99%. The outputs may be amplitude- or frequency-modulated by an external signal and adjusted in amplitude from six volts peak-to-peak down to millivolts. The sine, triangle, and square waves may be swept in frequency by a built-in linear sweep circuit or by an external signal. The cost is in the $50.00 range if you have a moderately stocked junk box. The majority of the parts are stocked by Radio Shack. About half of the cost is in the digital frequency display, which may be easily replaced with a frequency counter or an analog scale.

The entire unit consists of the function generator circuits, the sweep circuits, the digital display circuits, and the power supply. The function generator circuits actually contain two function generators, designated the primary and secondary, and labeled F1 and F2 in the picture of the front panel (Photo A). The two generators may be set independently of each other and it is possible to shift between the two merely by changing the logic level at the FSK jack. The amplitude of the

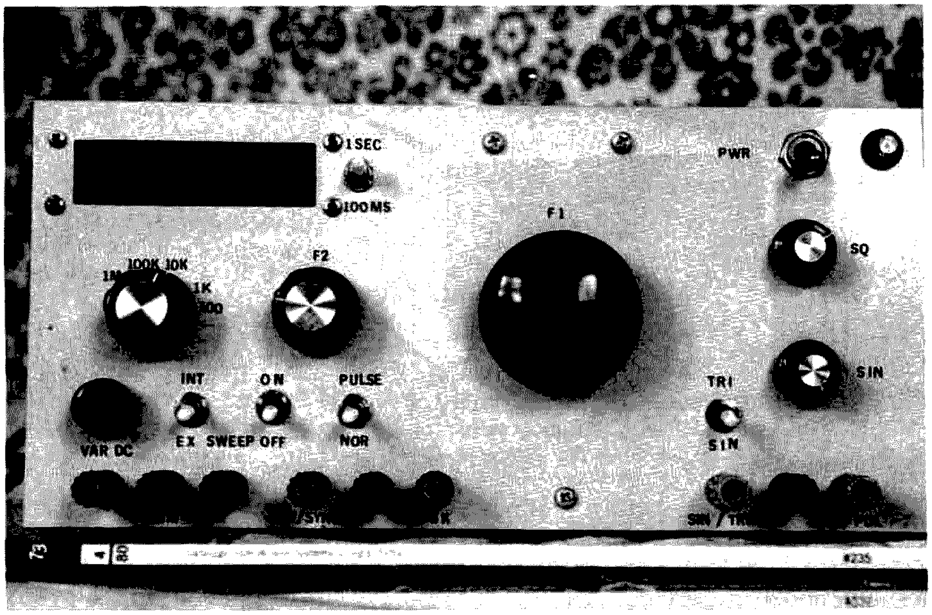

Photo A. The completed swept function generator. The knob labeled F1 is the primary frequency control and is mounted on a 3:1 gear drive. The SIN/TRI output jack also provides a ramp function. All unlabeled jacks are grounds, except the jack, far left, which is the variable dc output.

output is absolutely constant from the lowest frequency up to 300 kHz with a usable signal generated up to about 1 MHz. Distortion of the sine wave is adjustable and quite good at approximately .5% THD.

Construction

The heart of the function generator is an XR 2206 IC. I purchased my chip from Jameco Electronics, 1021 Howard Ave., San Carlos CA 94070. Be sure to ask for the spec sheet; the additional 25 cents is well worth the price. I used the manufacturer's recommendations on wiring the 2206 except for several modifications that are peculiar to my function generator. If you do not want to build the sweep circuit, then just leave those components off of the circuit board; there are no components that are used for both the function generator and the sweep circuits.

I used ¼-Watt, 5% resistors except for R12, which is not critical but should be at least 1 Watt. Capacitors C1 through C5 are frequency-determining components and should be 5% or better, and for best results should be made of some stable material such as polystyrene. Other types of capacitors could be substituted, but the generator will be slightly less stable. Wherever possible, I have tried to provide large pads on the circuit board to accommodate capacitors of different sizes.

Trimmer pots R1, R2, R3, R6, R7, and R8 all are mounted on the PC board. I have provided space on the circuit board so that either the stand-up or the lay-down type of trimmer may be used. It seems that I always have the wrong type when building a project on someone else's circuit board, so I have allowed for both types (prospective authors please take note). Front-panel pots R4 and R5 are the other frequency-determining components. During normal use, R4 is the main frequency control, and I have mounted mine using a 3:1 gear drive so that the frequency can be varied in small increments. Potentiometer R5 is used to set the frequency of the secondary function generator and to adjust the shape of the pulse and ramp functions. I found it sufficient to mount R5 directly on the front panel without a gear drive.

The function generator may be swept in frequency by applying a varying voltage to R5. For maximum frequency sweep, 1000:1 or better, this voltage should vary from 0 V to +3 V, with the highest frequency being generated at 0 V. I have arranged the front-panel

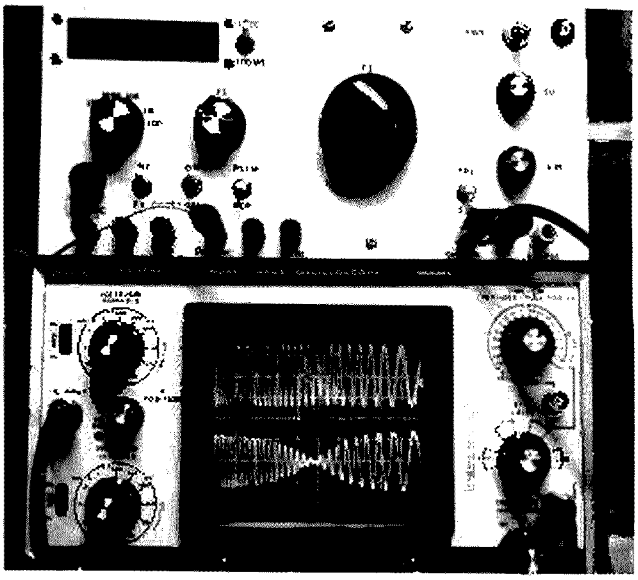

Photo B. The swept function generator in operation. The top trace is the output of the generator in the sweep mode. The bottom trace is the same signal after processing in a home-brew notch filter. The notch filter has a design frequency of 1100 Hz. Note the digital display showing 1,093 Hz which will correspond to the center of the scope face. The actual sweep here is about 20 Hz to 2200 Hz.

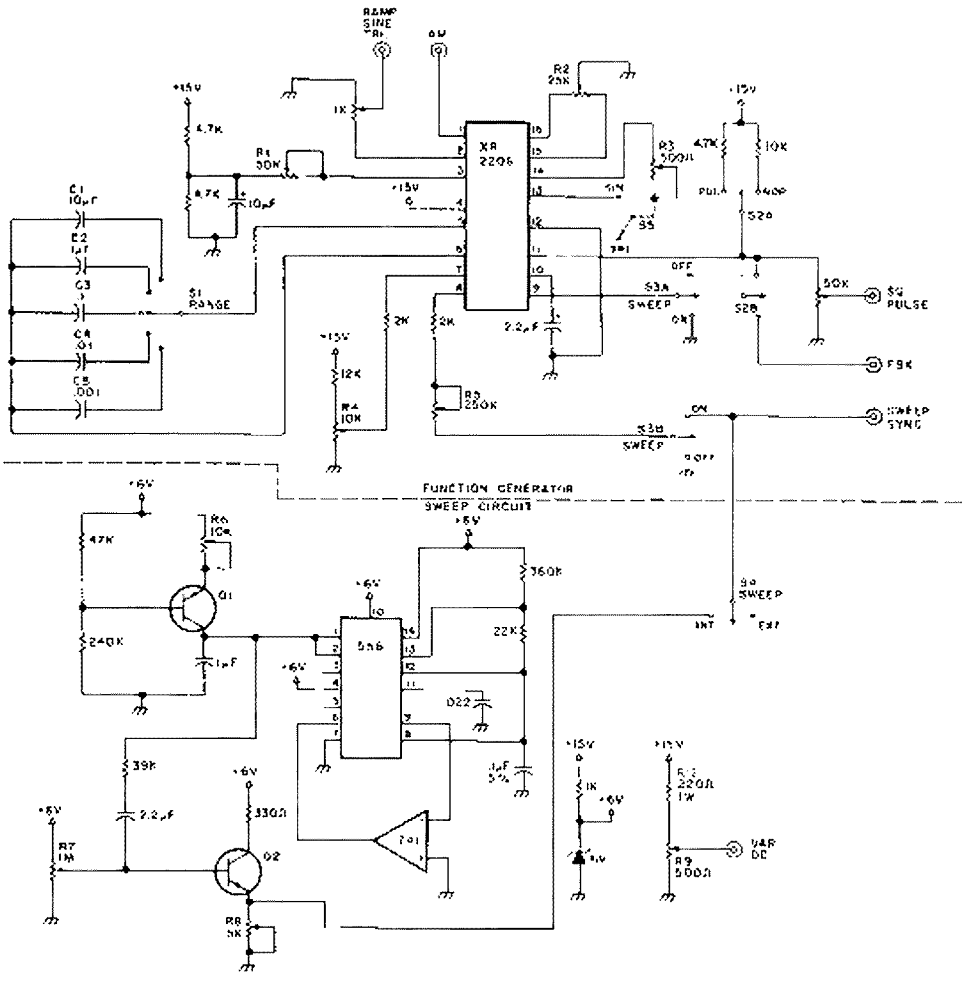

Fig. 1. Schematic of function generator and sweep generator.

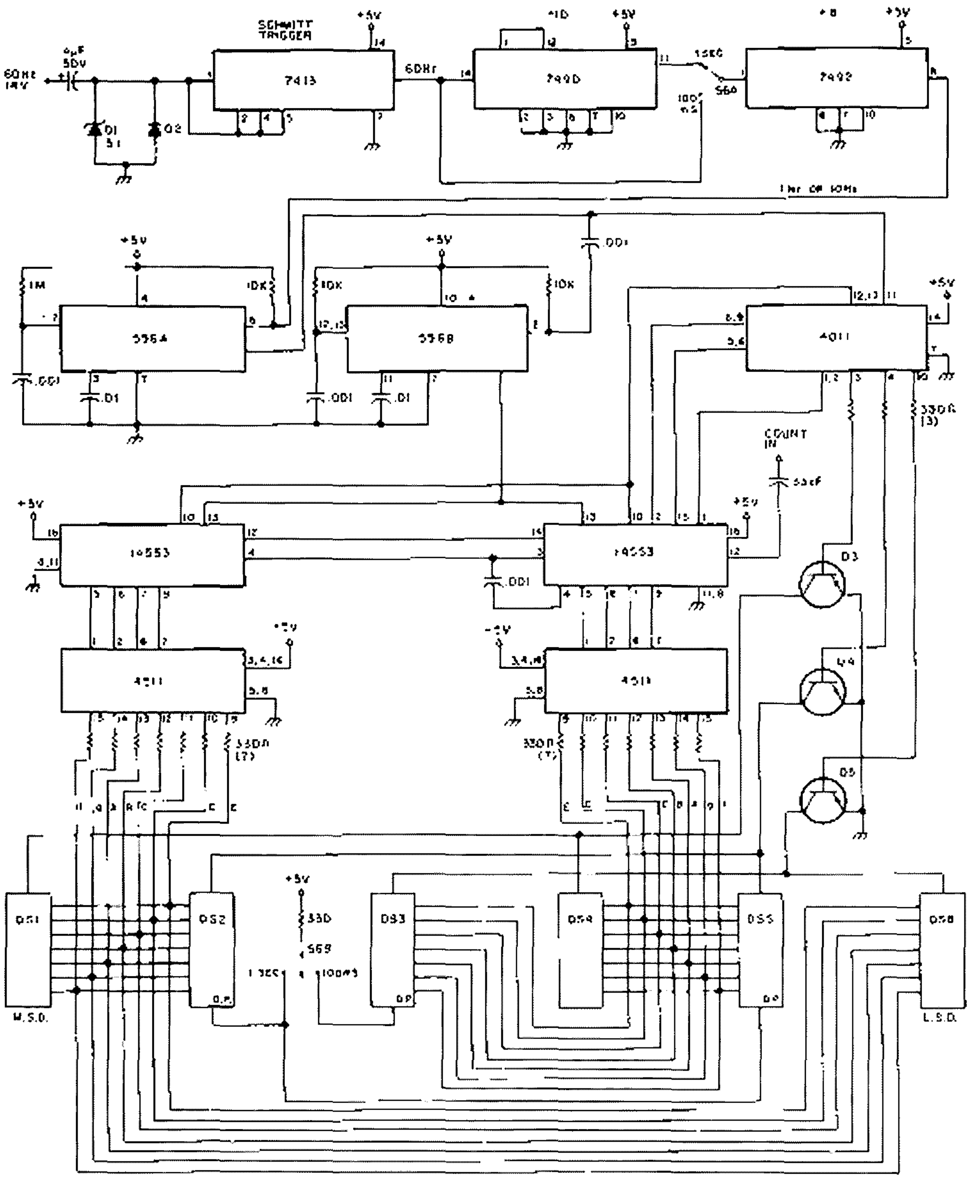

Fig. 2. Schematic of digital frequency display.

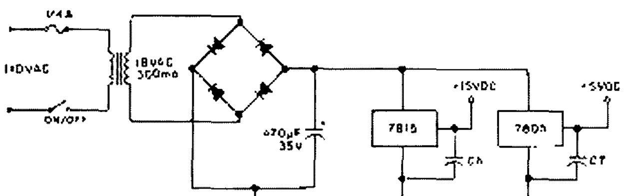

Fig. 3. Power supply. C6 and C7 are 2.2-uF tantalum and are mounted on the circuit board. All other components are mounted on the chassis.

switches so that the function generator may be swept or frequency-modulated by applying a varying voltage to the sweep/sync jack from an external source or from internal circuitry. The internal sweep circuit is a linear ramp generator which provides a 3-V ramp at a frequency which allows one sweep to fill my scope screen when set to 2 ms/cm. When the internal sweep circuit is used, the ramp signal is applied to the sweep/sync jack so that it may be used to trigger your scope.

Operation of the sweep circuit is not overly complex. One half of the 556 dual timer is wired as a monostable multivibrator which is used for a timebase. The 741 op amp inverts the output of the multivibrator to provide a good trigger signal. The actual ramp is generated by the other half of the 556 and the two transistors. Transistor Q1 is a 2N4250 or similar and provides a constant current source to capacitor C6. This constant current allows C6 to charge linearly. The other half of the 556 timer acts as a switch which grounds the positive side of C6, when triggered by the op amp. The voltage across C6 almost instantly goes to zero and then begins to recharge. Transistor Q2 (a 2N2222) is a buffer amplifier. By adjusting the dc bias on this transistor, the amplitude and position of the ramp relative to ground may be precisely set. The output of this emitter-follower type circuit is the final sweep signal.

The digital frequency display is a multiplexed unit and is based on the Radio Shack three-digit BCD counter IC, part 276-2489. The entire display was point-to-point wired on a multipurpose 22-pin edge connector circuit board which will just accommodate the 9 ICs and three 2N2222 transistors. The timebase is derived from the 60-cycle line. I have found the accuracy to be quite good at audio frequencies, often showing the same frequency as my lab grade counter, up through 50 kHz or so. Even at much higher frequencies, the difference is usually under 100 Hz and the error will always be on the low side. The frequency generated by the function generator is sampled at pin 11 of the XR 2206 and is coupled to the digital display through a 33 pF capacitor. This signal is then counted and displayed by the two sets of 14553 counter and 4511 driver ICs.

The wiring of the LED displays is a little unusual and requires an explanation. If the counter is placed in the 100-ms timebase position, it will count and display 1/10 of the actual frequency being generated, so that 4552 Hz would appear as 455. I found this to be distracting, so I added another LED display in the "ones" position and set it to display a

"0". Now the frequency display would appear as 4550. In order to get the newly-added display to have the same brightness as the other digits, I wired it as if it were in the "millionth" position. There is no leading-zero blanking, so the new digit will always show a zero unless a frequency of one MHz or higher is counted. In the one-second timebase mode, this newly-added digit will appear in the "tenths" position and will be zero unless a frequency of 100 kHz or higher is counted. In this timebase, the display would appear as 4,552.0. The decimal points are wired to the timebase switch so they will always correctly separate the hundredths and thousandths digits.

The digital display circuit is set up for common-cathode displays with right-hand decimal points. Maximum current should be limited to about 25 mA per segment. I used Radio Shack 276-1644 displays but would recommend some of the multiple-digit, multiplexed units such as those sold by Digi-Key, Inc.

The timebase and control circuits for the display are fairly straightforward. A 60-cycle signal is taken off the low voltage side of the power transformer. Diode D2 and zener D1 limit the voltage excursions to −0.7 V and ±5.1 V. This 60-cycle signal is applied to a Schmitt trigger to produce an accurate square wave, and then passes through the 7492 IC wired to divide by six. The resulting 10-Hz square wave triggers the two one-shot multivibrators which form the latch and counter reset pulses. In the one-second timebase, the 60-Hz signal is divided by ten in the 7490 IC before going through the 7492, so that a 1-Hz square wave is applied to the one-shots. Again, this is a surprisingly accurate system, and I have been very pleased with the results.

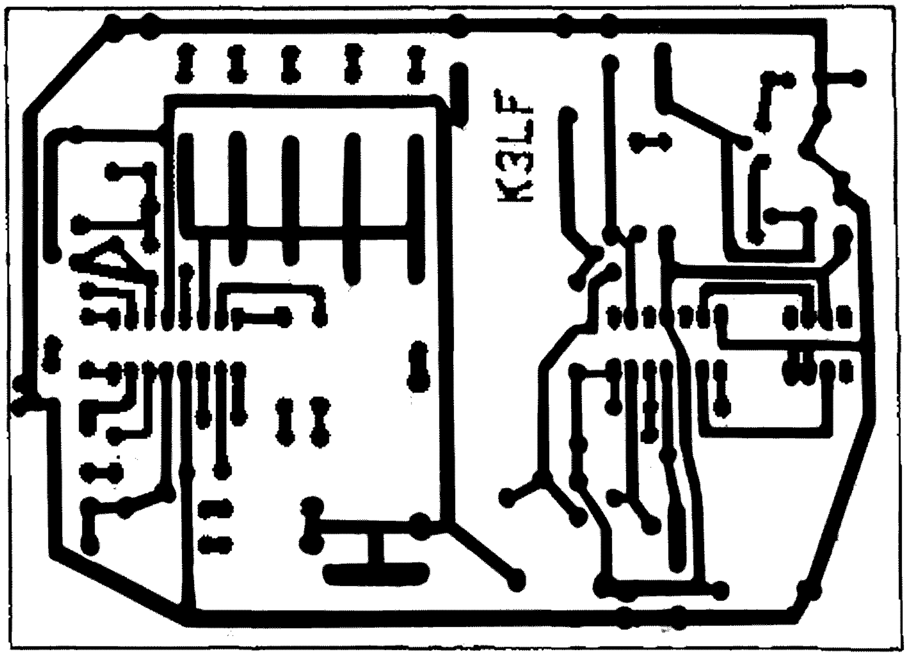

Fig. 4. PC board layout.

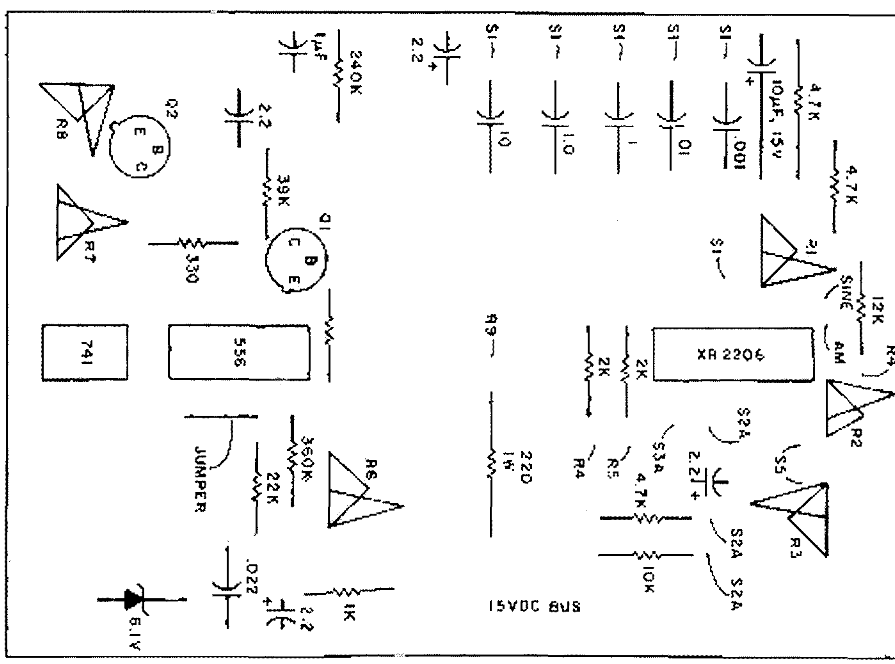

Fig. 5. PC board component location.

The power supply is fairly conventional, using an 18- or 24-V ac transformer, a bridge rectifier, and two regulators, a 15-volt and a 5-volt. If you use a 24-V ac transformer, be sure you do not exceed the maximum voltage which may be applied to the regulators; mine were rated for 35 V dc. All of the power supply components were mounted on the chassis. Note that a 2-wire power cord is used so that the chassis ground is floating and is not connected to the house wiring ground. This allows the function generator ground to be floating and set in relation to other pieces of test gear.

Calibration and Operation

Calibration is not difficult, but does require a dc-coupled oscilloscope. The function generator circuit has three adjustments. Trimmer R1 adjusts the amplitude of the signal with a maximum of six volts for

the triangle waveform. Symmetry is adjusted by R2, and R3 adjusts distortion of the sine wave and may be replaced with a 200-Ohm resistor with fairly good results. The three adjustments will interact to some degree; the object is to maximize amplitude and minimize distortion. The sweep circuit is adjusted using R6, R7, and R8. The collector of Q1 should be monitored while adjusting R6, which should be set to a position giving the longest ramp. Too little resistance here will make the ramp generator operate at twice the trigger frequency. With an oscilloscope connected to the output of the sweep circuit, adjust R7 so that the ramp just touches the 0-volt baseline. The amplitude of the ramp is adjusted by R8 to a value of three volts p-p. There is some interaction between R7 and R8, and these adjustments are somewhat critical—so be patient.

Operation of the swept function generator should be fairly obvious, but here are some helpful hints. When operating in the sweep mode, S3 should be placed in the ON position and S4 placed in INT. This will apply the ramp signal from the sweep circuit to the function generator and to the sweep/sync output jack for synchronizing or triggering your oscilloscope. You will find the signal appears to sweep from right to left as the lower frequencies are to the right. If S4 is placed in the EXT position, then an external device may be used to sweep or frequency-modulate the function generator. Whenever S3 is ON, the average frequency will be controlled by R5 and the range switch.

To determine the range of frequencies actually being swept, place the digital frequency display in the one-second timebase mode. The displayed frequency will be very close to half of the peak frequency and 500 times the lowest frequency. I have found this to be a very handy phenomenon. If I am looking at the response of a notch filter and want to know at what frequency the notch occurs, I can adjust R5 until the notch is at the center of my scope. At that point, the frequency displayed on the digital readout will be the frequency of the notch. If I want to apply a swept signal of 10 Hz to 10,000 Hz to some piece of equipment, then I merely adjust R5 until the display shows 5,000 Hz and I will be right on target.

When operating the generator with the sweep turned off and S2 in the NOR (normal) position, the secondary function generator may be activated by grounding the FSK jack. The frequency of the secondary generator is controlled by R5 (the primary generator is controlled by R4).

One last item: Any amplitude-modulating signal must have the same dc bias as the output. Potentiometer R9 has been included to provide an adjustable dc reference voltage. The 220-Ohm resistor, R12, limits the current if the VAR dc jack is grounded.

I have had my function generator in use for about a year and have been very happy with its performance. In the future, I hope to build an interface device so that the function generator can be controlled by my KIM-1 micro via the sweep and FSK inputs. This would probably open the door to all sorts of neat applications. I hope you enjoy this versatile instrument as much as I have. ■

New Horizons for the HW-8 Transceiver

—a dandy mod to expand frequency coverage

Roger C. Amundsen W1PQ
264 Old Sib Road
Ridgefield CT 06877

Would you like to increase the tuning range of your Heathkit HW-8 to add 3750 to 4000 kHz, 7250 to 7500 kHz, 14250 to 14500 kHz, and 21250 to 21500 kHz? I did and I found it very easy to do. I wanted to listen to some of my friends on 75 and 40 and also be able to receive CHU just above 7300 kHz.

To make this modification, only two parts are required: a capacitor to pad the vfo tuning and a toggle switch to add it or leave it out of the circuit. I used a trimmer, but if you are not too fussy, a fixed capacitor of 12 pF will do.

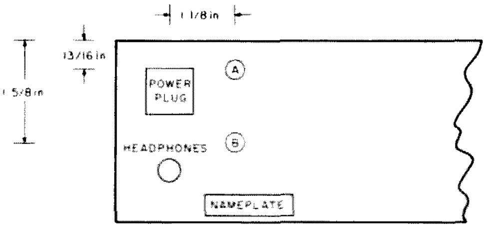

Fig. 1. HW-8 rear panel. A = 3/16" hole for 15-pF trimmer if used. B = 1/4" hole for miniature SPST toggle switch.

I located a miniature toggle switch on the rear panel (as shown in the sketch) so that no injuries were inflicted on the front panel. One side of my trimmer (mounted above the toggle switch) is grounded, so it was simple to run the other lead to one side of the toggle and then tie the other terminal of the switch via a piece of tinned bus wire to the lug on the vfo tuning capacitor, C302B.

One adjustment and you are in business. With the new capacitor switched out of the circuit, open up (reduce) the mica trimmer (C362A) on the vfo tuning capacitor to offset the stray capacity of the added circuitry. Adjust the vfo to 3500 kHz when the dial reads 0 (3.5 MHz band position). If in doubt, adjust it so that W1AW broadcasts are on 3580 kHz. No adjustments are required for the other bands. Throw the toggle switch and adjust the new trimmer for 3750 kHz for 0. The dial will now read 250 kHz higher on all bands or tune from about 3750 kHz to 4000 kHz on 80 meters. *Do not operate the transmitter function outside of authorized bands.*

Results: The HW-8 is no superhet, but for a direct-conversion receiver it is not bad. Also, if you desire to remove the mod, a couple of small hole plugs cover up the surgery. See you on 3540 kHz. ■

New Frequencies for the IC-2

—for MARS members only

MARS members will be happy to know that the no-compromise, synthesized, Icom IC-2 handie-talkie can be modified easily to transceive out of band. And, best of all, the cost of this modification is a total of *zero!*

Tuning this HT is done by setting three miniature thumbwheel switches—one each for MHz, 100 kHz, and 10 kHz. A slide switch beside the thumbwheels adds 5 kHz to the frequency. Although the MHz thumbwheel turns throughout its full 0-9 range, the synthesizer confines the actual frequency to the amateur band, as shown in Table 1.

After inspection of the circuit boards, thumbwheel switches, and schematic, it became apparent that this HT was manufactured for usage throughout the range of 140.000-149.995 MHz. By the placement of jumpers, it can be configured to the different band plans for Europe, England, and the USA.

After making this modification, the IC-2 will tune from 140.000 through 149.995 MHz in 5-kHz steps following the exact thumbwheel setting. All other functions remain the same.

Step 1. Remove the battery pack. Remove the four screws that hold the battery retaining plate on the bottom. (Note the position of the plate to assist in reassembly.)

Step 2. Turn the HT face down. Remove the two case retaining screws.

Warning: A paper-thin, flexible, printed circuit board connects between the touchtone™ pad and chassis on the IC-2AT model. Be extremely careful if you remove the front half of the HT case.

Step 3. Remove the back half of the HT case.

Step 4. Using the picture of the HT on page 20 of the Icom manual and Fig. 1, here, find the programmable divider chip, IC1, and the flexible circuit-board tape soldered to it. Run solder across the nonconductive gap in the line designated C4. Use a small, low-wattage iron so as not to damage the flexible circuit board.

Step 5. Remove the two retaining screws on the side of the chassis and hinge open the two circuit boards.

Step 6. Find the brown-colored jumper wire that connects two solder pads together on the underside of the MHz thumbwheel switch. Snip this jumper and tape the ends.

Step 7. Carefully reassemble the HT. Make changes in the Icom manual and on the schematic.

Navy-Marine Corps MARS in Tennessee is currently using a 600-kHz split in the 148-MHz range. If you require a non-standard split, the MARS modification article for the Tempo S1, written by Dorsey "Diz" Price K5EDS in the April, 1980, issue of *73* should be reviewed. A similar modification could be made to the IC-2. I'll let someone else write that one! ■

The Digital Defender

—computerized ham shack security

Protecting personal property, be it ham shack or home, is big business these days. Even traditional department stores have started to stock systems which blast you with bells, whistles, or horns when activated. None of those systems has the flexibility to cover several possible installation situations and provide complete protection. This system probably won't either, but it comes a lot closer.

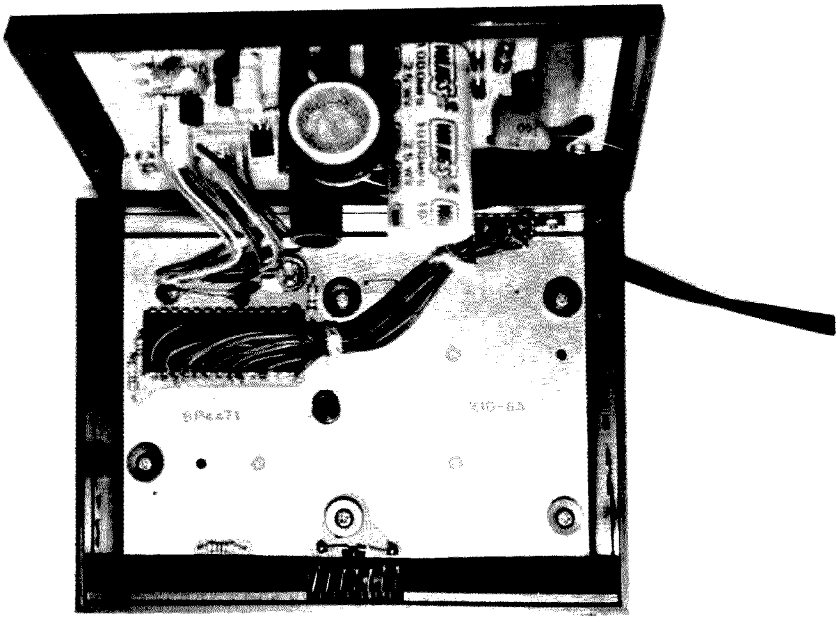
Requirements

Requirements for this system are that it be inexpensive, flexible, easily installed, and as foolproof as possible. The sensors must be easily installed and repairable. They should sense breakage, smoke, fire, and when someone is about to enter a protected area. Warnings should be audible and visual. The system should have built-in self-test features along with power-fail battery backup. And, as a final touch, it should have the capability of controlling lights or appliances.

To fulfill these requirements is no small task and is difficult without the use of some external intelligence. By now probably you have guessed that a microcomputer might be the intelligence. Well, it is, and the total cost of this system is well below that of most of today's allband transceivers. The system described here was developed on a Heath H8 with parallel I/O, but is easily adaptable to any system or single-board micro having an 8-bit parallel I/O port and about 8K of memory.

System Planning

To find out the best way to protect yourself or your property, ask a burglar. The next best way is to ask the police. Since this system is to provide for fire and smoke detection also, a stop by the fire station for a few pointers would be advisable. With these ideas in mind, on to the planning.



This photo shows the internal wiring of the Sears control unit. Be sure to route wiring as close to the circuit board as possible and away from the ac power wires.

One of the best ways to plan and install a detection system is to draw a scale floor plan of the area to be protected. Figs. 1, 2, and 3 assume that it is a house that is to be protected. It is a good idea to show fire-/smoke-detector locations as well as alarm sensors. Divide the total area to be protected into smaller, well-defined zones, keeping in mind how sensor wires can be installed. Once one has a general idea of how the sensor installation might be done, the next step is to define system operating conditions.

The fire-/smoke-alarm section of the system should function even though the micro may have failed or is being used for other purposes. If ac power has failed, the automatic lighting will not function, but the alarm will since the system has battery backup. For safety reasons, the complete system (except for micro power) operates at +18 volts or less. All voltages are derived from the same source so that if the battery fails, no false alarm will sound. This may or may not be an advantage depending on system usage.

No system yet devised is completely foolproof. Several techniques are used in software (see Software Description) to avoid false alarms caused by spurious noise spikes, power outages, lightning strikes, and ham radio transmissions. Murphy's Law is still in effect, however.

One additional feature is a time-of-day clock. It is not listed under requirements because it applies only to the Heath H8 system. It is a software-generated clock and utilizes the H8 front panel for readout. This same function (minus the H8 front panel) is used for timing in the software (lines 200-245) to control the rest of the sequence. This clock function is derived from the internal tick counter of the computer and is described in the software section below. Along with the clock, facilities were built into the software to record when (time of day) an entry was made. An automatic self-test feature also was included.

System Design

For purposes of system description and layout, the Fig. 4 block diagram is included to help avoid confusion. The system is divided into three basic parts. Part (C) is the H8-2 Heath I/O and is shown for clarity. Parts (A) and (B) can be combined into one unit or board even though they are shown as being separate. The reason for separation is that I chose to build two units using .1 × .1 inch, 22-pin, two-sided, plug-in vectorboards. Circuit-Stik copper strip and pads are used to mount components, and wire-wrap sockets are used for the IC sockets. The two boards are connected together by a 16-pin DIP jumper (U10).

Early in the design stage, a decision was made to allow for several types of simple sensors. The simplest of these is the open/closed circuit. A decision also was made to provide all signal conditioning and detector logic outside the computer enclosure. As a result, parts (A) and (B) are external to the computer and all inputs and outputs are external to the detector enclosure.

Power Source

To overcome the power problem, a backup source of power is used. Fig. 5 is a block diagram of one method of doing this. This particular method is not as efficient as a more complex battery and regulator circuit, but it is simpler. Also shown in Fig. 5 is the method of connecting both the charger and inverter to the battery. The inverter will run about ten hours on a fully-charged 12-volt automobile battery. The charger is set for 14 volts so that as soon as line power is restored, the battery is automatically recharged. Additional filtering was added to the charger to reduce the feedthrough ripple. A device called "Mayday," manufactured by Sun Technology, Inc., New Durham NH 03855, is purported to prevent loss of memory when brownouts or blackouts occur. In any case, a 200-Watt power source will be sufficient for a fully-loaded H8.

Sensors

All of the detector logic—part (A)—uses positive true logic, i.e., a 1, or high, level indicates a fault. Reverse logic can be used also and will be explained later. Both the burglar and/or fire alarms are designed to operate with positive or negative logic.

All sensors with the exception of the smoke alarms are made of small-gauge copper- or enamel-covered copper wire and are shown in Fig. 12. These are the least expensive and

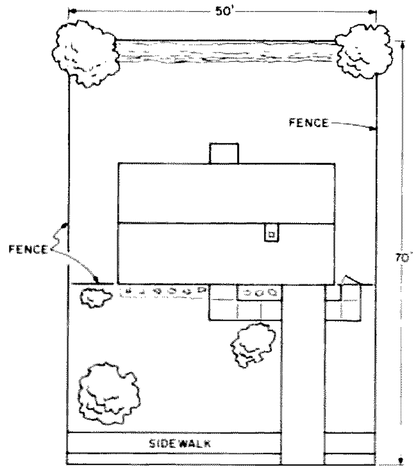


Fig. 1. Plat.

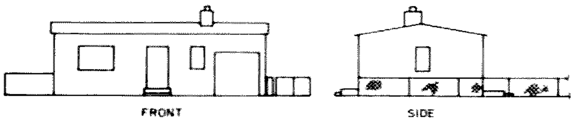

Fig. 2. Wall views.

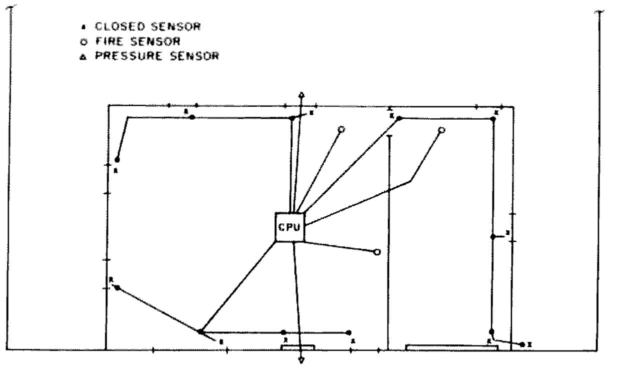

Fig. 3. Floor plan.

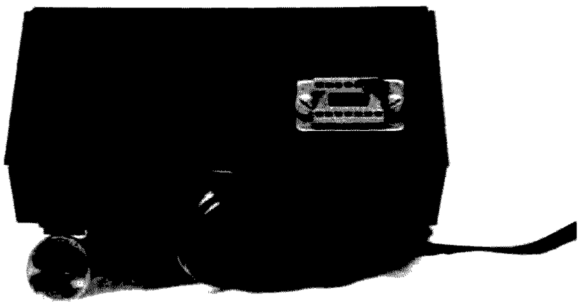

This shows the position of the I/O connector on the Sears control unit.

easiest to install. No relays or magnets are used although they are easily substituted.

Fire detectors are manufactured from a short piece of rosin core (Multicore) .028" (.71mm) solder. This solder melts at approximately 450 to 550 degrees F. This is below the flash point of paper and is great around a fireplace or flue. The output from a standard smoke detector is used to trigger the fire-/smoke-alarm input. Most smoke alarms use a transistor to turn on the alarm device, so the sensor lines (input and ground of U8) are connected at the switching-transistor input. Some schematic checking may be required for your particular smoke alarm.

Two additional sensors are provided; these are pressure types. They are manufactured from two galvanized sheet-metal plates separated by a 4- or 6-mil plastic sheet. The plates are approximately 2 × 3 feet and are covered by indoor/outdoor carpet. The carpet is used partly for protection from rain and partly for concealment on an outside step.

Part (A)—Alarm Logic

The schematic diagram of Fig. 6 is the detection board. U1 and U8 along with signal conditioning form the inputs to the system. U1 is the burglar-alarm section and U8 is the fire-alarm section. R15 through R28 (10k) form pull-up levels for each input line. Diodes CR1 through CR12 (10-V zeners) have two functions. The main function is to limit the positive input voltage via R1 through R12 (1k) to 10 volts. In normal operation, the input lines are shorted to ground through the sensor and go high only when the sensor is tripped. The second function of the diodes is to provide a method of checking operation of the system by software. U1 and U8 are CMOS non-inverting buffers. If it is desired to have a closure to ground when a sensor is tripped, U1 and/or U8 can be changed to a 4049B inverter. The diodes must be reversed along with ground and +5 volts on RL.

U2 and U3 form an 8-bit latch which stores whatever input changed. U4 is connected in parallel with U2 and U3 and is an 8-input NOR gate. No matter which input line goes high, the output of U4 (pin 13) goes low. This line is used to tell the computer I/O that valid data is ready to be sent. Pins 5 of U2 and U3 are tied together and to the SEND DATA line of the computer. The software will toggle this line several times to be sure that the data is constant and available for the correct length of time, thus preventing static discharges from triggering the alarm. These two lines form the major handshaking with the computer.

U9 and Q1 form the self-test circuit. U9 is connected via the board interconnect, U10 to U16. The software randomly checks the system to determine if it is still functional. RL forces +5 volts on all inputs simultaneously and the computer reads the results. If the value read is not correct, a notice is printed out and the program continues. S1 is provided to allow a local check of the system. The software monitors this function and will inform the operator if all is well.

U5 and U6a form the code logic. The logic is nothing more than an eight-line-to-binary conversion. This method allows 16 input lines to use only four of the eight data-output lines to the computer. Data-output line D4 is used only to record the fact that a fire/smoke sensor was triggered and to turn on all lights. The alarm is set off without computer intervention.

U7 is used in the same manner as U4 except that its output drives the input of U6b which is used as an inverter. As in the case of U1, if an input to U8 should open, pin 13 of U6b would go high, indicating an alarm condition. Two additional lines into U7 are provided as shown in Fig. 6. They are used to connect to the smoke alarms. If they are not used, they should be grounded.

U13/U11 and U14/U12 form the pressure sensors.

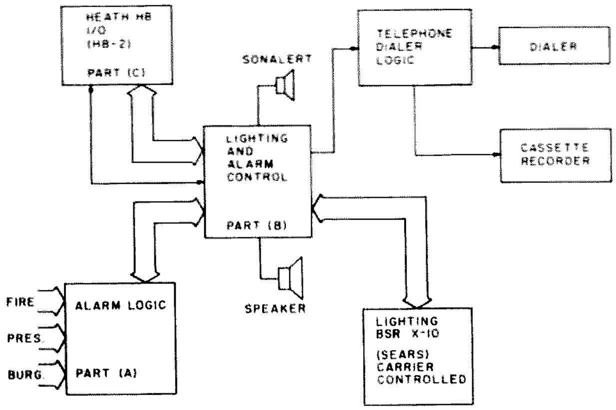

Fig. 4. Block diagram.

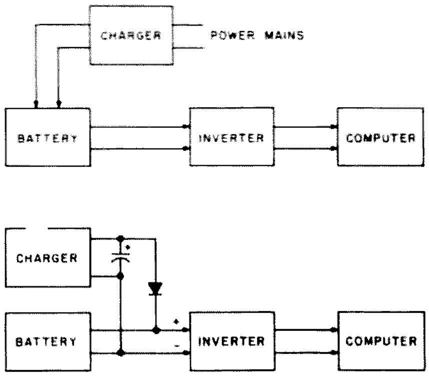

Fig. 5. Power source.

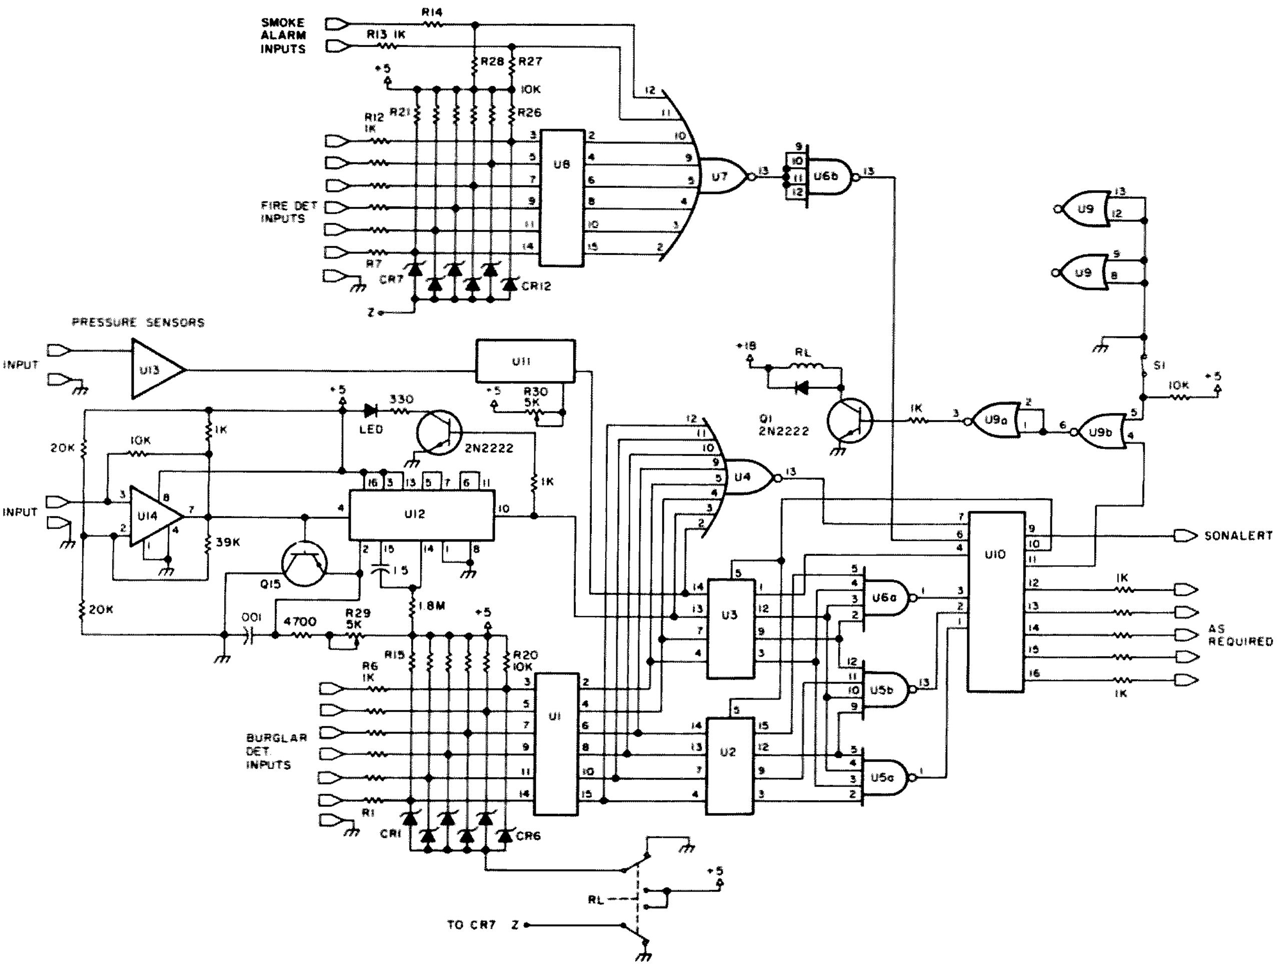

Fig. 6. Part (A), alarm logic.

Since the function of each is the same, only one set will be described. U14 is an LM311 that is connected as a multivibrator which runs at approximately 1 MHz with no input. When a fifty-foot length of Belden 8401 microphone cable and the two galvanized plates are attached, it runs at about 50 kHz. U12 is a CMOS dual one-shot. The first section along with Q15 forms a missing-pulse detector. When pressure (stepping on the plates) is applied to the plates, the frequency goes down and the one-shot times out and triggers the second section of U12. The second one-shot is retriggerable and the output goes high for approximately 3 seconds. The LED is used only for visual aid. R29 and R30 provide adjustment of the missing-pulse detector to allow for various cable lengths and plate sizes. A fixed resistor in series with R29 and R30 provides additional range if required.

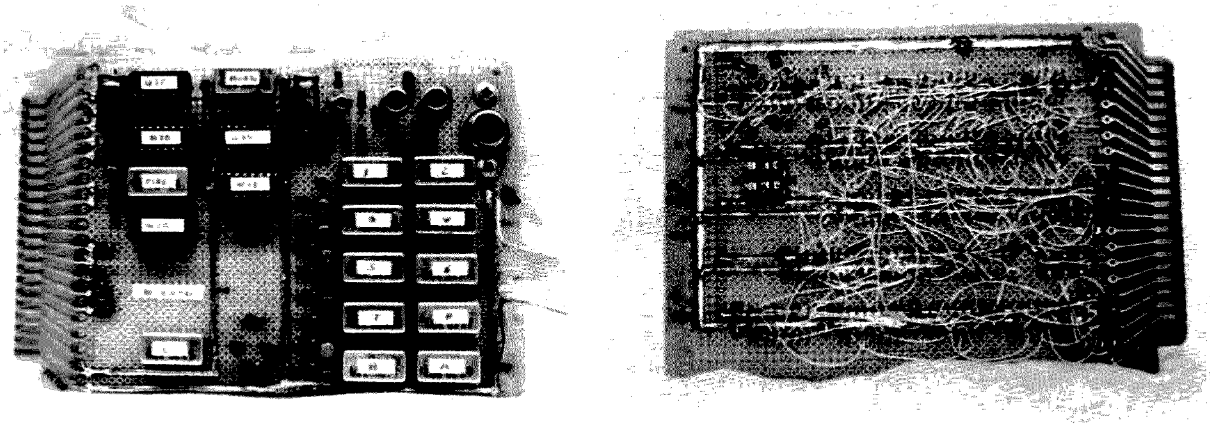
Part (B)—Lighting and Alarm Control

The Fig. 7, part (B), schematic is perhaps the heart of the system. The function of this part is to provide a path for data to and from the computer I/O. Handshaking information is passed through this card and onto the part (A) card. Incoming data from the part (A) card is passed through this card and into the computer I/O.

U15 and U16 form a 4-line-to-16-line decimal decoder. The output lines, 1 through 9, are connected directly to the inputs of nine driver transistors (Q3 through Q13) which, in turn, are connected to relays labeled 1 through 8. Line 9 is connected to the same type of transistor driver/relay (Fig. 8) as well as to the fire-alarm circuit. The line-9 relay controls the external alarm simultaneously with the internal fire-alarm circuit. This combination alerts anyone inside or outside the house. The remaining lines from U16 are returned via the U10 interconnect to the part (A) board.

U18 is a two-bit decoder which is used in combination with U15 and U16. The output of U18 is connected to three driver transistors which, in turn, are connected to relays. These relays are labeled A, B, and C. These relays, along with those labeled 1 through 8, are the control relays for the operation of one of the neatest devices to come along in a long time. This device is a BSR X-10 (Sears) carrier-controlled lighting system. This little gem will control home or office lighting or applicances with just a push of a button. It uses existing power wiring, is inexpensive, and provides an ideal solution to a complex problem. (It is beyond the scope of this article to describe the BSR X-10, but a good description of it can be found in the January, 1980, issue of *Byte*, "Computerize a Home.")

The BSR X-10 is modified slightly to allow the control lines to be brought out to the relays. Relays must be used to control the device because the control unit is



These photos show the front (left) and back (right) views of the "A" board. Note the use of "Circuit-Stik" copper strip for power and ground. The IC sockets are soldered to the copper strip to hold them in place before the wire-wrap is installed.
